Universal Access: An international comparison

- What is Universal Service / Universal Access?
- The "myth" of subsidised access
- Defining affordability
- Pricing strategies
$\Rightarrow$ For universal access
$\Rightarrow$ For universal service
- Targets for the year 2010

## Universal Access: An international comparison

## Universal access

-Availability ...

- Accessibility ...
- Affordability ...
of basic telephone service
"to promote the extension of the benefits of the new telecommunication technologies to all the world's inhabitants"
ITU Constitution, Article 1

## Universal Access: An international comparison

## Universal access and Universal service

- Universal service: telephone in every home
- Universal access: telephone within reasonable distance for everyone

## Universal Access: An international comparison

## Teledensity disparities

## The nature of the problem

## The scale of the problem

## Universal Access: An international comparison

## Teledensity transition

## ITU <br> Universal Access: An international comparison

## Measures of Accessibility: SA

Teledensity: $\quad 10.7$
Cellular density:
Total telephone density: 14.4

Household telephone penetration:

## Universal access

 penetration (\% of households with access to telephone): 82\%Source: Statistics South Africa.
[http://www.statssa.gov.za/](http://www.statssa.gov.za/)

## Universal Access: An international comparison

## Measures of Accessibility <br> : by province

South Africa . \% of households with a telephone, By province, 1996
Source: Statistics South Africa.

## Universal Access: An international comparison

## The "myth" of subsidised access

- It is commonly argued that telephone access should be priced at a low rate so that as many people as possible can afford it
- But,
$\Rightarrow$ this may result in 'subsidies' from non-telephone users to telephone owners, who are typically business, government and richest 1\% of population
$\Rightarrow$ if revenues do not cover costs, then the waiting list will grow

## Universal Access: An international comparison

## "Socially desirable" pricing

- Rates are kept artificially low
- Affordable price, maybe < break-even
- Initial group of telephone users are clustered in the largest city and are not poor
- May not generate enough revenue for network expansion

Percentage of households in Lima, Peru with a telephone, by income, 1996

| 1996 |  |
| :---: | :--- |
| 100 | A $=$ Richest 25\% <br> B $=$ Second 25\% |
| $\%$ | C $=$ Third 25\% |
| $\square$ | $84 \%$ |
| D $=$ Poorest 25\% |  |

## Defining affordability

$\bullet$ Relative affordability, e.g., <5 per cent of average family income
$\Rightarrow B U T$, initial telephone users are are not necessarily "average
$\Rightarrow$ In low income countries, costs for network installation may be high, but incomes are low

- "Best practice" cost of operating a network
$\Rightarrow$ Methodology must be refined for residential and business users
$\Rightarrow$ Costs must be split between one-time $\&$ recurring

## Universal Access: An international comparison

## 

Affordability levels by differing costs of telephony per month*

|  | R30 | R40 | R50 | R60 | R70 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{H} / \mathrm{h}$ not able to afford more than $2 \%$ on income spent on telephony | 44\% | 53\% | 60\% | 65\% | 69\% |
|  | $\begin{aligned} & \hline 3 \\ & 829 \\ & \hline \end{aligned}$ | $4$ | $\begin{aligned} & 5 \\ & 215 \end{aligned}$ | $\begin{aligned} & 5 \\ & 642 \end{aligned}$ | $\begin{aligned} & 6 \\ & 017 \end{aligned}$ |
| $\mathrm{H} / \mathrm{h}$ not able to afford more than 3\% of income spent on telephony | 30\% | 40\% | 48\% | 53\% | 58\% |
|  | $\begin{aligned} & 2 \\ & 616 \end{aligned}$ | $\begin{aligned} & 3 \\ & 445 \end{aligned}$ | $\begin{aligned} & 4 \\ & 142 \end{aligned}$ | $\begin{aligned} & 4 \\ & 648 \end{aligned}$ | $\begin{aligned} & 5 \\ & 067 \end{aligned}$ |

Table from the DRA Development Document Defining the Categories of Needy People

## Universal Access: An international comparison

## Telephone charges relative to household income, 1995

Note: $\quad$ The annual telephone charges data are a basket based on one tenth of the installation charge, annual subscription in the largest local network, 700 local calls and 130 long-distance calls. Taxes are included.

## Methodology for determining average and best practice costs

| Establish average operating <br> costs for telephone network | US\$ 200-400 per subscriber <br> per year |
| :--- | :--- |
| Derive an average tariff | US\$ 64-122 per year |
| Determine how many <br> households can afford service | Where 5\% of household income <br> $>$ US $\$ 1 \prime 340-3 ' 200$ |
| Choose a policy for families that <br> cannot afford service | Financial assistance, widespread <br> payphones, etc. |

## Average \& best practice residential costs

|  | Average | Median | Best <br> practice |
| :--- | :---: | :---: | :---: |
| Annual operating cost <br> per line | 380 | 300 | 200 |
| Annual subscription ${ }^{1}$ | 122 | 96 | 64 |
| Annual connection fee ${ }^{2}$ | 39 | 7 | 3 |
| Total annual charge for <br> telephone service | 160 | 103 | 67 |
| Annual income required <br> to afford service | $5 ' 432$ | $4^{\prime} 320$ | $3^{\prime} 480$ |

## Universal Access: An international comparison

## Global measures of Affordability

## Universal Access: An international comparison

Pricing strategies for extending Universal Access

- Installation charges initially high, but coming down over time
- Residential subscription charges should reflect cost of servicing line (typically US\$5-10 per month)
- Set separate charges for residential and business subscribers
- Lower prices for payphone or community telephone access
- Tariff options, e.g., for low-volume users

## Universal Access: An international comparison

## Installation charges and teledensity in Argentina and Brazil, US\$

# Demand-side measures for extending Universal Access <br> - Tariff cross-subsidies 

$\Rightarrow$ Traditional method, but may not benefit those for which it is intended

- Universal Service Fund
$\Rightarrow$ Targeted assistance for special needs (e.g., rural areas, disabled), but may create administrative burden
- Direct Financial Assistance to users
$\Rightarrow$ Targeted assistance using non-telecom-specific criteria, but may be difficult to control abuses
- Community-wide initiatives
$\Rightarrow$ e.g., Payphone in every village, community

## Supply-side measures for extending Universal Access

- Market liberalisation
$\Rightarrow$ e.g., allowing new suppliers to enter market, liberalising equipment market, giving financial autonomy to PTO, encouraging foreign investment, Build/Transfer/Operate concessions
- Payphone liberalisation
$\Rightarrow$ e.g., permitting private installation and ownership of payphones, community telephone shops, telecentres
- Technical solutions
$\Rightarrow$ e.g., Mobile cellular, Wireless Local Loop, GMPCS, combined cable TV/telephony

## Universal Access: An international comparison

## Pricing strategies to achieve Universal Service

- Targeted tariff options
$\Rightarrow$ e.g., for low-volume users, the elderly, the disabled, foreign migrants
- Prepaid calling cards
$\Rightarrow$ for fixed-line and mobile networks
- Support for incoming calls
$\Rightarrow$ e.g., to allow families to receive calls from family members working abroad, for instance through voicemail, email, telecentres, callturnaround, foreign sales of calling cards etc
