

ITU Cross Regional Seminar on Broadband Access (Fixed, Wireless including Mobile) for CIS, ASP and EUR Regions

Traffic Demand Trends and Modeling for Broadband

**Chisinau (Republic of Moldova)
4-6 October 2011**

**Oscar González Soto
ITU Consultant Expert
Spain
oscar.gonzalez-soto@ties.itu.int**

Agenda

- **Services traffic trends on Broadband**
- **Traffic demand activities and processes**
- **Traffic modeling for BB services**

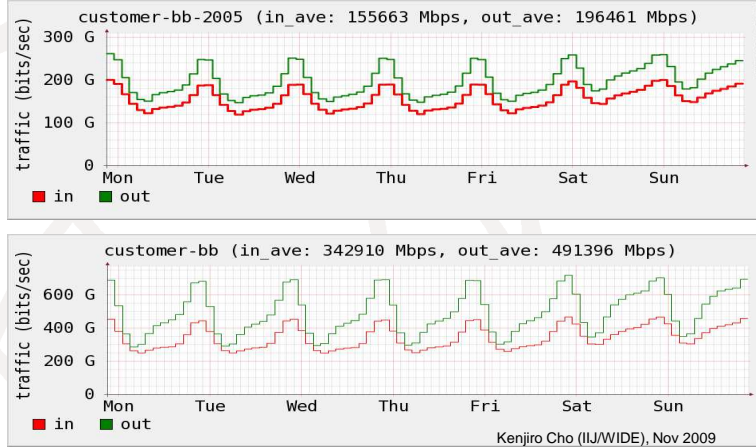

Traffic related questions

- Is traffic important in NGN and IP flows?
- What units to consider for dimensioning, charging and engineering?
- Which traffic activities are needed in operation?
- Which units to consider for interconnection and SLA?
- How to ensure a balanced dimensioning for BW hungry applications?
- Others.....?

Broadband Service traffic demand: Recent trends

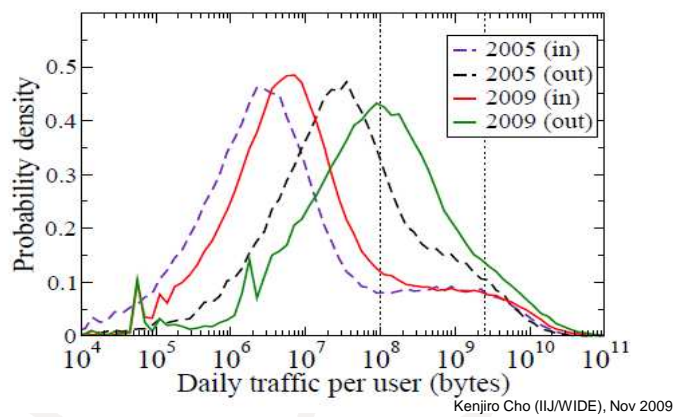

- Major increase of data traffic both in fixed and mobile networks (mainly video, browsing and social networks)
- More heterogeneous behavior (up to 20:1 in volume and 10:1 in signaling for new terminals) and in session composition due to the multiplicity of terminals and applications
- Different proportion of busy hour traffic to the overall daily traffic as compared with traditional (> 25%)
- Several Origin/Destination patterns/matrix and flow modeling mainly in mobile
- Need for a continuous process in traffic measurement, projection and dimensioning

Broadband Service traffic demand: Recent trends

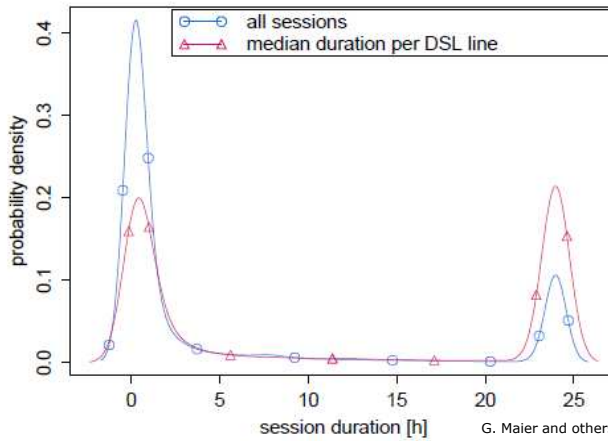

- Evolution of traffic daily profile in Japan 2005-2009: (daily periodicity maintained, increase of peakness for busy period and asymmetry D/U)

Broadband Service traffic demand: Recent trends

- Evolution of traffic volume distribution per day in Japan: (mode multiplied by ~ 50 in 4 years)

Broadband Service traffic demand: Recent trends

G. Maier and others, T-Lab, Nov 2009

- Diversity of customers behaviour with peaks at short and long durations

Broadband Service traffic demand: Recent trends

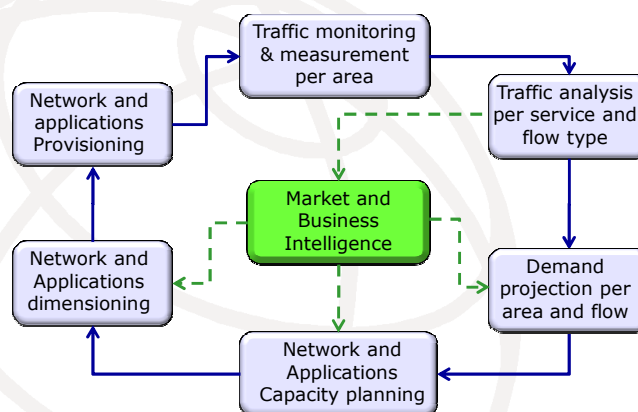

G. Maier and others, T-Lab, Nov 2009

- Mix of applications with HTTP dominant overall and high increase of video
- Need to careful follow-up to avoid the "bandwidth crunch"

Agenda

- Services traffic trends on Broadband
- Traffic demand activities and processes
- Traffic modeling for BB services

Broadband Service traffic demand: Required Traffic Activities for NGN

Traffic/Planning activities and continuous cycle to engineer network according to the very dynamic evolution of applications (specially on mobile)

Broadband Service traffic demand: Traffic activities for NGN

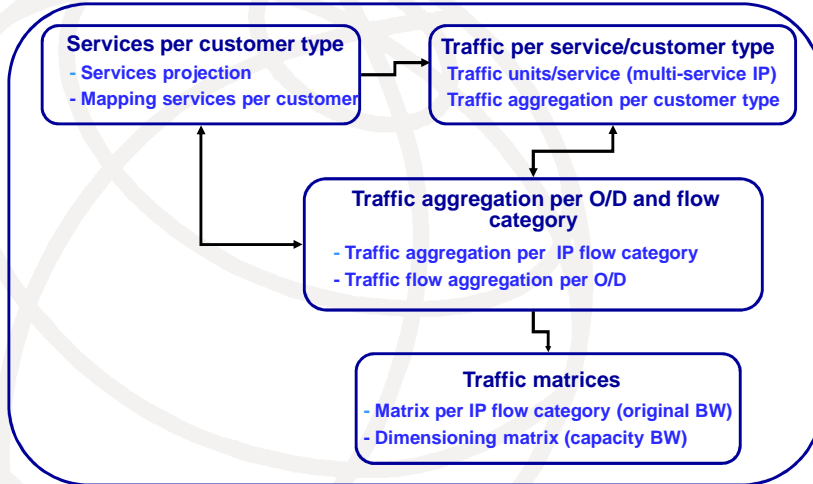

Demand
projection per
area and flow

- Customer **segmentation** per lifestyle and profile
- Customer **location**
- Customer/terminal **usage pattern** for media and signaling
- Customer **purchasing criteria** for services and bundles
- Service and application **success rate**

Broadband Service traffic demand: Traffic matrix characterization criteria

- Per **O/D network points** (end to end user, user to service providers location and multiple to multiple O/D)
- Per **dimensioning criteria** (constant, guaranteed streaming, best effort)
- Per **application type** (Video, Web, Bulk, P2P, Social networking, Gaming, etc.)
- Per **customer category** (Wholesale, LAN, business, residential)

Broadband Service demand evaluation process

Reference points for inter-domain performance measurement by ITU

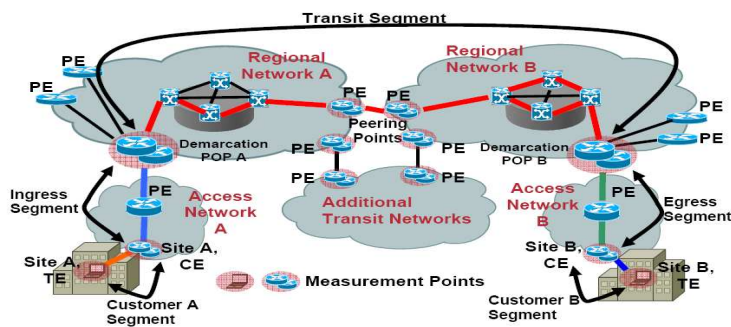

Figure 5/Y.1543 - TE-TE Model

Agenda

- Services traffic trends on Broadband
- Traffic demand activities and processes
- **Traffic modeling for BB services**

Traffic Characterization

- Hierarchical modelling for call driven communications generating traffic flows in NGN

- Aggregated average traffic per level as a weighted average of the services categories (i) and customer classes (j) at that level.

Traffic Characterization for NGN

- **Which** units used to predict traffic demand ?

Traditional

- ◆ Customers for given project (operator, country, region, worldwide)
- ◆ Ports associated to customers per class
- ◆ Calls generated at user interface
- ◆ Erlangs originated/terminated at user interface

New

- ◆ Sessions/Information/requests generated at user interface
- ◆ Packets handled at a given resource through the network
- ◆ Mbits transported through a given network link/path

Traffic flow types for Quality of Service based dimensioning

- ◆ **constant stream**: bandwidth transmission at a constant speed with a specified delivery and jitter (ie: video distribution)
- ◆ **variable stream** : bandwidth transmission at a variable speed derived from a user information and coding algorithm which requires guaranteed quality and specified jitter (ie: VoIP, Video streaming, audio streaming, etc.)
- ◆ **elastic**: bandwidth transmission at a variable speed without jitter restrictions and asynchronous delivery (ie: browsing, file transfer, mail, UMS, etc.)

Traffic Characterization for NGN

- Different relation between peak traffic and average traffic per service classes: CBR (1), VBR(2), VBR(3)

Example of time-scale influence on measurements

Variation per measurement averaging period at ENST campus measurements in 2001 for advanced internet applications

- Impact of averaging period
 - ♦ 1,8:1 ratio between "5 min" and "1 hour"
 - ♦ 2,3:1 ratio between "1 hour" and "24 hours"

Example of aggregated flows per category

Traffic units for aggregated flows

- Traffic Units definition for network dimensioning
 - Equivalent Sustained Bit Rate (ESBR) or aggregated equivalent rates for same QoS category flows in a common reference busy period (ie. 5 minutes)
 - Computed as weighted average of the services at QoS category (i) and customer classes (j) at each network element: $\sum_i \sum_j \text{ESBR}_{ij}$

Dimensioning Criteria

- ▶ **Stream traffics** need reserve capacity procedures like MPLS and Call Acceptance Control (CAC) in the access and may be modeled with equivalent bandwidth methods.
 - ➔ Available “**multi-rate formulas**” with different peakness factors for a given quality.
- ▶ **Elastic traffics** may be modeled with resource shared models.
 - ➔ Available “**processor-sharing**” models that provide a minimum capacity and a delivery speed as a function of simultaneous users
- ▶ **Constant rate** traffics need to be aggregated and reserved on top of the others with a given protection factor
- ▶ Overall dimensioning will be a combination of the previous procedures with different degrees of detail as a function of the model granularity

Traffic/pricing management for better services monetization

- Measure **traffic bandwidth and signaling** evolutions for new applications and smart terminals
- Consider **busy periods specific for mobile services** and geographical areas
- Introduce **intelligent traffic management** to handle flows according to services priorities
- Manage service pricing to transfer **traffic from peak periods to valleys**
- Introduce **dynamic pricing** per application according to **traffic and quality required** by smart terminals

Recommendations

- Consider **traffic activities as a central role** within the operational processes and business management
- Perform network measurements, dimensioning and engineering with the **specific IP models for QoS**
- Apply **intelligent traffic management** together with **intelligent pricing** to avoid the “bandwidth crunch” and optimize benefits
