

#### ITU / BDT workshop

Warsaw, Poland,

6-10 October 2003

### **Network Planning**

Lecture NP-3.3

### **Network Design and Dimensioning**

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 1

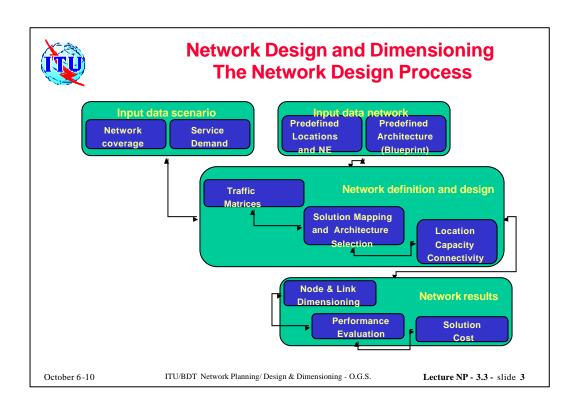

### **Content Chapter 3.3**

- Design process and criteria
- Traffic characterization
- Capacity modeling and dimensioning
- Efficiency increase

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

# Network Design and Dimensioning: The Network Design Criteria

- A) Match realistic service demands and workloads for a given time
  - Node and links loads based on proper characterization, measurements and projections
- B) Consider equilibrium between QoS and cost
  - Statistical behavior for the flows
  - Traffic modeling for given quality, efficiency and protection
  - Overload protection and control
- C) Anticipate capacity as a function of service grow rate and needed installation time. Reserve capacity
- D) Follow SLA when different service classes coexist

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

### **Network Design and Dimensioning:**The 5 begin Traffic a stighting

- The 5 basic Traffic activities
- Traffic Characterization for services and network flows
- Traffic **Demand** forecasting at the user and Network interfaces
- · Traffic Dimensioning for all network elements
- Traffic Measurements and Validation for key parameters
- Traffic Management in focussed and generalized overload

October 6-10

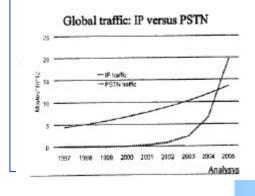

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 5

## **Network Design and Dimensioning: Service and Traffic Demand**

Some examples of published forecasts.... Good enough ??

October 6-10

 $ITU/BDT\ \ Network\ Planning/\ Design\ \&\ Dimensioning\ -\ O.G.S.$ 

#### Network Design and Dimensioning: Traffic Forecasting

#### **Service demand Characterization**

- By a profile through days in a year/week
- By a busy period within a day
- By superposition of non-coincidence of busy periods (for intercountry traffic in different time zone)
- By aggregation or convolution of flows for different services
- By interest factors between areas (adjusting matrices in the two dimensions ie: Kruithof, affinity, correlation)

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 7

## **Network Design and Dimensioning:**Traffic Characterization

- Traffic Units definition
  - At call, session and packet level
  - Needed additional clarification on the different type of averages and meaning (CBR,SBR, Billed)
- Reference periods
  - Should be common when aggregating services to ensure validity and represent behavior of IP flows
- Statistical laws
  - For calls, sessions and packets
- Aggregation process
  - Considering reference period above and coincidence/noncoincidence of busy periods among services

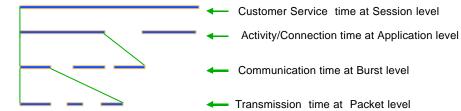

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

#### Network Design and Dimensioning: Traffic network engineering Bottom-up SBR aggregation

 Generalized utilization time and levels per user activity in the busy period: Example for IP

•Aggregated average traffic per level as a weighted average of the services i and customer classes j at that level.

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 9

## **Network Design and Dimensioning: Traffic Architectures to be modeled**

To simplify analysis, the following partition is made:

- L1) Global Network Level
  - Overall topological network (access and/or core) including routing procedures and all alternative paths.
- L2) End to End Path or sub-path
  - For different user type scenarios: VoIP to VoIP, VoIP to POTS, etc. and network segments: user to LEX, user to GW, etc.
- L3) Network Elements
  - For Network Nodes
    - LEX, RSU, POP, GW, SS, TGW, IP router, etc.
  - Network Links
    - At functional, transmission and physical levels

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

#### Network Design and Dimensioning: Basic methods

- Analytical

  - Delay based "Infinite" memory ie: Computers, Packet
- Simulation
  - Discrete events Call by call, packet by packet, etc
  - Analog
     Load flow
- Frequent statistical distributions
  - Poisson, Negative exponential, Lognormal, Hyperexponential, Self-similar, Generalized

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 11

## Network Design and Dimensioning: Basic methods

- · Mathematical processes for the modeling
  - Markov processes
     New events function of last system state (easy to be treated)
  - Semi-Markov processess
     New events function of oldest states but history resumed with new variables at last state
  - Non-Markovian
     New events strongly dependent on all previous states (high complexity for modeling)

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

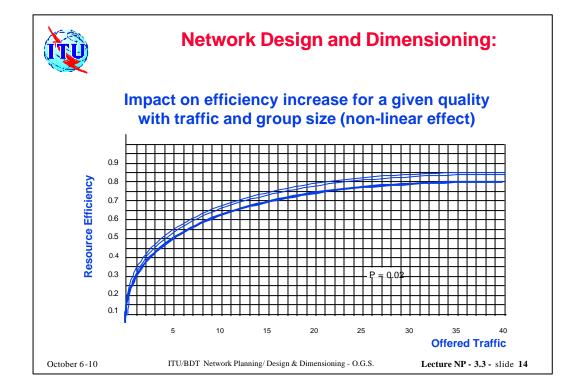

#### Network Design and Dimensioning: Basic methods

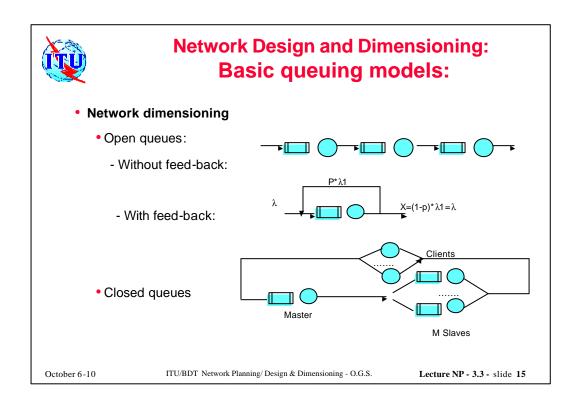

#### Most common models

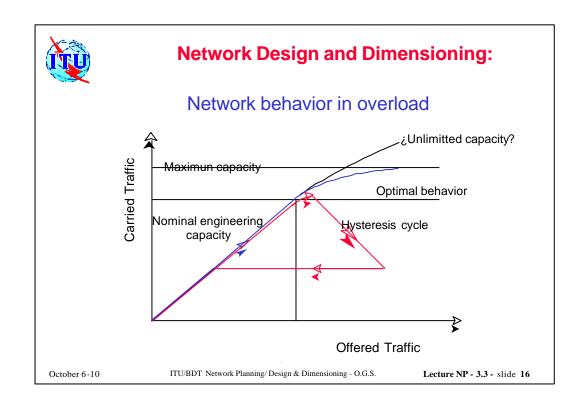

- M/M/1/∞ Poisson arrival/negative exponential service time/one server/infinite traffic sources
- M/D/1 Poisson arrival/constant service time/one server/infinite sources
- M/M/n/m Poisson arrival/negative exponential service time/n servers/m sources
- M/G/n/∞ Poisson arrival/generalized service law/n servers/infinite sources

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

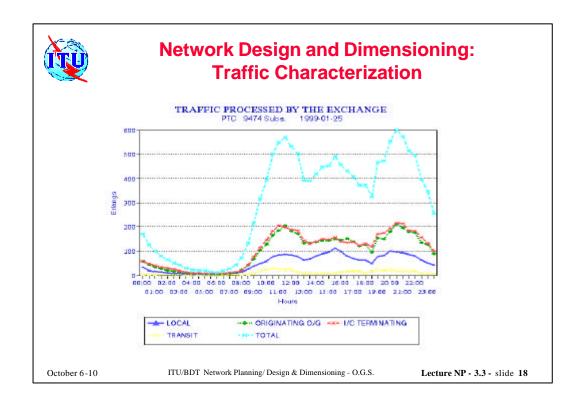

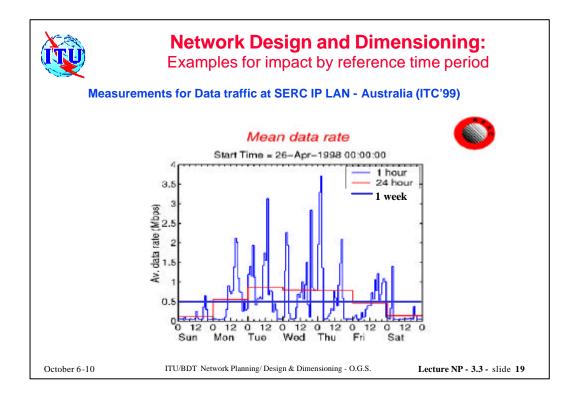

## **Network Design and Dimensioning: Traffic Measurement and Validation**

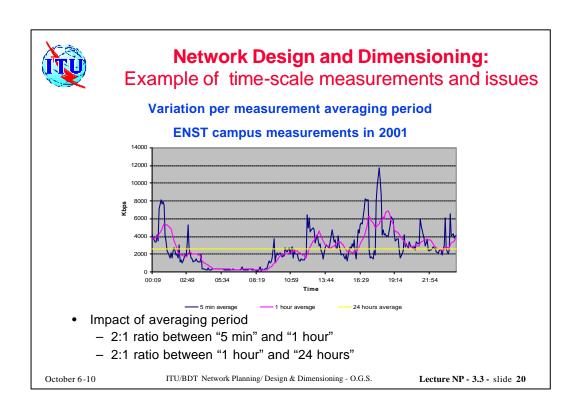

- For Overall Network and network Paths/sub-paths including parameters used in the network dimensioning and performance
  - By internal measurements. May alter original flows and overload systems and memory due to the high volume of information)
  - By statistical stratified sampling to solve the previous problems (recommended)
- For Network Nodes and Links including more detailed system parameters
  - Following harmonized measurement period for statistical significance
- · Result analysis and validation
  - For all defined 3 levels (network, path and NE) and parameters used in the dimensioning and SLA/QoS

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

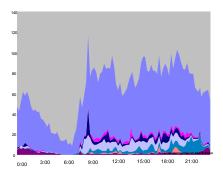

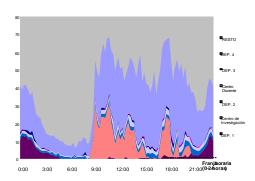

#### **Network Design and Dimensioning:**

Examples for behavior per user class

Example of I/O hourly variation per user class in a region IP/ATM Internet National Backbone - Red IRIS Spain by UPM (IFIP'99)

#### Mbytes

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 21

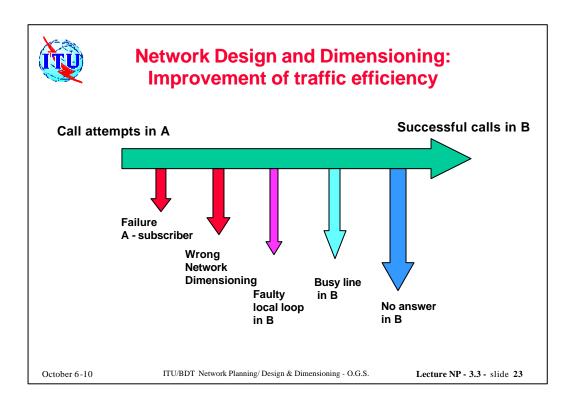

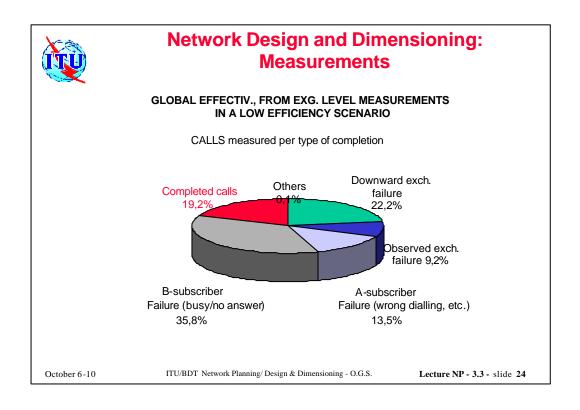

# Network Design and Dimensioning: Measurements utility

- To analyse end to end flow completion rates
- To follow up and to analyse the occupancy rates
  - for each type of systems (local exchange, primary/secondary main cables, distribution cables)
  - for each elementary service area
- To detect the bottlenecks and saturation level
- To determine the lost revenues due to waiting list in each area
- To classify areas by priority depending on the profitability of projects of extensions.

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

# Network Design and Dimensioning: Example for performance objectives

- Overall end to end success billed calls: > 70 %
- Average trunk call success rate during office hours: 95%
- Percentage of exchanges achieving a minimum success rate of 95% for calls to and from individual exchange areas: 95%
- Max number of customer reported faults per 1000 mainlines and year (average): 150
- Delivery time for installations in permanent dwellings within 5 working days: 90%
- Fault clearing time for telephone service in permanent dwellings no later than one working day after being reported: 90%

October 6-10

ITU/BDT Network Planning/ Design & Dimensioning - O.G.S.

Lecture NP - 3.3 - slide 25

# **Network Design and Dimensioning: Network Challenges and Trends**

- Provide High Capacity and Scalability for the expected demands at any location
- Benefit in all layers from the large Economy of Scale provided by new technologies ie: DWDM
- Provide Flexible Topologies and Architectures able to evolve for changing flow patterns and demands
- Provide sufficient Connectivity and Protection to ensure Survivability to unexpected events
- Reach Low cost for low density customers varying five orders of magnitude between different scenarios

October 6-10
