

“Mobile Broadband Everywhere: Spectrum for Services” - Wladimir Bocquet, Orange – France Telecom Group

Abstract:

Mobile Broadband concept consists of extending, to mobile users, access to the range of broadband services which will exist for fixed users. This implies the establishment of a system, capable of offering a wide range of applications. In this presentation, we develop and illustrate the principle of mobile broadband everywhere, opportunities for consumers and the importance of spectrum harmonisation. We encourage harmonisation of spectrum usage worldwide to optimise economies of scale, to ensure timely availability of equipment, to respond quickly to market needs and bridge the Digital Divide.
