

Achitecture of broadband access network – modern vision

Development of networks of broadband access assumes changes in the business organization. Active development of networks BWA as independent networks, introduction of new business models, leads to occurrence in the telecommunication market of new players - suppliers of access.

It is showed that suppliers of access can have as own infrastructure, and to own to it virtually. Till now sharing of resources was applied in networks of the fixed access. However, such questions can be solved for technologies of mobile radio telephone communication on following technical decisions such as MORAN and MOCN.
