

Home Network QoS with UPnP-QoS

Michael van Hartskamp
Philips Research Europe

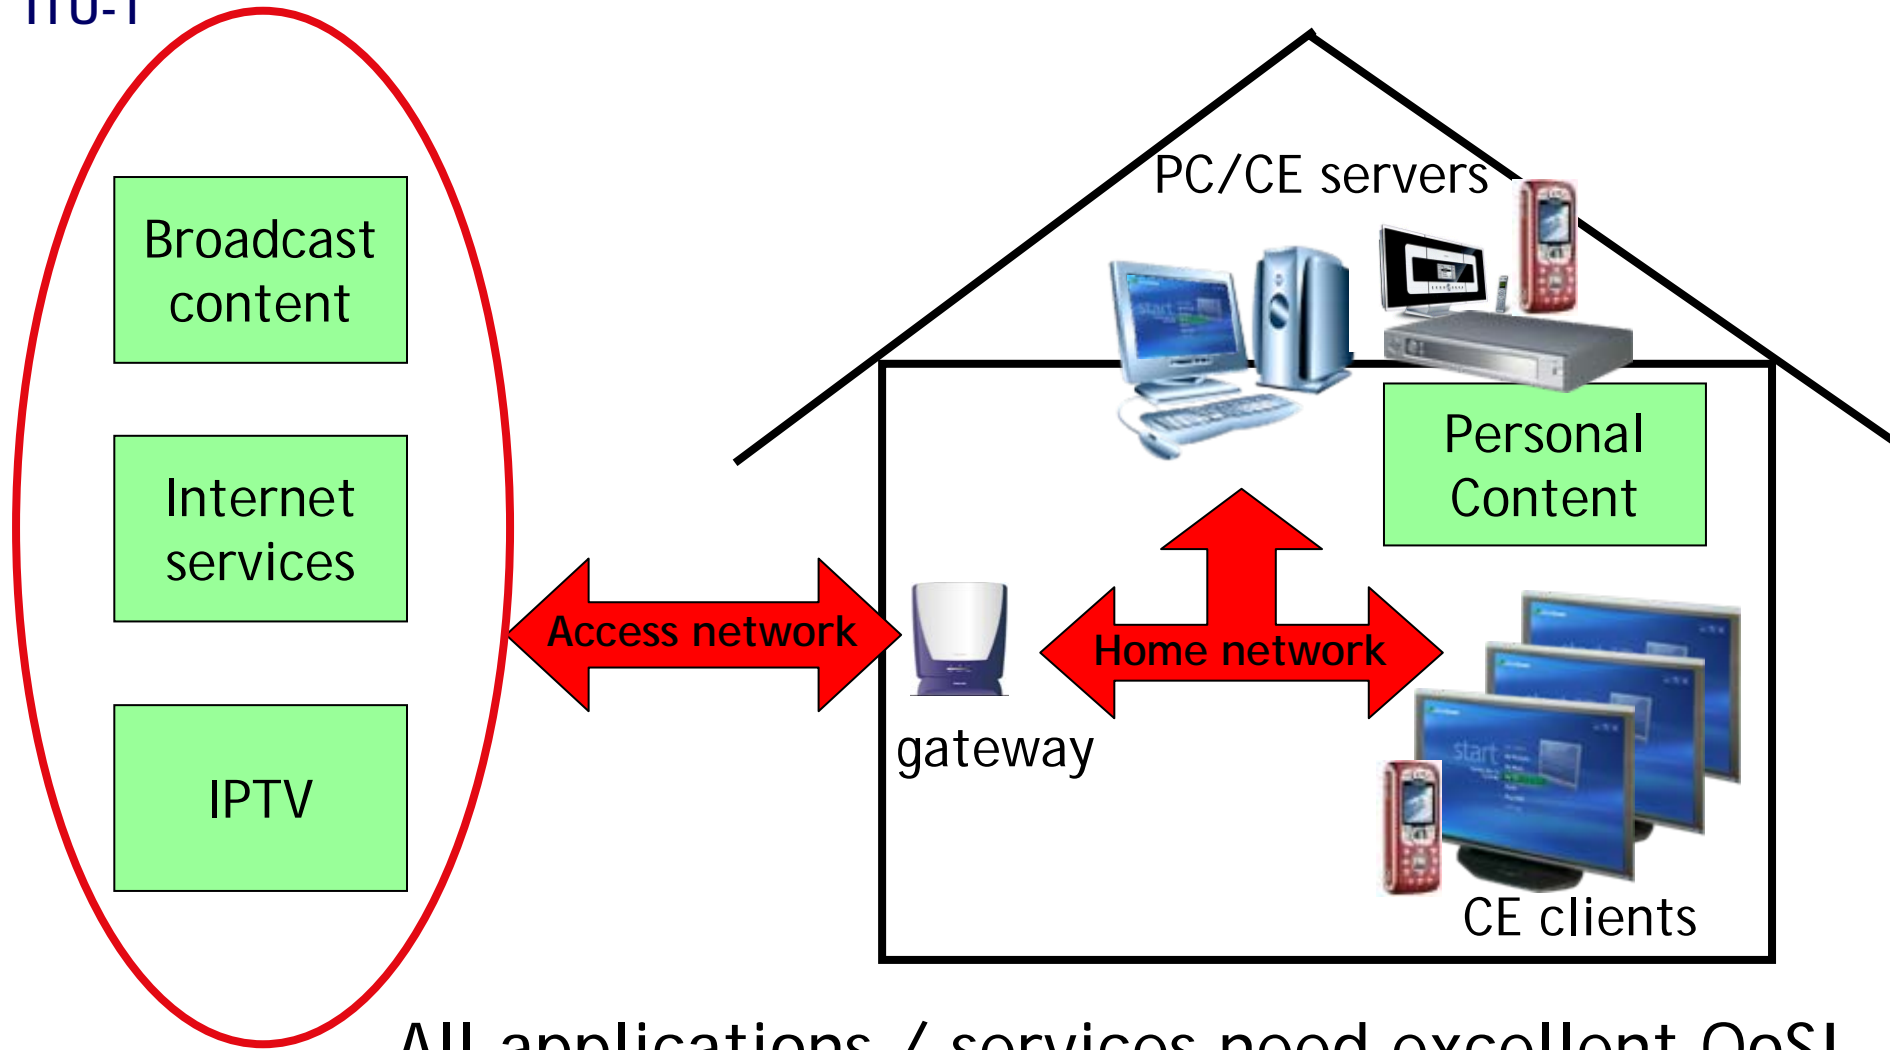

ITU-T

Overview

- o Introduction
- o UPnP-QoS versions 1 and 2
- o UPnP-QoS version 3
- o User Management of QoS
- o Conclusions

Home Networking

All applications / services need excellent QoS!

UPnP/DLNA Home Networking

ITU-T

AV Control Point

UPnP-QoS - goals

- o QoS vs. QoS Management
 - QoS solutions exist or forthcoming: WMM(-SA), 802.1p, ..., but (were) not used
 - Applications require QoS Management to use QoS

- o UPnP-QoS for QoS Management in the home
 - *Not* a new QoS solution
 - But managing existing QoS solutions
 - For the home network, not the Internet
 - 3 UPnP-Service definitions

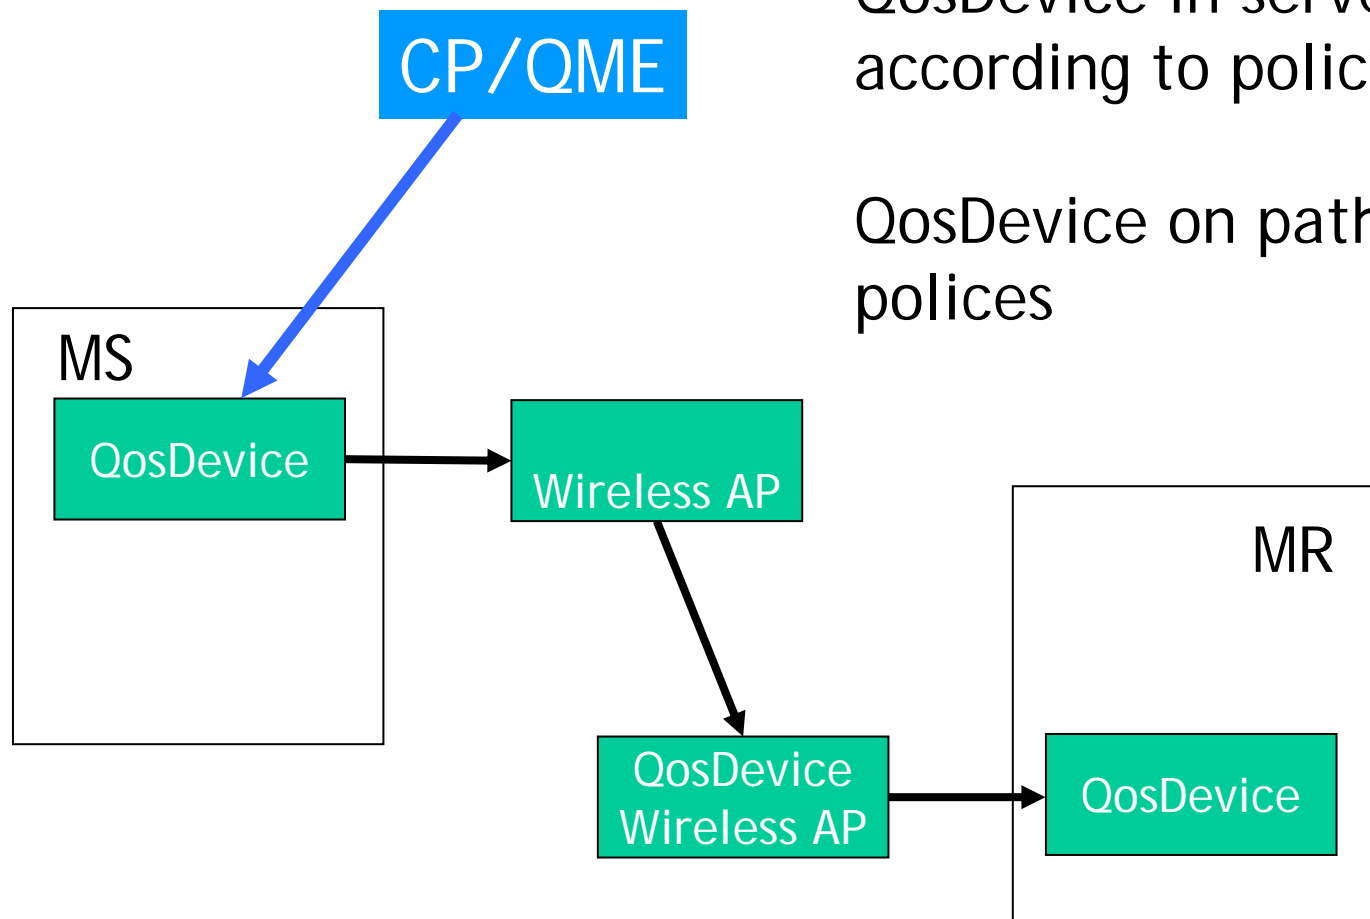

UPnP-QoS version 1 and 2

UPnP-QoS version 1 and 2

UPnP-QoS version 1 and 2

QosDevice in server sets priority according to policy

QosDevice on path (optionally) polices

UPnP-QoS version 3

o Goals

- Admission control (End-to-end and device-level)
- Parameterized QoS / Scheduled access
- Improve QoS management by User

o Solution approach

- Control Point-based *not* per hop
- Discovery of QoS capabilities
 - Network Capability Model
 - Parameter Capability Model

UPnP-QoS version 3

Basically...
introduce 1 new action on QosDevice

| Name | Req. or Opt. ¹ |
|-----------------|---------------------------|
| AdmitTrafficQos | R |

¹ R = Required, O = Optional, X = Non-standard.

- o What to request?
- o Where to invoke this action?

UPnP-QoS version 3

Basically...
introduce 1 new action on QosDevice

| Name | Req. or Opt. ¹ |
|-----------------|---------------------------|
| AdmitTrafficQos | R |

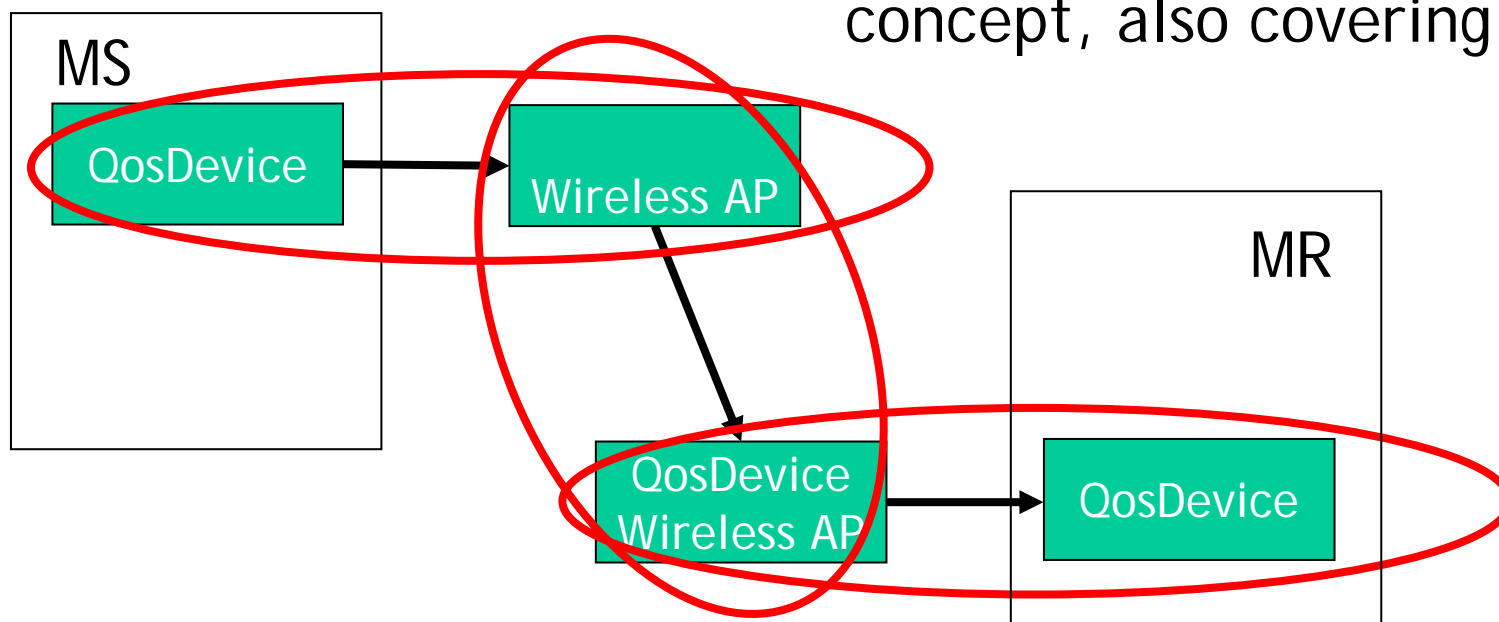

¹ R = Required, O = Optional, X = Non-standard.

- o What to request?
 - A traffic specification
- o Where to invoke this action?
 - Such that resources are not accidentally requested twice...

Models of UPnP-QoS version 3

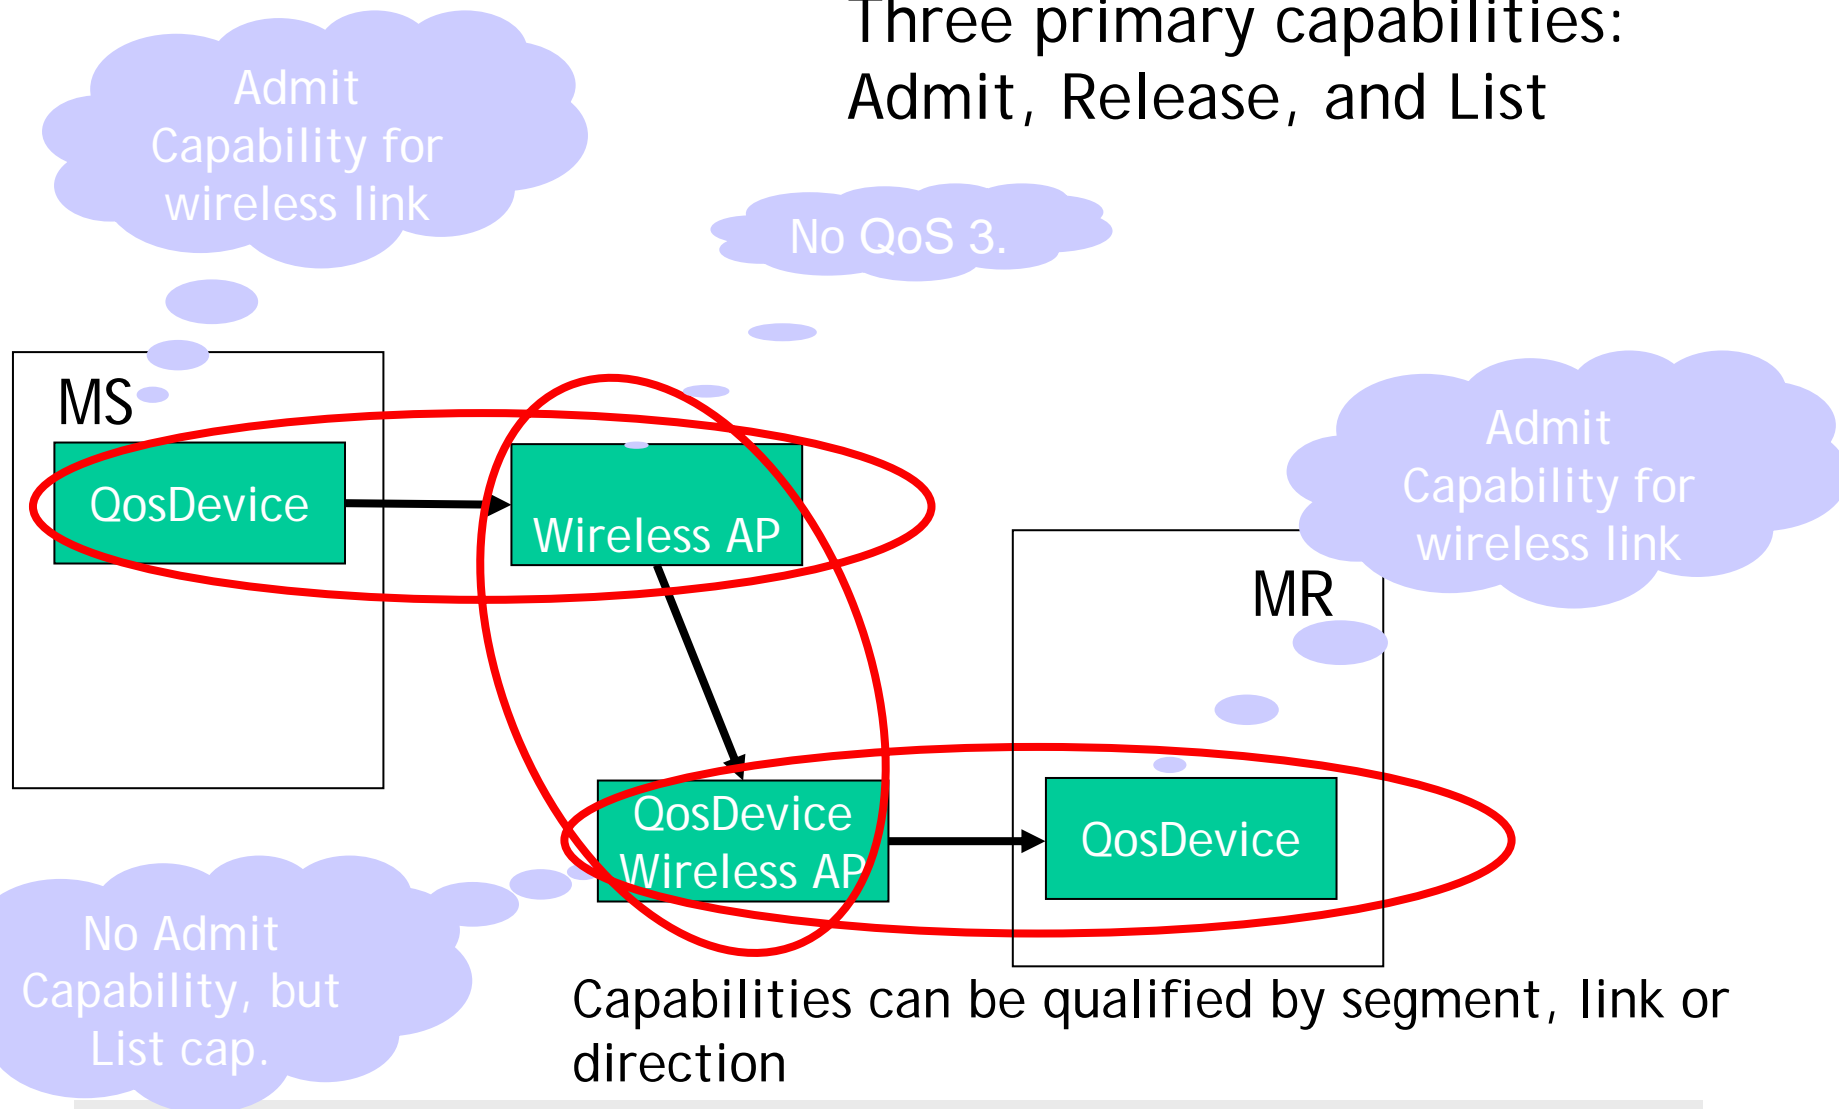

First step: L2-dependent segmentation of the network

Segment generalizes “per hop” concept, also covering e.g. AVB

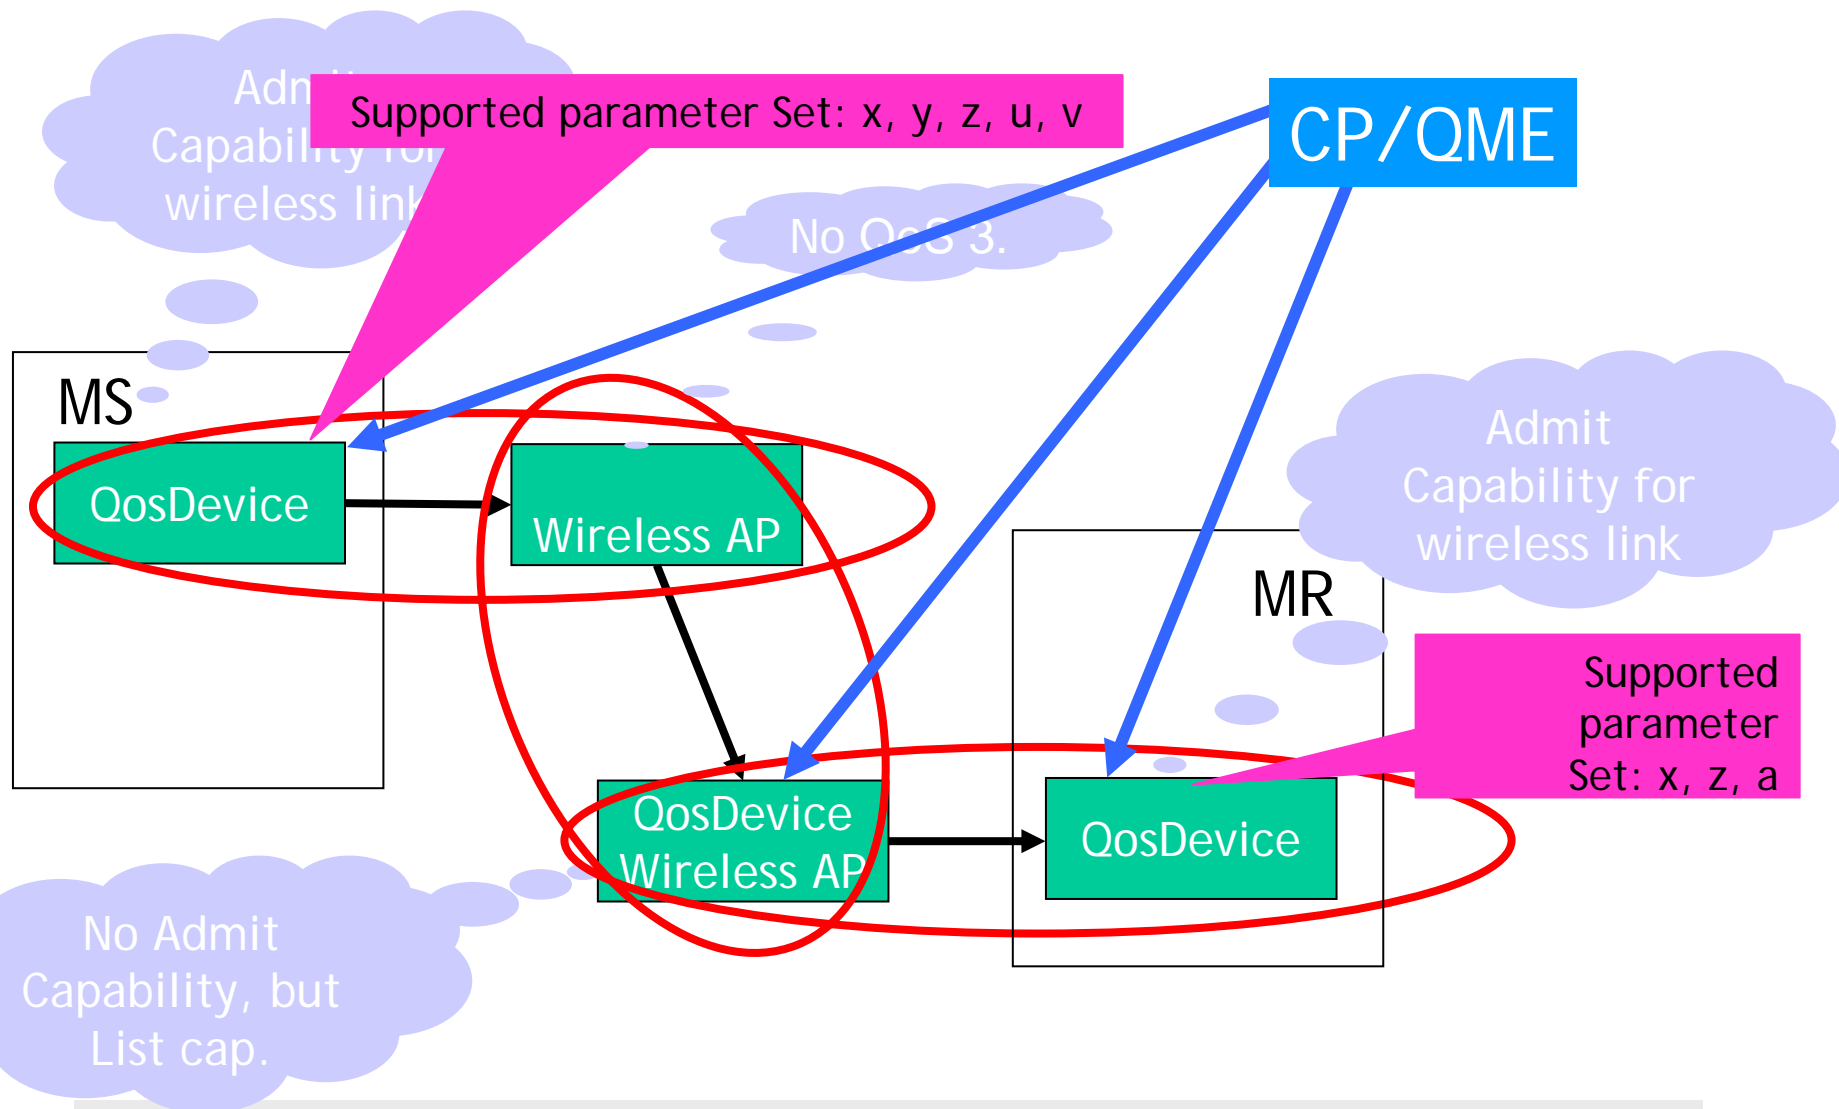

Models of UPnP-QoS version 3

Three primary capabilities:
Admit, Release, and List

Models of UPnP-QoS version 3

User Management of QoS

- o Admission Control makes Resource limitations explicit
 - More resources are not always the answer
- o How to decide which applications may use the resources?
 - Automatic through Policy
 - Impossible to a priori determine *the* policy
 - Manual
 - Potentially annoying to have to much interaction

Tech Req'mnts for User QoS Mgmt

- o Solutions known
 - Assigned resources remain available (FCFS)
 - Bind QoS to application: No resource → No application
 - Allow users to override resource assignments
 - Avoid users (unintentionally) taking away resources
- o For further investigation
 - Identify alternative resource assignments
 - Enable intelligent control points

Conclusions

- o Home Networking is based on (traditional) IT-standards and QoS is still a problem
- o Layer 2 technologies (start to) deliver “real” QoS, but applications cannot make use of it
- o User interaction to be minimized, yet user must stay in control and understand limitations
- o UPnP-QoS v3 is the middleware solution of choice for enabling applications to do QoS management while leaving users in control

Questions?

Thank you,
