Hanoi 24 November 2003**

Tutorial on Access Technologies

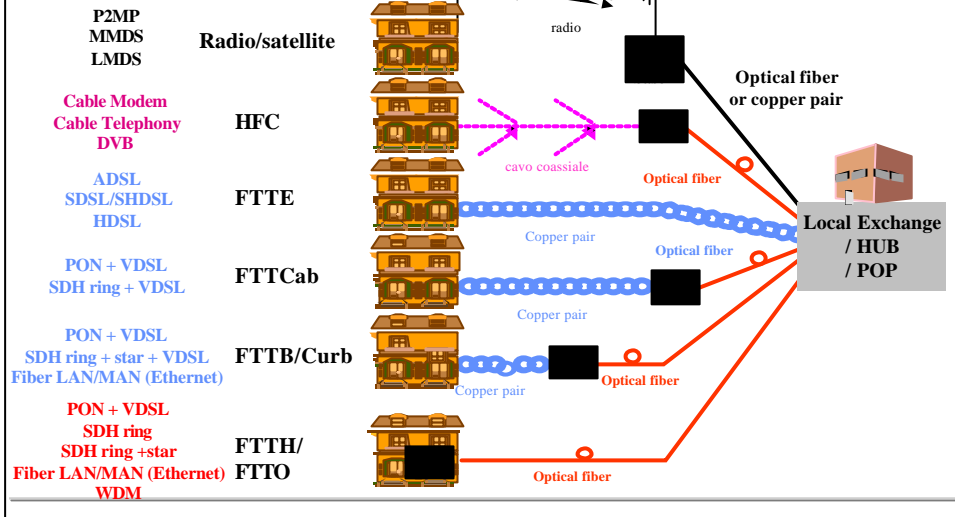

Outline

- ▶ **Introduction**
- ▶ **xDSL**
- ▶ **HFC**
- ▶ **FTTx**
- ▶ **PON**
- ▶ **Radio Access**
- ▶ **PLC**

First Mile Network Technologies

Technologies Architecture

xDSL Systems

xDSL system birth

Historically DSL (Digital Subscriber Loop) was the line system for basic rate access ISDN (ISDN BRA)

ANSI & ETSI (end of 80's beginning of 90's) encourage activities on copper-based HDSL systems (High bit rate DSL) standardization

- **Need: fast provisioning of leased lines**
 - DS1 1,544 kbit/s in USA
 - E1 2,048 kbit/s in Europe
- **Requirement: cost-effective systems**
 - no repeater up to 3- 4 km from LEX
 - no line upgrade required
- **Enabling factor: high performance DSPs available**

xDSL system today

- High performance video compression/coding (MPEG-1, MPEG-2, MPEG-4) make possible Video On Demand (VOD) service distribution
- Internet access with fast increasing band requirements
- Highly asymmetrical bandwidth requirements in the two directions (upstream « downstream)
- Copper pair is already deployed and can be used to provide residential customers with interactive multimedia services

xDSL System Impairments

xDSL transmission uses the frequency band between a few tens kHz up to a few tens MHz

Performance depends on:

- Copper pair attenuation and transfer function (amplitude and phase)
- Stubs on copper pair (distortion increases)
- Cable crosstalk
- Burst noise (non-steady state effect)

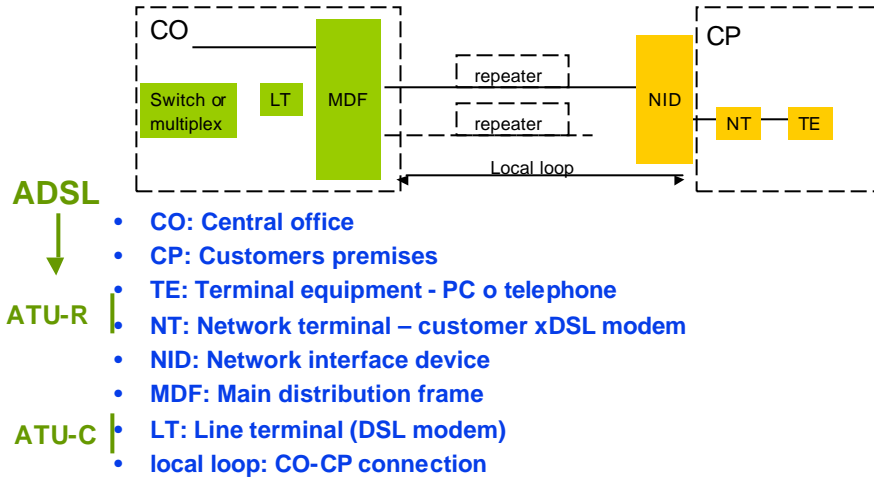

Crosstalk

- Near-end crosstalk (**NEXT**) is present when the uplink and downlink share the same frequency bands
- Far-end crosstalk (**FEXT**) is always present
- Environment conditions modify Xtalk and line impedance

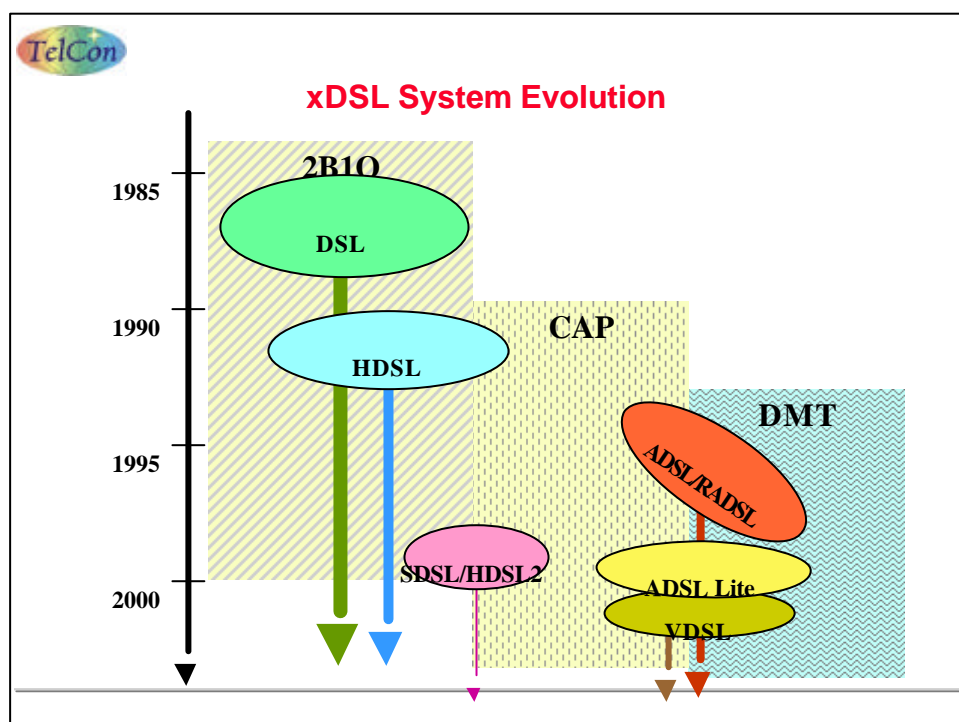

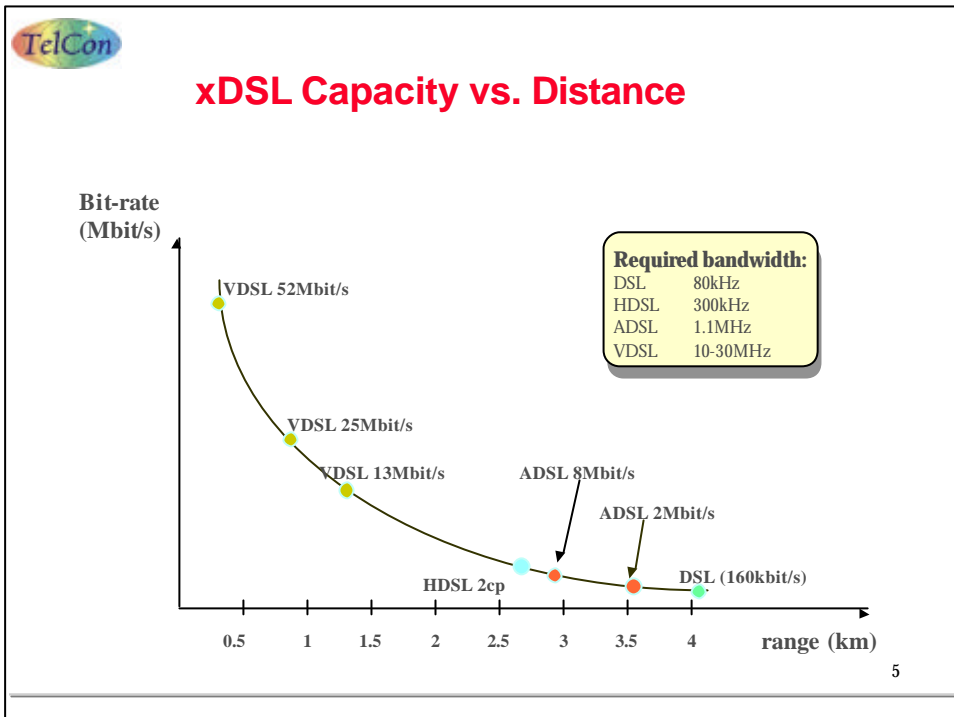

xDSL Reference Model

xDSL Flavours

HDSL	High bit-rate DSL 2Mbit/s over 2 cp, 2B1Q code
SDSL	Symmetric DSL up to 2Mbit/s, 1 cp + POTS, CAP & 2B1Q code
ADSL	Asymmetric DSL up to 8Mbit/s down, 1Mbit/s up + POTS, 1 cp, CAP & DMT code
VDSL	Very high bit-rate DSL 52, 26 or 13Mbit/s down, 2Mbit/s up + POTS (or ISDN), 1 cp, CAP & DMT code

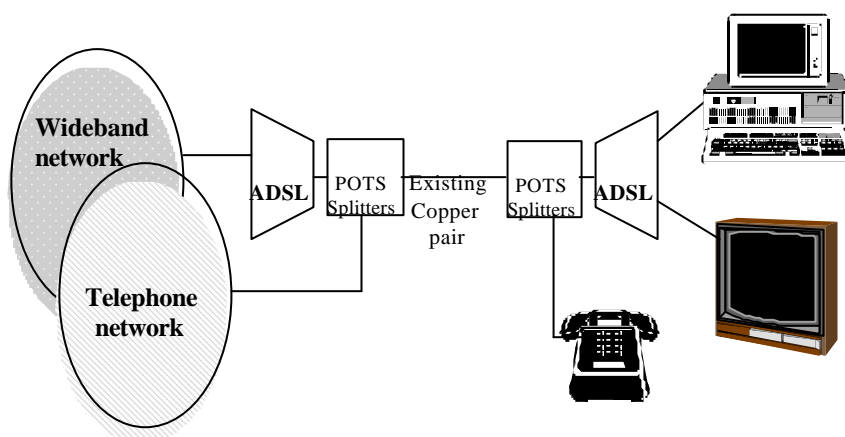

ADSL

Asymmetric Digital Subscriber Line

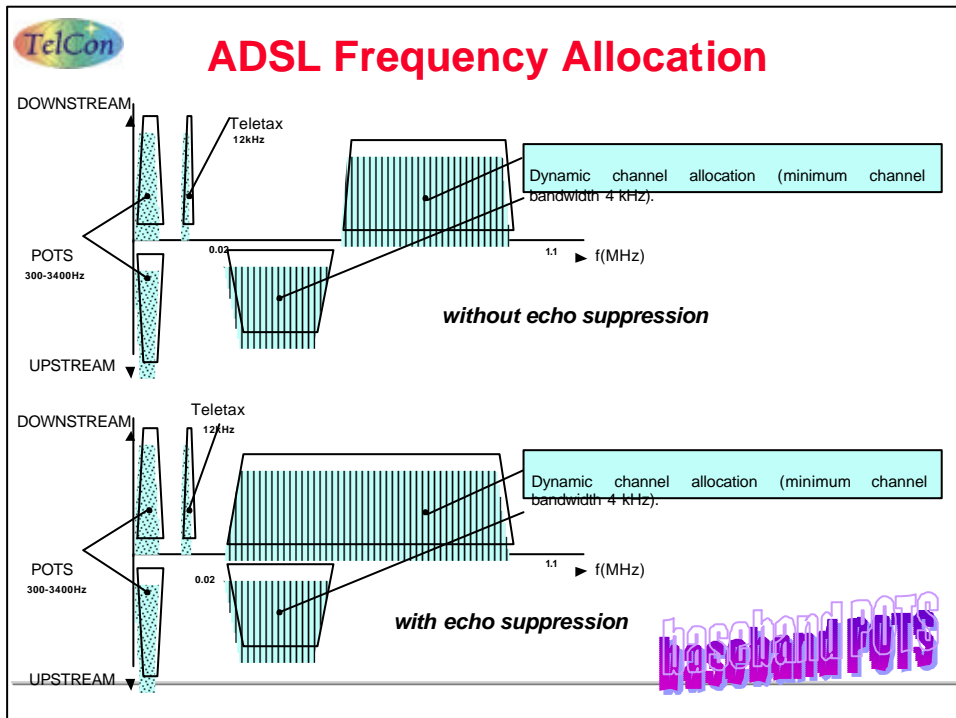

Asymmetrical Digital Subscriber Line

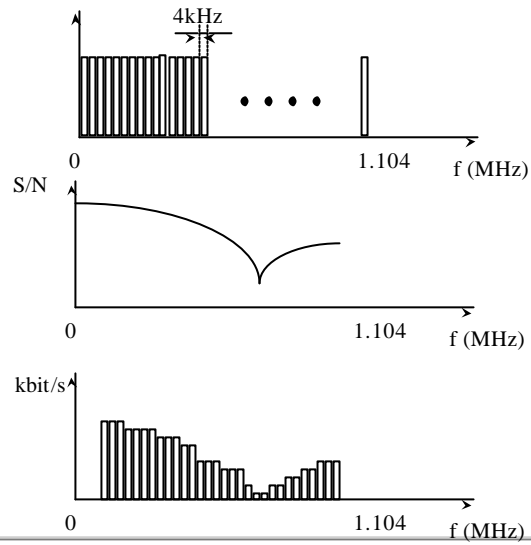

ADSL DMT CODING/MODULATION

- ITU-T G.992.1 defines an ADSL modem based on DMT (Discrete Multi Tone) modulation
- Downstream:
 - Sampling frequency 2,208 MHz, 256 carriers between 0 and 1,104 MHz
 - 4000 symbols/s. Each channel 4,3 kHz wide
 - Maximum rate 32 kbit/s per channel
- Upstream:
 - Sampling frequency 275 kHz, 32 carriers between 0 and 138 kHz

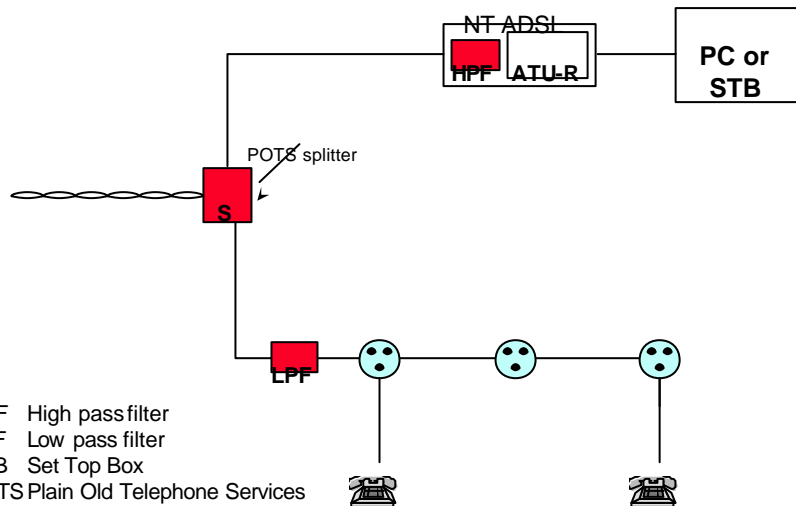

Channel response DMT modulation matching

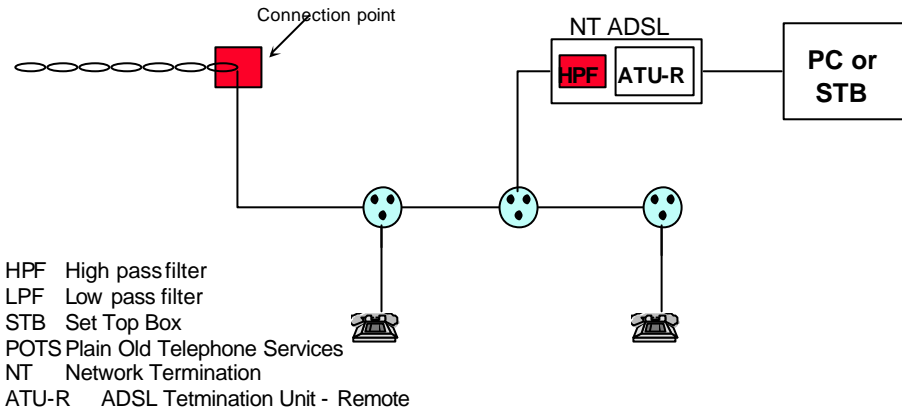

Splittered installation

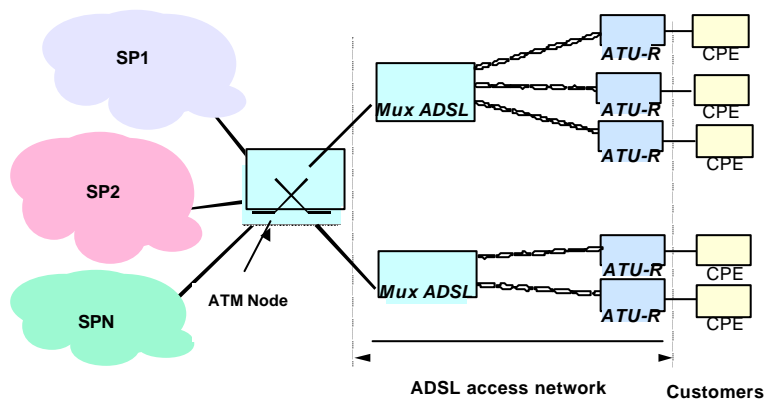

- HPF High pass filter
- LPF Low pass filter
- STB Set Top Box
- POTS Plain Old Telephone Services
- NT Network Termination
- ATU-R ADSL Termination Unit - Remote

Splitterless installation

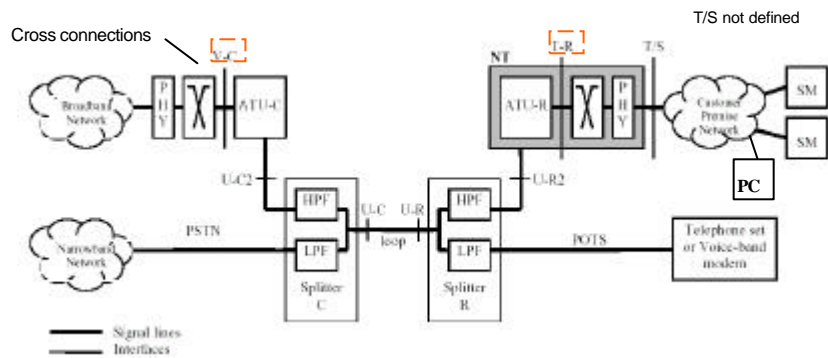

ADSL Network Architecture

ADSL Reference Model

- Standard defines both interfaces and modems:
 - **ATU-R**: ADSL transceiver unit - remote terminal
 - **ATU-C**: ADSL transceiver unit - central office terminal ← modem
 - **U-C (2), U-R (2)** ← interfaces

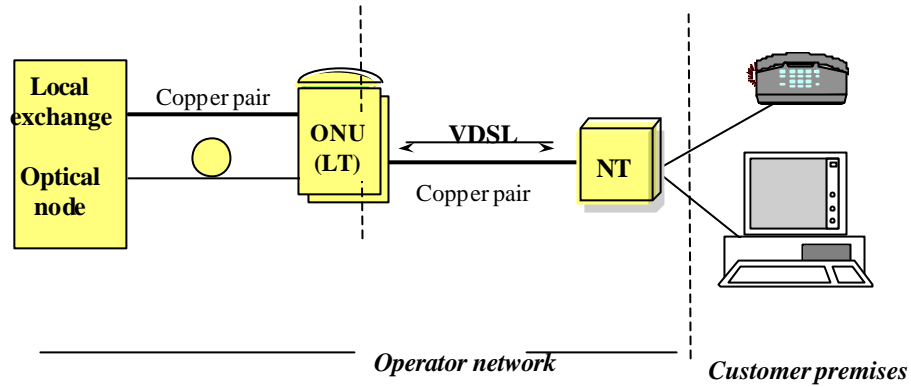

VDSL

Very High bit rate Digital Subscriber Line

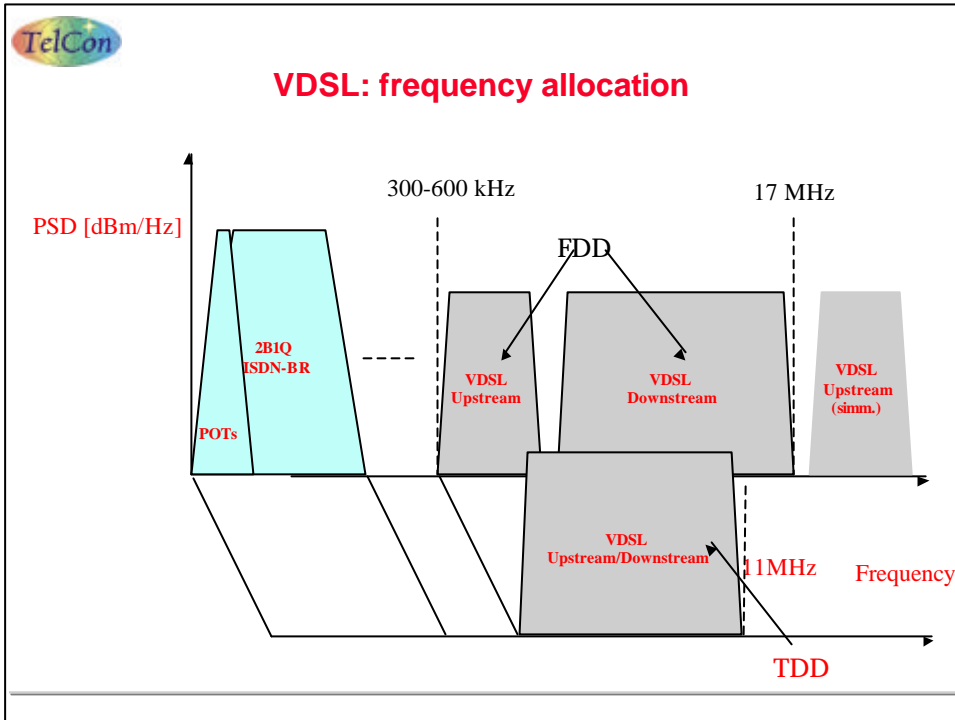

VDSL: reference configuration

Performance

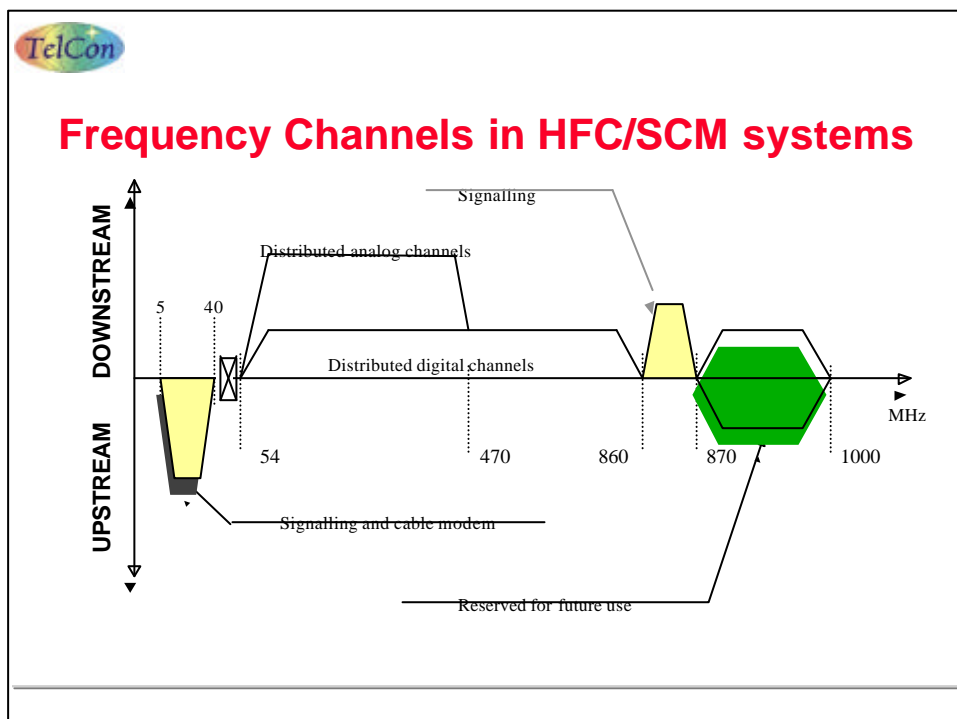

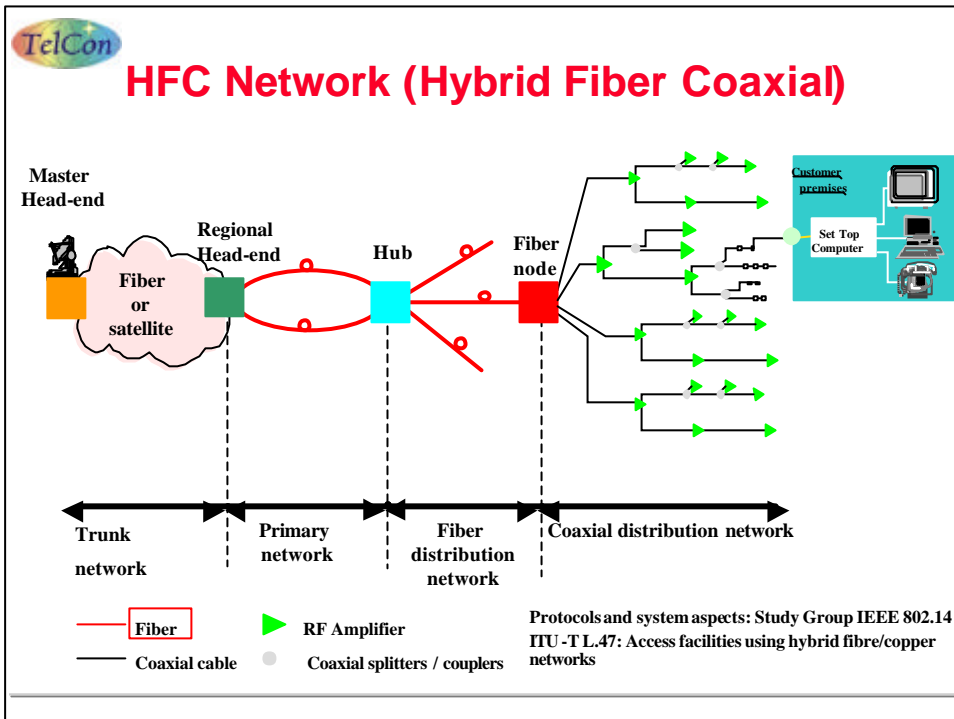

- ETSI standard defines various rates, both for symmetrical and asymmetrical data streams :

SYMMETRICAL TRAFFIC		ASYMMETRICAL TRAFFIC		
Bitrate (Mbit/s)	Distance (m)	Bitrate (Mbit/s)		Distance (m)
		Down	Up	
28	< 500	23	4	< 700
23	< 600	14	3	< 1100
14	< 800	8	2	< 1300
8	< 1000	6	2	< 1400
6	< 1200			

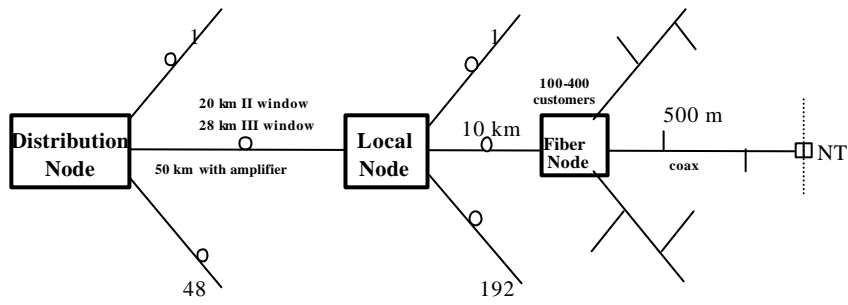

HFC Networks

Hybrid Fiber Coaxial Networks

Network Coverage

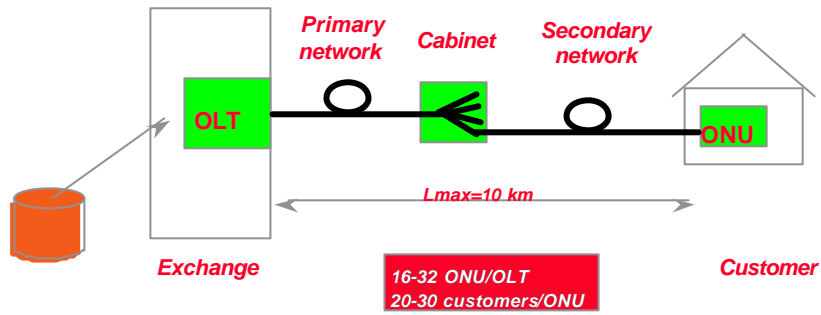

Total number of customers = $48 \times 192 \times 400 = 3,686,400$

PON Networks

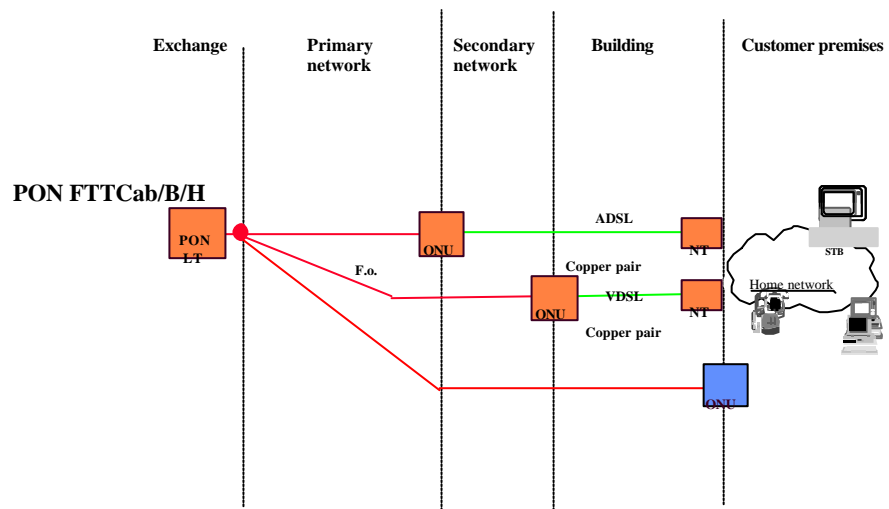

Passive Optical Networks

Passive Optical Network

- Full Service Access Network
- Various topologies: FTTCab, FTTC, FTTB, FTTH
- Possible overlay of FTTB and HFC

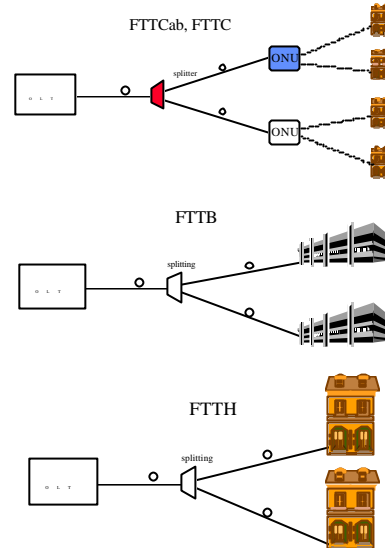

PON Topologies

FTTx Architecture

- **Splitting ratio: up to 1:32**
- **Range: up to 20 km**
- **Capacity**
 - 50 Mbit/s symmetrical
 - 155 Mbit/s symmetrical
 - 155 Mbit/s- 622 Mbit/s
- **Ranging**
- **Bandwidth and resource allocation flexibility**

Characteristics of PON networks

- **PON reduce the amount of fibers, transceivers and line terminals**
- **Longer reach than ADSL (15/20 km)**
- **First wideband PON were known as APON (ATM-PON with ATM as layer 2 protocol)**
- **APON technology based on results from FSAN consortium (Full Services Access Network), agreed in 1995 among main world operators.**

PON Standardization

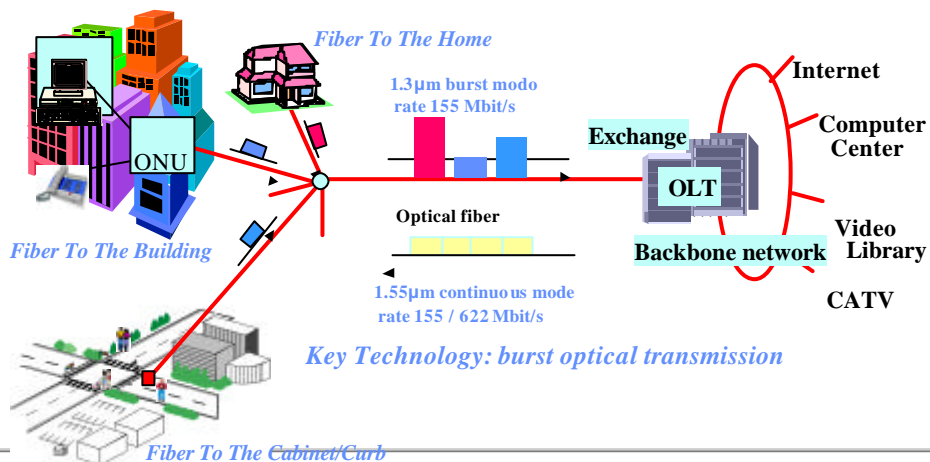

- Specification of APON in FSAN group and endorsed in ITU-T SG.15 G.984 –series: Broadband optical access systems based on Passive Optical Networks (PON)
 - G.983.1 – APON physical layer and transmission convergence
 - G.983.2 – ONT Management and Control Interface (OMCI)
 - G.983.3 – WDM upgrades
- Ongoing standardization work
 - G.983.dba – Dynamic bandwidth allocation
 - G.983.sur – Survivability schemes
- G.984-series Gigabit-capable PON

G.671 - Transmission characteristics of passive optical components

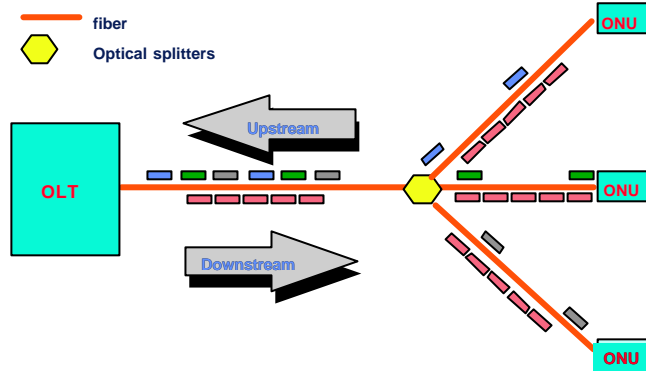

ATM-PON high speed access

ATM: Asynchronous Transfer Mode
>service(CATV, VOD, POTS etc) multiplexing
PON: Passive Optical Network
>high speed, low cost subscriber loop

TDM/TDMA Protocol

Problems:

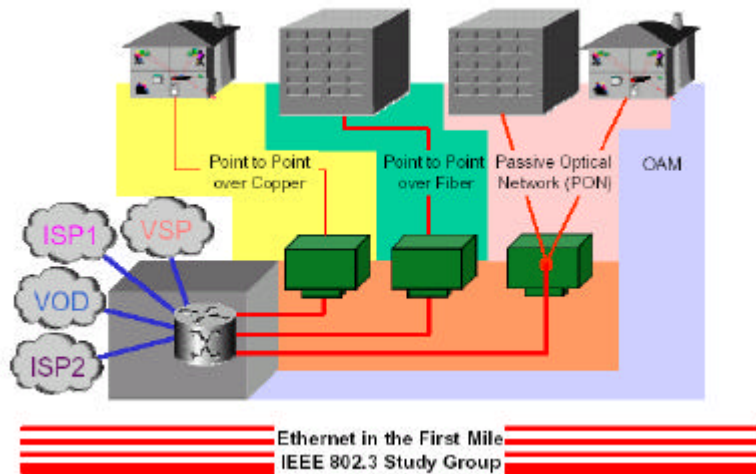

- *ranging*
- laser power control

EFM: Ethernet in the First Mile

- Study Group IEEE 802.3ah EFM (Ethernet in the First Mile)
- EFM started in September 2001
- Specification issued in September 2003
- Key aspects for further study:
 - security and privacy though cryptographic encoding
 - QoS aspects

EFM: Technologies

Optical First Mile

•P2P Ethernet

- N fibers
- 2N optical transceivers

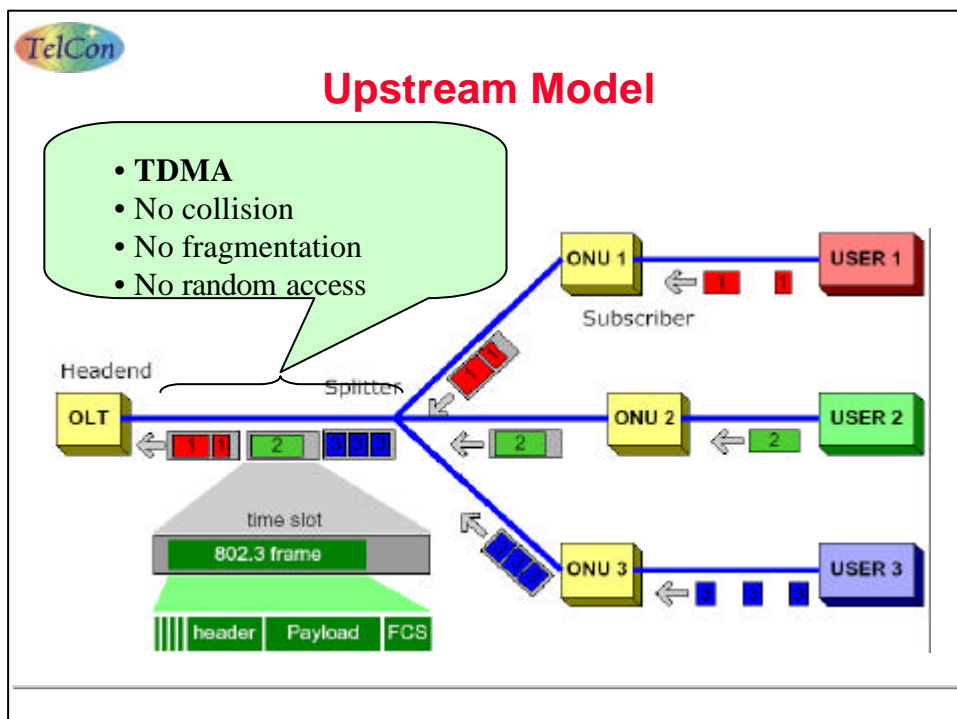

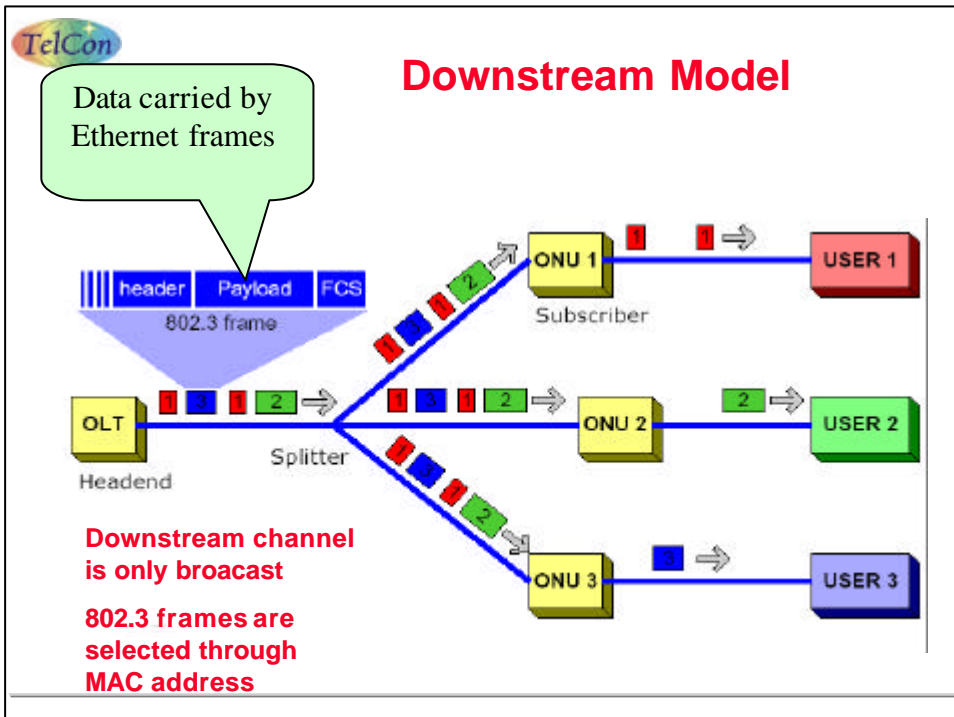

•Curb Switched Ethernet

- 1 fiber
- 2N+2 optical transceivers
- Power supply needed

•Ethernet PON (EPON)

- 1 fibra
- N+1 optical transceivers
- Power supply not needed
- Broadcast downstream (video)

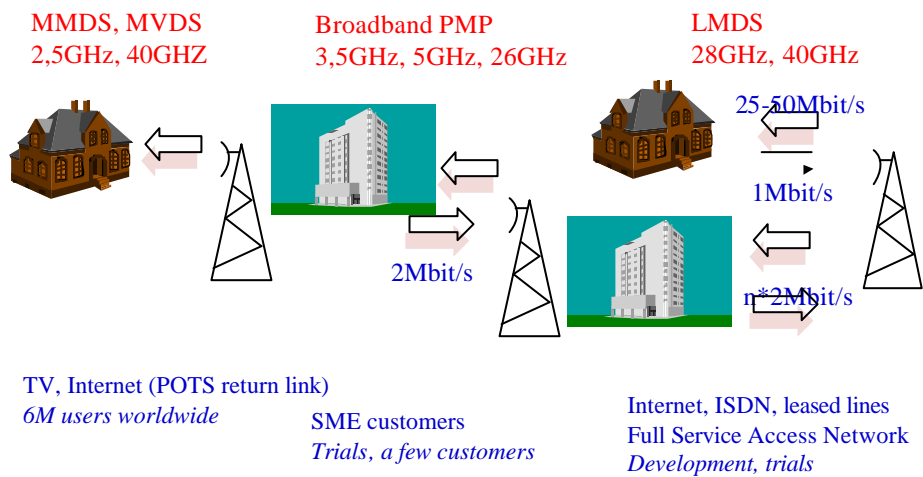

Radio Access Networks

Wideband Radio Access Technologies

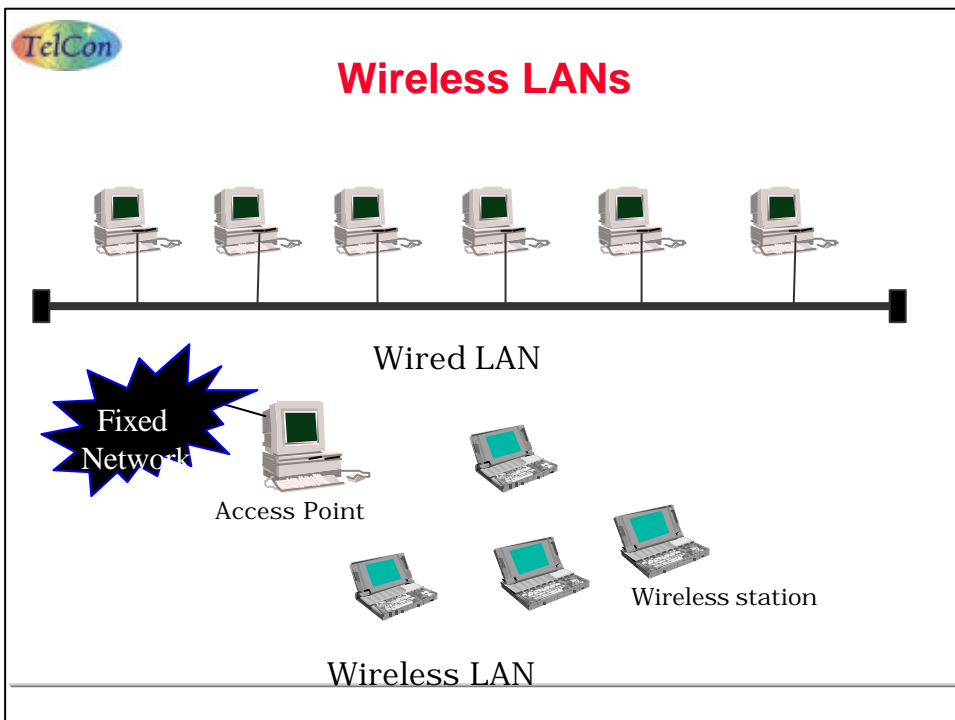

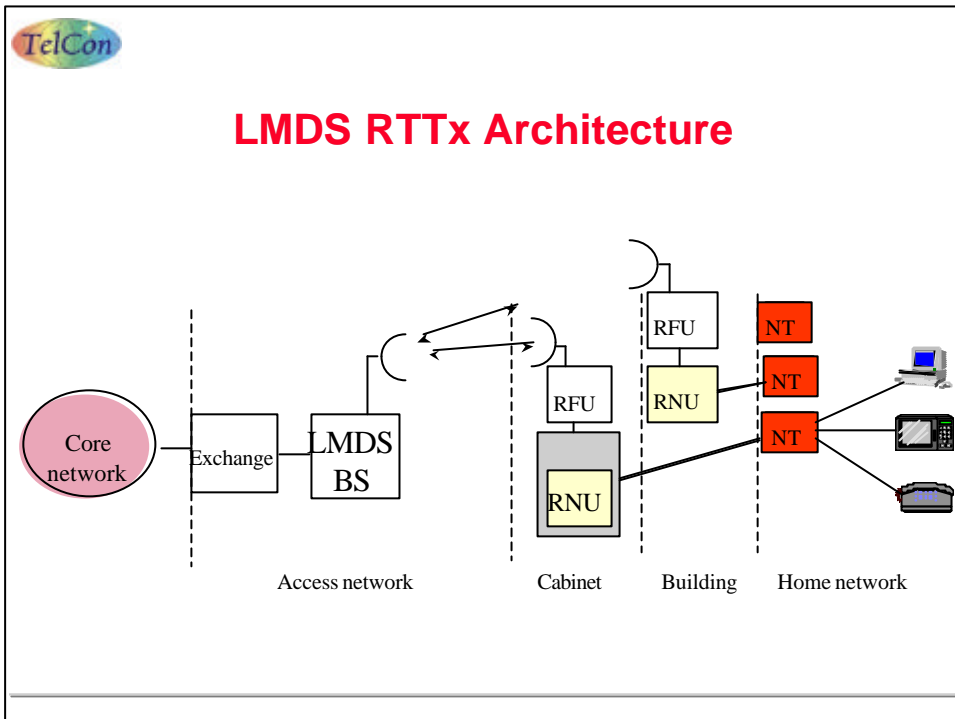

MMDS Systems

- **MMDS (Microwave Multipoint Distribution Services) systems were developed to deliver video services:**
 - Pay-TV and/or pay-per-view services in rural areas
 - Pay-TV and/or pay-per-view services in cities where cable TV is not present or competition is to be encouraged
- **US MMDS operators deliver Internet access services with PSTN return channel**

LMDS Systems

- Local Multipoint Distribution System is a wideband radio technology used to deliver voice, data, Internet access and video services at carrier frequencies equal or higher than 25 GHz
- In USA LMDS Systems have been assigned a 1,3 MHz bandwidth

WLAN components

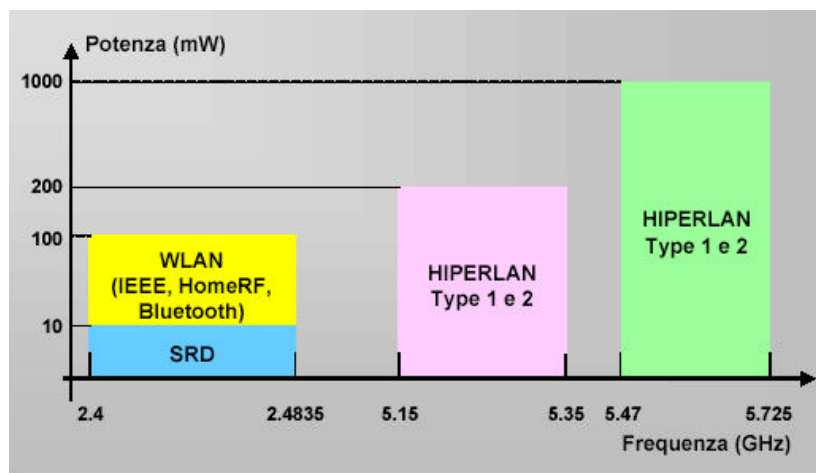

- **Wireless station**
 - is usually a PC equipped with a wireless network interface card (NIC)

- **Access Point (AC)**
 - aggregates access for multiple wireless stations onto the wired network

Reserved frequencies in Europe

HyperLAN/1: Main Issues

- 5 GHz technology
- ETSI Standard for *ad hoc* networking of portable devices
- CSMA/CA
- No QoS control or guarantee over wireless link
- Best effort data delivery

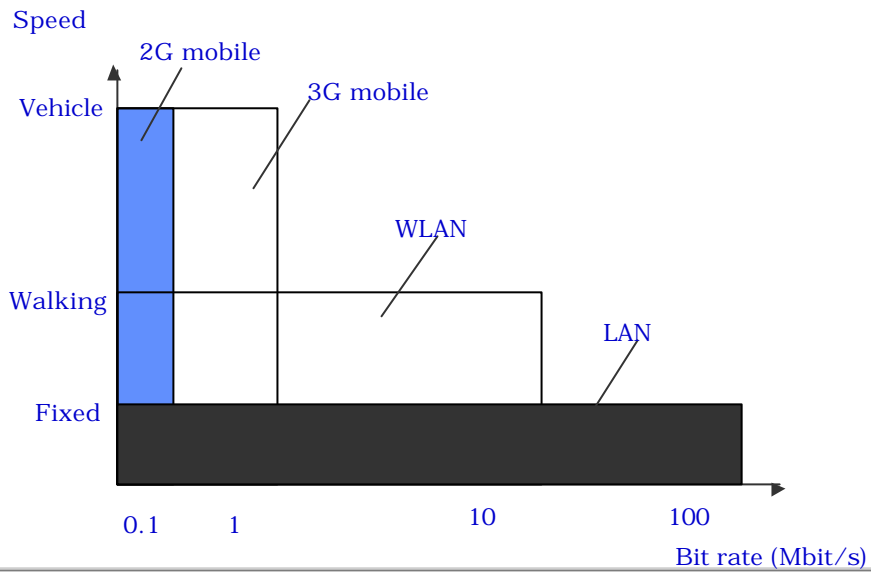

HIPERLAN/2

- 5 GHz technology
- High connection rates in hot spot areas
- Flexible platform to deliver business and multimedia residential applications with bit rate up to 54 Mbit/s
- Two basic operating modes
 - Centralized Mode (CM): used in cellular network topology with each radio transceiver controlled by a single access point (AP)
 - Direct Mode (DM): used in *ad hoc* network topology in private residential areas with a single radio cell covering the whole area

LAN, WLAN and mobile systems

PLC Networks

Power Line Communication

Key regulatory issues

Vendors must comply with RF generation regulations

- PLC source of RF signals
- Normally rules limit non licensed RF emissions (PLC operate between 1,7 and 88 MHz)
- Devices are required to provide maximum reach using minimum power

PLC encourages competition

- PLC provide ISP with an alternative technology for service delivery
- PLC provide open access to any ISP; any ISP can use the network
- Technical limitation: only one ISP can use the Medium Voltage network

Two Classes of Systems

Narrow band (up to 500 kHz)

- Mainly used for building automations
- Subject to regulations

Wide band (1 MHz – 30 MHz)

- Mainly used in LANs
- Not subject to regulations, even if some frequencies are internationally used for radio broadcasting

Narrow band PLC Spectrum Allocation

(a) FCC Frequency Band Allocation for North America

(b) CENELEC Frequency Band Allocation for Europe

Main Standards

	Standard	Technology	Vendor
Narrow band 0-500 kHz	X-10	X-10	X-10
	CEBus	PL-I, CEWay	Domosys
		SSC P300	Intellon
	Lonworks	Neuron Chip	Echelon
	Powerbus	PowerBus	Domosys
Wide band 1-100 MHz	Powerstream	Powerstream	Adaptive Networks
	Homeplug Alliance	Piranha Chipset	Cogency
		Powerpacket	Intellon
