This volume specifies analogue operation at 800 MHz based upon the standard TIA/EIA-553-A. This standard provides the differences within TIA/EIA-553-A, which are used by dual-mode mobile stations. Section 1 defines the terms and numeric indications used in this document. Section 2 describes the requirements for CDMA-analogue dual-mode mobile stations operating in the analogue mode. Section 3 describes the requirements for analogue BSs. Section 4 describes the requirements for CDMA-analogue dual-mode mobile stations, which use the 32-digit dialing

option on the reverse analogue control channel. In addition, this section describes mobile station requirements for use of the optional extended protocol. Section 5 describes the BS requirements for using the 32-digit dialing option on the reverse analogue control channel. In addition, this section describes BS requirements for use of the optional extended protocol.

#### 5.2.2.1.1.7 C.S0007

##### Direct Spread Specification for Spread Spectrum Systems on ANSI-41 (DS-41) (Upper Layers Air Interface)

This specification covers upper layers signalling protocols and procedures for the DS-41 (IMT-2000 CDMA-DS on ANSI-41) radio interface which support functionality customarily classified as pertaining to CC and MM.

### 5.2.2.1.1.17 C.S0017

#### Data Service Options for Spread Spectrum Systems

This specification defines the CDMA data services, which include asynchronous and synchronous circuit switched data, packet data, and analog fax. This specification includes the definition of the protocol stack, and specifications for the various protocol layers.

## 5.2.2.1.1.18 C.S0018

**Minimum Performance Specification for Enhanced Variable Rate Codec (EVRC) Speech Option 3 for Spread Spectrum Systems**

This specification provides definitions, methods of measurement, and minimum performance requirements for the EVRC speech codec, C.S0014 (see § 5.2.2.1.1.14).

## 5.2.2.1.1.19 C.S0020

**High Rate Speech Service Option 17 for Wideband Spread Spectrum Communication Systems – Addendum 2**

This specification defines the high rate variable rate speech codec which has a full rate of 13 kbit/s.

**5.2.2.1.1.33 C.S0035****CDMA Card Application Toolkit (CCAT)**

This document contains the requirements for CDMA Card Application Toolkit (CCAT). CCAT is a set of commands and procedures for use during the network operation phase of CDMA. Specifying the interface is to ensure interoperability between an R-UIM and an ME independently of the respective manufacturers and operators. CCAT will allow Service Providers to offer unique services to their subscribers by placing applications they have designed (or third party applications) on the R-UIM that would function on any particular manufacturer's ME that supports the Toolkit features.

**5.2.2.1.1.94 C.S0090****Test Application Specification for cdma2000 Ultra Mobile Broadband (UMB)**

This standard is a companion to the Ultra Mobile Broadband (UMB) air interface standards. This specification provides a set of procedures that the access terminal and the access network can use to conduct the access terminal minimum performance tests in a factory/laboratory environment. It also allows measurements of certain forward and reverse link performances in a field environment.

**5.2.2.1.1.112 A.S0006****Interoperability Specification (IOS) for Hybrid Mobile Station/Access Terminal (HAT) Authentication, Using the CAVE Algorithm**

This document provides alternative procedures that allow a properly configured Hybrid mobile station/Access Terminal (HAT) to use its cdma2000®1 1x access network authentication credentials and the Cellular Authentication and Voice Encryption (CAVE) algorithm when accessing an HRPD network that requires HRPD network access authentication.

**5.2.2.2.1.17 C.S0035****CDMA Card Application Toolkit (CCAT)**

This document contains the requirements for CDMA Card Application Toolkit (CCAT). CCAT is a set of commands and procedures for use during the network operation phase of CDMA. Specifying the interface is to ensure interoperability between an R-UIIM and an ME independently of the respective manufacturers and operators. CCAT will allow Service Providers to offer unique services to their subscribers by placing applications they

have designed (or third party applications) on the R-UIM that would function on any particular manufacturer's ME that supports the Toolkit features.

## 5.3 IMT-2000 CDMA TDD

### 5.3.1 Overview of the radio interface

#### 5.3.1.1 Introduction

The IMT-2000 radio interface specifications for CDMA TDD technology are developed by a partnership of standards development organizations (SDOs) (see Note 1). This radio interface is called the Universal Terrestrial Radio Access (UTRA) time division duplex (TDD), where three options, called 1.28 Mchip/s TDD (TD-SCDMA – see Note 2), 3.84 Mchip/s TDD and 7.68 Mchip/s TDD can be distinguished.

The UTRA TDD specifications have been developed with the strong objective of harmonization with the FDD component (see § 5.1) to achieve maximum commonality. This was achieved by harmonization of important parameters of the physical layer and a common set of protocols in the higher layers are specified for both FDD and TDD, where 1.28 Mchip/s TDD has significant commonality with 3.84 Mchip/s TDD and 7.68 Mchip/s TDD. UTRA TDD with the three options accommodates the various needs of the different Regions in a flexible way and is specified in a common set of specifications.

In the development of this radio interface the core network specifications are based on an evolved GSM-MAP. However, the specifications include the necessary capabilities for operation with an evolved ANSI-41-based core network.

The radio access scheme is direct-sequence code division multiple access. There are three chip rate options: the 3.84 Mchip/s TDD option, with information spread over approximately 5 MHz bandwidth and a chip rate of 3.84 Mchip/s, the 7.68 Mchip/s TDD option with information spread over approximately 10 MHz bandwidth and a chip rate of 7.68 Mchip/s and the 1.28 Mchip/s TDD option, with information spread over approximately 1.6 MHz bandwidth and a chip rate of 1.28 Mchip/s. The radio interface is defined to carry a wide range of services to efficiently support both circuit-switched services (e.g. PSTN- and ISDN-based networks) as well as packet-switched services (e.g. IP-based networks). A flexible radio protocol has been designed where several different services such as speech, data and multimedia can simultaneously be used by a user and multiplexed on a single carrier. The defined radio bearer services provide support for both real-time and non-real-time services by employing transparent and/or non-transparent data transport. The QoS can be adjusted in terms such as delay, BER and FER.

The radio-interface specification includes enhanced features for High-Speed Downlink Packet Access (HSDPA) and improved L2 support for high data rates, allowing for downlink packet-data transmission with peak data rates of 2.8 Mbit/s, 10.2 Mbit/s and 20.4 Mbit/s for the 1.28 Mchip/s, 3.84 Mchip/s and 7.68 Mchip/s modes respectively, and for simultaneous high-speed packet data and other services such as speech on the single carrier. Multiple input multiple output antennas (MIMO), higher order modulation (64-QAM) allowing for downlink packet data transmission with peak data rates of 8.4Mbit/s on the single carrier for the 1.28 Mchip/s UTRA TDD mode. Multi-carrier HSDPA feature is also support allowing for downlink packet data transmission with peak data rates of  $N \times 8.4$ Mbit/s for the 1.28 Mchip/s UTRA TDD mode, where N is the number of carriers for simultaneous transmission in the downlink. Features for enhanced uplink have been introduced, allowing for improved capacity and coverage, higher data rates, and reduced delay and delay variance for the uplink. The addition of Higher Order Modulation (16-QAM) for the enhanced uplink, allows for peak data rates up to 2.2 Mbit/s, 9.2 Mbit/s and 17.7 Mbit/s for the 1.28 Mchip/s, 3.84 Mchip/s and 7.68 Mchip/s modes respectively. The TDD radio interface is able to support enhanced uplink and high-speed downlink packet data services efficiently without the need for UE-dedicated radio resources thus allowing for low-overhead always-on connectivity and battery savings in the UE. For 1.28 Mchip/s UTRA TDD mode, for efficient support of always-on connectivity whilst enabling battery saving in the UE and further increasing the air interface

capacity, the specifications also include the continuous packet connectivity feature (CPC); improved L2 support for both uplink and downlink to allow efficient support of high data rates and reduced L2 overhead; For fast state transitions between different states, the specifications also include enhanced CELL\_FACH state, supporting both HSDPA and enhanced uplink operation. The CS voice services are supported over HSPA. Support has been added for multi-frequency operation for the 1.28 Mchip/s UTRA TDD mode.

The radio access network architecture also provides support for Multimedia Broadcast and Multicast Services, i.e. allowing for multimedia content distribution to groups of users over a point-to-multipoint bearer. A transmission method for broadcast services using time-synchronised common waveform transmission from multiple cells and exhibiting high spectral efficiency has been introduced for the 1.28 Mchip/s, 3.84 Mchip/s and 7.68 Mchip/s TDD modes. QPSK and 16-QAM modulation are supported for this method. It is possible to time multiplex such point to multipoint transmissions with other (e.g. unicast) transmissions within the same TDD carrier, or to dedicate an entire TDD carrier for broadcast transmission.

CDMA TDD was originally specified for the IMT-2000 bands identified in WARC-92 and using 1 900-1 920 MHz and 2 010-2 025 MHz for both uplink and downlink operation. At WRC-2000 additional spectrum for IMT-2000 was also identified and then the relevant 3GPP specifications have been updated to also include the bands of 1 850-1 910 MHz; 1 910-1 930 MHz, 1 930-1 990 MHz, 3 400-3 600 MHz and 3 600-3 800 MHz for CDMA TDD.

Evolved-UTRA (E-UTRA) has been introduced for the evolution of the radio-access technology towards a high-data-rate, low-latency and packet-optimized radio-access technology. The downlink transmission scheme is based on conventional OFDM to provide a high degree of robustness against channel frequency selectivity while still allowing for low-complexity receiver implementations also at very large bandwidths.

The uplink transmission scheme is based on SC-FDMA (Single carrier FDMA), more specifically DFT-spread OFDM (DFTS-OFDM). It also supports multi-cluster assignment of DFTS-OFDM. The use of DFTS-OFDM transmission for the uplink is motivated by the lower Peak-to-Average Power Ratio (PAPR) of the transmitted signal compared to conventional OFDM. This allows for more efficient usage of the power amplifier at the terminal, which translates into an increased coverage and/or reduced terminal power consumption. The uplink numerology is aligned with the downlink numerology.

Channel coding is based on rate-1/3 Turbo coding and is complemented by Hybrid-ARQ with soft combining to handle decoding errors at the receiver side. Data modulation supports QPSK, 16QAM, and 64QAM for both the downlink and the uplink.

The E-UTRA supports bandwidths from approximately 1.4 MHz to 100 MHz, yielding peak data rates up to roughly 3 Gbit/s in the downlink and 1.5 Gbit/s in the uplink. Carrier aggregation, i.e. the simultaneous transmission of multiple component carriers in parallel to/from the same terminal, is used to support bandwidths larger than 20 MHz. Component carriers do not have to be contiguous in frequency and can even be located in different frequency bands in order to enable exploitation of fragmented spectrum allocations by means of spectrum aggregation.

Channel-dependent scheduling in both the time and frequency domains is supported for both downlink and uplink with the base-station scheduler being responsible for (dynamically) selecting the transmission resource as well as the data rate. The basic operation is dynamic scheduling, where the base-station scheduler takes a decision for each 1 ms Transmission Time Interval (TTI), but there is also a possibility for semi-persistent scheduling. Semi-persistent scheduling enables transmission resources and data rates to be semi-statically allocated to a given User Equipment (UE) for a longer time period than one TTI to reduce the control-signalling overhead.

Multi-antenna transmission schemes are an integral part of this radio interface. Multi-antenna precoding with dynamic rank adaptation supports both spatial multiplexing (single-user MIMO) and beam-forming. Spatial multiplexing with up to eight layers in the downlink and four layers in the uplink is supported. Multi-user MIMO, where multiple users are assigned the same time-frequency resources, is also supported. Finally, transmit diversity based on Space-Frequency Block Coding (SFBC) or a combination of SFBC and Frequency Switched Transmit Diversity (FSTD) is supported.

Inter-cell interference coordination (ICIC), where neighbour cells exchange information aiding the scheduling in order to reduce interference, is supported. ICIC can be used for homogenous deployments with non-overlapping cells of similar transmission power, as well as for heterogeneous deployments where a higher-power cell overlays one or several lower-power nodes.

Relaying functionality is included. The relay node (RN, Relay Node) appears as a conventional base station (e-Node B) to terminals but is wirelessly backhauled to the remaining part of the radio-access network (RN connects to an eNB called Donor eNB, DeNB) using a modified version of the E-UTRA radio interface.

SON (Self Organizing Networks) concept has been introduced and includes several different functions from eNB activation to radio parameter tuning for self-configuration /self-optimization functions. SON includes eNB self-configuration functions, that is Dynamic S1-MME/X2 interface configuration, PCI self-configuration, ANR (Automatic Neighbour Relations), PCI selection, and eNB self-optimisation functions, that is RACH optimisation, MLB (Mobility Load Balancing) and MRO (Mobility Robustness Optimisation).

SON has been extended to UTRAN as well, with the introduction of ANR UTRAN function. Inter-RAT self-configuration/optimisation functions are defined as well.

E-UTRAN supports a full set of services ranging from real-time to non real-time packet data services, including optimizations for support of emergency call VoIP and support for location services.

Further, the technology includes RF requirements for multicarrier and multi-RAT base stations (MSR) enabling support of all 3GPP based technologies operating in the same base station equipment.

Features are also included in support of Minimization of Drive Tests, by means of collection of UE-specific measurements using Control Plane architecture, for both UTRAN and E-UTRAN.

NOTE 1 – Currently, these specifications are developed within the third generation partnership project (3GPP) where the participating SDOs are ARIB, ATIS, CCSA, ETSI, TTA and TTC.

NOTE 2 – The same name TD-SCDMA was previously used for one of the original proposals that was further refined following the harmonization process.

### **5.3.1.2 Radio access network architecture**

The overall architecture of the Universal Terrestrial Radio Access Network (UTRAN) is shown in Fig. 33.

The architecture of the radio access network consists of a set of radio network subsystems (RNS) connected to the core network through the Iu interface.

An RNS consists of a radio network controller (RNC) and one or more entities called Node B. The Node B is connected to the RNC through the Iub interface. Node B can handle one or more cells.

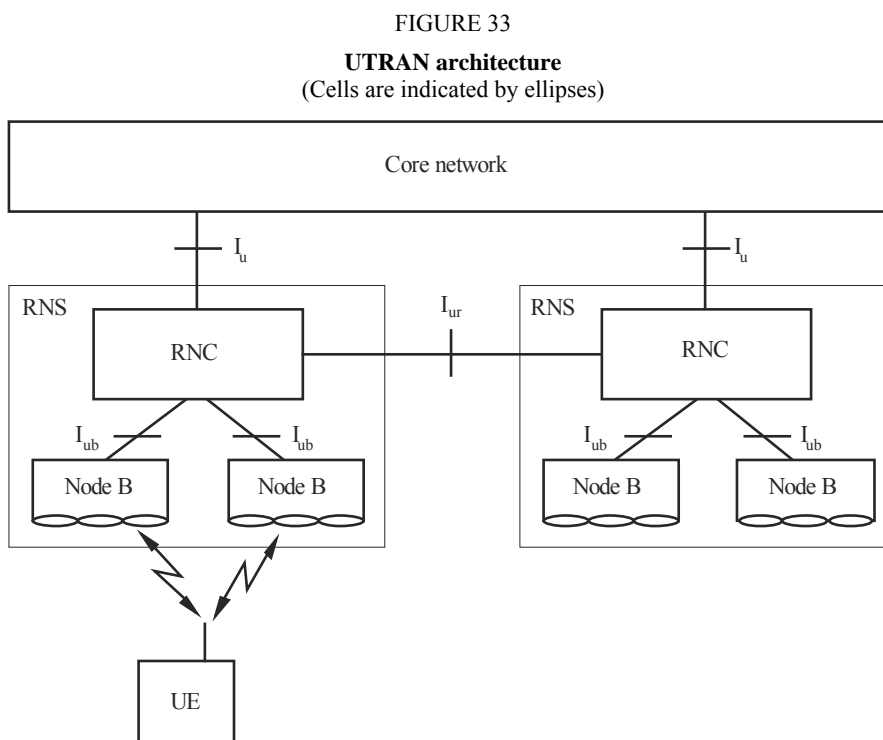

The RNC is responsible for the handover decisions that require signalling to the user equipment (UE).

The RNCs of the RNS can be interconnected together through the I<sub>ur</sub> interface. I<sub>u</sub> and I<sub>ur</sub> are logical interfaces, i.e. the I<sub>ur</sub> interface can be conveyed over a direct physical connection between RNCs or via any suitable transport network.

UTRAN architecture includes the HNB GW entity, in case of HNBs deployment. The HNB-GW appears to the CN as an RNC and serves as a concentrator of HNB connections.

Figure 34 shows the radio interface protocol architecture for the radio access network. On a general level, the protocol architecture is similar to the current ITU-R protocol architecture as described in Recommendation ITU-R M.1035. Layer 2 (L2) is split into the following sub-layers; RLC, MAC, Packet Data Convergence Protocol (PDCP) and Broadcast/Multicast Control (BMC). Layer 3 (L3) and RLC are divided into Control (C-) and User (U-) planes.

In the C-plane, L3 is partitioned into sub-layers where the lowest sub-layer, denoted as RRC, interfaces with L2. The higher layer signalling such as MM and CC are assumed to belong to the core network. There are no L3 elements in UTRAN for the U-plane.

M.1457-33

Each block in Fig. 34 represents an instance of the respective protocol. Service access points (SAPs) for peer-to-peer communication are marked with circles at the interface between sub-layers.

The SAP between MAC and the physical layer provides the transport channels. A transport channel is characterized by how the information is transferred over the radio interface (see §§ 5.3.1.3.1.2 and 5.3.1.3.2.2 for an overview of the types of transport channels defined).

The SAPs between RLC and the MAC sub-layer provide the logical channels. A logical channel is characterized by the type of information that is transferred over the radio interface. The logical channels are divided into control channels and traffic channels. The different types of logical channels are not further described in this overview. The physical layer generates the physical channels that will be transmitted over the air. The physical channel in each TDD option (1.28 Mchip/s, 3.84 Mchip/s, 7.68 Mchip/s) is defined by carrier frequency, code, time slot and multi-frame information. In the C-plane, the interface between RRC and higher L3 sub-layers

(CC, MM) is defined by the GC, Nt and DC SAPs. These SAPs are not further discussed in this overview.

Also shown in the figure are connections between RRC and MAC as well as RRC and L1 providing local inter-layer control services (including measurement results). An equivalent control interface exists between RRC and the RLC sub-layer. These interfaces allow the RRC to control the configuration of the lower layers. For this purpose separate control SAPs are defined between RRC and each lower layer (RLC, MAC, and L1).

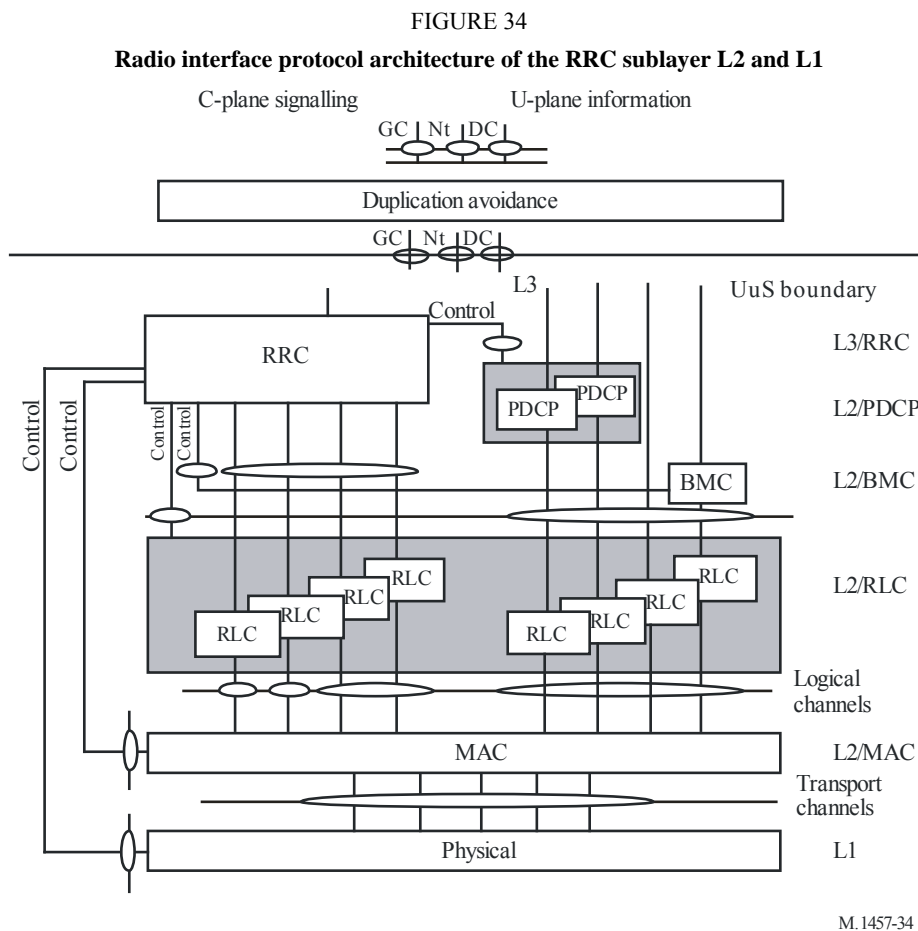

Figure 35 shows the general structure and some additional terminology definitions of the channel formats at the various sub-layer interfaces indicated in Fig. 34. The figure indicates how higher layer SDUs and PDUs are segmented and multiplexed to transport blocks to be further treated by the physical layer (e.g. CRC handling). The transmission chain of the physical layer is exemplified in the next section.

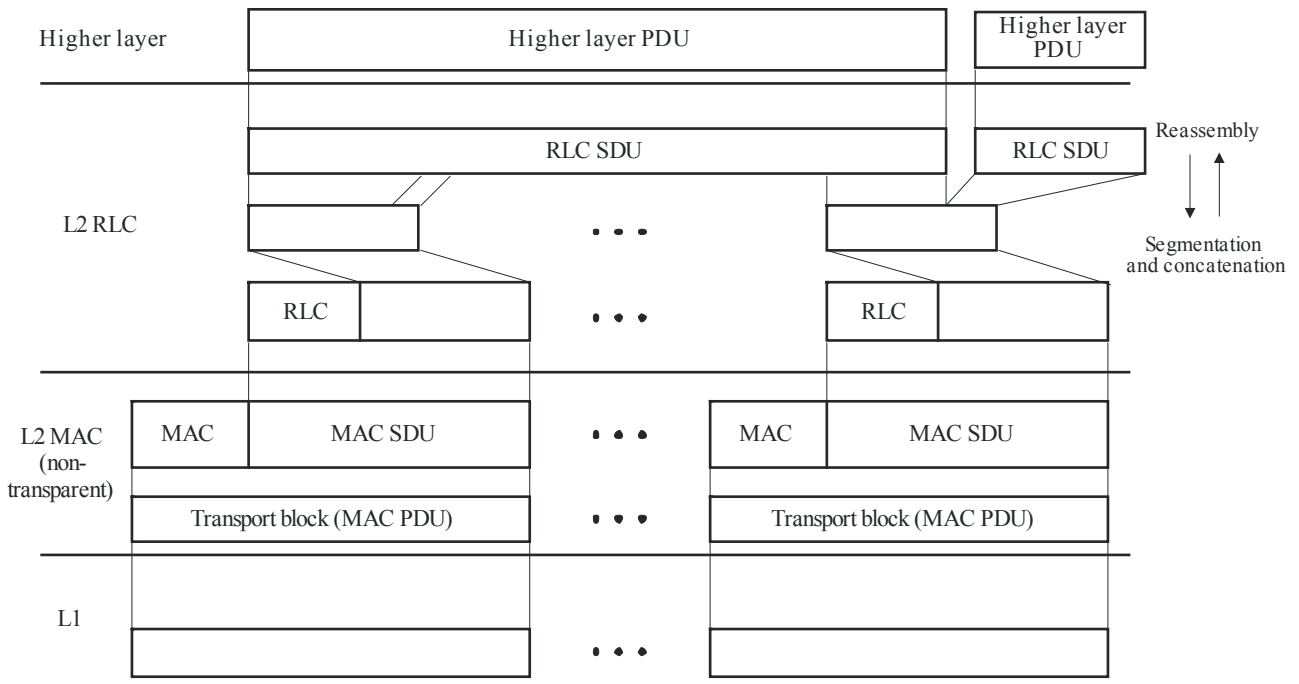

The Evolved UTRAN (E-UTRAN) has a flat architecture with a single type of node, the *eNodeB*, which is responsible for all radio-related functions in one or several cells, providing the user plane (PDCP/RLC/MAC/PHY) and control plane (RRC) protocol terminations towards the UE. The eNBs are interconnected with each other by means of the X2 interface. The eNBs are also connected by means of the S1 interface to the EPC (Evolved Packet Core), more specifically to the MME (Mobility Management Entity) by means of the S1-MME and to the SAE Gateway by means of the S1-U. The S1 interface supports a many-to-many relation between MMEs/SAE Gateways and eNBs.

The E-UTRAN architecture may deploy a Home eNB Gateway (HeNB GW) to allow the S1 interface between the HeNB and the EPC to support a large number of HeNBs in a scalable manner.

The HeNB GW serves as a concentrator for the C-Plane, specifically the S1-MME interface. The S1-U interface from the HeNB may be terminated at the HeNB GW, or a direct logical U-Plane connection between HeNB and S-GW may be used.

FIGURE 35

**Data flow for a service using a non-transparent RLC and non-transparent MAC (see §§ 5.3.1.4.1 and 5.3.1.4.2 for further definitions of the MAC and RLC services and functionality)**

M.1457-35

The E-UTRAN architecture (not including HeNB GW and RNs) is illustrated in Fig. 36.

FIGURE 36  
Overall architecture

M.1457-36

The eNB hosts the following functions:

- functions for Radio Resource Management: Radio Bearer Control, Radio Admission Control, Connection Mobility Control, Dynamic allocation of resources to UEs in both uplink and downlink (scheduling);
- IP header compression and encryption of user data stream;
- selection of an MME at UE attachment when no routing to an MME can be determined from the information provided by the UE;
- routing of User Plane data towards SAE Gateway;
- scheduling and transmission of paging messages (originated from the MME);
- scheduling and transmission of broadcast information (originated from the MME or O&M);
- measurement and measurement reporting configuration for mobility and scheduling
- scheduling and transmission of PWS (which includes ETWS and CMAS) messages (originated from the MME);
- CSG handling;
- Transport level packet marking in the uplink.

The DeNB hosts the following functions in addition to the eNB functions:

- S1/X2 proxy functionality for supporting RNs;
- S11 termination and S-GW/P-GW functionality for supporting RNs.

The MME hosts the following functions:

- NAS signalling;
- NAS signalling security;
- inter CN node signalling for mobility between 3GPP access networks;
- idle mode UE Reachability (including control and execution of paging retransmission);
- tracking area list management (for UE in idle and active mode);
- PDN GW and Serving GW selection;
- MME selection for handovers with MME change;
- SGSN selection for handovers to 2G or 3G 3GPP access networks;
- roaming;
- authentication;
- bearer management functions including dedicated bearer establishment.

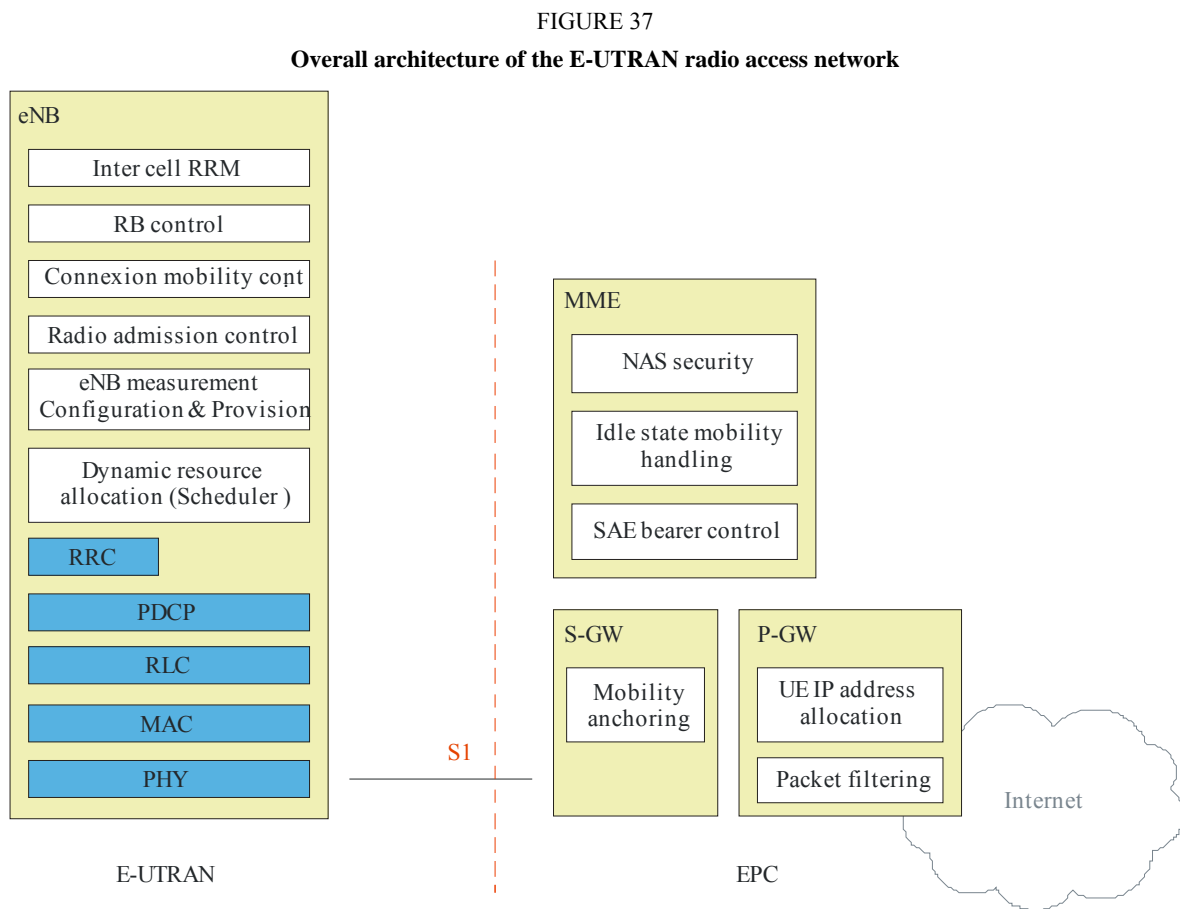

The S-GW hosts the following functions:

- the local Mobility Anchor point for inter-eNB handover;
- mobility anchoring for inter-3GPP mobility;
- E-UTRAN idle mode downlink packet buffering and initiation of network triggered service request procedure;
- lawful Interception;
- packet routing and forwarding;
- transport level packet marking in the uplink and the downlink;
- accounting on user and QCI granularity for inter-operator charging;
- UL and DL charging per UE, PDN, and QCI.

The PDN Gateway (P-GW) hosts the following functions (see 3GPP TS 23.401 [17]):

- per-user based packet filtering (by, e.g. deep packet inspection);
- lawful Interception;
- UE IP address allocation;
- transport level packet marking in the downlink;
- UL and DL service level charging, gating and rate enforcement;
- DL rate enforcement based on AMBR.

This is summarized in Fig. 37 where yellow boxes depict the logical nodes, white boxes depict the functional entities of the control plane and blue boxes depict the radio protocol layers.

M.1457-37

### 5.3.1.3 Physical layer

#### 5.3.1.3.1 UTRA TDD (3.84 Mchip/s and 7.68 Mchip/s TDD options)

##### 5.3.1.3.1.1 Physical layer functionality and building blocks

For UTRA, the physical layer includes the following functionality:

- Error detection on transport channels and indication to higher layers.
- FEC encoding/decoding of transport channels.
- Multiplexing of transport channels and demultiplexing of coded composite transport channels.
- Rate matching (data multiplexed on dedicated and shared channels).

- Mapping of coded composite transport channels on physical channels.
- Modulation and demodulation of physical channels.
- Spreading and despreading of physical channels.
- Radio characteristics measurements including FER, signal-to-interference (SIR), interference power level, etc. and indication to higher layers.
- Frequency and time (chip, bit, slot, frame) synchronization.
- Power weighting and combining of physical channels.
- Closed-loop power control for downlink.
- RF processing.
- Support of UE positioning methods.
- Beamforming.
- Support of timing advance on uplink channels.
- Support of a Node B synchronization method over the air (not supported for the 7.68 Mchip/s option).

Figure 38 gives the physical layer transmission chain for the UTRA user plane data, i.e. from the level of transport channels down to the level of physical channel. The figure shows how several transport channels can be multiplexed onto one or more DPDCH.

The CRC provides for error detection of the transport blocks for the particular transport channel. The CRC can take the length zero (no CRC), 8, 12, 16 or 24 bits depending on the service requirements.

The transport block concatenation and code block segmentation functionality performs serial concatenation of those transport blocks that will be sent in one transmission time interval and any code block segmentation if necessary.

The types of channel coding defined are convolutional coding, turbo coding and no coding. Realtime services use only FEC encoding while non-real-time services uses a combination of FEC and ARQ. The ARQ functionality resides in the RLC sub-layer of Layer 2. The convolutional coding rates are 1/2 or 1/3 while the rate is 1/3 for turbo codes.

The possible interleaving depths are 10, 20, 40 or 80 ms.

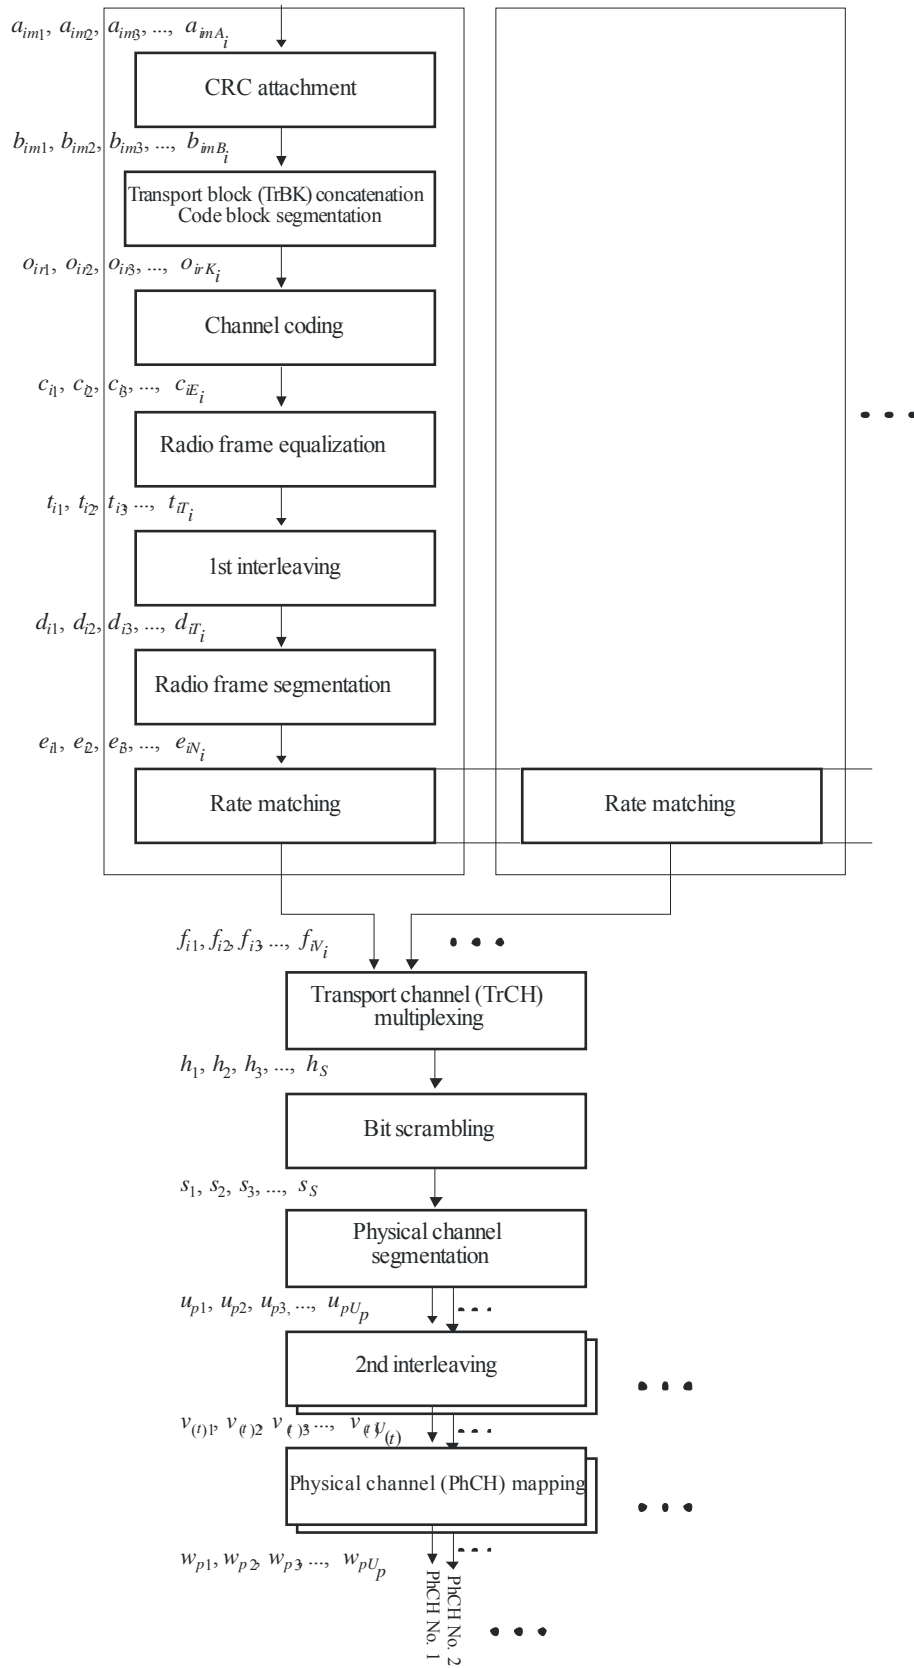

The radio frame segmentation performs padding of bits. The rate matching adapts any remaining differences of the bit rate so the number of outgoing bits fit to the available bit rates of the physical channels. Repetition coding and/or puncturing is used for this purpose.

The TrCH multiplexing stage combines transport channels in a serial fashion. This is done every 10 ms. The output of this operation is also called coded composite transport channels.

If several physical channels will be used to transmit the data, the split is made in the physical channel segmentation unit.

FIGURE 38

Transport channel multiplexing structure

### 5.3.1.3.1.2 Transport channels

The interface to the MAC sub-layer is the transport channels, see Fig. 34. The transport channels define how and with which type of characteristics the data is transferred by the physical layer. They are categorized into dedicated channels or common channels where many UEs are sharing the latter type. Introducing an information field containing the address then does the address resolution, if needed. The physical channel itself defines a dedicated channel. Thus no specific address is needed for the UE. Table 1 summarizes the different types of available transport channels.

TABLE 1

**The defined transport channels**

Transport channel	Type and direction	Used for
DCH (Dedicated channel)	Dedicated; uplink and downlink	User or control information to a UE (entire cell or part of cell (lobe-forming))
BCH (Broadcast channel)	Common; downlink	Broadcast system and cell specific information
FACH (Forward access channel)	Common; downlink	Control information when system knows UE location or short user packets to a UE
PCH (Paging channel)	Common; downlink	Control information to UEs when good sleep mode properties are needed, e.g. idle mode operation
RACH (Random access channel)	Common; uplink	Control information or short user packets from an UE
USCH (Uplink shared channel)	Common; uplink	Carries dedicated user data and control information using a shared channel
E-DCH	Common; uplink	An uplink channel serving several UEs carrying dedicated control or traffic data. E-DCH offers the possibility for high-speed uplink packet access through the support of higher-order modulation, adaptive modulation and coding, fast scheduling, and hybrid ARQ with soft combining
DSCH (Downlink shared channel)	Common; downlink	Carries dedicated user data and control information using a shared channel.
HS-DSCH (High Speed Downlink shared channel)	Common; downlink	A downlink channel serving several UEs carrying dedicated control or traffic data. HS-DSCH offers the possibility for high-speed downlink packet access through the support of higher-order modulation, adaptive modulation and coding, fast channel-dependent scheduling, and hybrid ARQ with soft combining

The RACH on the uplink is contention-based while the DCH is reservation-based.

On each transport channel, a number of Transport Blocks are delivered to/from the physical layer once every Transmission Time Interval (TTI). To each transport channel, there is an associated Transport Format or set of transport formats. The transport format describes the physical properties of the transport channel, such as the TTI, the number of transport blocks per TTI, the number of bits per transport blocks, the coding scheme and coding rate, and the modulation scheme.

### 5.3.1.3.1.3 Transport channels to physical channel mapping

The transport channels are mapped onto the physical channels and Fig. 39 shows the different physical channels and summarizes the mapping of transport channels onto physical channels for UTRA. Each UTRA physical channel has its tailored slot content. The DCH is shown in § 5.3.1.3.1.4.

FIGURE 39

#### Transport channels, physical channels and their mapping

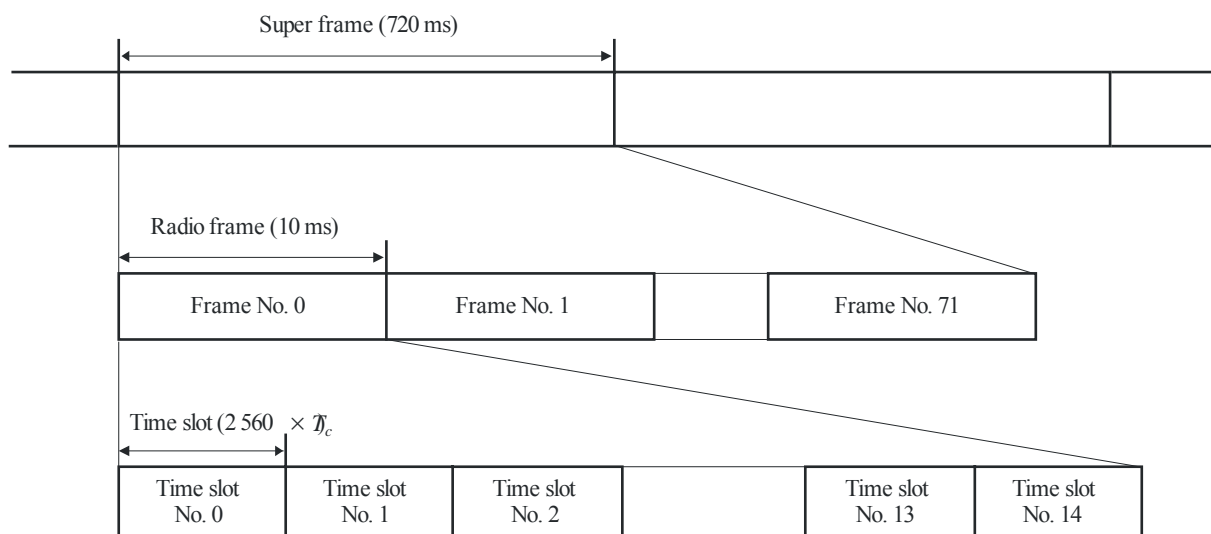

<i>Transport Channels</i>	<i>Physical Channels</i>
DCH	Dedicated Physical Channel (DPCH)
BCH	Primary Common Control Physical Channel (P-CCPCH)
FACH	Secondary Common Control Physical Channel (S-CCPCH)
PCH	Secondary Common Control Physical Channel (S-CCPCH)
RACH	MICH-MBMS Notification Indicator Channel
	Physical Random Access Channel (PRACH)
	Synchronisation Channel (SCH)
USCH	Physical Uplink Shared Channel (PUSCH)
DSCH	Physical Downlink Shared Channel (PDSCH)
	Page Indicator Channel (PICH)

	E-DCH Absolute Grant Channel (E-AGCH)
	E-DCH Hybrid ARQ Indicator Channel (E-HICH)

M.1457-39

### 5.3.1.3.1.4 Physical frame structure

The basic physical frame rate is 10 ms with 15 slots. Figure 40 shows the frame structure.

FIGURE 40  
Basic frame structure

M.1457-40

Each 10 ms frame consists of 15 time slots, each allocated to either the uplink or the downlink. With such a flexibility, this radio interface can be adapted to different environments and deployment scenarios. In any configuration at least one time slot has to be allocated for the downlink and at least one time slot has to be allocated for the uplink.

Figures 41, 42 and 43 show the three burst formats stating the content for a slot used by a DCH for 3.84 Mchip/s TDD. The usage of either burst format 1, 2 or 3 is depending on the application for UL or DL type 3 for uplink only) and the number of allocated users per time slot.

FIGURE 41  
Burst structure of the burst type 1

M.1457-42

FIGURE 43

**Burst structure of the burst type 3**  
(GP denotes the guard period and CP the chip periods)

M.1457-43

In both cases data bits are QPSK or 16-QAM modulated and the resulting symbols are spread with a channelization code of length 1 to 16 (for the DL, only 1 and 16 apply). Due to this variable spreading factor, each burst provides the number of symbols as shown in Table 2 for the 3.84 Mchip/s option.

Thus, the number of bits per TDD burst in the 3.84 Mchip/s TDD option is two or four times the number shown in Table 2 depending on the applied modulation. Usage of multicode and multiple time slots can be applied.

For the 7.68 Mchip/s TDD option, the same burst structures as for the 3.84 Mchip/s option are employed but with a corresponding doubling in the number of chips per field within the burst. Additionally, the range of spreading factors is extended to provide for spreading factor 32. Thus, channelization codes with lengths ranging between 1 and 32 are used to spread the modulation symbols (for the DL, only 1 and 32). The number of bits per TDD burst in the 7.68 Mchip/s TDD option is shown in Table 3. As for the 3.84 Mchip/s option, usage of multicode and multiple time slots can be applied.

TABLE 2

**Number of data symbols in TDD bursts in 3.84 Mchip/s TDD option**

Spreading factor, $Q$	Number of symbols, $N$ , for Burst type 1	Number of symbols, $N$ , for Burst type 2	Number of symbols, $N$ , for Burst type 3
1	1 952	2 208	1 856
2	976	1 104	928
4	488	552	464
8	244	276	232
16	122	138	116

TABLE 3

**Number of data symbols in TDD bursts in the 7.68 Mchip/s TDD option**

Spreading factor, $Q$	Number of symbols, $N$ , for Burst type 1	Number of symbols, $N$ , for Burst type 2	Number of symbols, $N$ , for Burst type 3
1	3 904	4 416	3 712
2	1 952	2 208	1 856
4	976	1 104	928
8	488	552	464
16	244	276	232
32	122	138	116

Downlink and uplink transmissions are organized into radio frames with  $T_f = 307200 \times T_s = 10$  ms duration.

### 5.3.1.3.1.5 Spreading, modulation and pulse shaping

Spreading is applied after modulation and before pulse shaping. It consists of two operations. The first is the channelization operation, which transforms every data symbol into a number of chips, thus increasing the bandwidth of the signal. The number of chips per data symbol is called the spreading factor (SF) and is in the range of 1 to 16 for 3.84 Mchip/s TDD and in the range 1 to 32 for 7.68 Mchip/s TDD. The second operation is the scrambling operation, where a scrambling code is applied to the spread signal. This procedure is similar to the radio interface specified in § 5.1, but it should be noted that the midamble part in TDD bursts (see Figs 41, 42 and 43) is not spread.

The applied channelization codes are OVSF-codes that preserve the distinguishability of different users. The applied scrambling code is cell-specific and 128 different scrambling codes are available.

In the uplink, the applied midamble is user specific and derived from a cell-specific basic midamble sequence. In the downlink, the applied midamble is either user specific, code specific (default) or common for the whole cell. In each case 128 different basic midamble sequences are available.

After spreading the same pulse-shaping is applied as in FDD mode, i.e. the filters are root-raised cosine with roll-off  $\alpha = 0.22$  in the frequency domain.

Downlink spreading for downlink physical channels other than the downlink DPCH is very similar. For the physical channel to which HS-DSCH and E-DCH are mapped, 16-QAM can be used in addition to QPSK.

### 5.3.1.3.2 UTRA TDD (1.28 Mchip/s TDD option)

#### 5.3.1.3.2.1 Physical layer functionality and building blocks

The physical layer includes the following functionality:

- Error detection on transport channels and indication to higher layers.
- Forward error control (FEC) encoding/decoding of transport channels.
- Multiplexing of transport channels and demultiplexing of coded composite transport channels.
- Rate matching (data multiplexed on dedicated and shared channels).
- Mapping of coded composite transport channels on physical channels.
- Modulation and demodulation of physical channels.
- Spreading and despreading of physical channels.
- Radio characteristics measurements including FER, SIR, DOA, timing advance, handover measurements, etc.
- Frequency and time (chip, bit, time slot, subframe) synchronization.
- Power weighting and combining of physical channels.
- Power control.
- RF processing.
- UE location/positioning (smart antenna).
- Beamforming for both uplink and downlink (Smart antenna).
- Macrodiversity distribution/combining and handover execution (excluding E-UTRAN).
- Uplink synchronization.

- Random access process.
- Subframe segmentation.

Figure 44 gives the physical layer transmission chain for the user plane data, i.e. from the level of transport channels down to the level of physical channel. Figure 44 shows how several transport channels can be multiplexed onto one or more dedicated physical channels (DPCH).

The CRC provides for error detection of the transport blocks for the particular transport channel. The CRC can take the length zero (no CRC), 8, 12, 16 or 24 bits depending on the service requirements.

The transport block concatenation and code block segmentation functionality performs serial concatenation of those transport blocks that will be sent in one transmission time interval and any code block segmentation if necessary.

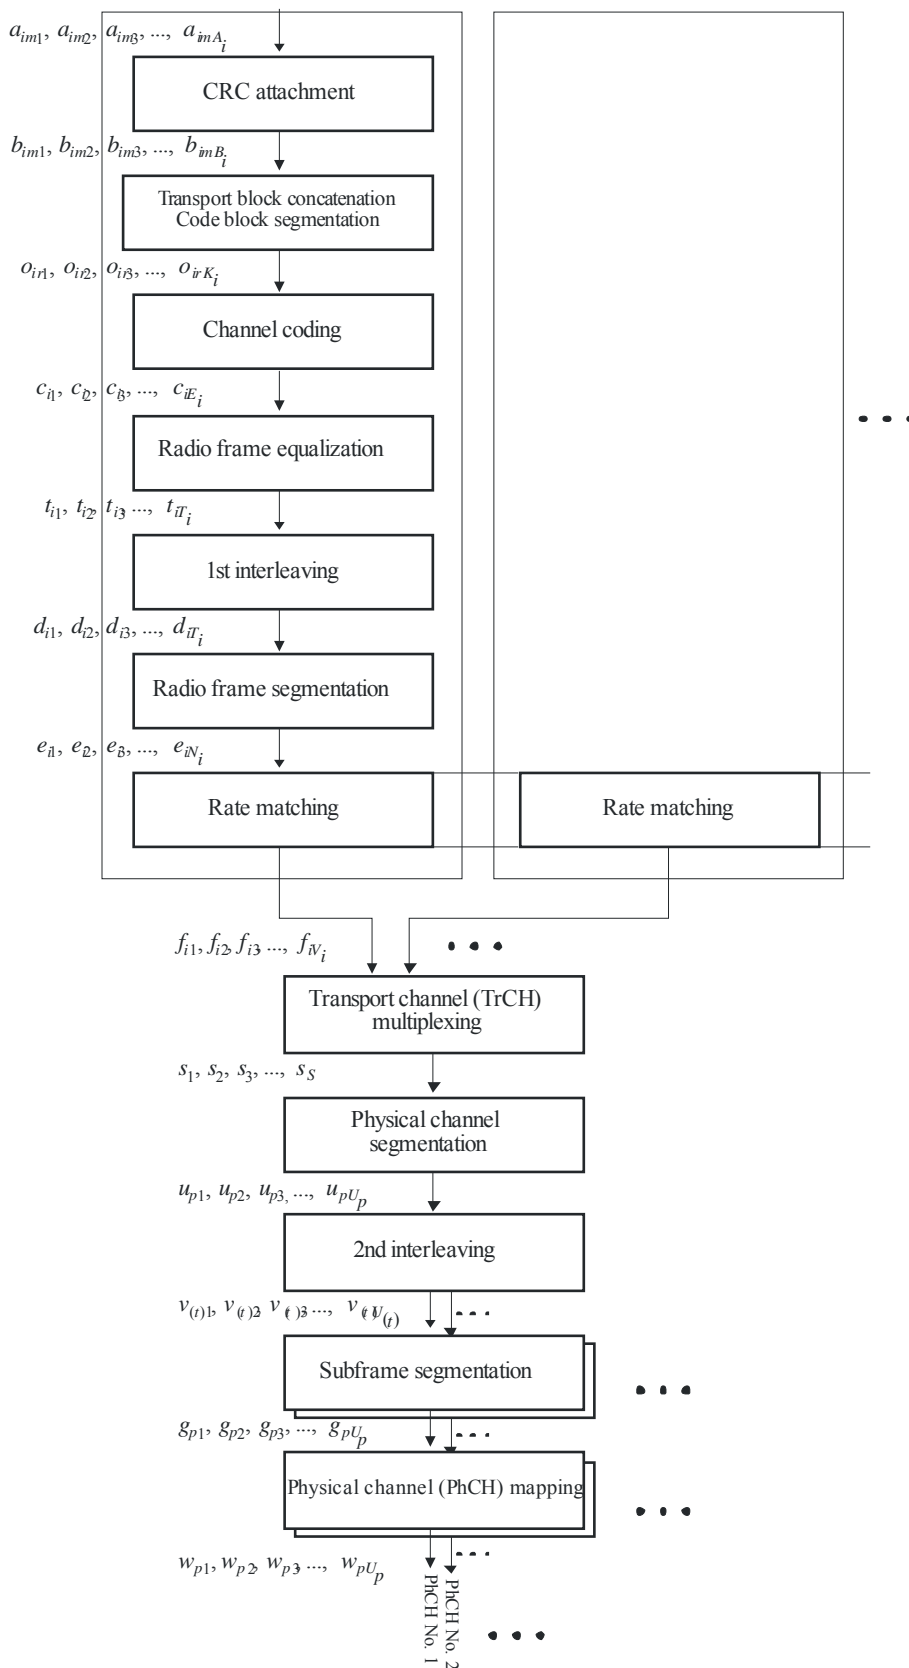

The types of channel coding defined are convolutional coding, turbo coding and no coding. Real-time services use only FEC encoding while non-real-time services uses a combination of FEC and ARQ. The ARQ functionality resides in the RLC sub-layer of Layer 2. The convolutional coding rates are 1/2 or 1/3 while the rate is 1/3 for turbo codes.

The possible interleaving depths are 10, 20, 40 or 80 ms, for the RACH also 5 ms may apply. The radio frame equalization performs padding of bits. The rate matching adapts any remaining differences of the bit rate so the number of outgoing bits fit to the available bit rates of the physical channels. Repetition coding and/or puncturing is used for this purpose.

The TrCH multiplexing stage combines transport channels in a serial fashion. This is done every 10 ms. The output of this operation is also called coded composite transport channels.

FIGURE 44

Transport channel multiplexing structure

If several physical channels will be used to transmit the data, the split is made in the physical channel segmentation unit.

### 5.3.1.3.2.2 Transport channels

The interface to the MAC sub-layer is the transport channels, see Fig. 38. The transport channels define how and with which type of characteristics the data is transferred by the physical layer. They are categorized into DCH or common channels where many UEs are sharing the latter type. Introducing an information field containing the address then does the address resolution, if needed. The physical channel itself defines a DCH. Thus no specific address is needed for the UE. Table 4 summarizes the different types of available transport channels.

TABLE 4  
The defined transport channels

Transport channel	Type and direction	Used for
DCH (dedicated channel)	Dedicated; uplink and downlink	User or control information to a UE (entire cell or part of cell (lobe-forming))
BCH (broadcast channel)	Common; downlink	Broadcast system and cell specific information
FACH (forward access channel)	Common; downlink	Control information when system knows UE location or short user packets to a UE
PCH (paging channel)	Common; downlink	Control information to UEs when good sleep mode properties are needed, e.g. idle mode operation
RACH (random access channel)	Common; uplink	Control information or short user packets from an UE
DSCH (downlink shared channel)	Common; downlink	Carries dedicated user data and control information using a shared channel
HS-DSCH (high Speed Downlink shared channel)	Common; downlink	A downlink channel serving several Ues carrying dedicated control or traffic data. HS-DSCH offers the possibility for high-speed downlink packet access through the support of higher-order modulation, adaptive modulation and coding, fast channel-dependent scheduling, and hybrid ARQ with soft combining
USCH (uplink shared channel)	Common; uplink	Carries dedicated user data and control information using a shared channel
E-DCH	Common; uplink	An uplink channel serving several UEs carrying dedicated control or traffic data. E-DCH offers the possibility for high-speed uplink packet access through the support of higher-order modulation, adaptive modulation and coding, fast scheduling, and hybrid ARQ with soft combining

The RACH on the uplink is contention-based while the DCH is reservation-based.

On each transport channel, a number of Transport Blocks are delivered to/from the physical layer once every Transmission Time Interval (TTI). To each transport channel, there is an associated Transport Format or set of transport formats. The transport format describes the physical properties of the transport channel, such as the TTI, the number of transport blocks per TTI, the number of bits per transport blocks, the coding scheme and coding rate, and the modulation scheme.

### 5.3.1.3.2.3 Transport channels to physical channel mapping

The transport channels are mapped onto the physical channels and Fig. 45 shows the different physical channels and summarizes the mapping of transport channels onto physical channels. Each physical channel has its tailored slot content. The DCH is shown in § 5.3.1.3.2.4.

FIGURE 45

Transport channel, physical channel and their mapping

	E-DCH absolute grant channel (E-AGCH)
	E-DCH hybrid ARQ indicator channel (E-HICH)

M.1457-45

### 5.3.1.3.2.4 Frame structure

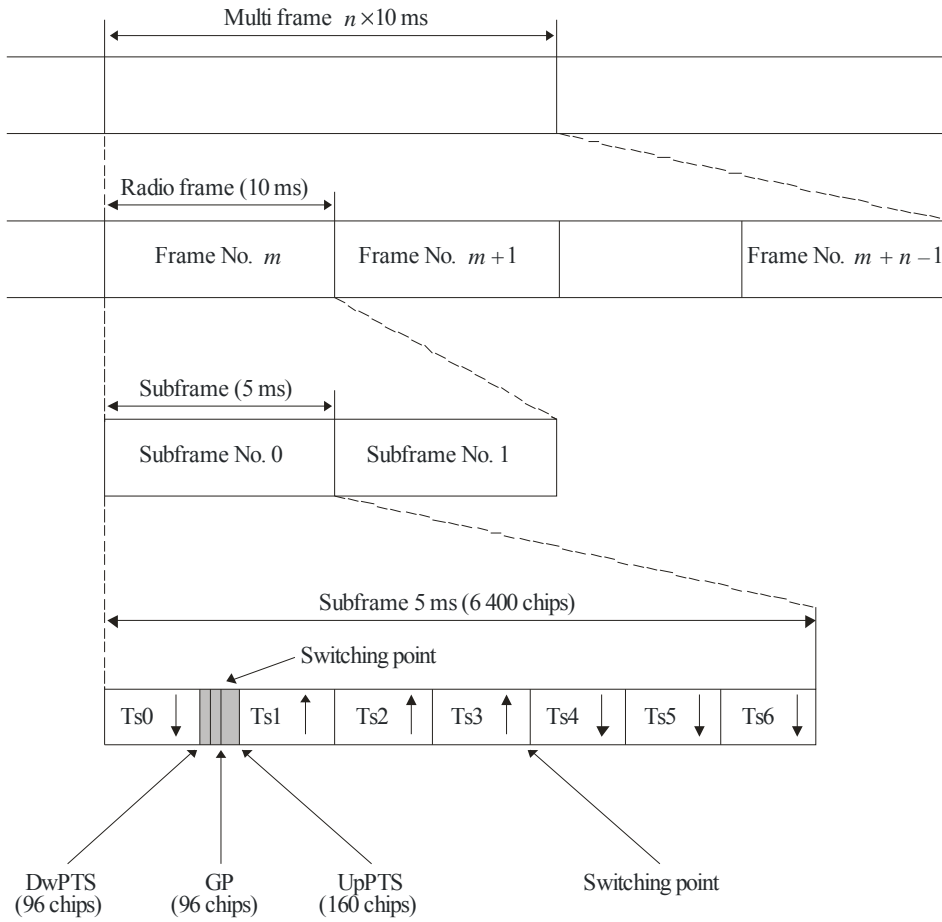

The frame structure is shown in Fig. 46. Physical channels take four-layer structure of multi-frames, radio frames, sub-frames and time slots/codes. The radio frame has a duration of 10 ms and is subdivided into 2 sub-frames of 5 ms each, and each sub-frame is then subdivided into 7 traffic time slots of 675  $\mu$ s duration each and 3 special time slots: DwPTS (downlink pilot timeslot), GP (guard period) and UpPTS (uplink pilot timeslot).

The burst structure is shown in Fig. 47. The burst type consists of two data symbol fields, a midamble of 144 chips and a guard period of 16 chips. The data fields of the burst type are 704 chips long. The data bits in the burst are QPSK modulated and are spread by the spreading factor of 1 to 16 in the UL and with the spreading factors 1 or 16 in the DL. The guard period is 16 chips long. 8-PSK and 16-QAM modulation may optionally be applied.

The corresponding number of symbols depends on the spreading factor as indicated in Table 5.

4	88
8	44
16	22

### 5.3.1.3.2.5 Spreading, modulation and pulse shaping

Spreading is applied after modulation and before pulse shaping. It consists of two operations. The first is the channelization operation, which transforms every data symbol into a number of chips, thus increasing the bandwidth of the signal. The number of chips per data symbol is called the SF and is in the range of 1 to 16. The second operation is the scrambling operation, where a scrambling code is applied to the spread signal. It should be noted that the midamble part in TDD bursts is not spread.

The applied channelization codes are OVFSF-codes that preserve the distinguishability of different users. The applied scrambling code is cell-specific.

In the uplink, the applied midamble is user specific and derived from a cell-specific basic midamble sequence. In the downlink, the applied midamble is either user specific, code specific (default) or common for the whole cell.

After spreading, pulse-shaping is applied, i.e. the filters are root-raised cosine with roll-off  $\alpha = 0.22$  in the frequency domain.

### 5.3.1.3.2.6 Transmission and reception

The frequency bands assumed for operation are unpaired frequency bands at 2 GHz. Also the system can work in other frequency bands available. Several Tx power classes for UE are being defined currently.

### 5.3.1.3.3 E-UTRA TDD

#### 5.3.1.3.3.1 Physical layer functionality and building blocks

For E-UTRA the physical layer includes the following functionality:

- Error detection on the transport channel and indication to higher layers;
- FEC encoding/decoding of the transport channel;
- Hybrid ARQ soft-combining;
- Rate matching of the coded transport channel to physical channels;
- Mapping of the coded transport channel onto physical channels;
- Power weighting of physical channels;
- Modulation and demodulation of physical channels;
- Frequency and time synchronisation;
- Radio characteristics measurements and indication to higher layers;

- Multiple Input Multiple Output (MIMO) antenna processing;
- Transmit Diversity (TX diversity);
- Beamforming;
- RF processing;
- Frequency domain multiplexing with users;
- Single frequency combining from multiple cells.

### 5.3.1.3.3.2 Transport channels

For E-UTRAN, the following transport channels are defined.

Downlink transport channel types are:

- Broadcast Channel (BCH) characterized by:
  - fixed, pre-defined transport format;
  - requirement to be broadcast in the entire coverage area of the cell.
- Downlink Shared Channel (DL-SCH) characterized by:
  - support for HARQ;
  - support for dynamic link adaptation by varying the modulation, coding and transmit power;
  - possibility to be broadcast in the entire cell;
  - possibility to use beamforming;
  - support for both dynamic and semi-static resource allocation;
  - support for UE discontinuous reception (DRX) to enable UE power saving;
  - support for MBMS transmission (FFS).
- Paging Channel (PCH) characterized by:
  - support for UE discontinuous reception (DRX) to enable UE power saving (DRX cycle is indicated by the network to the UE);
  - requirement to be broadcast in the entire coverage area of the cell;
  - mapped to physical resources which can be used dynamically also for traffic/other control channels.
- Multicast Channel (MCH) characterized by:
  - requirement to be broadcast in the entire coverage area of the cell;
  - support for SFN combining of MBMS transmission on multiple cells;
  - support for semi-static resource allocation, e.g. with a time-frame of a long cyclic prefix.

Uplink transport channel types are:

- Uplink Shared Channel (UL-SCH) characterized by:
  - possibility to use beamforming (likely no impact on specifications);
  - support for dynamic link adaptation by varying the transmit power and potentially modulation and coding;
  - support for HARQ;
  - support for both dynamic and semi-static resource allocation.
- Random Access Channel(s) (RACH) characterized by:
  - limited control information;

- collision risk.

Figure 47A gives the physical transmission chain for the E-UTRA UL-SCH and DL-SCH transport channels (top and bottom respectively).

The following coding steps can be identified for each transport block of an UL cell:

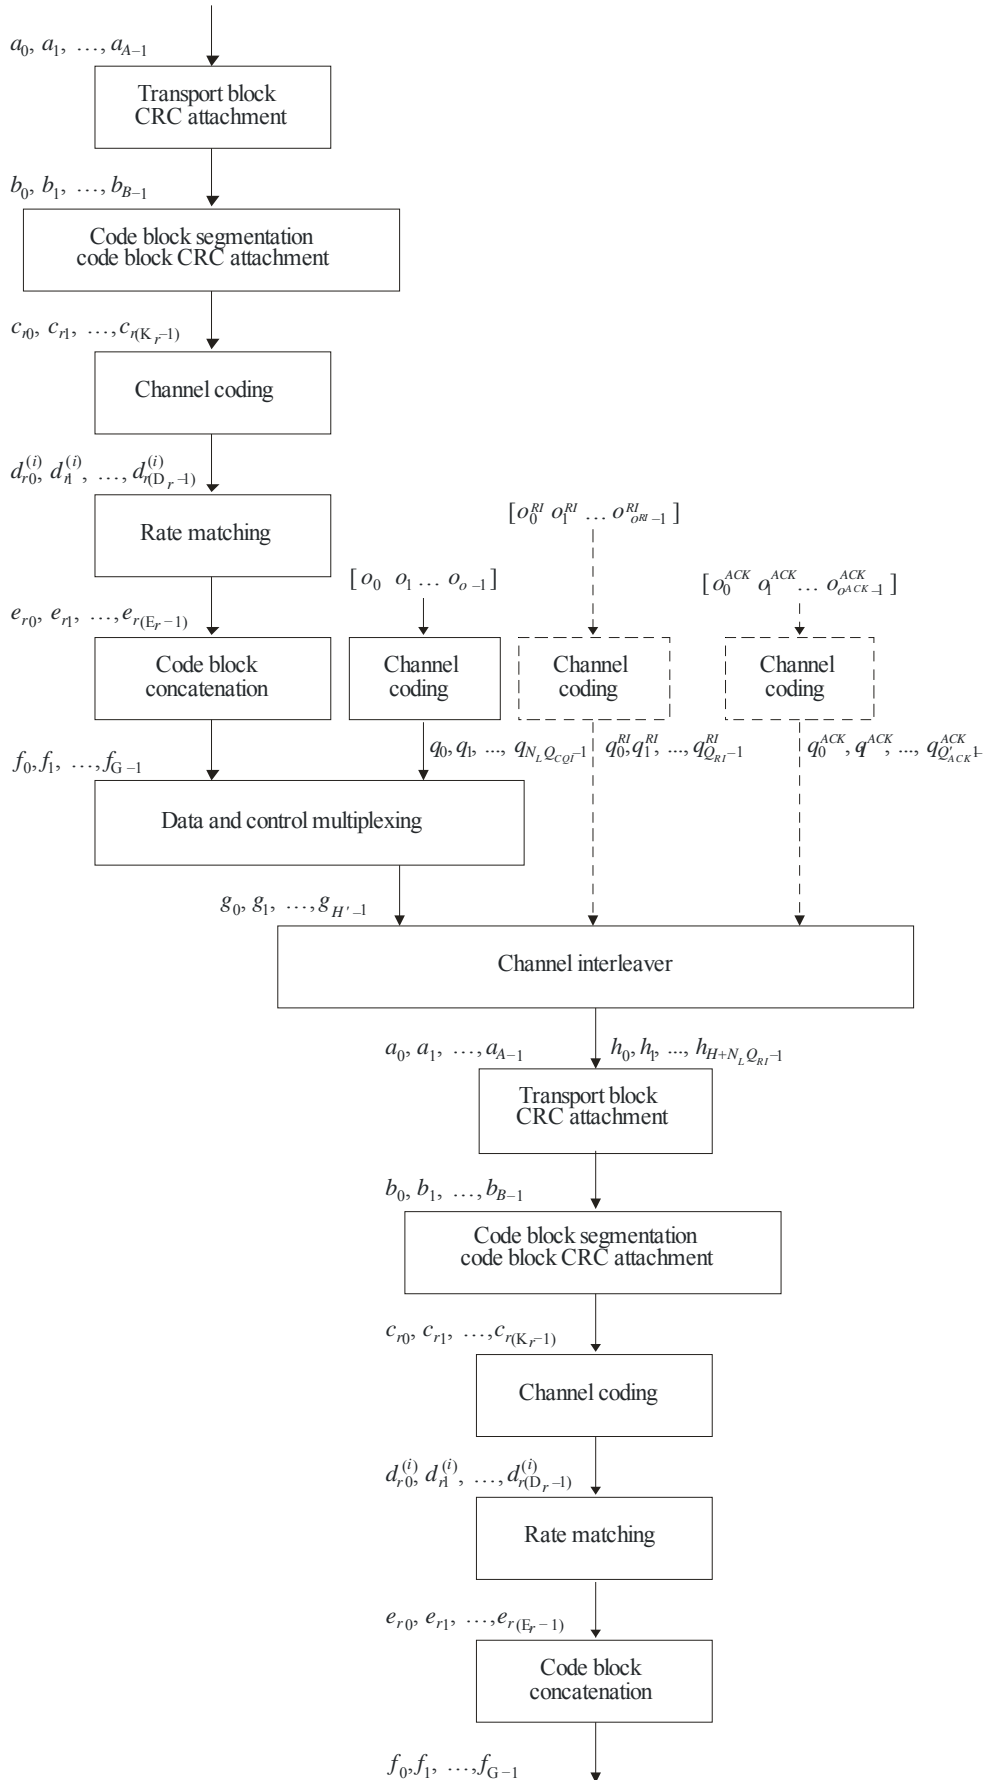

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding of data and control information
- Rate matching
- Code block concatenation
- Multiplexing of data and control information
- Channel interleaver.

The following coding steps can be identified for each transport block of a DL cell:

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding
- Rate matching
- Code block concatenation.

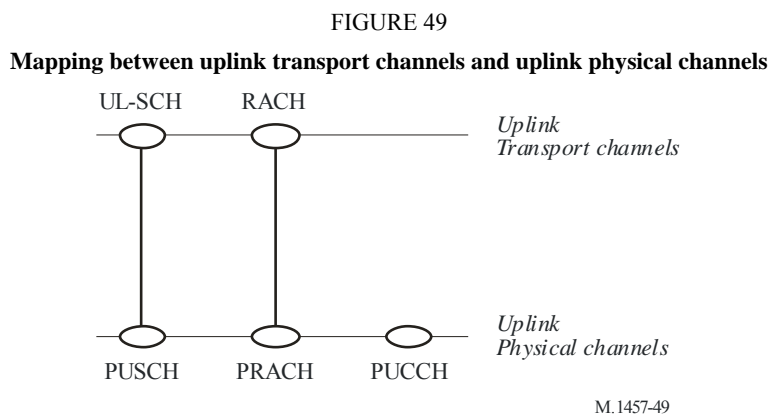

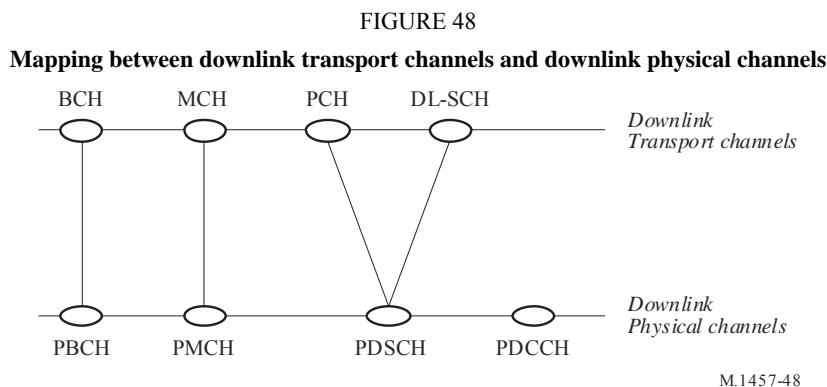

FIGURE 47A

UL-SCH and DL-SCH transport channel multiplexing structure (top and bottom respectively)

### 5.3.1.3.2.3 Transport channels to physical channel mapping

Figures 48 and 49 depict the mapping between transport and physical channels for E-UTRAN:

### 5.3.1.3.3.4 Frame structure

E-UTRA TDD uses a frame structure type 2. Frame structure type 2 is applicable to TDD. Each radio frame consists of two half-frames of length  $T_f = 153\,600 \times T_s = 5$  ms each. Each half-frame consists of eight slots of length  $T_{slot} = 15\,360 \times T_s = 0.5$  ms and three special fields, DwPTS, GP, and UpPTS. The lengths of DwPTS and UpPTS are configurable subject to the total length of DwPTS, GP and UpPTS being equal to  $30\,720 \times T_s = 1$  ms. Subframe 1 and 6 consists of DwPTS, GP and UpPTS, all other subframes are defined as two slots where subframe  $i$  consists of slots  $2i$  and  $2i + 1$ .

Subframes 0 and 5 and DwPTS are always reserved for downlink transmission.

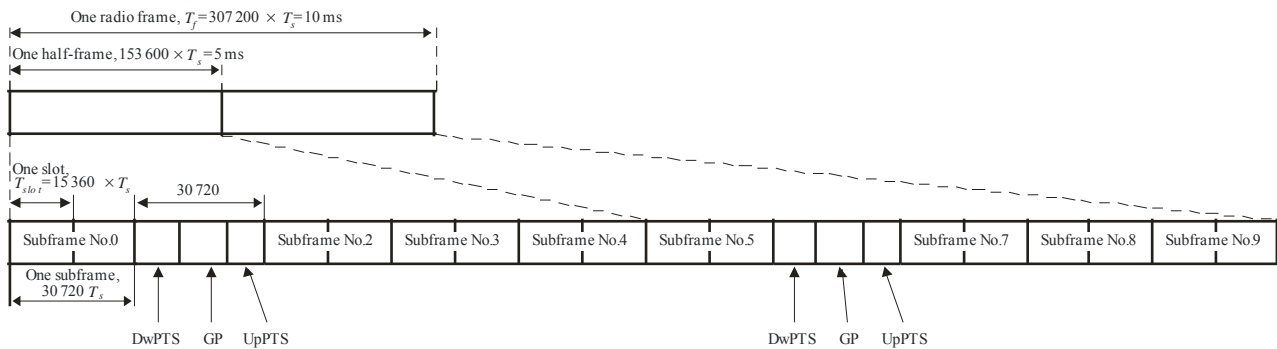

Both 5 ms and 10 ms switch-point periodicity is supported.

In case of 5 ms switch-point periodicity, UpPTS and subframes 2 and 7 are reserved for uplink transmission.

In case of 10 ms switch-point periodicity, DwPTS exist in both half-frames while GP and UpPTS only exist in the first half-frame and DwPTS in the second half-frame has a length equal to  $30\,720 \times T_s = 1$  ms. UpPTS and subframe 2 are reserved for uplink transmission and subframes 7 to 9 are reserved for downlink transmission.

FIGURE 50

Frame structure type 2

M.1457-50

### 5.3.1.3.3.5 Spreading, modulation and pulse shaping

In E-UTRA, the uplink radio access scheme is based on single carrier FDMA, more specifically, DFTS-OFDM. The sub-carrier spacing is 15 kHz. The baseline antenna configuration is MU-MIMO. Modulation scheme for the uplink is up to 16-QAM and optionally 64-QAM.

The downlink radio access scheme of E-UTRA is based on conventional OFDM using cyclic prefix. The OFDM sub-carrier spacing is 15 kHz. In addition, there is also a reduced sub-carrier spacing of 7.5 kHz only for MBMS-dedicated cell.

Single User MIMO and Multi User MIMO with 2, 4 and 8 transmit antennas are supported.

### 5.3.1.4 Layer 2

#### 5.3.1.4.1 MAC layer

The MAC sub-layer is responsible for the handling of the data streams coming from the RLC and RRC sub-layers. It provides an unacknowledged transfer mode service to the upper layers. The interface to the RLC sub-layer is through logical channel service access points. It also re-allocates radio resources on request by the RRC sub-layer as well as provides measurements to the upper layers. The logical channels are divided into control channels and traffic channels. Thus, the functionality handles issues like:

- mapping of the different logical channels to the appropriate transport channels, selection of appropriate transport format for the transport channels based on the instantaneous source bit rate, and optimization of the HS-DSCH, DL-SCH (E-UTRA) and UL-SCH (E-UTRA) transport channel;
- multiplexing/demultiplexing of the PDUs to/from transport blocks which are thereafter further treated by the physical layer;
- dynamic switching between common and dedicated transport channels based on information from the RRC sub-layer;
- priority issues for services to one UE according to information from higher layers and physical layer (e.g. available transmit power level) as well as priority handling between UEs by means of dynamic scheduling in order to increase spectrum efficiency;
- monitoring of traffic volume that can be used by the RRC sub-layer;
- hybrid ARQ with soft combining in case of the HS-DSCH, DL-SCH (E-UTRA) or UL-SCH (E-UTRA) transport channel;
- segmentation in the case that improved L2 support for high data rates is used;
- padding (E-UTRA).

Figure 51 shows the possibilities of mapping the logical channel DTCH onto transport channels. There are possibilities to map onto common transport channels as well as dedicated transport channels. The choice of mapping could be determined on, e.g. amount of traffic a user creates.

FIGURE 51

M.1457-51

Figures 52 and 53 similarly show the possibilities of mapping the logical channels onto transport channels for E-UTRA.

M.1457-53

#### 5.3.1.4.2 RLC sub-layer

The RLC sub-layer provides three different types of data transfer modes:

- *Transparent data transfer* – This service transmits higher layer PDUs without adding any protocol information, possibly including segmentation/reassemble functionality.
- *Unacknowledged data transfer* – This service transmits higher layer PDUs without guaranteeing delivery to the peer entity. The unacknowledged data transfer mode has the following characteristics:
  - a) *Detection of erroneous data*: The RLC sub-layer shall deliver only those SDUs to the receiving higher layer that are free of transmission errors by using the sequence-number check function.
  - b) *Unique delivery*: The RLC sub-layer shall deliver each SDU only once to the receiving upper layer using duplication detection function.
  - c) *Immediate delivery*: The receiving RLC sub-layer entity shall deliver a SDU to the higher layer receiving entity as soon as it arrives at the receiver.
- *Acknowledged data transfer* – This service transmits higher layer PDUs and guarantees delivery to the peer entity. In case RLC is unable to deliver the data correctly, the user of RLC at the transmitting side is notified. For this service, both in-sequence and out-of-sequence delivery are supported. In many cases a higher layer protocol can restore the order of its PDUs. As long as the out-of-sequence properties of the lower layer are known and controlled (i.e. the higher layer protocol will not immediately request retransmission of a missing PDU) allowing out-of-sequence delivery can save memory space in the receiving RLC. The acknowledged data transfer mode has the following characteristics:
  - a) *Error-free delivery*: Error-free delivery is ensured by means of retransmission. The receiving RLC entity delivers only error-free SDUs to the higher layer.
  - b) *Unique delivery*: The RLC sub-layer shall deliver each SDU only once to the receiving upper layer using duplication detection function.
  - c) *In-sequence delivery*: RLC sub-layer shall provide support for in-order delivery of SDUs, i.e. RLC sub-layer should deliver SDUs to the receiving higher layer entity in the same order as the transmitting higher layer entity submits them to the RLC sub-layer.
  - d) *Out-of-sequence delivery*: Alternatively to in-sequence delivery, it shall also be possible to allow that the receiving RLC entity delivers SDUs to higher layer in different order than submitted to RLC sub-layer at the transmitting side.

It also provides for RLC connection establishment/release. As well as QoS setting and notification to higher layers in case of unrecoverable errors.

An example of the data flow for non-transparent (acknowledged/unacknowledged) data transfer is shown in Fig. 35.

#### 5.3.1.4.3 PDCP sub-layer

PDCP provides transmission and reception of Network PDUs in acknowledged, unacknowledged and transparent RLC mode.

It is responsible for the mapping of Network PDUs from one network protocol to one RLC entity and it provides compression in the transmitting entity and decompression in the receiving entity of redundant Network PDU control information (header compression/decompression).

For E-UTRAN, PDCP is also responsible for in-sequence delivery of upper layer PDUs at hand-over, duplicate detection of lower layer SDUs and retransmission of PDCP SDUs at handover.

#### 5.3.1.4.4 BMC sub-layer

In UTRA, the BMC provides a broadcast/multicast transmission service in the user plane on the radio interface for common user data in transparent or unacknowledged mode.

It can handle functionalities such as storage, scheduling and transmission of BMC messages.

#### 5.3.1.5 Layer 3 (radio resource control sub-layer)

The radio resource control (RRC) sub-layer handles the control plane signalling of Layer 3 between the UEs and the radio access network. In addition to the relation with the upper layers (such as core network) the following main functions are performed:

- *Broadcast of information provided by the non-access stratum (core network)* – The RRC layer performs system information broadcasting from the network to all UEs. The system information is normally repeated on a regular basis. This function supports broadcast of higher layer (above RRC) information. This information may be cell specific or not. As an example RRC may broadcast core network location service area information related to some specific cells.
- *Broadcast of information related to the access stratum* – The RRC layer performs system information broadcasting from the network to all UEs. This function supports broadcast of typically cell-specific information.
- *Establishment, maintenance and release of an RRC connection between the UE and this radio interface* – The establishment of an RRC connection is initiated by a request from higher layers at the UE side to establish the first signalling connection for the UE. The establishment of an RRC connection includes an optional cell re-selection, an admission control, and a Layer 2 signalling link establishment.
- *Establishment, reconfiguration and release of radio access bearers* – The RRC layer will, on request from higher layers, perform the establishment, reconfiguration and release of radio access bearers in the user plane. A number of radio access bearers can be established to an UE at the same time. At establishment and reconfiguration, the RRC layer performs admission control and selects parameters describing the radio access bearer processing in Layer 2 and Layer 1, based on information from higher layers.
- *Assignment, reconfiguration and release of radio resources for the RRC connection* – The RRC layer handles the assignment of radio resources (e.g. codes and, for TDD only, time slots) needed for the RRC connection including needs from both the control and user plane. The RRC layer may reconfigure radio resources during an established RRC connection. This function includes coordination of the radio resource allocation between multiple radio bearers related to the same RRC connection. RRC controls the radio resources in the uplink and downlink such that UE and the radio access network can communicate using unbalanced radio resources (asymmetric uplink and downlink). RRC signals to the UE to indicate resource allocations for purposes of handover to GSM or other radio systems.
- *RRC connection mobility functions* – The RRC layer performs evaluation, decision and execution related to RRC connection mobility during an established RRC connection, such as handover, preparation of handover to GSM or other systems, cell re-selection and cell/paging area update procedures, based on, e.g. measurements done by the UE.
- *Paging/notification* – The RRC layer can broadcast paging information from the network to selected UEs. The RRC layer can also initiate paging during an established RRC connection.

- *Control of requested QoS* – This function ensures that the QoS requested for the radio access bearers can be met. This includes the allocation of a sufficient number of radio resources.
- *UE measurement reporting and control of the reporting* – The measurements performed by the UE are controlled by the RRC layer, in terms of what to measure, when to measure and how to report, including both this radio interface and other systems. The RRC layer also performs the reporting of the measurements from the UE to the network.
- *Outer loop power control* – The RRC layer controls setting of the target of the closed-loop power control.
- *Control of ciphering* – The RRC layer provides procedures for setting of ciphering (on/off) between the UE and the radio access network.
- *Initial cell selection and re-selection in idle mode* – Selection of the most suitable cell based on idle mode measurements and cell selection criteria.
- *Arbitration of the radio resource allocation between the cells* – This function shall ensure optimal performance of the overall radio access network capacity.
- *Slow DCA* – Allocation of preferred radio resources based on long-term decision criteria.
- *Timing advance control* – The RRC controls the operation of timing advance.

### 5.3.1.6 Summary of major technical parameters

Parameter	Value	Reference to § 5.3.2
Multiple access technique and duplexing scheme	Multiple access: TDMA/CDMA (E-UTRAN) OFDM in DL. SC-FDMA in UL Duplexing: TDD	5.3.2.1.1 5.3.2.3.1
Chip rate (Mchip/s)	3.84 Mchip/sTDD option: 3.84 7.68 Mchip/s TDD option: 7.68 1.28 Mchip/sTDD option: 1.28	5.3.2.1.4
Frame length and structure	3.84 Mchip/sTDD option: Frame length: 10 ms 15 slots per frame, each 666.666 µs 7.68 Mchip/s TDD option: Frame length: 10 ms 15 slots per frame, each 666.666 µs 1.28 Mchip/s TDD option: Frame length: 10 ms Sub-frame length: 5 ms 7 main slots per sub-frame, each 675 µs (E-UTRAN) Sub-frame length; 1 ms (E-UTRAN) Slot length 0.5 ms TTI: 10 ms, 20 ms, 40 ms, 80 ms, 5 ms (HS-DSCH, E-DCH and PRACH, 1.28 Mchip/s option only) (E-UTRAN) 1 ms	5.3.2.1.2 5.3.2.3.1

Parameter	Value	Reference to § 5.3.2
Occupied bandwidth (MHz)	3.84 Mchip/sTDD option: Less than 5 7.68 Mchip/s TDD option: Less than 10 1.28 Mchip/sTDD option: Less than 1.6 (E-UTRAN) 1.4 MHz, 3 MHz, 10 MHz, 15 MHz and 20 MHz	5.3.2.4.1 5.3.2.4.3 5.3.2.9.1 5.3.2.9.2
Adjacent channel leakage power ratio (ACLR) (transmitter side)	3.84 Mchip/sTDD option: UE (UE power class: 21 dBm, 24 dBm) ACLR (5 MHz) = 33 dB ACLR (10 MHz) = 43 dB BS: ACLR (5 MHz) = 45 dB ACLR (10 MHz) = 55 dB 7.68 Mchip/s TDD option: UE (UE power class: 21 dBm, 24 dBm) ACLR (10 MHz) = 33 dB ACLR (20 MHz) = 43 dB BS: ACLR (10 MHz) = 45 dB ACLR (20 MHz) = 55 dB 1.28 Mchip/sTDD option: UE (UE power class: 21 dBm, 24 dBm) ACLR (1.6 MHz) = 33 dB ACLR (3.2 MHz) = 43 dB BS: ACLR (1.6 MHz) = 40 dB ACLR (3.2 MHz) = 45 dB	5.3.2.4.1, 5.3.2.9.1  5.3.2.4.3, 5.3.2.9.2
Adjacent channel selectivity (ACS) (receiver side)	3.84 Mchip/s TDD option: UE: (UE power class: 21 dBm, 24 dBm) ACS (5 MHz) = 33 dB BS: ACS (5 MHz) = 45 dB 7.68 Mchip/s TDD option: UE: (UE power class: 21 dBm, 24 dBm) ACS (10 MHz) = 33 dB BS: ACS (10 MHz) = 45 dB 1.28 Mchip/sTDD option: UE: (UE power class: 21 dBm, 24 dBm) ACS (1.6 MHz) = 33 dB BS: ACS (1.6 MHz) = 45 dB	5.3.2.4.1, 5.3.2.9.1 5.3.2.4.3, 5.3.2.9.2
Random access mechanism	3.84 Mchip/s and 7.68 Mchip/s TDD options: RACH burst on dedicated uplink slot(s) 1.28 Mchip/sTDD option: Two step random-access with fast physical layer signalling	5.3.2.1.2, 5.3.2.1.5

<b>Parameter</b>	<b>Value</b>	<b>Reference to § 5.3.2</b>
Channel estimation	Midambles are used for channel estimation	5.3.2.1.2
Inter-base station asynchronous/ synchronous operation	Synchronous operation	5.3.2.1.5

### 5.3.2 Detailed specification of the radio interface

The standards contained in this section are derived from the global core specifications for IMT-2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

- 1) The relevant SDOs should make their reference material available from their Web site.
- 2) This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

#### 5.3.2.1 25.200 series

##### 5.3.2.1.1 TS 25.201

#### Physical layer – general description

This specification gives a general description of the physical layer of the UTRA radio interface.

**5.3.2.1.3 TS 25.221****Physical channels and mapping of transport channels onto physical channels (TDD)**

This specification describes the characteristics of the Layer 1 transport channels and physical channel in the TDD mode of UTRA. The main objectives of the document are to be a part of the full description of the UTRA Layer 1, and to serve as a basis for the drafting of the actual technical specification (TS).

## 5.3.2.2.3 TS 25.303

## Interlayer procedures in Connected Mode

This specification describes informative interlayer procedures to perform the required tasks. This specification attempts to provide a comprehensive overview of the different states and transitions within the connected mode of universal mobile telecommunications system (UMTS) terminal.

**5.3.2.2.4 TS 25.304****User Equipment (UE) procedures in idle mode and procedures for cell reselection in connected mode**

This specification describes the overall idle mode process for the UE and the functional division between the non-access stratum and access stratum in the UE. The UE is in idle mode when the connection of the UE is closed on all layers, e.g. there is neither an MM connection nor an RRC connection. This specification presents also examples of inter-layer procedures related to the idle mode processes and describes idle mode functionality of a dual mode UMTS/GSM UE.

### 5.3.2.2.12 TS 25.323

#### Packet Data Convergence Protocol (PDCP) specification

This document provides the description of the Packet Data Convergence Protocol (PDCP). PDCP provides its services to the NAS at the UE or the relay at the Radio Network Controller (RNC). PDCP uses the services provided by the Radio Link Control (RLC) sublayer.

### 5.3.2.3.10 TS 25.420

#### UTRAN Iur interface general aspects and principles

This specification describes an introduction to the TSG RAN TS 25.42x series of technical specifications that define the Iur interface. It is a logical interface for the interconnection of two RNC components of the UTRAN.

### 5.3.2.3.16 TS 25.426

#### UTRAN Iur and Iub interface data transport & transport signalling for DCH data streams

This specification describes the transport bearers for the DCH data streams on UTRAN Iur and Iub interfaces. The corresponding transport network control plane is also specified. The physical layer for the transport bearers is outside the scope of this TS.

## 5.3.2.3.18 TS 25.430

**UTRAN Iub Interface: general aspects and principles**

This specification describes the TSG RAN TS 25.43x series of UMTS technical specifications that define the Iub interface. The Iub interface is a logical interface for the interconnection of Node B and RNC components of the UTRAN.

**5.3.2.3.20 TS 25.432**

**UTRAN Iub interface: signalling transport**

This specification describes the signalling transport related to the Node B application part (NBAP) signalling to be used across the Iub interface. The Iub interface is a logical interface for the interconnection of Node B and RNC components of the UTRAN. The RNC signalling between these nodes is based on NBAP.

### 5.3.2.3.25 TS 25.450

#### UTRAN Iupc interface general aspects and principles

This document is an introduction to the TSG RAN TS 25.45z series of UMTS Technical Specifications that define the Iupc Interface. The Iupc interface is a logical interface for the interconnection of Standalone SMLC (SAS) and Radio Network Controller (RNC) components of the Universal Terrestrial Radio Access Network (UTRAN) for the UMTS system.

### 5.3.2.3.29 TS 25.460

#### UTRAN Iuant interface: General aspects and principles

This document is an introduction to the TSG RAN TS 25.46x series of UMTS Technical Specifications that define the Iuant Interface. The logical Iuant interface is a Node B internal interface between the implementation specific O&M function and the Remote Electrical Tilting (RET) Antenna Control unit function of the Node B.

### 5.3.2.4 25.100 series

#### 5.3.2.4.1 TS 25.102

#### User Equipment (UE) radio transmission and reception (TDD)

This document establishes the minimum RF characteristics of the UTRA User Equipment (UE) operating in the TDD mode. The values in the TS make no allowance for measurement uncertainty in conformance testing. \$

Test limits to be used for conformance testing are specified separately in the UE conformance test specifications TS 34.122.

**5.3.2.4.2 TS 25.123****Requirements for support of radio resource management (TDD)**

This specification describes the requirements for support of radio resource management for TDD including requirements on measurements in UTRAN and the UE as well as on node dynamic behaviour and interaction, in terms of delay and response characteristics.

**5.3.2.4.3 TS 25.105****Base Station (BS) radio transmission and reception (TDD)**

This specification describes the minimum RF characteristics of the TDD mode of UTRA. The values in the TS make no allowance for measurements uncertainties in conformance testing. Test limit to be used for conformance testing are specified separately in the base station conformance test Specification TS 25.142.

## 5.3.2.4.4 TS 25.142

**Base Station (BS) conformance testing (TDD)**

This specification describes the radio frequency (RF) test methods and conformance requirements for UTRA base transceiver stations (BTS) operating in the TDD mode. These have been derived from, and are consistent with, the core UTRA specifications specified in the requirements reference sub-clause of each test. The maximum acceptable measurement uncertainty is specified in the TS for each test, where appropriate.

### 5.3.2.5.3 TS 34.122

#### Terminal conformance specification; Radio transmission and reception (TDD)

This document specifies the Radio Frequency (RF) test methods and conformance requirements for UTRA User Equipment (UE) operating in the TDD mode. These have been derived from, and are consistent with, the core UTRA specifications. The maximum acceptable measurement uncertainty is specified in the TS for each test, where appropriate.

### 5.3.2.5.5 TS 34.123-2

#### User Equipment (UE) conformance specification; Part 2: Implementation conformance statement (ICS) proforma specification

This document provides the Implementation Conformance Statement (ICS) proforma for 3rd Generation User Equipment (UE), in compliance with the relevant requirements, and in accordance with the relevant guidance given in ISO/IEC 9646-7 and ETS 300 406. This document also specifies a recommended applicability statement for the test cases included in TS 34.123-1. These applicability statements are based on the features implemented in the UE.

**5.3.2.7.10 TS 36.305****Evolved Universal Terrestrial Radio Access Network (E-UTRAN); Stage 2 functional specification of User Equipment (UE) positioning in E-UTRAN**

This document specifies the stage 2 of the UE positioning function of E-UTRAN, which provides the mechanisms to support or assist the calculation of the geographical position of a UE. The purpose of this stage 2 specification is to define the E-UTRAN UE Positioning architecture, functional entities and operations to support positioning methods. This description is confined to the E-UTRAN Access Stratum. This stage 2 specification covers the E-UTRAN positioning methods, state descriptions, and message flows to support UE positioning.

### 5.3.2.8.12 TS 36.440

#### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); General aspects and principles for interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN

This document describes the overall architecture of the interface for the provision of MBMS in the E-UTRAN. This includes also a description of the general aspects, assumptions and principles guiding the architecture and interface. The MBMS functions to be provided within that architecture are summarized. It provides an introduction to the TSG RAN TS 36.44x series of UMTS technical specifications that define the different interfaces introduced for MBMS provision in E-UTRAN.

### 5.3.2.8.13 TS 36.441

#### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); Layer 1 for interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN

This document specifies the standards allowed to implement layer 1 on the interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN. In the following, “layer 1” and “physical layer” are assumed to be synonymous.

**5.3.2.8.14 TS 36.442****Evolved Universal Terrestrial Radio Access Network (E-UTRAN); Signalling Transport for interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN**

This document specifies the standards for signalling transport to be used across M2 and M3 interfaces. M2 interface is a logical interface between the eNodeB and the MCE. M3 interface is a logical interface between the MCE and the MME. This document describes how the M2-AP signalling messages are transported over M2, and how the M3-AP signalling messages are transported over M3.

### 5.3.2.9.5 TS 36.133

#### Evolved Universal Terrestrial Radio Access (E-UTRA); Requirements for support of radio resource management

This specification specifies requirements for support of Radio Resource Management for the FDD and TDD modes of Evolved UTRA. These requirements include requirements on measurements in UTRAN and the UE as well as requirements on node dynamical behaviour and interaction, in terms of delay and response characteristics.

### 5.3.2.11 Multiple radio access technology aspects specifications

#### 5.3.2.11.1 TS 37.104

##### E-UTRA, UTRA and GSM/EDGE; Multi-Standard Radio (MSR) Base Station (BS) radio transmission and reception

This specification establishes the minimum RF characteristics of E-UTRA, UTRA and GSM/EDGE Multi-Standard Radio (MSR) Base Station (BS). Requirements for multi-RAT and single-RAT operation of MSR BS are covered in this document. The requirements in this document for E-UTRA and UTRA single-RAT operation of MSR BS are also applicable to E-UTRA and UTRA multi-carrier capable single-RAT BS. Requirements for GSM BS that are only single-RAT capable are not covered.

**5.3.2.11.2 TS 37.113****E-UTRA, UTRA and GSM/EDGE; Multi-Standard Radio (MSR) Base Station (BS) Electromagnetic Compatibility (EMC)**

This document covers the assessment of E-UTRA, UTRA and GSM/EDGE Multi-Standard Radio (MSR) Base Stations and associated ancillary equipment in respect of Electromagnetic Compatibility (EMC). This document specifies the applicable test conditions, performance assessment and performance criteria for E-UTRA, UTRA and GSM/EDGE Base Stations and associated ancillary equipment in one of the following categories: (i) Multi-Standard Radio (MSR) Base Stations for E-UTRA, UTRA and GSM/EDGE meeting the requirements of TS 37.104, with conformance demonstrated by compliance to TS 37.141; (ii) Base Stations for E-UTRA meeting the requirements of TS 36.104, with conformance demonstrated by compliance to TS 36.141; (iii) Base Stations for UTRA FDD meeting the requirements of TS 25.104, with conformance demonstrated by compliance to TS 25.141; (iv) Base Stations for UTRA TDD meeting the requirements of TS 25.105, with conformance demonstrated by compliance to TS 25.142; (v) Base Stations for GSM/EDGE meeting the requirements of TS 45.005, with conformance demonstrated by compliance to TS 51.021. The environment classification used in this document refers to the environment classification used in IEC 61000-6-1 and IEC 61000-6-3. The EMC requirements have been selected to ensure an adequate level of compatibility for apparatus at residential, commercial and light industrial environments. The levels, however, do not cover extreme cases which may occur in any location but with low probability of occurrence.

### 5.3.2.11.4 TS 37.320

#### Universal Terrestrial Radio Access (UTRA) and Evolved Universal Terrestrial Radio Access (E-UTRA); Radio measurement collection for Minimization of Drive Tests (MDT); Overall description; Stage 2

This document provides an overview and overall description of the minimization of drive tests functionality. The document describes functions and procedures to support collection of UE-specific measurements for MDT using Control Plane architecture, for both UTRAN and E-UTRAN.

### 5.3.2.12 Core network and Terminal aspects

#### 5.3.2.12.1 TS 21.111

##### USIM and IC card requirements

This document defines the requirements of the USIM (Universal Subscriber Identity Module) and the IC card for 3G (UICC). These are derived from the service and security requirements defined in TS 22.100 and TS 22.101. The USIM is a 3G application on an IC card. It inter-operates with

a 3G terminal and provides access to 3G services. This document is intended to serve as a basis for the detailed specification of the USIM and the UICC, and the interface to the 3G terminal.

### 5.3.2.12.3 TS 23.007

#### Restoration procedures

The data stored in location registers are automatically updated in normal operation; the main information stored in a location register defines the location of each mobile station and the subscriber data required to handle traffic for each mobile subscriber. The loss or corruption of these data will seriously degrade the service offered to mobile subscribers; it is therefore necessary to define procedures to limit the effects of failure of a location register, and to restore the location register data automatically. This document defines the necessary procedures.

### 5.3.2.12.5 TS 23.009

#### Handover procedures

This document contains a detailed description of the handover procedures to be used in PLMNs. The purpose of the handover procedures are to ensure that the connection to the Mobile Station (MS) or User Equipment (UE) is maintained as it moves from one cell or radio network to another.

The document defines the circuit switched handover functionality based on the service requirements in 3GPP TS 22.129. For the circuit switched handover functionality related to SRVCC, it is based on the service requirements in 3GPP TS 23.216.

### 5.3.2.12.6 TS 23.018

#### Basic call handling; Technical realization

This document specifies the technical realization of the handling of calls originated by a UMTS or GSM mobile subscriber and calls directed to a UMTS or GSM mobile subscriber, up to the point where the call is established. Normal release of the call after establishment is also specified. Trunk Originated call is also modelled.

### 5.3.2.12.7 TS 23.034

#### High Speed Circuit Switched Data (HSCSD); Stage 2

This document contains the stage 2 service description for a High Speed Circuit Switched Data (HSCSD) on GSM/GERAN in A/Gb mode and Iu mode. HSCSD utilizes the multislot mechanism, i.e. using multiple traffic channels (/bearers) for the communication. Additionally, this document specifies some HSCSD related requirements for multi system mobile stations operating in UTRAN Iu mode. In UTRAN Iu mode one bearer can provide all needed data rates, and the multislot mechanism is therefore not needed. However, for inter-system handover to GERAN, certain information has to be provided by the mobile station during the service negotiation.

**5.3.2.12.9 TS 23.040****Technical realization of the Short Message Service (SMS)**

This document describes the Short Message Service (SMS) for GSM/UMTS networks. It defines:

- the services and service elements;
- the network architecture;
- the Service Centre functionality;
- the SMS Router functionality;
- the MSC functionality (with regard to the SMS);
- the SGSN functionality (with regard to the SMS);
- the routing requirements;

– the protocols and protocol layering;

for the Mobile Originated and Mobile Terminated Short Message Service Teleservices, as specified in 3GPP TS 22.003 and 3GPP TS 22.105.

The use of radio resources for the transfer of short messages between the MS and the MSC or the SGSN is described in 3GPP TS 24.011.

**5.3.2.12.10 TS 23.041****Technical realization of Cell Broadcast Service (CBS)**

This document describes the Cell Broadcast short message service (CBS) for GSM and UMTS.

For GSM it defines the primitives over the Cell Broadcast Centre – Base Station System (CBC-BSS) interface and the message formats over the Base Station System – Mobile Station (BSS-MS) interface for Teleservice 23 as specified in 3GPP TS 22.003. For UMTS it defines the interface requirements for the Cell Broadcast Center – UMTS Radio Network System (RNS) interface and the radio interface requirements for UMTS Radio Acces Networks to support CBS as specified in 3GPP TS 22.003. The document also describes the Public Warning System (PWS) for GSM, UMTS and E-UTRAN, see 3GPP TS 22.268.

### 5.3.2.12.12 TS 23.057

#### Mobile Execution Environment (MExE); Functional description; Stage 2

This document defines stage 2 and stage 3 of the Mobile Execution Environment (MExE). Stage 2 identifies the functional capabilities and information flows needed to support the service described in stage 1. MExE uses a number of technologies to realise the requirements of the stage 1 description (3GPP TS 22.057). The document describes how the service requirements are realized with the selected technologies. The specification covers areas of MExE common to all technologies.

### 5.3.2.12.14 TS 23.066

#### Support of Mobile Number Portability (MNP); Technical realization; Stage 2

This document describes several alternatives for the realization of Mobile Number Portability. It is left to operator and implementation decisions which option, or combination of options, is used, taking into account the regulatory and architectural constraints that may prevail.

### 5.3.2.12.15 TS 23.078

#### Customised Applications for Mobile network Enhanced Logic (CAMEL) Phase 4; Stage 2

This document specifies the stage 2 description for the fourth phase (see 3GPP TS 22.078) of the Customized Applications for Mobile network Enhanced Logic (CAMEL) feature which provides the mechanisms to support services of operators which are not covered by standardized services even when roaming outside the HPLMN.

**5.3.2.12.16 TS 23.090****Unstructured Supplementary Service Data (USSD); Stage 2**

This document gives the stage 2 description of Unstructured Supplementary Service Data (USSD). The unstructured supplementary service data (USSD) mechanism allows the Mobile Station (MS) user and a PLMN operator defined application to communicate in a way which is transparent to the MS and to intermediate network entities. The mechanism allows development of PLMN specific supplementary services. This document defines the requirements for handling USSD at the MS and network entities.

### 5.3.2.12.18 TS 23.110

#### Universal Mobile Telecommunications System (UMTS) access stratum; Services and functions

This specification describes the detailed specifications of the protocols which rule the information flows, both control and user data, between the access stratum and the parts of UMTS outside the access stratum, and of the detailed specifications of the UTRAN. These detailed specifications are to be found in other technical specifications.

### 5.3.2.12.19 TS 23.122

#### Non-Access-Stratum (NAS) functions related to Mobile Station (MS) in idle mode

This specification provides an overview of the tasks undertaken by a Mobile Station (MS) when in idle mode, that is, switched on but not having a dedicated channel allocated, e.g. not making or receiving a call, or when in group receive mode, that is, receiving a group call or broadcast call but having a dedicated connection. It also describes the corresponding network functions.

**5.3.2.12.22 TS 23.205****Bearer-independent circuit-switched core network; Stage 2**

This document defines the stage 2 description for the bearer independent CS core network. The stage 2 covers the information flow between the GMSC server, MSC server and media gateways. The document shows the CS core network termination of the Iu interface in order to cover the information flow stimulus to the core network and describe the interaction with the supplementary and value added services and capabilities.

The protocol used over the Nc interface is an enhanced call control protocol supporting call bearer separation such as BICC. The protocol used over the Mc interface is H.248. SIP-I based CS core network is further specified in 3GPP TS 23.231.

Local Call Local Switch (LCLS) functionality is further specified in 3GPP TS 23.284.

This document is applicable only for ATM or IP transport in the CS core network.

**5.3.2.12.25 TS 23.231****SIP-I based circuit-switched core network; Stage 2**

This document defines the stage 2 description for the SIP-I based CS core network. The logical architecture for the SIP-I based CS core network is defined in 3GPP TS 23.205. Stage 2 covers the information flows between the GMSC server, MSC server and media gateways that are required to support a SIP-I based Nc interface. The document shows the CS core network termination of the Iu and A interfaces in order to cover the information flow stimulus to the core network and describe the interaction with the supplementary and value added services and capabilities.

The Nc interface profile is based on ITU-T Q.1912.5 SIP-I profile C and is specified in 3GPP TS 29.231. The Mc interface profile is based on ITU-T H.248.1 and is specified in 3GPP TS 29.232. Local Call Local Switch (LCLS) functionality is further specified in 3GPP TS 23.284.

This document is applicable only for IP transport in the CS core network.

**5.3.2.12.28 TS 23.333****Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) Mp interface: Procedures descriptions**

This specification describes the functional requirements and information flows that generate procedures between the Multimedia Resource Function Controller (MRFC) and the Multimedia Resource Function Processor (MRFP), the Mp Interface. This specification is limited to information flows relevant to the Mp Interface; in order to define these procedures and make the functional requirements clear some triggers from an external interface may be described; these may be specified within the Mr interface for example or within an AS in which the MRFC function resides. However for the overall stage 2 procedures of IMS. The protocol on the Mp interface is defined to comply with ITU-T H.248.1 Gateway Control Protocol.

### 5.3.2.12.29 TS 23.334

#### IP Multimedia Subsystem (IMS) Application Level Gateway (IMS-ALG) – IMS Access Gateway (IMS-AGW) interface: Procedures descriptions

Annex G of 3GPP TS 23.228 gives out an IMS Application Level Gateway (IMS-ALG) and IMS Access Media Gateway (IMS-AGW) based reference model to support NAPT-PT, gate control and traffic policing between IP-CAN and IMS domain. The Iq reference point is between the P-CSCF (IMS-ALG) and the IMS-AGW. It conveys the necessary information that is needed to allocate, modify and release (IP) transport addresses. This document defines the stage 2 description for the Iq reference point. Stage 2 covers the information flow between the P-CSCF (IMS-ALG) and IMS-AGW. The protocol used over the Iq interface is the gateway control protocol according ITU-T Recommendation H.248 (which is specified for Iq by an H.248 profile according 3GPP TS 29.334).

### 5.3.2.12.30 TS 23.335

#### User Data Convergence (UDC); Technical realization and information flows; Stage 2

This document describes the procedures and signalling flows associated to the technical realization of the 3GPP User Data Convergence (UDC). It furthermore indicates some requirements for the Stage 3 specifications. Special consideration is put in the following areas: – reference architecture for the UDC concept – general description of procedures for the user data manipulation (e.g. create, delete, update, etc.) – identification of the requirements on the UDC for the applicability of the mechanisms described in this document. User data convergence is an optional concept to ensure data consistency and simplify creation of new services by providing easy access to the user data, as well as to ensure the consistency of storage and data models and to have minimum impact on traffic mechanisms, reference points and protocols of network elements.

**5.3.2.12.33 TS 24.007****Mobile radio interface signalling layer 3; General Aspects**

This specification describes the principal architecture of Layer 3 and its sub-layers on the GSM Um interface, i.e. the interface between mobile station (MS) and network; for the CM sub-layer, the description is restricted to paradigmatic examples, CC, supplementary services, and short message services for non-general packet radio service (GPRS) services. It also defines the basic message format and error handling applied by the Layer 3 protocols.

**5.3.2.12.34 TS 24.008**

**Mobile radio interface Layer 3 specification; Core network protocols; Stage 3**

This specification describes the procedures used at the radio interface for Call Control, Mobility Management and Session Management. The procedures currently described are for the CC of circuit-switched connections, SM for GPRS services, MM and radio resource management for circuit-switched and GPRS services. MBMS is also added.

### 5.3.2.12.36 TS 24.011

#### Point-to-Point (PP) Short Message Service (SMS) support on mobile radio interface

This specification describes the procedures used across the mobile radio interface by the signalling Layer 3 function short message control (SMC) and short message relay (SM-RL) function for both circuit-switched GSM and GPRS.

**5.3.2.12.37 TS 24.022****Radio Link Protocol (RLP) for circuit switched bearer and teleservices**

This specification describes the RLP for data transmission over the UMTS public land mobile network (PLMN). RLP covers the Layer 2 functionality of the ISO OSI reference model (IS 7498). It is based on ideas contained in IS 3309, IS 4335 and IS 7809 (HDLC of ISO) as well as ITU-T Recommendations X.25, Q.921 and Q.922 (LAP-B and LAP-D, respectively). RLP has been tailored to the special needs of digital radio transmission. RLP provides to its users the OSI data link service (IS 8886).

### 5.3.2.12.38 TS 24.080

#### Mobile radio interface layer 3 supplementary services specification; Formats and coding

This specification describes the coding of information necessary for support of supplementary service operation on the mobile radio interface L3. Details are specified in other TS.

**5.3.2.12.39 TS 24.081****Line Identification supplementary services; Stage 3**

This document specifies the procedures used at the radio interface for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of line identification supplementary services. Provision and withdrawal of supplementary services is an administrative matter between the mobile subscriber and the service provider and cause no signalling on the radio interface.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.081 is related specially to line identification supplementary services:

- Calling line identification presentation (CLIP)
- Calling line identification restriction (CLIR)
- Connected line identification presentation (COLP)
- Connected line identification restriction (COLR).

**5.3.2.12.40 TS 24.082****Call Forwarding (CF) supplementary services; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, interrogation, and network invocation of call offering supplementary services.

In 3GPP TS 24.010, the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.082 is related specially to call offering supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.082 is related specially to call offering supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call offering supplementary services and are described in this document:

- Call forwarding unconditional (CFU)
- Call forwarding on mobile subscriber busy (CFB)
- Call forwarding on no reply (CFNRy)
- Call forwarding on mobile subscriber not reachable (CFNRc).

**5.3.2.12.41 TS 24.083****Call Waiting (CW) and Call Hold (HOLD) supplementary services; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call completion supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.083 is related specially to call completion supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and GSM 03.8x and GSM 03.9x series.

3GPP TS 23.083 is related specially to call completion supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call completion supplementary services and are described in this document:

- Call waiting (CW)
- Call hold (HOLD).

**5.3.2.12.42 TS 24.084****Multi Party (MPTY) supplementary service; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation and invocation of MultiParty supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and the 3GPP TS 22.08x and 3GPP TS 22.09x series.

3GPP TS 22.084 is related specially to MultiParty supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and the 3GPP TS 23.08x and 3GPP TS 23.09x series.

3GPP TS 23.084 is related specially to MultiParty supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary service belongs to the MultiParty supplementary services and is described in this document:

- MultiParty service (MPTY).

### 5.3.2.12.43 TS 24.085

#### Closed User Group (CUG) supplementary service; Stage 3

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of community of interest supplementary services.

In 3GPP TS 24.010, the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x-series. 3GPP TS 22.085 is related to the community of interest supplementary services.

Technical realization of supplementary services is described in technical specifications 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x-series. 3GPP TS 23.085 is related to the community of interest supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

Signalling interworking for supplementary services between 3GPP TS 29.002 and 3GPP TS 24.008 and between 3GPP TS 29.002 and 3GPP TS 24.080 is defined in 3GPP TS 29.011.

The following supplementary services belong to the community of interest supplementary services and are described in this TS:

- Closed User Group (CUG).

### 5.3.2.12.44 TS 24.086

#### Advice of Charge (AoC) supplementary services; Stage 3

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of charging supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.024 and 02.86 are related to the charging supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.086 is related to the charging supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the charging supplementary services and are described in this document:

- Advice of Charge (Information) (AoCI)
- Advice of Charge (Charging) (AoCC).

**5.3.2.12.46 TS 24.088****Call Barring (CB) supplementary service; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call barring supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 22.08x and 22.09x series.

Technical realization of supplementary services is described in 3GPP TS 23.011, 23.08x and 23.09x series.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call restriction supplementary services and are described in this specification:

- Barring of outgoing calls
- Barring of incoming calls

**5.3.2.12.48 TS 24.091****Explicit Call Transfer (ECT) supplementary service; Stage 3**

This document gives the stage 3 description of the call transfer supplementary services. It specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call transfer supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.091 is related specifically to call transfer supplementary services.

The technical realization of supplementary services is described in 3GPP TS 23.011, 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.091 is related specifically to call transfer supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call transfer supplementary services and are described in this document:

- Explicit Call Transfer (ECT).

### 5.3.2.12.49 TS 24.093

#### Call Completion of Calls to Busy Subscriber (CCBS); Stage 3

This document gives the stage 3 description of the Completion of Calls to Busy Subscriber (CCBS) supplementary service. It specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, activation, deactivation, invocation and interrogation of the completion of calls to busy subscriber supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 3GPP TS 22.08x and 3GPP TS 22.09x-series. Technical specification 3GPP TS 22.093 is related specifically to the Completion of Calls to Busy Subscriber supplementary service.

The technical realization of supplementary services is described in technical specifications 3GPP TS 23.011, 3GPP TS 23.08x and 3GPP TS 23.09x-series. 3GPP TS 23.093 is related specifically to Completion of Calls to Busy Subscriber supplementary service.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call completion supplementary services and are described in this document:

- Completion of Calls to Busy Subscriber (CCBS).

### 5.3.2.12.50 TS 24.096

#### Name Identification supplementary services; Stage 3

This document specifies the procedures used at the radio interface for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of name identification supplementary services. In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given. 3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.096 is related specially to name identification supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. Technical specification 3GPP TS 23.096 is related specially to name identification supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the name identification supplementary services and are described in this TS:

- Calling name presentation (CNAP).

### 5.3.2.12.51 TS 24.109

#### Bootstrapping interface (Ub) and network application function interface (Ua); Protocol details

This document defines stage 3 for the HTTP Digest AKA based implementation of Ub interface (UE-BSF), the Disposable-Ks model based implementation of Upa interface (NAF-UE) and the HTTP Digest and the PSK TLS based implementation of bootstrapped security association usage over Ua interface (UE-NAF) in Generic Authentication Architecture (GAA) as specified in 3GPP TS 33.220.

The purpose of the Ub interface is to create a security association between UE and BSF for further usage in GAA applications. The purpose of the Upa interface is to provide a push mechanism to create a bootstrapped security association between the UE and NAF for secure communication of pushed messages. The purpose of the Ua interface is to use the so created bootstrapped security association between UE and NAF for secure communication.

This document also defines stage 3 for the Authentication Proxy usage as specified in 3GPP TS 33.222.

This document also defines stage 3 for the subscriber certificate enrolment as specified in 3GPP TS 33.221 which is one realization of the Ua interface. The subscriber certificate enrolment uses the HTTP Digest based implementation of bootstrapped security association usage to enrol a subscriber certificate and the delivery of a CA certificate.

**5.3.2.12.54 TS 24.166****3GPP IP Multimedia Subsystem (IMS) conferencing Management Object (MO)**

This document defines the IMS conferencing management object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELD\_DM-V1\_2. The IMS conferencing management object consists of relevant parameters that can be managed for IMS conferencing capabilities.

**5.3.2.12.55 TS 24.167****3GPP IMS Management Object (MO); Stage 3**

This document defines a mobile device 3GPP IMS Management Object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELD\_DM-V1\_2. The 3GPP IMS Management Object consists of relevant parameters that can be managed for the IM CN Subsystem. This includes the basic framework defined in 3GPP TS 23.228 and 3GPP TS 24.229, and early IMS as defined in 3GPP TS 23.221. This also includes relevant parameters that can be managed for the application of SMS over IP networks defined in 3GPP TS 24.341. The IMS Management Object defines a repository of data into the ME including parameters that are provisioned from the ISIM application (i.e. 3GPP TS 31.103) or, after derivation, from the USIM application (i.e. 3GPP TS 31.102).

#### Communication Continuity Management Object (MO)

This document defines the Communication Continuity Management Object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELED\_DM-V1\_2. The Communication Continuity Management Object consists of relevant parameters that can be managed for Communication Continuity capabilities.

### 5.3.2.12.62 TS 24.237

#### IP Multimedia (IM) Core Network (CN) subsystem IP Multimedia Subsystem (IMS) service continuity; Stage 3

This specification provides the protocol details for voice call continuity between the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP) and the Session Description Protocol (SDP) and the protocols of the 3GPP Circuit-Switched (CS) domain

(CAP, MAP, ISUP, BICC and the NAS call control protocol for the CS access). Voice call continuity allows users to move between the CS domain and the IP Connectivity Access Network (e.g. WLAN interworking) with home IM CN subsystem functionality.

### 5.3.2.12.63 TS 24.238

#### Session Initiation Protocol (SIP) based user configuration; Stage 3

This document provides a Session Initiation Protocol (SIP) based protocol framework that serves as a means of user configuration of supplementary services in the IP Multimedia (IM) Core Network (CN) subsystem. The protocol framework relies upon the contents of the Request-URI in a SIP INVITE request to enable basic configuration of services without requiring use of the Ut interface.

### 5.3.2.12.66 TS 24.279

#### Combining Circuit Switched (CS) and IP Multimedia Subsystem (IMS) services; Stage 3

This specification provides the technical realization for the combination of Circuit Switched calls and IM sessions when using them simultaneously between the same two users. It also describes the use of CS and IM services in combination, using the existing procedures that have been defined for CS and IMS. It includes the necessary function as adding an IM session to an ongoing CS call, adding a CS call to an ongoing IM session, supplementary services as they relate to CSICS and supporting capability exchange.

**5.3.2.12.67 TS 24.285****Allowed Closed Subscriber Group (CSG) list; Management Object (MO)**

This document specifies an Allowed Closed Subscriber Group (CSG) List Management Object (MO). The Allowed CSG List MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELED-DM-V1\_2. The Allowed CSG List MO consists of relevant parameters for that can be used by the UE to select the appropriate CSG cell based on its subscription. The Allowed CSG List MO defines the relevant parameters related to the Allowed CSG List and to the Operator CSG List. The usage of the Allowed CSG List for in the idle mode process and the mobility management procedure is defined in 3GPP TS 23.122, 3GPP TS 24.008 and 3GPP TS 24.301.

### 5.3.2.12.69 TS 24.292

IP Multimedia (IM) Core Network (CN) subsystem centralized services (ICS) allow for the delivery of consistent IMS services to the user regardless of the attached access type (e.g. CS domain access or IP-CAN). This document provides the protocol details for the realization of ICS based on the Session Initiation protocol (SIP), the Session Description Protocol (SDP), the I1 protocol, and the protocols of the 3GPP Circuit-Switched (CS) domain (e.g. CAP, MAP, ISUP, BICC and the NAS call control protocol for the CS access).

### 5.3.2.12.70 TS 24.294

#### IP Multimedia Subsystem (IMS) Centralized Services (ICS) protocol via I1 interface

This document describes the I1 interface between IMS Centralized Services (ICS) UE and Service Centralization and Continuity (SCC) Application Server (AS). This specification defines a new application layer protocol over I1 interface, specifies the interaction between the ICS UE and the SCC AS including session control procedures and supplementary services control procedures. The protocol is intended to be independent of the transport protocol used so it can be applied to a number of technologies that need different transport protocols. The overall ICS architecture is specified in 3GPP TS 23.292

### 5.3.2.12.72 TS 24.302

#### Access to the 3GPP Evolved Packet Core (EPC) via non-3GPP access networks; Stage 3

This document specifies the discovery and network selection procedures for access to 3GPP Evolved Packet Core (EPC) via non-3GPP access networks and includes Authentication and Access Authorization using Authentication, Authorization and Accounting (AAA) procedures used for the interworking of the 3GPP EPC and the non-3GPP access networks. The document also specifies the Tunnel management procedures used for establishing an end-to-end tunnel from the UE to the ePDG to the point of obtaining IP connectivity and includes the selection of the IP mobility mode. The non-3GPP access networks considered in this document are cdma2000® HRPD and Worldwide Interoperability for Microwave Access (WiMAX), and any access technologies covered in 3GPP TS 23.402. These non-3GPP access networks can be trusted or untrusted access networks.

### 5.3.2.12.73 TS 24.303

#### Mobility management based on Dual-Stack Mobile IPv6; Stage 3

This document specifies the signalling procedures for accessing the 3GPP Evolved Packet Core network and handling the mobility between 3GPP and non-3GPP accesses via the S2c reference point defined in 3GPP TS 23.402. The document is applicable to the User Equipment (UE) and the network node implementing the Home Agent functionality. In addition the document specifies the procedures used for the DSMIPv6 Home Agent discovery, for bootstrapping the DSMIPv6 security association between the UE and the Home Agent and for managing the DSMIPv6 tunnel. The specification of these procedures is compliant to IETF RFCs. DSMIPv6 procedures can be used independently of the underlying access technology.

**5.3.2.12.74 TS 24.304****Mobility management based on Mobile IPv4; User Equipment (UE) – foreign agent interface; Stage 3**

This document describes the stage 3 aspects of mobility management for User Equipment (UE) using IETF Mobile IPv4 foreign agent mode to access the Evolved Packet Core Network (EPC) through trusted non-3GPP access networks and for mobility management of UE between the 3GPP access network and trusted non-3GPP access networks. In particular, the document describes the UE – Mobile IPv4 Foreign Agent (FA) interface stage 3 aspects, where the FA functionality is located within the access network in the non-3GPP access domain. The document is applicable to the User Equipment (UE) and the network node implementing the FA functionality.

**5.3.2.12.75 TS 24.305****Selective Disabling of 3GPP User Equipment Capabilities (SDoUE) Management Object (MO)**

This document specifies a mobile device Selective Disabling of 3GPP UE Capabilities (SDoUE) Management Object (MO) and the rules and corresponding behaviour of the UE with regard to the selective disabling of 3GPP UE capabilities, for example, when services or functions are disabled/enabled. The SDoUE MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The SDoUE MO consists of the relevant parameters that can be managed for selective disabling of 3GPP UE capabilities. The SDoUE MO defines a repository of data into the ME. The service requirements for selective disabling of 3GPP UE capabilities are defined in 3GPP TS 22.011.

**5.3.2.12.76 TS 24.312****Access Network Discovery and Selection Function (ANDSF) Management Object (MO)**

This document defines management objects that can be used by the Access Network Discovery and Selection Function (ANDSF) and the UE. The Management Object (MO) is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The MO consists of relevant parameters for intersystem mobility policy- and access network discovery information that can be managed by the ANDSF. The service requirements and the functional requirements for the access network discovery and selection are described in 3GPP TS 22.278 and in 3GPP TS 23.402 respectively.

### 5.3.2.12.78 TS 24.337

#### IP Multimedia (IM) Core Network (CN) subsystem IP Multimedia Subsystem (IMS) inter-UE transfer; Stage 3

IP Multimedia (IM) Core Network (CN) subsystem inter-UE transfer (IUT) provides the capability of continuing ongoing communication sessions with multiple media across different user equipments (UEs) under the control of the same or different subscribers, and as part of Service Continuity (SC). This document provides the protocol details for enabling IMS inter-UE transfer based on the Session Initiation protocol (SIP) and the Session Description Protocol (SDP).

### 5.3.2.12.80 TS 24.368

#### Non-Access Stratum (NAS) configuration Management Object (MO)

This document defines a Management Object (MO) that can be used to configure the UE with parameters related to Non-Access Stratum (NAS) functionality. The MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The MO consists of relevant parameters for NAS related configuration of a UE.

**5.3.2.12.90 TS 24.623****Extensible Markup Language (XML) Configuration Access Protocol (XCAP) over the Ut interface for Manipulating Supplementary Services**

This document defines a protocol used for manipulating data related to supplementary services. The protocol is based on the eXtensible Markup Language (XML) Configuration Access Protocol (XCAP) RFC 4825. A new XCAP application usage is defined for the purpose of manipulating the supplementary services data. The common XCAP related aspects that are applicable to supplementary services are specified in this document. The protocol allows authorized users to manipulate service related data either when they are connected to IMS or when they are connected to non IMS networks (e.g. the public Internet).

### 5.3.2.12.91 TS 24.628

#### Common Basic Communication procedures using IP Multimedia (IM) Core Network (CN) subsystem; Protocol specification

This document describes the stage three protocol for basic communication procedures common to several services in the IP Multimedia (IM) Core Network (CN) subsystem when at least one Application Server (AS) is included in the communication. The common procedures are based on stage three specifications for supplementary services.

#### Advice Of Charge (AOC) using IP Multimedia (IM) Core Network (CN) subsystem

This document specifies the stage three Protocol Description of the Advice Of Charge (AOC) service, based on Stage 1 and 2 of the ISDN Supplementary Service Advice Of Charge for all calls (permanent mode). It provides the protocol details in the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP) and the Session Description Protocol (SDP).

**5.3.2.12.96 TS 27.005****Use of Data Terminal Equipment – Data Circuit terminating Equipment (DTE – DCE) interface for Short Message Service (SMS) and Cell Broadcast Service (CBS)**

This document defines three interface protocols for control of SMS functions within a GSM/UMTS mobile telephone from a remote terminal via an asynchronous interface. The “block mode” protocol includes error protection and is suitable for use where the link may not be completely reliable. It is of particular use where control of remote devices is required. Efficient transfer of binary encoded user data is possible. The “text mode”, based on AT commands, is suitable for unintelligent terminals or terminal emulators, and for application software built on command structures like those

defined in V.25ter. The character based “PDU mode” is suitable for software drivers based on AT command structures which do not understand the content of the message blocks and can only pass them between the MT and higher level software resident in the TE.

In all three modes, the terminal is considered to be in control for SMS/CBS transactions.

The document considers the mobile termination to be a single entity. Other 3GPP/GSM Technical Specifications describe the split of functionality between the mobile equipment and (U)SIM.

### 5.3.2.12.97 TS 27.007

#### AT command set for User Equipment (UE)

This document specifies a profile of AT commands and recommends that this profile be used for controlling Mobile Termination (MT) functions and GSM/UMTS network services from a Terminal Equipment (TE) through Terminal Adaptor (TA). The command prefix +C is reserved for Digital Cellular in ITU-T Recommendation V.250. The document has also the syntax details used to construct these extended GSM/UMTS commands. Commands from ITU-T Recommendation V.250 and existing digital cellular standards (TIA IS 99 and TIA IS 135) are used whenever applicable. Some of the new commands are defined such way that they can be easily applied to MT of networks other than GSM/UMTS. ITU-T Recommendation T.31 and ITU-T Recommendation T.32 fax AT commands may be used for GSM/UMTS fax transmission from TE. GSM/UMTS Short Message Service AT commands are defined in 3GPP TS 27.005. AT commands for GPRS and EPC are defined in this specification. The document assumes an abstract architecture comprising a TE (e.g. a computer) and a MT interfaced by a TA.

The commands described in this document may be observed on the link between the TE and the TA. However, most of the commands retrieve information about the MT, not about the TA.

### 5.3.2.12.99 TS 29.002

#### Mobile Application Part (MAP) specification

It is necessary to transfer between entities of a Public Land Mobile Network (PLMN) information specific to the PLMN in order to deal with the specific behaviour of roaming Mobile Stations (MS)s. The Signalling System No. 7 specified by CCITT is used to transfer this information.

**5.3.2.12.100 TS 29.016****General Packet Radio Service (GPRS); Serving GPRS Support Node (SGSN) – Visitors Location Register (VLR); Gs interface network service specification**

This document specifies the subset of MTP and SCCP which is used for the reliable transport of BSSAP+ messages in the Gs interface. The document references 3GPP TS 29.202 which specifies alternative transport layers that can be applied instead of the MTP. The document also specifies the SCCP addressing capabilities to be provided in the Gs interface.

### 5.3.2.12.101 TS 29.018

#### General Packet Radio Service (GPRS); Serving GPRS Support Node (SGSN) – Visitors Location Register (VLR); Gs interface layer 3 specification

This document specifies procedures used on the Serving GPRS Support Node (SGSN) to Visitors Location Register (VLR) interface for interoperability between circuit switched services and packet data services. The document specifies the layer 3 messages and procedures on the Gs interface to allow coordination between databases and to relay certain messages related to GSM circuit switched services over the GPRS subsystem.

### 5.3.2.12.103 TS 29.061

#### Interworking between the Public Land Mobile Network (PLMN) supporting packet based services and Packet Data Networks (PDN)

This document defines the requirements for Packet Domain interworking between a: a) PLMN and PDN; b) PLMN and PLMN.

This document is valid for a PLMN in A/Gb mode as well as for a PLMN in Iu mode. If text applies only for one of these systems it is explicitly mentioned by using the terms “A/Gb mode” and “Iu mode”. The A interface does not play any role in the scope of this document although the term “A/Gb mode” is used.

### 5.3.2.12.104 TS 29.079

#### Optimal media routeing within the IP Multimedia Subsystem (IMS); Stage 3

This document defines optional Optimal Media Routeing (OMR) procedures that can be applied by entities in the IP Multimedia Subsystem (IMS) that control media resources and are capable of manipulating the Session Description Protocol (SDP) as defined by IETF RFC 4566. The OMR procedures relate to the handling of OMR-specific SDP attributes that are documented in TS 24.229. The OMR procedures use SDP offer/answer related procedures in IETF RFC 3264 and in 3GPP TS 24.229 in a backward-compatible manner.

### 5.3.2.12.105 TS 29.118

#### Mobility Management Entity (MME) – Visitor Location Register (VLR) SGs interface specification

CS Fallback in the Evolved Packet System (EPS) enables the provisioning of CS-domain services (e.g. voice call, Location Services (LCS) or supplementary services) by reuse of CS infrastructure when the UE is served by E-UTRAN. Additionally, SMS delivery via the CS core network is realized without CS fallback. This document specifies the procedures and the SGs Application Part (SGsAP) messages used on the SGs interface between the Mobility Management Entity (MME) in the EPS and the Visitor Location Register (VLR), to allow location management coordination and to relay certain messages related to GSM circuit switched services over the EPS system. It also specifies the use of Stream Control Transmission Protocol (SCTP) for the transport of SGsAP messages.

### 5.3.2.12.106 TS 29.162

#### Interworking between the IM CN subsystem and IP networks

The IM CN subsystem interworks with the external IP networks through the Mb reference point. This document details the interworking between the IM CN subsystem and external IP networks for IM service support. It addresses the issues of control plane interworking and, user plane interworking for specific interworking use cases. The document describes the IMS-Ix interface requirements in the form of Use Cases which require H.248 protocol procedures and also details the additional Information Elements required to perform the specific procedures.

The IP version Interworking, between IP version 4 (IETF RFC 791) and IP version 6 (IETF RFC 2460) detailed in terms of the processes and protocol mappings required in order to support both mobile originated and terminated calls.

### 5.3.2.12.107 TS 29.163

#### Interworking between the IP Multimedia (IM) Core Network (CN) subsystem and Circuit Switched (CS) networks

This document specifies the principles of interworking between the 3GPP IM CN subsystem and BICC/ISUP based legacy CS networks, in order to support IM basic voice, data and multimedia calls. This document addresses the areas of control and user plane interworking between the IM CN subsystem and CS networks through the network functions, which include the MGCF and IM-MGW. For the specification of control plane interworking, areas such as the interworking between SIP and BICC or ISUP are detailed in terms of the processes and protocol mappings required

for the support of both IM originated and terminated voice and multimedia calls. Other areas addressed encompass the transport protocol and signalling issues for negotiation and mapping of bearer capabilities and QoS information.

### 5.3.2.12.108 TS 29.164

#### Interworking between the 3GPP CS domain with BICC or ISUP as signalling protocol and external SIP-I networks

This document defines interworking procedures between a 3GPP CS domain (see 3GPP TS 23.205) which applies either BICC or ISUP as signalling protocol, and external networks that use SIP-I (see ITU-T Q.1912.5, Profile C) as signalling protocol. The document also describes the related interworking architecture. The control plane interworking is performed by an interworking unit at the interconnection between the 3GPP CS domain and an external SIP-I network. The user plane interworking is performed by an MGW. The document defines stage 2 procedures for the control of the MGW.

**5.3.2.12.109 TS 29.165****Inter-IMS Network to Network Interface (NNI)**

The objective of this document addresses the Inter-IMS Network to Network Interface (II-NNI) consisting of Ici and Izi reference points between IMS networks in order to support end-to-end service interoperability. The document addresses the issues related to control plane signalling (3GPP usage of SIP and SDP protocols, required SIP header fields) as well as other interconnecting aspects like security, numbering/naming/addressing and user plane issues as transport protocol, media and codecs actually covered in a widespread set of 3GPP specifications. A profiling of the Inter-IMS Network to Network Interface (II-NNI) is also provided. Charging aspects are addressed as far as SIP signalling is concerned.

### 5.3.2.12.116 TS 29.205

#### Application of Q.1900 series to bearer independent Circuit Switched (CS) core network architecture; Stage 3

This document describes the protocols to be used when ITU-T Q.1902 “Bearer Independent Call Control” is used as call control protocol in a 3GPP Bearer Independent CS core network 3GPP TS 23.205 The Q.1902 operates between (G)MSC servers. The BICC architecture as described in ITU-T Q.1902 consists of a number of protocols. The following types of protocols are described: call control protocol, bearer control protocols and a resource control protocol for this architecture. The architecture complies with the requirements imposed by 3GPP TS 23.205 and TS 23.153.

### 5.3.2.12.117 TS 29.212

#### Policy and Charging Control (PCC) over Gx/Sd reference point

This document provides the stage 3 specification of the Gx and Gxx reference points. The functional requirements and the stage 2 specifications of the Gx and Gxx reference point are contained in 3GPP TS 23.203. The Gx reference point lies between the Policy and Charging Rule Function and the Policy and Charging Enforcement Function. The Gxx reference point lies between the Policy and Charging Rule Function and the Bearer

Binding and Event Reporting Function. Whenever possible the document specifies the requirements for the protocol by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible, extensions to Diameter are defined within the document itself.

### 5.3.2.12.118 TS 29.213

#### Policy and charging control signalling flows and Quality of Service (QoS) parameter mapping

This specification adds detailed flows of Policy and Charging Control (PCC) over the Rx, Gx, Gxx and S9 reference points and their relationship with the bearer level signalling flows over the Gn/Gp, S4, S5/S8, S2a and S2c interfaces. The call flows depicted represent usual cases, but not all situations are covered. The document also describes the binding and the mapping of QoS parameters among SDP, UMTS QoS parameters, and QoS authorization parameters, as well as PCRF addressing using DRA.

**5.3.2.12.119 TS 29.214****Policy and charging control over Rx reference point**

This document provides the stage 3 specification of the Rx reference point. The functional requirements and the stage 2 specifications of the Rx reference point are contained in 3GPP TS 23.203. The Rx reference point lies between the Application Function and the Policy and Charging Rule Function. Whenever possible this document specifies the requirements for the protocol by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible, extensions to Diameter are defined within the document itself.

**5.3.2.12.123 TS 29.232****Media Gateway Controller (MGC) – Media Gateway (MGW) interface; Stage 3**

This document describes the protocol to be used on the Media Gateway Controller (MGC) – Media Gateway (MGW) interface. The Media Gateway Controllers covered in this specification are the MSC server and the GMSC server. The basis for this interface profile is the H.248.1 protocol. The usage of this protocol is described in 3GPP TS 23.205 and 3GPP TS 29.205 for BICC circuit switched core network, in 3GPP TS 23.231 and 3GPP TS 29.231 for SIP-I circuit switched core network.

This profile includes the support for the enhanced MSC server to provide access to IMS Centralised services as described in 3GPP TS 23.292 and thus the procedures related to this interface are described in 3GPP TS 29.292. As a result the interworking with SIP and the associated MGW control procedures described in 3GPP TS 29.163 for the interworking between BICC/ISUP circuit switched core network and IP Multimedia core network are incorporated.

This specification describes the changes to H.248 which are needed to handle 3GPP specific traffic cases. This is done by using the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

### 5.3.2.12.124 TS 29.235

#### Interworking between SIP-I based circuit-switched core network and other networks

This specification defines the interworking between SIP-I based circuit-switched core network with out-of-band transcoder control related procedures and: – an external SIP-I based signalling network – an ISUP based network such as an ISUP based 3GPP CS Domain or an PSTN – an BICC based network such as an BICC based 3GPP CS Domain – an Internet Multimedia Subsystem.

### 5.3.2.12.125 TS 29.238

#### Interconnection Border Control Functions (IBCF) – Transition Gateway (TrGW) interface, Ix interface; Stage 3

This document describes the protocol to be used on the Interconnection Border Control Function (IBCF) – Transition Gateway (TrGW) interface and the CS-IBCF – CS-TrGW interface. The basis for this protocol is the H.248 protocol. The Profile provides MG control function for IMS and CS Border Control. The IMS architecture is described in 3GPP TS 23.228. The underlying reference model and stage 2 information is described in 3GPP TS 23.228 and in 3GPP TS 29.162. The CS architecture is described in 3GPP TS 29.235.

This specification describes the application of H.248 Ix profile for both Ix and CS-Ix interfaces. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

### 5.3.2.12.126 TS 29.272

#### Evolved Packet System (EPS); Mobility Management Entity (MME) and Serving GPRS Support Node (SGSN) related interfaces based on Diameter protocol

This document describes the Mobility Management Entity (MME) and Serving GPRS Support Node (SGSN) related diameter-based interfaces towards the Home Subscriber Server (HSS), and the MME and the SGSN related diameter-based interface towards the Equipment Identity Register (EIR). This specification defines the Diameter application for the MME-HSS, S6a reference point, and for the SGSN-HSS, S6d reference point. The interactions between the HSS and the MME/SGSN are specified, including the signalling flows. This specification defines the Diameter application for the MME-EIR, S13 reference point, and for the SGSN-EIR, S13' reference point. The interactions between the MME/SGSN and the EIR are specified, including the signalling flows.

### 5.3.2.12.128 TS 29.274

#### 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C); Stage 3

This document specifies the stage 3 of the control plane of the GPRS Tunnelling Protocol, Version 2 for Evolved Packet System interfaces (GTPv2-C). In this document, unless otherwise specified the S5 interface refers always to “GTP-based S5” and S8 interface refers always to “GTP-based S8” interface.

### 5.3.2.12.129 TS 29.275

#### Proxy Mobile IPv6 (PMIPv6) based Mobility and Tunnelling protocols; Stage 3

This document specifies the Stage 3 of the PMIPv6 Based Mobility and Tunnelling Protocols used over the PMIP-based S2a, S2b, S5, and S8 reference points defined in 3GPP TS 23.402, and are thus applicable to the Serving GW, PDN Gateway, ePDG, and Trusted Non-3GPP Access. Protocols specifications are compliant with relevant IETF RFCs. In this specification PMIP refers to PMIPv6 as defined in IETF RFC 5213.

**5.3.2.12.130 TS 29.276****3GPP Evolved Packet System (EPS); Optimized handover procedures and protocols between E-UTRAN access and cdma2000 HRPD Access; Stage 3**

This document specifies the Stage 3 of the Evolved Packet System S101 interface between the MME and the HRPD Access Network. The S101 interface supports procedures for Pre-Registration, Session Maintenance and Active handoffs between E-UTRAN and HRPD networks.

**5.3.2.12.131 TS 29.280****Evolved Packet System (EPS); 3GPP Sv interface (MME to MSC, and SGSN to MSC) for SRVCC**

This document describes the Sv interface between the Mobility Management Entity (MME) or Serving GPRS Support Node (SGSN) and 3GPP MSC server enhanced for SRVCC. Sv interface is used to support Inter-RAT handover from VoIP/IMS over EPS to CS domain over 3GPP UTRAN/GERAN access or from UTRAN (HSPA) to 3GPP UTRAN/GERAN access.

### 5.3.2.12.133 TS 29.292

#### Interworking between the IP Multimedia (IM) Core Network (CN) subsystem (IMS) and MSC Server for IMS Centralized Services (ICS)

Services as defined in 3GPP TS 24.173 to users regardless of the attached access network type; e.g. CS domain access or IP-CAN. This document specifies the principles of interworking between the IM CN subsystem and CS domain in order to enable ICS for UEs using CS domain access. The document addresses the area of registration procedures interworking between the CS domain and IM CN subsystem, and the areas of control and user plane interworking between the IM CN subsystem and CS domain through an MSC Server enhanced for ICS and CS-MGW respectively. This includes the signalling procedures between the MSC Server and CS-MGW.

For the specification of control plane interworking, the document defines the protocol interworking between the 3GPP profile of SIP as described in 3GPP TS 24.229 and NAS signalling as described in 3GPP TS 24.008 required for the support of IM CN subsystem based multimedia telephony and supplementary services. The document addresses the area of supplementary service configuration interworking between the CS domain and IM CN subsystem. It is applicable to the MSC Server and CS-MGW.

### 5.3.2.12.134 TS 29.311

#### Service level interworking for Messaging Services

This document specifies the protocol details of service level interworking between Instant Message (OMA-TS-SIMPLE\_IM) or Chat Session (OMA-TS-CPM\_Conv\_Funct) using the 3GPP IP Multimedia CN subsystem and the Short Message Service over both legacy CS/PS network as specified in the 3GPP TS 23.040 and a generic IP Connectivity Access Network (IP-CAN) as specified in the 3GPP TS 24.341. These include:

- Procedures to implement service level interworking between IM and SM;
- Procedures to implement service level interworking between CPM and SM;
- Enhancement of the IP-SM-GW as an Application Server to support service selection, authorization and mapping between IM or CPM and SM protocols; and
- Interaction between service level interworking and transport layer interworking.

### 5.3.2.12.135 TS 29.328

#### IP Multimedia (IM) Subsystem Sh interface; Signalling flows and message contents

This document specifies:

- The interactions between the HSS (Home Subscriber Server) and the SIP AS (Application Server) and between the HSS and the OSA SCS (Service Capability Server). This interface is referred to as the Sh reference point.
- The interactions between the SIP AS and the SLF (Subscription Locator Function) and between the OSA SCS and the SLF. This interface is referred to as the Dh reference point.

The IP Multimedia (IM) Core Network Subsystem stage 2 is specified in 3GPP TS 23.228 and the signalling flows for the IP multimedia call control based on SIP and SDP are specified in 3GPP TS 24.228.

The IP Multimedia (IM) Session Handling with the IP Multimedia (IM) call model is specified in 3GPP TS 23.218.

This document addresses the signalling flows and message contents for the protocol at the Sh and Dh interface and also addresses how the functionality of Ph interface is accomplished. The Presence Service Stage 2 description (architecture and functional solution) is specified in 3GPP TS 23.141.

**5.3.2.12.136 TS 29.329****Sh interface based on the Diameter protocol; Protocol details**

This document defines a transport protocol for use in the IP multimedia (IM) Core Network (CN) subsystem based on Diameter and is applicable to:

- The Sh interface between an AS and the HSS.
- The Sh interface between an SCS and the HSS.

Whenever it is possible this document specifies the requirements for this protocol by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible, extensions to Diameter are defined within this document.

**5.3.2.12.137 TS 29.332****Media Gateway Control Function (MGCF) – IM Media Gateway; Mn interface**

This document describes the protocol to be used on the Media Gateway Control Function (MGCF) – IM Media Gateway (IM-MGW) interface. This interface provides the Media Gateway Control for interworking between the IP Multimedia Subsystem (IMS) and CS domain (ISUP, BICC and SIP-I). The basis for this protocol is the H.248 protocol. The IMS architecture is described in 3GPP TS 23.228. The interaction of the MGCF-IM MGW interface signalling procedures in relation to the SIP, and BICC/ISUP signalling at the MGCF are described in 3GPP TS 29.163.

The interaction of the MGCF-IM MGW interface signalling procedures in relation to the IMS SIP and SIP-I on Nc at the MGCF are described in 3GPP TS 29.235.

This specification describes the application of H.248 on the Mn interface. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

In addition this profile provides support for PSTN/ISDN Emulation as required by ETSI TISPAN.

The main body of the specification provides an introduction to the use of the profile for the Mn interface and introduces any specific functionality (e.g. new packages) associated with the Mn.

**5.3.2.12.138 TS 29.333****Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) Mp interface; Stage 3**

This document describes the protocol to be used on the Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) interface (Mp interface). The IMS architecture is described in 3GPP TS 23.228, the functional requirements are described in 3G TS 23.333. This specification defines a profile of the Gateway Control Protocol (H.248.1) for controlling Multimedia Resource Function Processor supporting in-band user interaction, conferencing and transcoding for multimedia-services.

**5.3.2.12.139 TS 29.334****IMS Application Level Gateway (IMS-ALG) – IMS Access Gateway (IMS-AGW); Iq Interface; Stage 3**

This document describes the protocol to be used on the IMS Application Level Gateway (ALG) – IMS Access Gateway (IMS-AGW) interface. The basis for this protocol is the H.248 protocol as specified in ITU-T. The IMS architecture is described in 3GPP TS 23.228. The underlying reference model and stage 2 information is described in 3GPP TS 23.228 and in 3GPP TS 23.334. This specification describes the application of H.248 on the Iq interface. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

**5.3.2.12.141 TS 29.364****IP Multimedia Subsystem (IMS) Application Server (AS) service data descriptions for AS interoperability**

This specification standardizes the structure and the coding of the service data that are transported over the Sh interface between an Application Server supporting Multimedia Telephony supplementary services as defined in 3GPP TS 22.173 and the HSS. Two optional formats are specified. One is based on a binary coding of the service data and supports the subset of MMTEL services corresponding to PSTN/ISDN and CS supplementary services. The other uses an XML format and supports the full set of MMTEL Services.

**5.3.2.12.142 TS 31.101****UICC-terminal interface; Physical and logical characteristics**

This document specifies the interface between the UICC and the Terminal for 3G telecom network operation. It specifies:

- the requirements for the physical characteristics of the UICC;
- the electrical interface between the UICC and the Terminal;
- the initial communication establishment and the transport protocols;
- the model which serves as a basis for the logical structure of the UICC;
- the communication commands and the procedures;
- the application independent files and protocols.

**5.3.2.12.143 TS 31.102****Characteristics of the Universal Subscriber Identity Module (USIM) application**

This document defines the USIM application for 3G telecom network operation. It specifies:

- specific command parameters;
- file structures;
- contents of EFs (Elementary Files);
- security functions;
- application protocol to be used on the interface between UICC (USIM) and ME.

This is to ensure interoperability between a USIM and an ME independently of the respective manufacturer, card issuer or operator

**5.3.2.12.144 TS 31.103****Characteristics of the IP Multimedia Services Identity Module (ISIM) application**

This document defines the ISIM application for access to IMS services. This document specifies:

- specific command parameters;
- file structures;
- contents of EFs (Elementary Files);
- security functions;

– application protocol to be used on the interface between UICC (ISIM) and Terminal.

This is to ensure interoperability between an ISIM and Terminal independently of the respective manufacturer, card issuer or operator.

This document does not define any aspects related to the administrative management phase of the ISIM. Any internal technical realization of either the ISIM or the Terminal is only specified where these are reflected over the interface. This document does not specify any of the security algorithms that may be used.

**5.3.2.12.145 TS 31.111****Universal Subscriber Identity Module (USIM) Application Toolkit (USAT)**

This document defines the ISIM application for access to IMS services. It specifies:

- specific command parameters;
- file structures;
- contents of EFs (Elementary Files);
- security functions;
- application protocol to be used on the interface between UICC (ISIM) and Terminal.

This is to ensure interoperability between an ISIM and Terminal independently of the respective manufacturer, card issuer or operator. This document defines the interface between the UICC and the Mobile Equipment (ME), and mandatory ME procedures, specifically for “USIM Application Toolkit”.

The document mainly refers to ETSI TS 102 223, which describes the generic aspects of application toolkits within the UICC. USAT is a set of commands and procedures for use during the network operation phase of 3G/LTE, in addition to those defined in TS 31.101.

Specifying the interface is to ensure interoperability between a UICC and an ME independently of the respective manufacturers and operators.

This document defines for 3G/LTE technology:

- the commands;
- the application protocol;
- the mandatory requirements on the UICC and ME for each procedure.

**5.3.2.12.146 TS 31.115****Secured packet structure for (Universal) Subscriber Identity Module (U)SIM Toolkit applications**

This document specifies the structure of the Secured Packets in implementations using Short Message Service Point to Point (SMS-PP), Short Message Service Cell Broadcast (SMS-CB), Unstructured Supplementary Service Data (USSD) and Hyper Text Transfer Protocol (HTTP) based on ETSI TS 102 225. The structure of the Secured Packets complies with the one defined in ETSI TS 102 225. This document only contains additional requirements or explicit limitations for SIM/USIM applications. It is applicable to the exchange of secured packets between an entity in a 3G or GSM PLMN and an entity in the (U)SIM. Secured Packets contain application messages to which certain mechanisms according to ETSI TS 102 224 have been applied. Application messages are commands or data exchanged between an application resident in or behind the PLMN and on the

(U)SIM. The Sending/Receiving Entity in the 3G or GSM PLMN and the UICC are responsible for applying the security mechanisms to the application messages and thus turning them into Secured Packets.

### 5.3.2.12.147 TS 31.116

#### Remote APDU Structure for (U)SIM Toolkit applications

This document defines the remote management of files and applets on the SIM/USIM/ISIM.

It describes the APDU format for remote management. Furthermore the document specifies:

- a set of commands coded according to this APDU structure and used in the remote file management on the SIM/USIM specified in TS 51.011, TS 31.101, TS 31.102, TS 31.103;
- a set of commands coded according to this APDU structure and used in the remote applet management on the SIM/USIM. This is based on ETSI TS 102 226.

The remote APDU structure for SIM/USIM/ISIM applications complies with the one defined in ETSI TS 102 226. This document only contains additional requirements or explicit limitations for SIM/USIM/ISIM applications.

**5.3.2.12.151 TS 31.221****Contact Manager Application Programming Interface (API); Contact Manager API for Java Card**

This document defines the internal interface characteristics of the Contact Manager for 3GPP UICC applications.

The internal interface between the Contact Manager Server application on the UICC and the Contact Manager Client application on the UICC enables Java Card™ platform based applets to invoke and register to the Contact Manager Server services. In particular, the Contact Manager Java Card™ based API provides methods to:

- Read/Update/Create/Delete contact(s) in the Contact Manager Server;
- Manage group of contacts in the Contact Manager Server;

- Search for a contact in the Contact Manager Server storage;
- manage the contacts structure;
- Register/Un-register the application to pre-defined events (e.g. application to be notified when contacts are modified in the Contact Manager)

## 5.3.2.13.10 TS 22.022

**Personalisation of Mobile Equipment (ME); Mobile functionality specification**

This specification describes functional specifications of five features to personalize UE. These features are called: – network personalization; – network subset personalization; – service provider (SP) personalization; – corporate personalization; – UMTS subscriber identity module (USIM) personalization. This specification describes requirements for UE, which provide these personalization features.

## 5.3.2.13.11 TS 22.034

## High Speed Circuit Switched Data (HSCSD); Stage 1

This specification describes the Stage 1 description of HSCSD. HSCSD is a feature that allows users subscribing to the general bearer services to access user rates that can be achieved with one or more traffic channel. HSCSD also defines a flexible use of air interface resources, which makes efficient and flexible use of higher user rates feasible.

**5.3.2.13.12 TS 22.038****(U)SIM Application Toolkit (USAT); Service description; Stage 1**

This specification describes the Stage 1 description of the SAT primarily from the subscriber's and serving environment's points of view, and does not deal with the details of the human interface itself. It includes information applicable to network operators, serving environments and terminal, switch and database manufacturers and contains the core requirements for a SAT which are sufficient to provide a complete service.

## 5.3.2.13.13 TS 22.057

**Mobile Execution Environment (MExE); Service description; Stage 1**

This document defines the stage one description of the Mobile Execution Environment (MExE). The scope of this 3GPP TS encompasses the MExE functionality in the UE, interaction with the MExE service environment. The MExE service environment is not necessarily restricted to the PLMN, and nodes providing MExE services (i.e. MExE servers) may also exist outside the PLMN. Aspects of the support provided by MExE servers within the MExE service environment (such as charging aspects, security level classification etc.) are covered by this specification, but not the MExE servers themselves.

### 5.3.2.13.15 TS 22.067

#### Enhanced Multi Level Precedence and Pre-emption service (eMLPP); Stage 1

This specification describes the Stage 1 description of the enhanced multi-level precedence and pre-emption (eMLPP) service. This service has two parts: precedence and pre-emption. Precedence involves assigning a priority level to a call in combination with fast call set-up. Pre-emption involves the seizing of resources, which are in use by a call of a lower precedence, by a higher level precedence call in the absence of idle resources. Pre-emption can also involve the disconnection of an on-going call of lower precedence to accept an incoming call of higher precedence.

### 5.3.2.13.16 TS 22.071

#### Location Services (LCS); Service description; Stage 1

LCS is a network provided enabling technology consisting of standardized service capabilities which enables the provision of location applications. This application may be service provider specific. The description of the numerous and varied possible location applications which are enabled by this technology are outside the scope of this specification. However, clarifying examples of how the functionality being specified may be used to provide specific LCS is included in various sections of the specification.

### 5.3.2.13.17 TS 22.078

#### Customized Applications for Mobile network Enhanced Logic (CAMEL); Service description; Stage 1

This specification describes the Stage 1 description for CAMEL feature which provides the mechanisms to support services consistently independently of the serving network. The CAMEL features shall facilitate service control of operator specific services external from the serving network. The CAMEL feature is a network feature and not a supplementary service. It is a tool to help the network operator to provide the subscribers with the operator specific services even when roaming outside the home network.

### 5.3.2.13.18 TS 22.090

#### Unstructured Supplementary Service Data (USSD); Stage 1

There are two modes of USSD: MMI-mode and application mode. MMI-mode USSD is for the transparent transport of MMI strings entered by the user to the network and for the transparent transport of text strings from the network that are displayed by the mobile for user information. Application mode USSD is for the transparent transport of data between the network and the mobile station. Application mode USSD is intended to be used by applications in the network and their peer applications in the UE. The communication over the radio interface takes place on the signalling channels using short dialogues with peak data throughput rate capabilities of up to approximately 600 bit/s outside of a call and 1 000 bit/s during a call.

**5.3.2.13.19 TS 22.100****UMTS Phase 1**

This specification describes contains how the definition of the UMTS system will be achieved in a phased approach. This document also specifies the requirements for release 99 of UMTS. Some requirements which are necessary to ensure a smooth transition to later releases are also indicated. This document should, however, be read in conjunction with the other 22.000 series documents which provide a complete description of the requirements for UMTS release 1999 and beyond.

### 5.3.2.13.21 TS 22.105

#### Services and service capabilities

Pre-UMTS systems have largely standardized the complete sets of bearer services, teleservices and supplementary services which they provide. One major difference between UMTS and pre-UMTS systems is that service capabilities rather than services are standardized for UMTS, allowing service differentiation and system continuity. This document describes how and what kind of services the UMTS user has access to.

### 5.3.2.13.22 TS 22.115

#### Service aspects; Charging and billing

This specification describes the service aspects of charging and billing of the UMTS. This standard is not intended to duplicate existing standards or standards being developed by other groups on these topics, and will reference these where appropriate. This standard will elaborate on the charging requirements described in the charging principles in TS 22.101 UMTS service principles. It will allow the generation of accurate charging information to be used in the commercial and contractual relationships between the parties concerned.

### 5.3.2.13.23 TS 22.129

#### Service aspects; Handover requirements between UTRAN and GERAN or other radio systems

This specification describes service requirements for handover (terms are defined below) within UMTS systems and between UMTS, other IMT\_2000 family members and second generation systems. Particular emphasis has been placed on the description of requirements for handover between UMTS and GSM but requirements specific to other systems are incorporated as required.

**5.3.2.13.24 TS 22.135**

**Multicall; Service description; Stage 1**

This specification describes multicall scenarios and requirements for UMTS phase 1 release 1999. Multicall feature specifies functionality and interactions related to usage of several simultaneous bearers between a terminal and a network. Multicall features allows both circuit-switched call(s) and packet session(s) to exist simultaneously.

**5.3.2.13.26 TS 22.153****Multimedia priority service**

The document specifies the service requirements for Multimedia Priority Service (MPS). Its scope is to specify those requirements of MPS necessary to provide an end-to-end service and to interwork with external networks where needed. Service interactions with external networks are considered within the scope of this document although these interactions may be specified in other standards.

**5.3.2.13.27 TS 22.168****Earthquake and Tsunami Warning System (ETWS) requirements; Stage 1**

The Document defines the stage one description of the Earthquake and Tsunami Warning System (ETWS) Requirements. Stage one is the set of requirements seen primarily from the user's and service provider's points of view. It includes information applicable to network operators, service providers, terminal and network manufacturers, in case of deployment of ETWS. ETWS deployment depends on operator decision or national regulations. The TS contains the core requirements for the Earthquake and Tsunami Warning System, which are sufficient to provide a complete service. It also contains regional requirements for Earthquake and Tsunami Warning System.

### 5.3.2.13.36 TS 22.278

#### Service requirements for Machine-Type Communications (MTC); Stage 1

This document specifies the service requirements for Network Improvements for Machine Type Communications. In particular it will:

- identify and specify general requirements for machine type communications;
- identify service aspects where network improvements (compared to the current human-to-human oriented services) are needed to cater for the specific nature of machine-type communications;
- specify machine type communication requirements for these service aspects where network improvements are needed for machine type communication.

### 5.3.2.13.37 TS 22.368

#### Service requirements for Machine-Type Communications (MTC); Stage 1

This document specifies the service requirements for Network Improvements for Machine Type Communications. In particular it will:

- identify and specify general requirements for machine type communications;
- identify service aspects where network improvements (compared to the current human-to-human oriented services) are needed to cater for the specific nature of machine-type communications;
- specify machine type communication requirements for these service aspects where network improvements are needed for machine type communication.

### 5.3.2.13.38 TR 22.971

#### Automatic establishment of roaming relationships

This report describes a proposed framework for commercial and technical interworking between UMTS home environments and serving networks who have no direct prior commercial agreements with each other. This text is applicable to UMTS standardization within ETSI, and is produced with the intent to clarify the concepts involved, and identify those areas which require standardization.

### 5.3.2.13.40 TS 23.032

#### Universal Geographical Area Description (GAD)

This document defines an intermediate universal Geographical Area Description which subscriber applications, GSM or UMTS services can use and the network can convert into an equivalent radio coverage map.

For GSM or UMTS services which involve the use of an “area”, it can be assumed that in the majority of cases the Service Requester will be forbidden access to data on the radio coverage map of a particular PLMN and that the Service Requester will not have direct access to network entities (e.g. BSC/BTS or RNC/Node B).

The interpretation by the PLMN operator of the geographical area in terms of cells actually used, cells that are partly within the given area and all other technical and quality of service aspects are out of the scope of this document.

This specification also provides a description of velocity that may be associated with a universal Geographical Area Description when both are applied to a common entity at a common time.

### 5.3.2.13.41 TS 23.101

#### General Universal Mobile Telecommunications System (UMTS) architecture

This specification describes the basic physical and functional separation of UMTS. The content of this specification is limited to those features that are common to all UMTS networks independent of their origin. It identifies and names the reference points and functional groupings appearing at this level.

### 5.3.2.13.45 TS 23.167

#### IP Multimedia Subsystem (IMS) emergency sessions

This document defines the stage 2 service description for emergency services in the IP Multimedia Core Network Subsystem (IMS), including the elements necessary to support IP Multimedia (IM) emergency services.

This document covers also the Access Network aspects that are crucial for the provisioning of IMS emergency services. Other 3GPP specifications that are related to the IMS emergency services are TS 23.228 on IMS in general, including fixed broadband access aspects, TS 23.060 describing GPRS (UTRAN), TS 23.401, TS 23.060; TS 23.402 describing EPS (UTRAN and E-UTRAN); TS 23.234 describing 3GPP/WLAN Interworking; TS 23.271 that covers location services and TS 23.216 and TS 23.237 describing Single Radio Voice Call Continuity for IMS Emergency session. TS 25.301 contains an overall description of the UMTS Terrestrial Radio Access Network TS 36.300 contains an overall description of the Evolved Universal Terrestrial Radio Access (E-UTRA) and Evolved Universal Terrestrial Radio Access Network (E-UTRAN). Other non-3GPP specifications that are related to the IMS emergency services include 3GPP2 cdma2000 HRPD IP CAN, as specified in 3GPP2 X.S0060 when the UE is connected to a PDS core network and 3GPP2 X.S0057 A when the UE is connected to an EPC core network.

The emergency support in different IP-CANs is described in the Informative Annex E.

**5.3.2.13.46 TS 23.171****Location Services (LCS); Functional description; Stage 2 (UMTS)**

This document specifies the stage 2 of the LoCation Services (LCS) feature in UMTS, which provides the mechanisms to support mobile location services for operators, subscribers and third party service providers.

Location Services may be considered as a network provided enabling technology consisting of standardized service capabilities, which enable the provision of location applications. The application(s) may be service provider specific. The description of the numerous and varied possible location applications which are enabled by this technology are outside the scope of this document. However, clarifying examples of how the functionality being described may be used to provide specific location services may be included.

This stage 2 service description covers the LCS system functional model for the whole system, the LCS system architecture, state descriptions, message flows, etc.

**5.3.2.13.49 TS 23.207****End-to-end Quality of Service (QoS) concept and architecture**

This document provides the framework for end-to-end Quality of Service involving GPRS and complements TS 23.107 which describes the framework for Quality of Service within UMTS. The document describes the interaction between the TE/MT Local Bearer Service, the GPRS Bearer Service, and the External Bearer Service, and how these together provide Quality of Service for the End-to-End Service. The document also describes IP level mechanisms necessary in providing end-to-end Quality of Service involving GPRS networks, including possible interaction between the IP level and the GPRS level, as well as the application level and the IP level.

**5.3.2.13.51 TS 23.221****Architectural requirements**

This document covers the architectural requirements for 3GPP systems based on UTRAN, E-UTRAN and Iu mode GERAN. In particular it details the high level requirements for the Circuit Switched (CS) Domain and the stage 2 procedures that span more than one domain/subsystem. The reference model to which these procedures apply can be found within TS 23.002. In addition, A mode to Iu mode handover for CS services is addressed. Detailed architectural requirements within the subsystems are contained within the remainder of the 23 series of specifications e.g. the requirements for the Packet Switched (PS) domain are contained within TS 23.060, TS 23.401 and the requirements for the Bearer Independent CS Core Network are contained in TS 23.205.

**5.3.2.13.52 TS 23.226**

**Global text telephony (GTT); Stage 2**

This 3GPP Technical Specification defines the stage 2 description of the real time Text Conversation Feature called Global Text Telephony, GTT. GTT Stage 2 identifies the functional capabilities needed to support the service described in GTT Stage 1.

This TS contains the core functions for a real time Text Conversation Feature GTT, to be used in combination with other media in conversational services.

GTT offers real time conversation in text, to be used alone or in combination with other conversational media, and interworking with current and emerging text conversation features in the fixed networks and other mobile networks.

GTT uses a number of functional entities to realize the requirements of the stage 1 description (TS 22.226). This TS describes how the service requirements are realized with these functional entities. As far as possible existing protocols shall be used for the realization of the Global Text Telephony Feature. This may include e.g. SIP, 3G.324, or Circuit Switched Voice service as protocol environments, and CTM, AL1 and RTP/text as transmission protocols. It also means usage of existing text presentation format ITU-T Recommendation T.140, common to all GTT text conversation environments.

**5.3.2.13.54 TS 23.236****Intra-domain connection of Radio Access Network (RAN) nodes to multiple Core Network (CN) nodes**

UMTS will build on the success of GSM and is likely to become even more widespread, increasing the importance of a flexible network structure to permit the different operational configurations in which these networks will be deployed. The requirements to have a RNC or BSC controlled by a single MSC server or SGSN lead to certain limitations. Allowing the BSCs and RNCs to connect to a number of MSC servers or SGSNs increases the networks performance in terms of scalability, distributing the network load amongst the serving entities, and reducing the required signalling as the user roams.

**5.3.2.13.55 TS 23.237****IP Multimedia Subsystem (IMS) Service Continuity; Stage 2**

This document specifies the architectural requirements and procedures for delivery of IMS Service Continuity.

The scope of the specification includes:

- Access Transfer related functionality:
- PS-CS Access Transfer;
- PS-PS Access Transfer;
- PS-PS Access Transfer in conjunction with PS-CS Access Transfer;
- Adding and/or removing media flows to support service;
- MSC Server assisted mid-call feature;
- SRVCC session transfer of IMS emergency session.
- Inter UE Transfer related functionality:
- Establishment and release of a Collaborative Session;
- Addition of media flows to, modification of media flows in, and release of media flows from a Collaborative Session;
- Transfer of media flows from one UE to another;
- Transfer of the Collaborative Session Control with or without transfer of media flows;
- Transfer of all media flows to a target UE without establishing a Collaborative Session;
- Session discovery;
- Inter-UE Transfer initiated by the target UE or by the SCC AS;
- Replication of media flows by means of Inter-UE Transfer procedures;
- Authorization and other aspects to support Inter-UE Transfer across multiple IMS subscriptions.

The solution is restricted to service continuity using IMS procedures, i.e. mobility mechanisms on the IP-CAN level are not within the scope of this specification.

### 5.3.2.13.56 TS 23.240

#### 3GPP Generic User Profile (GUP); Architecture (Stage 2)

This document defines the stage 2 architecture description to the 3GPP Generic User Profile (GUP), which includes the elements necessary to realize the stage 1 requirements in TS 22.240.

This document includes the GUP reference architecture with descriptions of functional entities, and their interfaces and procedures, as well as the high-level information model for the GUP data.

### 5.3.2.13.58 TS 23.251

#### Network sharing; Architecture and functional description

This document covers the details of Network Sharing for GERAN, UTRAN and E-UTRAN. It shows how several core network operators can share one radio access network and details the impacts on the network architecture. All UEs shall comply with existing requirements, among them PLMN selection and system information reception. This document also defines requirements for network-sharing supporting UEs

**5.3.2.13.59 TS 23.261****IP flow mobility and seamless Wireless Local Area Network (WLAN) offload; Stage 2**

This document specifies the Stage 2 system description for IP flow mobility between a 3GPP and a WLAN. The technical solution is based on the working principles of DSMIPv62 and it is applicable to both the Evolved Packet System and the I-WLAN mobility architecture. The specification covers the system description of seamless WLAN offload and IP flow mobility between 3GPP and WLAN as well as the respective interactions with the PCC and ANDSF frameworks. The system description for non-seamless WLAN offload is covered in 3GPP TS 23.402. This document specifies also the detailed extensions to S2c and H1 reference points for IP flow mobility. The extensions to the PCC and to the ANDSF framework are specified respectively in 3GPP TS 23.203 and in 3GPP TS 23.402.

**5.3.2.13.61 TS 23.272****Circuit Switched (CS) fallback in Evolved Packet System (EPS); Stage 2**

This document defines the Stage 2 architecture and specification for the CS Fallback and for SMS over SGs for EPS or CS Fallback and SMS over S102. The scope of this document includes the architecture enhancements for functionality to enable fallback from E-UTRAN access to UTRAN/GERAN CS domain access and to CDMA 1x RTT CS domain access, and functionality to reuse of voice and other CS-domain services (e.g. CS UDI video/LCS/USSD) by reuse of the CS domain. The functionality specified to support SMS over SGs does not trigger any CS Fallback to UTRAN/GERAN. The functionality specified to support SMS over S102 does not trigger any CS Fallback to CDMA 1xRTT CS domain

**5.3.2.13.64 TS 23.401**

**General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access**

This Technical Specification defines the Stage 2 service description for the Evolved 3GPP Packet Switched Domain – also called the Evolved Packet System (EPS) in this document. The Evolved 3GPP Packet Switched Domain provides IP connectivity using the Evolved Universal Terrestrial Radio Access Network (E-UTRAN). The specification also covers mobility between E-UTRAN and pre-E-UTRAN 3GPP radio access technologies.

**5.3.2.13.66 TS 23.682****Architecture enhancements to facilitate communications with packet data networks and applications**

This document specifies architecture enhancements to facilitate communications with packet data networks and applications (e.g. Machine Type Communication (MTC) applications on the (external) network/MTC servers) as per the use cases and service requirements defined in TS 22.368, TS 22.101 and related 3GPP requirements specifications. Both roaming and non-roaming scenarios are covered.

- Device triggering by applications/servers (e.g.: MTC applications on the (external) network/MTC servers).
- PS-Only support with and without MSISDN.

**5.3.2.13.67 TR 23.930****Iu principles**

This **specification** describes the requirements on the Iu and studies relevant principles to guide further standardization of the related interface(s).

### 5.3.2.13.71 TS 26.092

#### Mandatory speech codec speech processing functions; Adaptive Multi-Rate (AMR) speech codec; Comfort noise aspects

This specification describes the detailed requirements for the correct operation of the background acoustic noise evaluation, noise parameter encoding/decoding and comfort noise generation for the AMR speech codec during source controlled rate (SCR) operation.

**5.3.2.13.76 TS 26.346****Multimedia Broadcast/Multicast Service (MBMS); Protocols and codecs**

This document defines a set of media codecs, formats and transport/application protocols to enable the deployment of MBMS user services either over the MBMS bearer service or other UMTS Bearer Services within the 3GPP system.

In this version of the specification, only MBMS download and streaming delivery methods are specified. This document does not preclude the use of other delivery methods.

This document includes information applicable to network operators, service providers and manufacturers.

**5.3.2.13.77 TR 26.911****Codec(s) for Circuit-Switched (CS) multimedia telephony service; Terminal implementor's guide**

This report describes non-mandatory Recommendations for the use of the different codec implementation options for the circuit-switched 3G-324M multimedia telephony service based on ITU-T Recommendation H.324, Annex C. These Recommendations address issues specific to the third generation operating environment, including guaranteeing sufficient error resilience and inter-working between terminals.

### 5.3.2.13.78 TS 32.101

#### Telecommunication management; Principles and high level requirements

This document establishes and defines the management principles and high-level requirements for the management of PLMNs. In particular, this document identifies the requirements for:

- the upper level of a management system;

- the reference model, showing the elements the management system interacts with;
- the network operator processes needed to run, operate and maintain a network;
- the functional architecture of the management system;
- the principles to be applied to management interfaces.

The requirements identified in this document are directed to the further development of management specifications as well as the development of management products. This document can be seen as guidance for the development of all other technical specifications addressing the management of PLMNs.

### 5.3.2.13.79 TS 32.102

#### Telecommunication management; Architecture

This document identifies and standardizes the most important and strategic contexts in the physical architecture for the management of PLMNs. It serves as a framework to help define a telecom management physical architecture for a planned PLMN and to adopt standards and provide products that are easy to integrate. The requirements identified in this document are applicable to all further development of 3GPP Telecom Management specifications as well as the development of PLMN Management products. This document can be seen as guidance for the development of all other technical specifications addressing the management of PLMNs, except TS 32.101.

## 5.3.2.13.84 TS 33.107

**3G security; Lawful interception architecture and functions**

This document describes the architecture and functional requirements within a Third Generation Mobile Communication System (3GMS) and the Evolved Packet System (EPS).

The specification shows the service requirements from a Law Enforcement point of view only. The aim of this document is to define a 3GMS and EPS interception system that supports a number of regional interception regulations, but these regulations are not repeated here as they vary. Regional interception requirements shall be met in using specific (regional) mediation functions allowing only required information to be transported.

**5.3.2.13.85 TS 33.108****3G security; Handover interface for Lawful Interception (LI)**

This specification addresses the handover interfaces for Lawful Interception (LI) of Packet-Data Services, Circuit Switched Services, Multimedia Services within the UMTS network and Evolved Packet System (EPS). The handover interface in this context includes the delivery of Intercept Related Information (HI2) and Content of Communication (HI3) to the Law Enforcement Monitoring Facility.

### 5.3.2.13.86 TS 33.110

#### Key establishment between a Universal Integrated Circuit Card (UICC) and a terminal

This document describes the security features and mechanisms to provision a shared key between a UICC and a terminal that may host the UICC or be connected to the device hosting the UICC via a local interface. Candidate applications to use this key establishment mechanism include but are not restricted to secure channel between a UICC and a terminal.

The scope of this specification includes an architecture overview and the detailed procedure how to establish the shared key between the UICC and the terminal.

### 5.3.2.13.88 TS 33.141

#### Presence service; Security

This document is the Stage 2 specification for the security requirements, security architecture, security features and security mechanisms for the Presence Service, which includes the elements necessary to realize the requirements in TS 22.141 and TS 23.141. As far as SIP-based procedures are concerned, this specification refers to TS 33.203. The main content of this specification is the security for the Ut reference point, which is HTTP-based, as applied in presence services.

The document includes information applicable to network operators, service providers and manufacturers.

### 5.3.2.13.89 TS 33.203

#### 3G security; Access security for IP-based services

The scope for this technical specification is to specify the security features and mechanisms for secure access to the IM subsystem (IMS) for the 3G mobile telecommunication system.

Since the scope also encompasses the use of these security features and mechanisms for secure access to IMS in the context of fixed broadband networks and 3GPP2 networks, Annex L and Annex S specify how the material in the main body and other normative Annexes of this document apply to the fixed broadband networks and 3GPP2 networks respectively.

The IMS supports IP Multimedia applications such as video, audio and multimedia conferences. SIP, Session Initiation Protocol, was chosen as the signalling protocol for creating and terminating Multimedia sessions, cf. RFC 3261. This specification only deals with how the SIP signalling is protected between the subscriber and the IMS, how the subscriber is authenticated and how the subscriber authenticates the IMS.

### 5.3.2.13.90 TS 33.204

#### 3G Security; Network Domain Security (NDS); Transaction Capabilities Application Part (TCAP) user security

This technical specification covers the security mechanisms and procedures necessary to protect all TCAP user messages which are sent between different security domains. The complete set of enhancements and extensions to facilitate security protection for the TCAP protocol is termed

TCAPsec and it covers transport security in the TCAP protocol itself and the security management procedures. This technical specification contains the stage 2 specification for security protection of the TCAP protocol. The actual implementation (stage 3) specification can be found in TS 29.204.

### 5.3.2.13.91 TS 33.210

#### 3G security; Network Domain Security (NDS); IP network layer security

This document defines the security architecture for network domain IP based control planes, which shall be applied to NDS/IP-networks (i.e. 3GPP and fixed broadband networks). The scope of network domain control plane security is to cover the control signalling on selected interfaces between network elements of NDS/IP networks.

### 5.3.2.13.92 TS 33.220

#### Generic Authentication Architecture (GAA); Generic Bootstrapping Architecture (GBA)

This document describes the security features and a mechanism to bootstrap authentication and key agreement for application security from the 3GPP AKA mechanism. Candidate applications to use this bootstrapping mechanism include but are not restricted to subscriber certificate distribution TS 33.221. Subscriber certificates support services whose provision mobile operator assists, as well as services that mobile operator provides. The scope of this specification includes a generic AKA bootstrapping function, an architecture overview and the detailed procedure how to bootstrap the credential. Clause 4 of this specification describes a mechanism, called GBA\_ME, to bootstrap authentication and key agreement, which does not require any changes to the UICC. Clause 5 of this specification describes a mechanism, called GBA\_U, to bootstrap authentication and key agreement, which does require changes to the UICC, but provides enhanced security by storing certain derived keys on the UICC.

### 5.3.2.13.93 TS 33.221

#### Generic Authentication Architecture (GAA); Support for subscriber certificates

This document describes subscriber certificate distribution by means of generic bootstrapping architecture (GBA) TS 33.220. Subscriber certificates support services whose provision the mobile operator assists, as well as services that are offered by the mobile operator. The scope of this specification presents signalling procedures for support of issuing certificates to subscribers and the standard format of certificates and digital signatures. It is not intended to duplicate existing standards being developed by other groups on these topics, and will reference these where appropriate.

### 5.3.2.13.94 TS 33.222

#### Generic Authentication Architecture (GAA); Access to network application functions using Hypertext Transfer Protocol over Transport Layer Security (HTTPS)

This document specifies secure access methods to Network Application Functions (NAF) using HTTP over TLS in the Generic Authentication Architecture (GAA), and provides Stage 2 security requirements, principles and procedures for the access. This document describes both direct access to an Application Server (AS) and access to an Application Server through an Authentication Proxy (AP).

### 5.3.2.13.96 TS 33.224

#### Generic Authentication Architecture (GAA); Generic Bootstrapping Architecture (GBA) push layer

This document specifies a generic push layer that makes use of the GBA Push Function as specified in TS 33.223. The GPL specification includes a message format, cipher suites and processing model. GPL assumes that keys and other SA parameters have been preinstalled in the Push-NAF and UE in the form of a NAF SA. GPL is a protection protocol that can be applied in a unidirectional fashion. The rationale for GPL is that having each application specify its own security mechanisms would for obvious reasons lead to duplication of work, specifications and implementations. Using a generic secure push layer avoids these problems. A generic secure push layer may also relieve the applications using the service of having to be aware of inner working of the security layer.

### 5.3.2.13.97 TS 33.234

#### 3G security; Wireless Local Area Network (WLAN) interworking security

This document specifies the security architecture; trust model and security requirements for the interworking of the 3GPP System and WLAN Access Networks. This specification is not limited to WLAN technologies. It is also valid for other IP based Access Networks that support the same security capabilities towards the interworking system as WLAN does. Specifications of the appropriate mechanisms for user and network authentication, key management, service authorization, confidentiality and integrity protection of user and signalling data are also provided.

### 5.3.2.13.98 TS 33.246

#### 3G Security; Security of Multimedia Broadcast/Multicast Service (MBMS)

The Technical Specification covers the security procedures of the Multimedia Broadcast/Multicast Service (MBMS) for 3GPP systems (UTRAN, GERAN and E-UTRAN). MBMS is a 3GPP system network bearer service over which many different applications could be carried. The actual method of protection may vary depending on the type of MBMS application.

### 5.3.2.13.99 TS 33.259

#### Key establishment between a UICC hosting device and a remote device

This document describes the security features and mechanisms to provision a shared key between a UICC Hosting Device and a Remote Device connected via a local interface. The shared secret is then intended to be used to secure the interface between the Remote Device and the UICC hosting device. Candidate applications to use this key establishment mechanism include but are not restricted to Personal Network Management (see TS 22.259). The scope of this specification includes an architecture overview and the detailed procedure how to establish the shared key between the UICC Hosting Device and the Remote Device. This is different from the Technical Specification TS 33.110 that describes an architecture overview and the detailed procedure how to establish the shared key between the UICC itself and the terminal hosting the UICC. The use cases utilizing the mechanisms described in this specification are seen to be different to the use cases where “Key establishment between a UICC and a terminal”, IETF RFC 4279 is utilized. The solution described in this document is built on the existing infrastructure defined in “GBA”, TS 33.220.

## 5.3.2.13.100 TS 33.310

**Network Domain Security (NDS); Authentication Framework (AF)**

The scope of this Technical Specification is limited to authentication of network elements, which are using NDS/IP or TLS. In the case of NDS/IP this specification includes both the authentication of Security Gateways (SEG) at the corresponding Za-interfaces and the authentication between NEs and between NEs and SEGs at the Zb-interface. Authentication of end entities (i.e. NEs and SEGs) in the intra-operator domain is considered an internal issue for operators. This is quite much in line with 3GPP TS 33.210 which states that only Za is mandatory and that the security domain operator can decide if the Zb-interface is deployed or not, as the Zb-interface is optional for implementation. Validity of certificates may be restricted to the operator's domain in case of Zb interface or in case of Za-interface between two security domains of the same operator. In the case of TLS this Specification concentrates on authentication of TLS entities across inter-operator links. For example, TLS is specified for inter-operator communications between IMS and non-IMS networks TS 33.203 and on the Zn' interface in GBA TS 33.220.

Authentication of TLS entities across intra-operator links is considered an internal issue for operators. However, NDS/AF can easily be adapted to the intra-operator use case since it is just a simplification of the inter-operator case when all TLS NEs and the PKI infrastructure belong to the same operator. Validity of certificates may be restricted to the operator's domain. An Annex contains information on the manual handling of TLS certificates in case automatic enrolment and revocation according to NDS/AF for TLS is not implemented.

**5.3.2.13.102 TS 33.328****IP Multimedia Subsystem (IMS) media plane security**

This document presents IMS media plane security for RTP based media which is designed to meet the following three main objectives:

- to provide security for media usable across all access networks
- to provide an end-to-end (e2e) media security solution to satisfy major user categories
- to provide end-to-end (e2e) media security for important user groups like enterprises, National Security and Public Safety (NSPS) organizations and different government authorities who may have weaker trust in the inherent IMS security and/or may desire to provide their own key management service.

The media plane security in this release of the TS is based on the well-established protocol SRTP. Key management solutions for SRTP are defined in this specification.

**5.3.2.13.107 TR 33.908****3G Security; General report on the design, specification and evaluation of 3GPP standard confidentiality and integrity algorithms**

This technical report is a description of the work undertaken by SAGE Task Force for the design of the standard 3GPP Confidentiality and Integrity Algorithms (SAGE TF 3GPP).

With regard to the design of the algorithms, the scope of this document is confined to a description of the design criteria, the design methodology and an outline of the content and structure of the specification and test data documents.

The standard 3GPP Confidentiality and Integrity Algorithms are based on a Block Cipher named KASUMI. The algorithms specification and associated test data are documented in the Specification of the 3GPP Confidentiality and Integrity Algorithms which consists of the following four documents:

- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 1: f8 and f9 specifications (TS 35.201).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 2: KASUMI algorithm specification (TS 35.202).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 3: Implementors' test data (TS 35.203).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 4: Design conformance test data (TS 35.204).

With regard to the evaluation of the algorithm, the scope of this report is restricted to a description of the evaluation criteria, the method of evaluation and the main conclusions from the evaluation that led to the Task Force approving the specification. A detailed summary of conclusions of the evaluation is provided in a public evaluation report TS 33.909 produced by the Task Force.

**5.3.2.13.108 TR 33.909****3G Security; Report on the design and evaluation of the MILENAGE algorithm set; Deliverable 5: An example algorithm for the 3GPP authentication and key generation functions**

This public report contains a detailed summary of the work performed during the design and evaluation of the 3GPP Authentication Functions denoted as the MILENAGE algorithm set. It contains all results and findings from this work and should be read as a supplement to the specifications of the algorithms in TS 35.205 and the general project report, TS 35.209.

**5.3.2.13.110 TR 33.919****3G Security; Generic Authentication Architecture (GAA); System description**

This 3GPP Technical Report gives an overview of the different mechanisms that mobile applications can rely upon for authentication between server and client (i.e. the UE). Additionally it provides guidelines related to the use of GAA and to the choice of authentication mechanism in a given situation and for a given application. To this end the TR puts the different 3GPP GAA related specifications into perspective. It clarifies the logic for having the technical specifications and technical reports, sketches their content and explains the inter-relation between these 3GPP TSs and TRs and their relation with this TR. The heart of GAA consists out of the Generic Bootstrapping Architecture (GBA): The GBA core specifications

consist out of TS 33.220, TS 24.109 and TS 29.109. GBA in turn is then used by many other TSs and TRs to enable specific usages e.g. HTTPS, subscriber certificates.

**5.3.2.13.112 TR 33.924****Identity management and 3GPP security interworking; Identity management and Generic Authentication Architecture (GAA) interworking**

The objective is to extend identity management as outlined in TS 33.220, TS 33.222, TS 29.109 and TR 33.980 with the latest developments on identity management outside of the 3GPP sphere. This will allow a better integration and usage of identity management for services in 3GPP and seamless integration with existing services that are not standardized in 3GPP. This report outlines the interworking of GBA and OpenID.

**5.3.2.13.113 TR 33.937****Study of mechanisms for Protection against Unsolicited Communication for IMS (PUCI)**

The scope of this Report is to highlight alternative solutions that could be used to protect mobile subscribers from receiving unsolicited communication over IMS and to analyze these solutions in respect of their requirements and impacts on standardized interfaces. This activity took into account the study done in ETSI TISPAN TR 187 009 on “Feasibility study of prevention of unsolicited communications in the NGN”.

**5.3.2.13.114 TR 33.980****Liberty Alliance and 3GPP security interworking; Interworking of Liberty Alliance Identity Federation Framework (ID-FF), Identity Web Services Framework (ID-WSF) and Generic Authentication Architecture (GAA)**

This document provides guidelines on the interworking of the Generic Authentication Architecture (GAA) and the Liberty Alliance architecture. The document studies the details of possible interworking methods between the Security Assertion Markup Language v2.0, SAML v2.0 (or alternatively the Liberty Alliance Identity Federation Framework, ID-FF), the Identity Web Services Framework (ID-WSF), the Security Assertion Markup Language (SAML) and a component of GAA called the Generic Bootstrapping Architecture (GBA). This document only applies if Liberty Alliance and GBA or SAML v2.0 and GBA are used in combination.

### 5.3.2.13.117 TS 35.203

#### 3G Security; Specification of the 3GPP confidentiality and integrity algorithms; Document 3: Implementors' test data

This specification gives detailed test data for implementors of the algorithm set. It provides visibility of the internal state of the algorithm to aid in the realization of the algorithms.

**5.3.2.13.118 TS 35.204****3G Security; Specification of the 3GPP confidentiality and integrity algorithms; Document 4: Design conformance test data**

This specification gives black-box test data for the algorithm set. The test data has been selected to give a high degree of confidence that the implementation is correct. However, no claim is made that conformance with this test data guarantees a correct implementation.

### 5.3.2.13.119 TS 35.205

#### **3G Security; Specification of the MILENAGE algorithm set: An example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 1: General**

This Report is a description of the work undertaken by an ETSI SAGE Task Force on the design of the Milenage Algorithm Set: an example set of 3GPP Authentication and Key Generation Functions.

The 3GPP Authentication and Key Generation Functions are not standardized. An example set of these algorithms has been produced on request from 3GPP with the intent that it shall be offered to the UMTS operators, to utilize instead of developing their own. An ETSI SAGE Task Force has carried out this work.

The requirement specification from 3GPP SA3 stated that operator personalization of the example set must be possible and that the basic kernel must be possible to replace.

The example set is based on the block cipher Rijndael, which at the time was one of the AES candidates and the specification describes how the 7 algorithms used in 3GPP authentication and key generation are scheduled around this basic kernel. The specification and associated test data for the example algorithm set is documented in three documents:

- A formal specification of both the modes and the example kernel
- A detailed test data document, covering modes and the example kernel
- A “black box” test data document

A detailed summary of the evaluation is provided in a public evaluation report, ETSI SAGE 3GPP AF TF: “Report on the design and evaluation of 3GPP Authentication and Key Generation Functions”. This report gives an overview of the overall work by the task force.

### 5.3.2.13.120 TS 35.206

#### **3G Security; Specification of the MILENAGE algorithm set: An example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 2: Algorithm specification**

This document has been prepared by the 3GPP Task Force, and contains an example set of algorithms which may be used as the authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*. (It is not mandatory that the particular algorithms specified in this document are used – all seven functions are operator-specifiable rather than being fully standardized.)

### 5.3.2.13.121 TS 35.207

#### 3G Security; Specification of the MILENAGE algorithm set: An example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 3: Implementors' test data

This document has been prepared by the 3GPP Task Force, and contains an example set of algorithms which may be used as the authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*. (It is not mandatory that the particular algorithms specified in this document are used – all seven functions are operator-specifiable rather than being fully standardized.)

### 5.3.2.13.127 TR 35.909

#### 3G Security; Specification of the MILENAGE algorithm set: an example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 5: Summary and results of design and evaluation

This Report contains a detailed summary of the work performed during the design and evaluation of the 3GPP Authentication Functions denoted as the MILENAGE algorithm set. It contains all results and findings from this work and should be read as a supplement to the specifications of the algorithms in ETSI/SAGE Specification of the MILENAGE Algorithm Set: an Example Algorithm Set for the 3GPP Authentication and Key generation Functions, f1, f1\*, f2, f3, f4, f5 and f5\*; Document 1: Algorithm Specification. and the general project report on the Design and Evaluation of the 3GPP Authentication and Key generation Functions.

## 5.4 IMT-2000 TDMA Single-Carrier

### 5.4.1 Overview of the radio interface

#### 5.4.1.1 Introduction

The IMT-2000 TDMA Single-Carrier radio interface specifications contain two variations depending on whether a TIA/EIA-41 circuit switched network component or a GSM evolved UMTS circuit switched network component is used. In either case, a common enhanced GSM General Packet Radio Service (GPRS) packet switched network component is used. The initial focus of the following sections has been to provide an evolution path for the TIA/EIA-136 pre-IMT-2000 radio interface to evolve to IMT-2000. As WRC 2000 identified additional frequency bands for IMT-2000, another pre-IMT-2000 radio interface (GSM/GPRS) is provided with an evolution path to TDMA Single-Carrier by incorporating common components of the IMT-2000 TDMA Single-Carrier radio interface. This application furthers the objective of maximum commonality between TIA/EIA-136 and GSM/EDGE GPRS.

##### 5.4.1.1.1 Radio interface used with TIA/EIA-41 Circuit Switched Network Component

The IMT-2000 radio interface specifications for TDMA single-carrier technology utilizing the TIA/EIA-41 circuit switched network component are developed by TIA TR45.3 with input from the Universal Wireless Communications Consortium. This radio interface is called Universal Wireless Communication-136 (UWC-136), which is specified by American National Standard TIA/EIA-136. It has been developed with the objective of maximum commonality between TIA/EIA-136 and GSM EDGE GPRS.

This radio interface was designed to provide a TIA/EIA-136 (designated as 136)-based radio transmission technology that meets ITU-R's requirements for IMT-2000. It maintains the TDMA community's philosophy of evolution from 1st to 3rd generation systems while addressing the specific desires and goals of the TDMA community for a 3rd generation system.

This radio interface is an attractive and powerful evolutionary step for 136. The technology presented provides for future IMT-2000 services to existing operators, as well as providing new operators competitive features, services and technology. Additionally, the technology provides these same features and services in other bands around the world where regulatory approval has been granted to offer such services.

UWC-136 used a three component strategy for evolving the 136 technology to 3rd generation. The initial strategy consisted of enhancing the voice and data capabilities of the 30 kHz channels (designated as 136□), adding a 200 kHz carrier (EDGE) component for high-speed data (384 kbit/s) accommodating high mobility (designated as 136HS Outdoor), and adding a 1.6 MHz carrier component for very high-speed data (2 Mbit/s) in low mobility applications (designated as 136HS Indoor). The second phase update further enhanced the voice capabilities of the 30 kHz channel (designated as 136+), and added an additional alternative 200 kHz carrier EDGE component for high speed data (384 kbit/s) (designated as 136EHS).

The third phase update added support for GSM EDGE Release 5 services and the IP multimedia subsystem (IMS) as well as incorporation of the harmonised Mobile Equipment Identifier (MEID). Additionally, an alternative for the circuit switched network component is added. The combined result constituted this radio interface specification.

The fourth phase update added support for GERAN Release 6 services which include Multimedia Broadcast/Multicast Service (MBMS), Wideband AMR voice coder, and Packet Switched handoff. Additional improvements include Flexible Layer One (FLO) and downlink receiver performance.

The fifth phase update added support for GERAN Release 7 services which include improved location services utilizing UTDOA and Galileo systems, latency reductions, and conversational

services over the A/Gb interface. Additional improvements included dual carrier capability along with Enhanced GPRS phase 2 (EGPRS2) which included higher order modulation, turbo codes, and reduced symbol period. Receiver diversity and Generic Access Network support enhancements were also included.

The 136HS Outdoor and Indoor components were developed to satisfy the requirements for an IMT-2000 radio transmission technology, with the additional requirement for the consideration of commercially effective evolution and deployment in current 136 networks. Such considerations include flexible spectrum allocation, spectrum efficiency, compatibility with 136 and 136□, and support of macrocellular performance at higher mobile speeds. 136EHS provided compatibility with GSM EGPRS, while this update provides a common EDGE enhanced GPRS phase 2 packet switched component with GSM EDGE Release 8 functionality thus providing commercially effective evolution and global roaming.

The TDMA community continues to enhance UWC-136, regularly providing revisions to the standards.

#### **5.4.1.1.2 Radio interface used with GSM evolved UMTS circuit switched network component**

This radio interface provides an evolution path for an additional pre-IMT-2000 technology (GSM/GPRS) to IMT-2000 TDMA Single-Carrier. The IMT-2000 radio interface specifications for TDMA Single-Carrier technology utilizing the GSM evolved UMTS circuit switched network component are developed by 3GPP and transposed by ATIS Wireless Technologies and Systems Committee (WTSC). The circuit switched component uses a common 200 kHz carrier as does the GSM EDGE enhanced GPRS phase 2 packet switched component, as used by 136EHS, to provide high speed data (384 kbit/s). In addition a new dual carrier configuration is supported.

#### **5.4.1.2 Services**

UWC-136 builds on the mature and powerful TIA/EIA-136 standard, which has evolved over many years. Thus, all TIA/EIA-136 services are included, and the capabilities of 384 kbit/s, and 2 Mbit/s high-speed data are added. Through TIA/EIA-136, this technology supports both full-rate (3 users/30 kHz) and half-rate (6 users/30 kHz) voice services. Utilizing the GSM evolved UMTS circuit switched network component, all the circuit switched services of the GSM system are provided by TDMA Single-Carrier. Additionally, the GAIT interoperability function provides interoperability between the two circuit switched networks.

##### **5.4.1.2.1 Voice services**

###### **5.4.1.2.1.1 TIA/EIA-41 circuit switched network component**

Four full-rate voice coders are presently defined: VSELP, ACELP, US1, and AMR. Additionally, one half-rate voice coder is presently defined: AMR. Enhancements to voice services entail a more robust full-rate voice service using DQPSK modulation, and a low delay and improved tandeming codec for wireless office applications using 8-PSK modulation. An additional slot format for DQPSK results in a link budget improvement of 4 dB in robustness for ACELP.

The AMR voice coder supports 3 users per RF carrier (Full Rate) and 6 users per RF carrier (Half-Rate), utilizing slot sharing and enhanced interleaving to achieve diversity gains and lower delay. RF carriers support both DQPSK and 8-PSK modulation formats so that mobiles supporting either modulation can exist on the same carrier to maximize trunking efficiency.

Voice services are supported with robust error correction coding and link quality improvement techniques such as per slot power control. Enhanced reporting mechanisms for FER, real-time C/I, and BER are also defined to aid in RF system engineering.

#### 5.4.1.2.1.2 GSM evolved UMTS circuit switched network component

The AMR voice coder supports 8 users per 200 kHz RF carrier (Full Rate) and 16 users per RF carrier (Half-Rate), utilizing the common coding and adaptation technology used in the UWC-136 AMR. The fourth phase update provided an additional voice coder known as Wideband AMR (AMR-WB).

Wideband coding brings quality improvement over the existing narrowband telephony through the use of extended audio bandwidth. The AMR codec, standardised for Release 98 and Release 99, provides good performance for telephone bandwidth speech (audio 5.4.2 limited to 3.4 kHz). However, the introduction of a wideband speech service (audio bandwidth extended to 7 kHz) brings improved voice quality especially in terms of increased voice naturalness. Wideband coding brings speech quality exceeding wireline quality to GERAN systems.

The wideband codec was developed as a multi-rate codec consisting of several codec modes like the AMR codec. Consequently, similar to the existing AMR codec, in the AMR-WB codec, the codec mode is chosen based on the operating conditions on the radio channel. Adapting coding depending on the channel quality provides high robustness against transmission errors. The codec also includes a source controlled rate operation mechanism, which allows it to encode speech at a lower average rate by taking into account speech inactivity.

The AMR-WB codec provides the following capabilities:

- Voice quality equal to ITU-T G.722-56k in a GSM full-rate traffic channel.
- Voice quality equal to ITU-T G.722-64K in a GERAN 8-PSK Radio Channel.

The codec mode can be changed every 40 ms in GERAN channels.

#### Extended AMR Wideband codec

The fifth phase update added an extension to the AMR-WB codec which adds the detailed mapping from input blocks of monophonic or stereophonic audio samples in 16 bit uniform PCM format to encoded blocks and from encoded blocks to output blocks of reconstructed monophonic or stereophonic audio samples. The coding scheme is an extension of the AMR-WB coding scheme and is referred to as extended AMR-WB or AMR-WB+ codec. It comprises all AMR-WB speech codec modes including VAD/DTX as well as extended functionality for encoding general audio signals such as music, speech, mixed, and other signals. AMR-WB+ extends the AMR-WB codec by adding transform coded excitation (TCX), bandwidth extension, and stereo.

The AMR-WB+ audio codec processes input frames equal to 2 048 samples at an internal sampling frequency  $F_s$ . The internal sampling frequency is limited to the range 12 800-38 400 Hz. The 2 048-sample frames are split into two critically sampled equal frequency bands. This results in two superframes of a 1 024 samples corresponding to the low frequency (LF) and high frequency (HF) band. Each superframe is divided into four 256-samples frames. Sampling at the internal sampling rate is obtained by using a variable sampling conversion scheme, which re-samples the input signal.

The LF and HF signals are then encoded using two different approaches: the LF is encoded and decoded using the “core” encoder/decoder, based on switched ACELP and transform coded excitation (TCX). In ACELP mode, the standard AMR-WB codec is used. The HF signal is encoded with relatively few bits (16 bits/frame) using a bandwidth extension (BWE) method.

#### Enhanced AAC Plus General audio codec

The fifth phase update also added an additional codec known as the Enhanced Advanced Audio Coding Plus (AAC Plus) general audio codec. The Enhanced AAC Plus audio codec is based on the Advanced Audio coding (AAC), Spectral Band Replication (SBR) and Parametric Stereo coding tools defined in the MPEG-4 Audio standard. In addition it includes further tools such as error concealment, spline resampler, and stereo-to-mono downmix. Also described is the detailed

mapping from a PCM sample input to an MPEG-4 bitstream containing Enhanced aacPlus coded audio.

#### 5.4.1.2.2 Data services

A scalable packet data service having data rates from 11.2 kbit/s to greater than 2 Mbit/s is supported. For 136+, 136HS Outdoor, and 136HS Indoor, this packet data service is referred to as GPRS-136. For 136EHS this packet data service is referred to as EGPRS-136. Both use the GPRS backbone network. Packet-switched services are integrated with existing circuit-switched services while maintaining TIA/EIA-136 capabilities. A mobile station in operation on the packet network may automatically move to the circuit network to place and receive calls, then return to the packet network upon completion of a circuit call. Mobile stations in operation on the packet network are also able to support services such as short message service (SMS) and message waiting indications.

The user can access two forms of data network; X.25 and Internet protocol (IP)-based. For IP-based networks the user may have dynamic or static IP allocation. Differing QoS requirements are supported for any data session and multiple simultaneous data sessions are supported. Only the user's subscription and system engineering limit the number of data sessions that are open for a user. The general approach of this integrated data model is to overlay the circuit-switched network nodes with packet data network nodes for service provisioning, registration, mobility management, and accounting. Interworking is provided between the circuit-switched and packet data networks for mobiles capable of both services. This allows a user engaged in an active data transfer to pause/resume operation should they wish to make or receive a circuit call.

#### Conversational services

Conversational services are used for real-time applications, such as IP-telephony (VoIP) and video-conferencing. Support for conversational services is necessary to maintain compatibility with legacy systems and should be implemented with a minimum of impact to existing systems and standards. This requires maintaining the current functional split of the protocol architecture between the core and radio access network. Implementing conversational services in the PS domain in A/Gb mode requires consideration of the following GERAN packet service characteristics:

- Minimizing the transfer delay between the SGSN and the MS.
- Improving the feedback reporting mechanism.
- Defining a suitable RLC mode to allow retransmissions for delay-sensitive applications.
- Defining radio resource management functions to efficiently support Conversational Services.

For instance, conversational services need a reduced transfer delay and a fast acknowledgement procedure over the radio interface. In addition, support of Packet-switched Handover for GERAN A/Gb mode is a prerequisite to achieve support for conversational services.

#### 5.4.1.2.3 Ancillary services

A host of services are offered, some of which are: portable subscriptions through Removable User Identity Modules (R-UIM), short messaging, message waiting indication, calling name indication, extended standby time via sleep mode, wireless office (private systems), circuit-switched data, over-the-air activation, over-the-air programming, encryption, broadcast teleservice transport, general UDP transport, and authentication.

The second update also provided location services capabilities through System Assisted Mobile Positioning through Satellite (SAMPS).

The third phase update added a rich broadcast or point to multipoint service known as Multimedia Broadcast/Multicast Service (MBMS). Point to multipoint services exist today which allow data

from a single source entity to be transmitted to multiple endpoints. MBMS efficiently provides this capability for such broadcast/multicast services provided by the home environment and other Value Added Service Providers (VASPs).

The MBMS is a unidirectional point to multipoint bearer service in which data is transmitted from a single source entity to multiple recipients. It will also be capable of expanding to support other services with these bearer capabilities.

It will support two modes of operation:

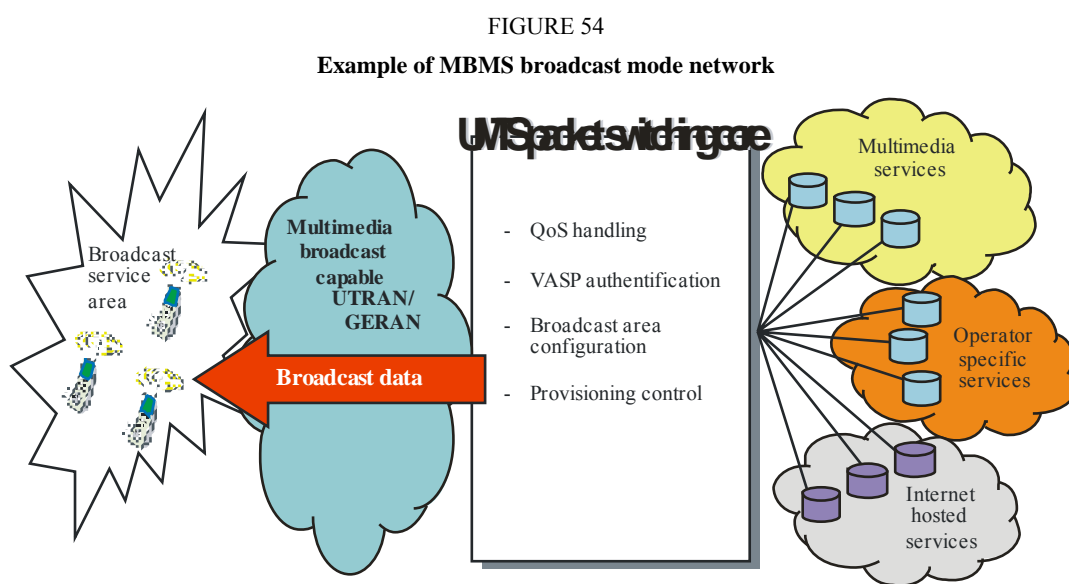

- the broadcast mode;
- the multicast mode.

### MBMS broadcast mode

MBMS data transmission will adapt to different RAN capabilities or different radio resource availability, e.g. by reducing the bitrate of the MBMS data.

Figure 54 gives an example of how a network can be configured to broadcast a variety of high bit rate services to users within the associated broadcast service area.

A broadcast service received by the MS, involves one or more successive broadcast sessions. A broadcast service might, for example, consist of a single on-going session (e.g. a media stream) or may involve several intermittent sessions over an extended period of time (e.g. messages).

M.1457-54

An example of a service using the broadcast mode could be advertising or a welcome message to the network. As not all users attached to the network may wish to receive these messages then the user shall be able to enable/disable the reception of these broadcast service on his MS.

### MBMS multicast mode

The multicast mode allows the unidirectional point-to-multipoint transmission of multimedia data (e.g. text, audio, picture, video) from a single source point to a multicast group in a multicast service area. The multicast mode will efficiently use radio/network resources, e.g. data is transmitted over a common radio channel. Data is transmitted in the multicast service area as defined by the network (Home environment). In the multicast mode there is the possibility for the

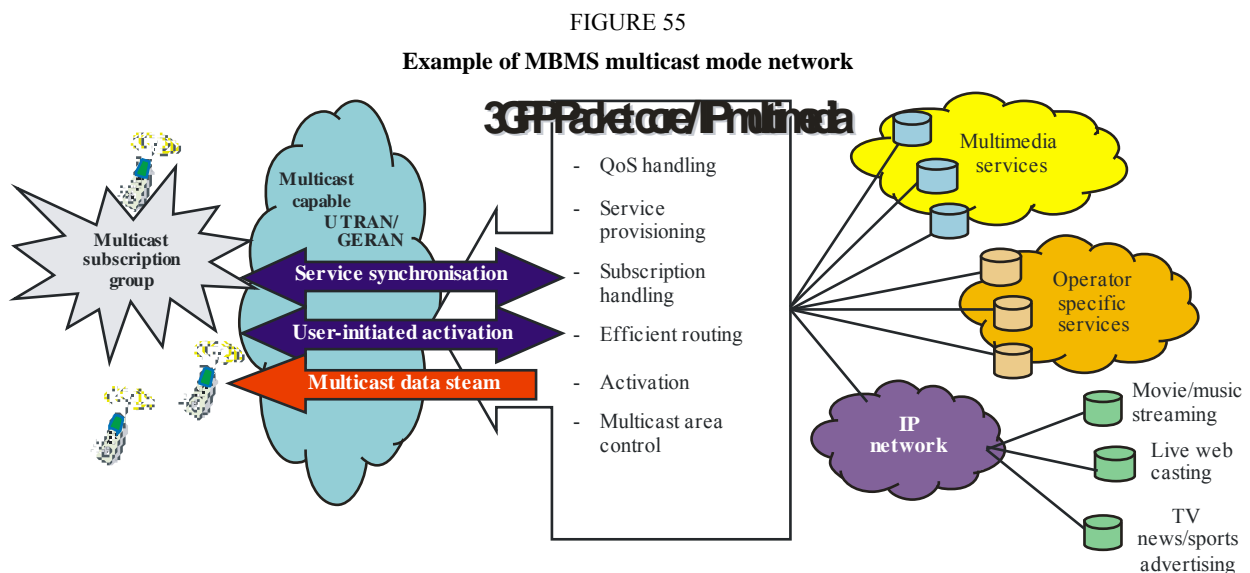

network to selectively transmit to cells within the multicast service area which contain members of a multicast group.

MBMS data transmission will adapt to different RAN capabilities or different radio resource availability, e.g. by reducing the bitrate of the MBMS data.

A multicast service received by the MS, involves one or more successive multicast sessions. A multicast service could, for example, consist of a single on-going session (e.g. a multimedia stream) or may involve several intermittent multicast sessions over an extended period of time (e.g. messages).

An example of a service using the multicast mode could be a football results service for which a subscription is required.

Unlike the broadcast mode, the multicast mode generally requires a subscription to the multicast subscription group and then the user joining the corresponding multicast group. The subscription and group joining may be made by the operator, the user or a third party on their behalf (e.g. company).

M.1457-55

Reception of multicast services cannot be guaranteed over the access network. For many applications and services guaranteed data reception may be carried out by higher layer services or applications which make use of MBMS.

Multicast mode should allow terminals to minimise their power consumption.

Multicast mode shall be inter-operable with IETF IP Multicast. This will allow the best use of IP service platforms to help maximize the availability of applications and content so that current and future services can be delivered in a more resource efficient manner. Figure 55 above shows a general high level overview of multicast mode network.

### Location services enhancements

The 3GPP GERAN specifications include support for various location technologies, such as Cell-ID, E-OTD and A-GPS positioning. Following the decision from the European Union to develop the GALILEO Global Navigation Satellite System, it was decided to add support for GALILEO in 3GPP GERAN Release 7 specifications. GALILEO will consist of a constellation of 30 satellites in three orbit planes. It is based on the same technology as GPS and provides a similar

degree of precision. Using GPS and GALILEO constellations together provides real advantage in terms of accuracy, service availability and reliability, since essentially twice the number of satellites with interoperable signals will be available for position calculation and navigation. In addition, GALILEO specific signal characteristics (e.g. new modulation formats and dataless ranging channels) are expected to bring themselves significant enhancements. Consequently, 3GPP introduced the concept of Assisted Global Navigation Satellite System (A-GNSS) in Release 7. In this concept, different Global Navigation Satellite Systems (GNSS) (currently GPS and GALILEO) can be used separately or in combination to perform the location of a mobile station. GALILEO support has been added to Release 7 specifications in such a way, that additional Global Navigation Satellite Systems can be added in the future without requiring major changes to the specifications.

The concept of GANSS (GALILEO and Additional Navigation Satellite Systems) has been introduced by defining GANSS common assistance data (applicable to any GNSS) and GANSS specific assistance data. The GANSS specific assistance data are identified by a certain GANSS-ID. Currently, GANSS includes support for GALILEO only. In the future, additional GANSS-IDs may be defined for additional constellations and the GANSS specific assistance data formats may be used for these additional GNSS in the future as well. Hence, the Assisted-GNSS concept combines Assisted-GPS (defined since Release 98) and Assisted-GANSS (new defined in Release 7). All interfaces supporting the transport of information for localization have been modified to incorporate the transport of the new GANSS elements.

### **Support for GNSS extended orbits**

In order to compute a location in the MS based on GNSS (GPS and GANSS) signal measurements, the MS must determine with good precision the position and clock bias of the GNSS satellites. For that purpose Navigation Model assistance (ephemeris and clock corrections) are delivered to the MS in assistance data information elements. The Navigation Model assistance (as also provided in the broadcast message of each individual GNSS satellite) usually has a lifespan of four hours. There are various commercial services available that produce satellite ephemeris and clock corrections predictions with extended lifespan of several days. GERAN Release 7 includes the option to extend the satellite orbits beyond that provided by the individual GNSS. Extended Navigation Model assistance can be provided for the all satellites in a GNSS constellation with a validity period of typically between 1 and 7 days in advance. The MS may download the extended orbit data regularly (e.g. once a week) and therefore, valid navigation model assistance data would already be available in the MS when it receives a position request from the network. This usually also reduces the time to report a location estimate since most data required to calculate a location in the MS would already be available in the MS. In addition, Extended Orbits enable A-GNSS like benefits outside network/service coverage as ephemeris data for the full constellation may be already available in the MS, and hence, can achieve faster time to first fix with greater sensitivity than otherwise possible with standalone GNSS receivers.

Since the data needed to describe ephemeris and clock corrections for a period of, e.g. 7 days is rather huge, the navigation model data is differentially encoded before delivered to the MS. The orbit data are divided into periods of 4-6 hours, and the difference between adjacent orbit model data are sent to the MS. This compression technique reduces the message size of the extended orbit data significantly.

Support for Extended Orbits has been added for GPS and GANSS.

#### **5.4.1.3 Layer 1**

The basic premise of operation is spectrum on demand. The amount of spectrum allocated at a given time is a function of the service mix that is required. It allows for incremental channels to be allocated and de-allocated as required. The bandwidth associated with each service is tailored to that service. By aggressively managing the spectrum, high spectral efficiency performance is

supported as well as underlay cells which can steal spectrum from the overlay network to provide even more capacity in a given geographical region.

The 136+ bearer supports both voice and data service on a 30 kHz RF channel. Two modulation types are specified: mandatory  $\pi/4$ -DQPSK and optional 8-PSK at a common channel symbol rate of 24.3 ksymbols/s. Channels are spaced 30 kHz apart, centre to centre. Both the voice and data services can operate on either modulation to allow for service differentiation and channel robustness.

### **EDGE Bearer**

The 136HS Outdoor bearer and the 136EHS bearer uses a 200 kHz RF carrier, known as EDGE, to enable the deployment of the high-speed data services. Two mandatory modulations are specified: GMSK and 8-PSK at a common channel symbol rate of 270.833 ksymbols/s. The channel coding and modulation can be varied to provide an optimal adaptation of throughput versus channel robustness. Channels are spaced 200 kHz apart, centre to centre.

### **Dual carrier configuration**

In the fifth phase update, which added GERAN Release 7 functionality, two 200 kHz carriers are supported in the Mobile station which is known as “Downlink Dual Carrier”. In a downlink dual carrier configuration, one or more PDCHs are assigned to a single MS on each of two different radio frequency channels on either the uplink or downlink, or both. On the downlink, radio blocks may be allocated on both radio frequency channels in any radio block period. On the uplink, radio blocks shall not be allocated on both radio frequency channels in the same radio block period.

A downlink dual carrier configuration shall support multislot configurations either for packet switched connections or dual transfer mode. For a Dual Transfer Mode capable MS which supports Downlink Dual Carrier, support of Downlink Dual Carrier configurations for Dual Transfer Mode is optional.

### **EGPRS Phase 2 bearers**

Release 7 of the Evolved GERAN also added Downlink and Uplink physical layer enhancements collectively referred to as Enhanced GPRS Phase 2 (EGPRS2). Specifically, they introduce Higher Order Modulations (16 & 32-QAM) to improve Spectral Efficiency; Higher Symbol Rate (1.2 x the legacy symbol rate) to increase peak data rates and Turbo Coding to improve link performance. In order to facilitate a phased deployment of these features, various levels are defined. For example, EGPRS2 Downlink Level-A standardizes 16 & 32-QAM and Turbo Coding, whereas EGPRS2 Downlink Level-B additionally includes Higher Symbol Rate (as well as QPSK modulation). Similarly, EGPRS2 Uplink Level-A standardizes 16-QAM, whereas EGPRS Uplink Level-B additionally includes 32-QAM as well as Higher Symbol Rate. In order to accommodate the transmission of a higher symbol rate, a spectrally wide pulse shaping filter is also defined for the Uplink and is being explored for the Downlink. Further development of EGPRS2 was accomplished in Release 8 and included in this revision.

### **Downlink Advanced Receiver Performance**

In addition to the Modulation and coding changes, Downlink Advanced Receiver Performance (DARP) is introduced. DARP is the new project name for Single Antenna Interference Cancellation (SAIC) for GERAN networks. This feature improves the link level performance and thereby the radio network capacity (spectral efficiency) for GMSK modulated circuit switched voice and packet data services (EGPRS MCS1-4) when operating in areas being limited by GMSK interference. The conclusion of the Feasibility Study is that DARP is indeed a very viable and feasible technology, and that when applied to GMSK modulation and fully deployed, will provide significant gains in voice capacity in interference-limited networks, both synchronous and asynchronous. In addition,

DARP was also found to support modest increases in GPRS data throughput for the data traffic models considered. Another key conclusion is that the capacity gain due to DARP is not linearly related to DARP terminal penetration. Hence, for low to moderate terminal penetration rates, DARP is expected to provide its primary benefit in terms of immediate improvement in call quality (and GPRS throughput), with the secondary benefit of modest system capacity gain. For high terminal penetration rates (>70-80%), DARP is expected to provide both, improvement in call quality as well as large gain in overall system capacity.

### **Downlink Advanced Receiver Performance Phase II**

The feasibility of MS Receive Diversity (MSRD) was determined during the feasibility study for evolved GSM/EDGE Radio Access Network (see § 5.4.2.5.46).

MSRD is a downlink feature, which improves the receiver performance of the mobile station by means of an additional antenna. The introduction of Single Antenna Interference Cancellation (SAIC) characterised by the Downlink Advanced Receiver Performance (DARP) Phase I has shown that receiver enhancements in the MS can provide significant gains in terms of spectral efficiency. MSRD offers the possibility of enhanced channel diversity and the potential for further improved interference cancellation performance for GMSK modulated signals as well as significant gains for 8PSK-modulated signals. Therefore gains in both user throughput and system capacity can be achieved.

Finally, the 136HS Indoor bearer uses a 1.6 MHz RF carrier to enable the deployment of high-speed indoor data services at greater than 2 Mbit/s. Two mandatory modulations are specified: B-O-QAM and Q-O-QAM at a common channel symbol rate of 2.6 Msymbols/s. The channel modulation can be varied to provide an optimal adaptation of throughput versus channel robustness. Channels are spaced 1 600 kHz apart, centre to centre.

### **Flexible Layer One**

In the third phase update, a new logical mapping was introduced known as Flexible Layer One. Previously, the MAC sublayer was responsible for the mapping between the logical channels (traffic or control channels) and the basic physical channels. The logical channels are the channels the physical layer offers to the MAC sublayer. Until now these logical channels and the mapping to the basic physical channel have been fully specified statically.

A different approach has been taken in UTRAN, where instead of providing logical channels the physical layer offers Transport Channels (TrCH), which can be used by the MAC sublayer. A transport channel is used to transmit one data flow with a given QoS over the radio interface. A number of transport channels can be active at the same time and multiplexed at the physical layer. The transport channels are configured at call setup by the network.

With the Flexible Layer One addition, the concept of transport channels used in UTRAN is reused in GERAN, i.e. the physical layer offers one or several transport channels to the MAC sublayer.

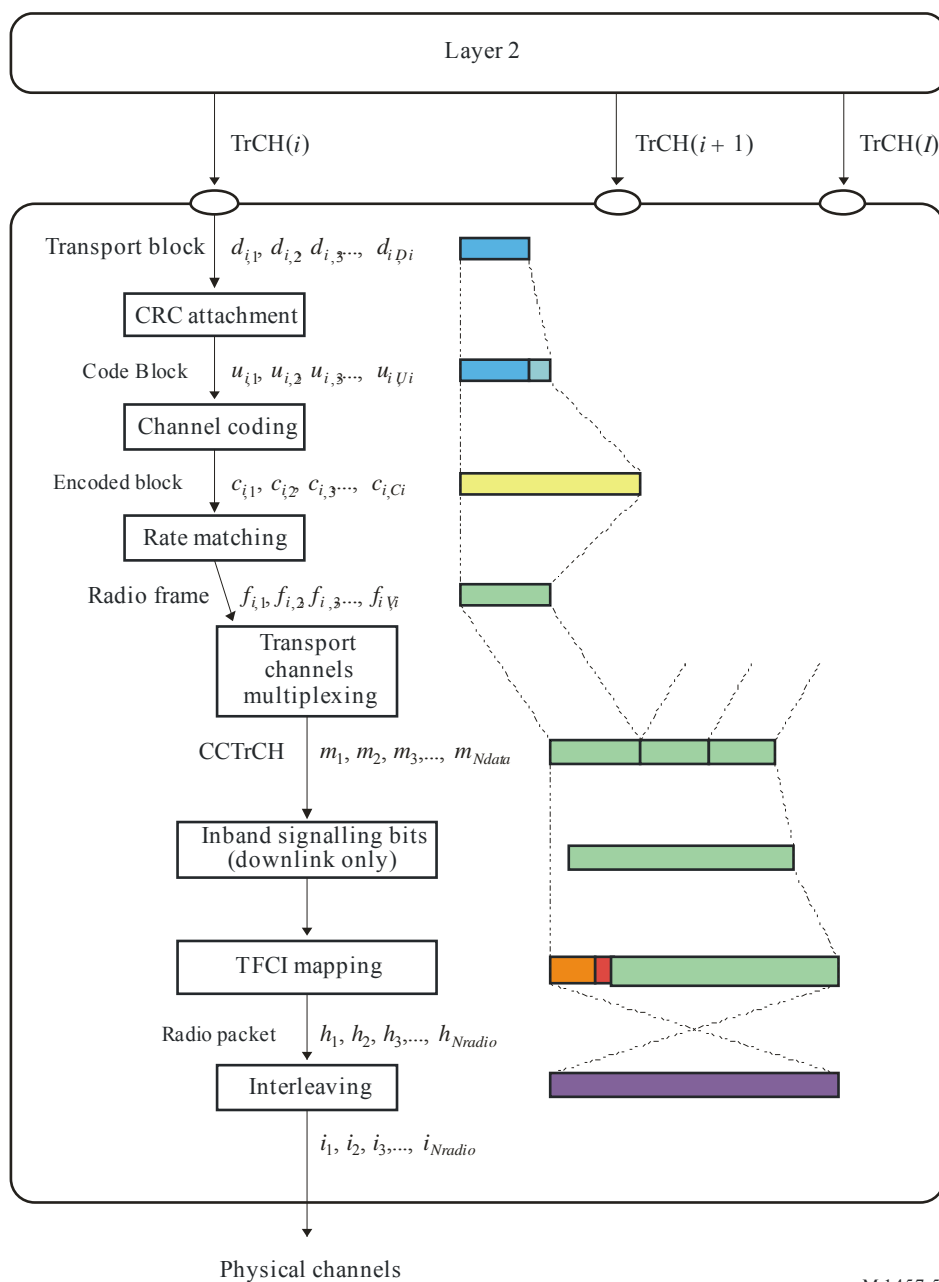

With Flexible Layer One, the physical layer of GERAN offers one or several transport channels to the MAC sublayer. Each of these transport channels can carry one data flow providing a certain Quality of Service (QoS). A number of transport channels can be multiplexed and sent on the same basic physical subchannel at the same time. This is illustrated in the figure below.

The configuration of a transport channel, i.e. the number of input bits, channel coding, interleaving, etc., is denoted the Transport Format (TF). As in UTRAN, a number of different transport formats can be associated to one transport channel. The configuration of the transport formats is completely controlled by the RAN and signalled to the MS at call setup. In both the MS and the BTS, the transport formats are used to configure the encoder and decoder units. When configuring a transport format, the RAN can choose between a number of predefined CRC lengths and block lengths.

On transport channels, transport blocks (TB) are exchanged between the MAC sublayer and the physical layer on a transmission time interval (TTI) basis. For each TTI a transport format is chosen and indicated through the transport format indicator (TFIN). In other words, the TFIN tells which transport format to use for that particular transport block on that particular TrCH during that particular TTI. When a transport channel is inactive, the transport format with a transport block size of zero (empty transport format) is selected.

Only a limited number of combinations of the transport formats of the different TrCHs are allowed. A valid combination is called a Transport Format Combination (TFC). The set of valid TFCs on a basic physical subchannel is called the Transport Format Combination Set (TFCS). The TFCS is signalled through the Calculated Transport Format Combinations (CTFC).

FIGURE 56  
Flexible layer one architecture

#### 5.4.1.4 Layer 2

Layer 2 provides two different types of functionalities: those to support circuit-based operation and those that support packet-based operation.

##### 5.4.1.4.1 Circuit

The modulated/encoded voice is carried over the digital traffic channel (DTC). The connection of the traffic channel is supervised using the coded digital verification colour code (CDVCC) on Layer 2. The mobile station (MS) decodes the CDVCC (either explicitly or implicitly) received from the base station in every DTC time slot, and compares it with the colour code received from the original connection messages or the hand-off message (DVCCs). The MS transmits the CDVCCs to the base station in each burst.

The DTC also contains fast and slow associated control channels (FACCH and SACCH) which carry control and supervising messages.

Layer 2 of the digital control channel (DCCH) services requests from and provides indications to Layer 3. On the MS side, Layer 2 services the Layer 3 reverse DCCH (RDCCH) request primitive to initiate a mobile station access attempt on the random access channel (RACH) which is controlled by Layer 2. Layer 2 then performs random or reserve access procedures, and decoding of the shared channel feedback (SCF) status information. Layer 2 issues a forward DCCH (FDCCH) indication primitive to Layer 3 when the MS receives a complete Layer 3 message broadcast or addressed on various FDCCH channels.

On the base station side, Layer 2 services the Layer 3 F-BCCH, E-BCCH, S-BCCH, and SPACH request primitives containing the Layer 3 messages to be sent to the MS. Layer 2 issues an RDCCH indication primitive to deliver to Layer 3 messages received from the MS.

Various Layer 2 protocols can be used to carry RDCCH and FDCCH information in support of Layer 3 messages such as frame segmentation and re-assembly, and ARQ mode of operation. Other functions of the DCCH Layer 2 are: message concatenation of Layer 3 messages, MSID management, header formatting, and monitoring radio link quality (MRLQ).

##### 5.4.1.4.2 Packet

The overall function Layer 2 provides is to realize radio bearers for Layer 3, taking into consideration the requested QoS objectives. Layer 2 is structured into logical link control (LLC), radio link control (RLC), and medium access control (MAC) (RLC and MAC may be combined into one function referred to as MAC).

The LLC is independent of the radio interface. The LLC provides acknowledged or unacknowledged data transfer, and provides support to the Tunneling Of Message sub-layer allowing for TIA/EIA-41 signalling over the packet bearer.

Three separate MAC entities may be included in a single Layer 2 MAC, one entity to support each type of bearer: 136□ bearer, 136HS Outdoor bearer or 136EHS bearer and 136HS Indoor bearer. The main task of the MAC is to dynamically multiplex the radio resource so that the RF resources can be efficiently utilized among multiple users with minimal packet collisions. The MAC supports both an unacknowledged and an acknowledged mode. In acknowledged mode, the MAC is responsible for sequenced delivery of packets to the higher layers, and an error recovery method using a sliding window automatic repeat request is utilized. The MAC also supports transactions with different priorities, and provides QoS information with four levels of priority. This radio interface also supports several unique design features such as implicit addressing and active mobile identity management which provide link quality robustness, and resource efficiency.

The reason why RLC and MAC are considered as belonging to the same sub-layer is that both entities have direct access to the physical layer and the LLC sub-layer. Furthermore, the LLC protocol does not depend on the radio interface, whereas the RLC/MAC protocol is radio specific.

GERAN Release 7 functionality added latency reduction for both ideal and non-ideal radio conditions. This latency reduction made it possible to provide services that were not otherwise feasible in GERAN (e.g. VoIP, gaming, etc.). The reduction is split into two parts, improved Ack/Nack reporting and reduced TTI (transmission time interval). The improved Ack/Nack reporting enables a faster reporting scheme based on sending the data on the RLC data block. This also included a requirement for a reduction of the MS reaction time to transmit the report and to retransmit a block of data. The reduced TTI method involves using transmission times as low as 10 ms on the radio interface as compared to 20 ms for legacy systems. In this update further development contained in GERAN Release 8 is added.

#### 5.4.1.5 Layer 3

Layer 3 provides two different types of mobility and resource management functionalities: those to support circuit-based operation and those that support packet-based operation.

136 mobility management and radio resource management entities at Layer 3 provide circuit-switched services. Layer 3 procedures (known as intelligent roaming) are defined to provide the user access to the optimum circuit-switched service provider. Once the initial control channel selection has been accomplished, cell re-selection and handoff algorithms provide continuity of service. The cell re-selection algorithms include several trigger conditions and selection criteria to provide versatile management capability.

The GSM-based GPRS mobility management function and the 136 mobility management function, operating in parallel, comprise the GPRS-136 mobility manager for GPRS-136. The GSM based EGPRS mobility management function and the 136 mobility management function, operating in parallel, comprise the EGPRS-136 Mobility Manager for EGPRS-136. The packet mobility management function provides packet data mobility management, while the 136 mobility management function provides circuit-switched service mobility management. Together they ensure that the network knows the current location of MS.

The packet radio resource management (RRM) entity is similar to the DCCH procedures that control voice resources. The main task of the RRM is to dynamically allocate the radio resource among the bearers so that the RF resources can be efficiently utilized among multiple users. Procedures are defined which will spread the load across multiple packet channels in a given cell. Techniques are outlined that allow for rapid finding of packet resources. Continuity of service is supported via cell re-selection as a mobile traverses multiple cells. The packet RRM supports all three packet data bearers defined in this radio interface.

In the third phase update, packet switched handover was added. The packet switched handover procedure is used to handover an MS with one or more packet flows from a source cell to a target cell. The source and target cells can be located within either the same BSS (Intra BSS HO), different BSSs within the same SGSN (Intra SGSN HO) or belonging to different SGSNs (Inter SGSN HO), or systems with different radio access types (Inter RAT HO, Inter mode HO). Handover is network controlled and mobile assisted.

While the MS is still in the source cell:

- Radio resources in the target cell are allocated and signalled to the MS.
- System information of the target cell needed for access in the target cell is signalled to the MS.

In addition to the management functions Layer 3 provides other capabilities. Layer 3 message construction rules provides backwards compatibility so that a MS or base station can process a message to the extent it understands it. This capability also allows new functions to be easily added for extensibility.

Layer 3 provides a generic R-DATA transport that can function in point-to-point or broadcast mode. This R-DATA transport can carry various teleservice messages without regard to the exact using entity. This generic capability allows various value-added services such as short message services and over-the-air programming to be defined or added to using the common transport.

#### **5.4.1.6 Network**

A system is realized by uniquely combining a TDMA Single-Carrier Radio Interface with an EDGE enhanced GPRS or an EGPRS2 packet switched network component combined with either a TIA/EIA-41 circuit switched network component or a GSM evolved UMTS circuit switched network component.

##### **TIA/EIA-41 Circuit switched network component**

Figure 58 presents the network elements and the associated reference points that comprise a system utilizing the TIA/EIA-41 circuit switched network component. The primary TIA/EIA-41 network node visible to the serving GPRS support node (SGSN) is the gateway mobile switching centre (MSC)/visitor location register (VLR). The interface between the TIA/EIA-41 gateway MSC/VLR and the SGSN is the Gs' interface, which allows the tunnelling of TIA/EIA-136 signalling messages between the MS and the gateway MSC/VLR. The tunnelling of these signalling messages is performed transparently through the SGSN. Between the MS and the SGSN, the signalling messages are transported using the tunnelling of messages (TOM) protocol layer. TOM uses the LLC unacknowledged mode procedures to transport the signalling messages. Between the SGSN and the gateway MSC/VLR, the messages are transported using the BSSAP protocol.

Upon receiving a TIA/EIA-136 signalling message from a MS via the TOM protocol, the SGSN forwards the message to the appropriate gateway MSC/VLR using the BSSAP protocol. Upon receiving a TIA/EIA-136 signalling message from a gateway MSC/VLR via the BSSAP protocol, the SGSN forwards the message to the indicated MS using the TOM protocol.

MS supporting both the TIA/EIA-41 circuit switched network component and packet services (Class B136 MS) perform location updates with the circuit system by tunnelling the registration message to the gateway MSC/VLR. When an incoming call arrives for a given MS, the gateway MSC/VLR associated with the latest registration pages the MS through the SGSN. The page can be a hard page (no Layer 3 information included in the message), in which case, the Gs' interface paging procedures are used by the MSC/VLR and the SGSN. If the circuit page is not for a voice call or, if additional parameters are associated with the page, a Layer 3 page message is tunnelled to the MS by the MSC/VLR. Upon receiving a page, the MS pauses the packet data session and leaves the packet data channel for a suitable DCCH. Broadcast information is provided on the packet control channel to assist the MS with a list of candidate DCCHs. Once on a DCCH, the MS sends a page response. The remaining call setup procedures, such as traffic channel designation, proceed as in a normal page response situation.

The signalling plane between a MS and the gateway MSC/VLR for the TIA/EIA-41 circuit switched network component is shown in Fig. 60.

##### **GSM evolved UMTS circuit switched network component**

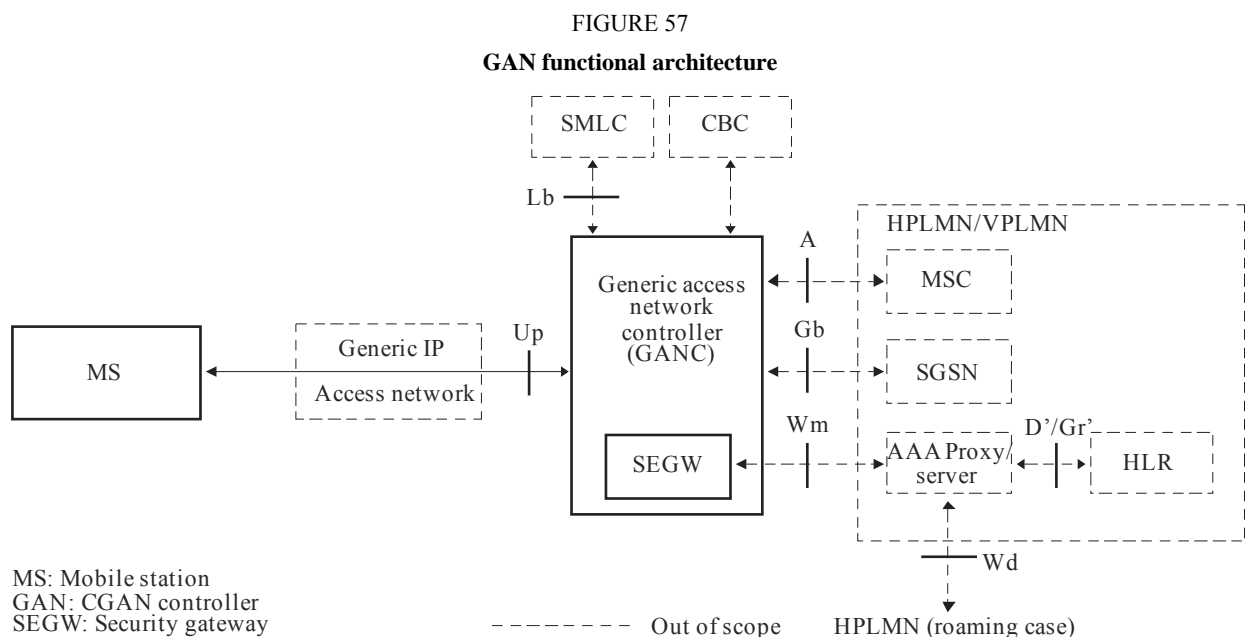

Figure 59 presents the network elements and the associated reference points that comprise a system utilizing the GSM evolved UMTS circuit switched network component along with the common GSM EDGE enhanced GPRS or EGPRS2 packet switched component.

Since the TDMA-SC network supports a common EDGE 136EHS bearer connected to a core enhanced GPRS backbone network or a GSM EDGE radio access network, along with either circuit switched component, GSM EDGE Release 5, Release 6, Release 7, and Release 8 mobile stations and functions are supported. In addition to the Gs interface, GSM SMS functionality is also supported through the Gd interface.

### Generic access network

GERAN Release 6 introduced Generic Access to the A/Gb interfaces, or GA, which is an extension of GSM/GPRS mobile services that is achieved by tunnelling Non Access Stratum (NAS) protocols between the MS and the Core Network over an IP network. GA is a complement to traditional GSM/GPRS/UTRAN radio coverage.

The Generic access network functional architecture is illustrated in Fig. 57.

M.1457-57

The main components of the GAN architecture are a Mobile Station (MS) with enhanced functionality and the Generic Access Network Controller (GANC). The GANC appears to the core network as a GERAN Base Station Subsystem (BSS). It includes a Security Gateway (SEGW) that terminates secure remote access tunnels from the MS, providing mutual authentication, encryption and data integrity for signalling, voice and data traffic.

A Generic IP Access network provides connectivity between the MS and the GANC. The IP transport connection extends from the GANC to the MS. A single interface, the Up interface, is defined between the GANC and the MS.

GAN provides co-existence with the GSM/GPRS Radio Access Network (GERAN) and interconnection with the Core Network (CN) via the standardized interfaces defined for GERAN A/Gb mode (A-interface for circuit switched services and Gb-interface for packet switched services). In addition, the Lb-interface provides support for location services and CBC-BSC interface supports cell broadcast services.

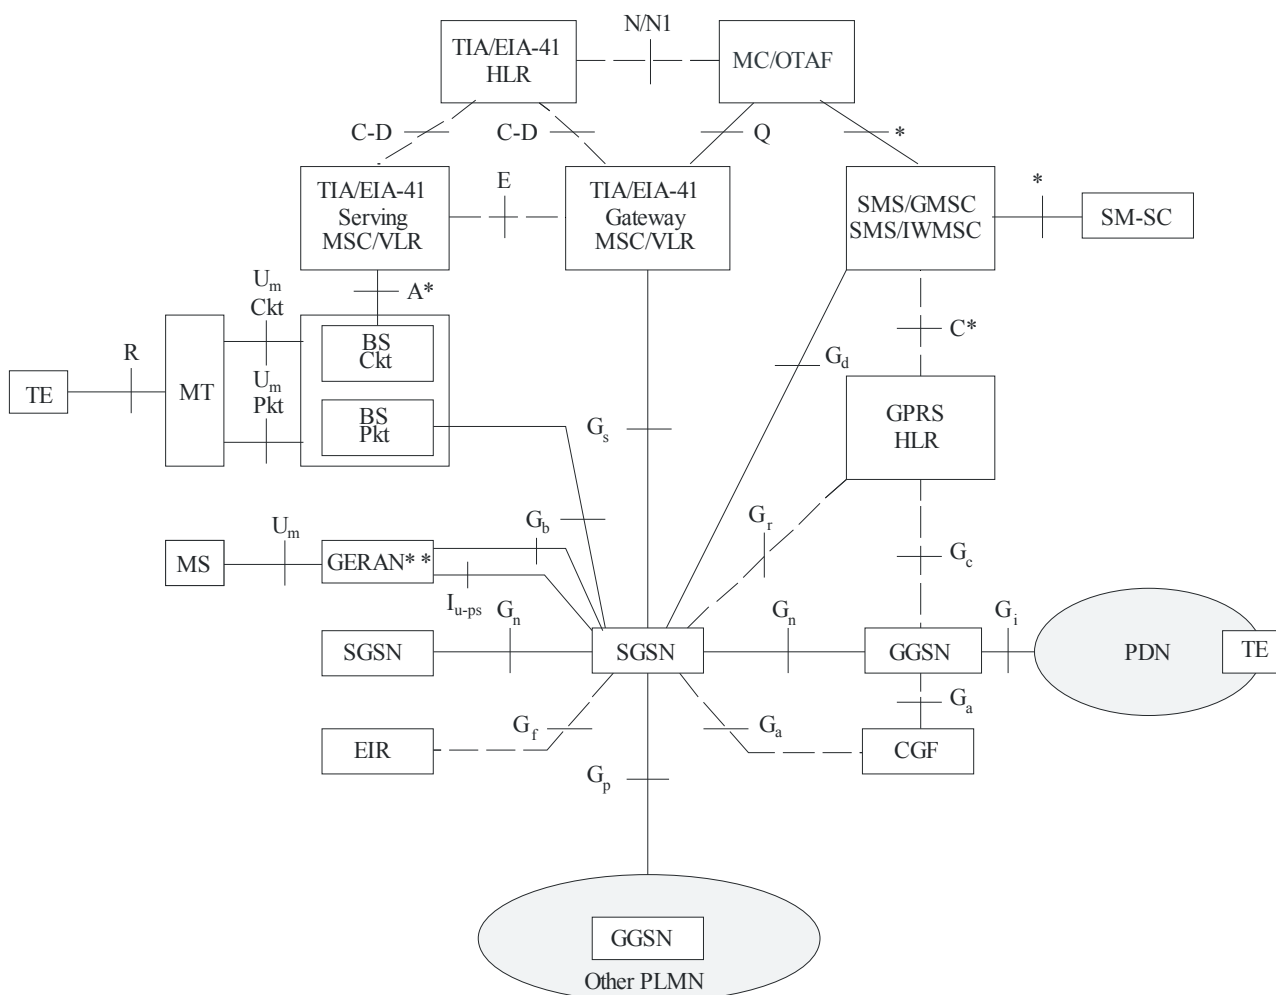

Transaction control (e.g. CC, SM) and user services are provided by the core network (e.g. MSC/VLR and the SGSN/GGSN).

Use of AAA server over the Wm interface is used to authenticate the MS when it sets up a secure tunnel. Note that only a subset of the Wm functionalities is required for the GAN application. As a minimum the GANC-SEGW shall support the Wm authentication procedures.

Indication of support for PS Services and of support for DTM is provided through appropriate signalling to the MS.

Enhancements to GAN provided in GERAN Release 7 are Seamless mobility for CS and for PS which includes real time conversational services (no disruption to downloads along with low latency and handover interruption), while development continues with GERAN Release 8. Transparent support for all services between UTRAN or GERAN, and GAN is provided along with reduced complexity for delivery of CS and PS services and transport efficiencies. Power consumption for the MS is also reduced.

Frequency Stability	Base Station: 0.05 ppm Mobile Station: 0.1 ppm	5.4.2.4.9

## 5.4.2 Detailed specification of the radio interface

The standards contained in this section are derived from the global core specifications for IMT-2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated: (1) The relevant SDOs should make their reference material available from their Web site. (2) This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

*Note by the Secretariat: In accordance with the established procedure for updating this Recommendation, the SDO's information regarding the development of standards transposed from the global core specifications will be submitted to ITU by 21 September 2012 and included in the sections below when the final text is sent out for approval.*

### 5.4.2.1 TIA/EIA-136/UWC-136

#### 5.4.2.1.1 136-000

##### List of parts

This part outlines the intended scope of the TIA/EIA-136 standard and details the list of parts comprising the current revision. The parts are organized into subgroups denoted by “nXX”. For example, group TIA/EIA-136-4XX contains parts 410, 420, 430 and 440.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-000	H	Published ANS	Apr 11	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

### 5.4.2.2 Identities, Code Assignments, and UIM Information

#### 5.4.2.2.1 136-005

##### Introduction, identification and semi-permanent memory

This part contains explanations of terms along with identity definition and selection as used in all of the parts.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-005	C	Published ANS	Jan 04	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.2.2 136-010****Optional mobile station facilities**

This part outlines optional mobile station facilities.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-010	C	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.2.3 136-020****SOC, BSMC, and other code assignments**

This part provides a list of the system operator codes (SOC), base station manufacturer codes (BSMC), carrier specific higher layer protocol identifiers, and broadcast air-interface transport service category assignments.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-020	E	Published ANS	Jan 04	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.2.4 136-030****R-UIM Overview and Operations**

This part provides an overview of the operation of the Removable User Identity Module as supported in TIA/EIA-136.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 99</b>					
TIA	TIA/EIA-136-030	A	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>
<b>Release 5</b>

#### 5.4.2.2.19 3GPP TS 11.11

##### Specification of SIM – ME Interface

This document describes the interface between the mobile equipment and the subscriber identity module. Standalone SIM functionality is not specified beyond Release 4. For the latest available information see section 5.4.2.13.41.

### 5.4.2.3 Channels

#### 5.4.2.3.1 136-100

##### Introduction to channels

This part provides the protocol reference model, the logical channel definitions, and the Layer 3 message mapping through Layer 2 to the physical layer.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-100	B	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.2 136-110

##### RF channel assignments

This part provides RF channel assignments for MS and BS.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-110	B-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.3 136-121

##### Digital control channel layer 1

This part describes the digital control channel (DCCH) Layer 1 including the frame structures and channel/subchannel descriptions.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-121	A	Published ANS	Nov 99	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.4 136-122

##### Digital control channel layer 2

This part provides the digital control channel (DCCH) Layer 2 service access points, protocols, and ARQ procedures, as well as requirements on the monitoring of radio link quality.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-122	B	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.5 136-123

##### Digital control channel layer 3

This part provides the digital control channel (DCCH) Layer 3 description, including the mobile station state diagram, detailed procedures (e.g. intelligent roaming), the Layer 3 message set, information element descriptions, and timer descriptions.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-123	H	Published ANS	Apr 11	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.6 136-131

##### Digital traffic channel layer 1

This part describes the digital traffic channel (DTC) Layer 1 including the channel structure, digital voice and data slot formats, modulation, and channel coding for the MS and BS.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-131	C	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.7 136-132

##### Digital traffic channel layer 2

This part describes Layer 2 for the digital traffic channel (DTC), which consists primarily of supervision information.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-132	0	Published ANS	Mar 99	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.3.8 136-133

##### Digital traffic channel layer 3

This part describes digital traffic channel (DTC) Layer 3, including discontinuous transmission, mobile assisted handoff, charging rate and total charge indication, MS control signalling and formats, smart antenna support, and per-slot power control.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-133	E	Published ANS	Jan 04	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.3.9 136-140****Analogue control channel**

This part describes the identification call processing, signalling formats, MS and BS requirements for the analogue control channel.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-140	B	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.3.10 136-150****Analogue voice channel**

This part includes descriptions of the modulation characteristics, charging indication, MS control, and signalling formats for the analogue voice channel.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-150	B	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.3.11 3GPP TS 45.001****Physical layer on the radio path; General description**

This document provides a general description of the organization of the physical layer for the 200 kHz channel.

<b>Release 8</b>					
ATIS	ATIS.3GPP.45.902V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
TIA	Included in TIA/EIA-136-370 as ETSI TR 145 902 v8.0.0	D-1	Published ANS	Aug 12	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.3.41 3GPP TS 43.026****Multiband operation of GSM/DCS 1800 by a single operator**

This document contains an overview of operation of GERAN at 900 MHz and 1 800 MHz by a single operator.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 6</b>					
ATIS	ATIS.3GPP.43.026V600-2008	6.0.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.43.026V700-2008	7.0.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.43.026V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.3.42 3GPP TS 43.059

##### Functional stage 2 description of Location Services (LCS) in GERAN

This document contains a stage 2 description of the location services provided in GERAN networks.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 6</b>					
ATIS	ATIS.3GPP.43.059V660-2008	6.6.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.43.059V730-2008	7.3.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.43.059V810-2010	8.1.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.4 Minimum performance

##### 5.4.2.4.1 136-210

##### ACELP minimum performance

This part details the BS minimum performance requirements for the ACELP vocoder.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-210	A	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

##### 5.4.2.4.2 136-220

##### VSELP minimum performance

This part details the minimum performance requirements for the VSELP vocoder. This standard includes a software distribution.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-220	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

##### 5.4.2.4.3 136-230

##### US1 minimum performance

This part details the BS minimum performance requirements for the US1 vocoder. This standard includes a software distribution.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-230	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.4 136-240****Minimum Performance for Adaptive Multi-rate Codec**

This part details the minimum performance requirements for the Adaptive Multi-Rate voice coder. This standard includes a software distribution.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-240	0	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.5 136-250****VAD Minimum Performance**

This part details the minimum performance requirements for the Voice Activity Detection feature. This standard includes a software distribution.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-250	0	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.6 136-270****Mobile stations minimum performance**

This part details definitions, methods of measurement, and MS minimum performance requirements operating 136+ bearers.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-270	C	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.7 136-271****Mobile stations minimum performance for Global Circulation**

This part details definitions, methods of measurement, and minimum performance requirements for 2 GHz Wireless1 mobile stations. Unless otherwise stated, these requirements apply only to digital operation, within the regulatory mandates of the European Union “Electromagnetic compatibility and Radio spectrum Matters (ERM); Base stations (BS) and user equipment (UE) for IMT-2000 Third Generation cellular networks; Part 8: Harmonized EN for IMT-2000 TDMA Single Carrier (UWC 136) (UE)” covering essential requirements of article 3.2 of the R&TTE Directive.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-271	0	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.8 136-280****Base stations minimum performance**

This part details definitions, methods of measurement, and BS minimum performance requirements operating 136+ bearers.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-280	D	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.9 136-290****RF Minimum performance requirements for 136HS Outdoor and 136HS Indoor bearers**

This part details the RF minimum performance requirements for BS and MS operating 136HS/136EHS Outdoor and 136HS Indoor bearers.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-290	A	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.4.10 3GPP TS 23.110****Universal Mobile Telecommunications System (UMTS) access stratum; Services and functions**

This document specifies the services provided by the Access Stratum to the rest of the GERAN/UMTS systems.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 5</b>					
ATIS	ATIS.3GPP.23.110V500-2005	5.0.0	Approved	Apr 05	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

<b>Release 8</b>					
ATIS	ATIS.3GPP.51.026V830-2010	8.3.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.5 Data services

##### 5.4.2.5.1 136-310

##### Radio link Protocol 1

This part specifies a radio link protocol (RLP1) that provides error recovery functions allowing Layer 3 functions to asynchronously transport data octets across a TDMA radio interface utilizing an underlying half-rate, full-rate, double-rate, or triple-rate digital traffic channel as specified in TIA-136-131, 132, and 133.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-310	A	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.5.2 136-320

##### Radio link Protocol 2

This part specifies a radio link protocol (RLP2) that allows Layer 3 functions to isochronously transport data octets across a TDMA radio interface utilizing an underlying half-rate, full-rate, double-rate, or triple-rate digital traffic channel as specified in TIA-136-131, 132, and 133.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-320	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.5.3 136-330

##### Packet-data service – Overview

This part provides an overview of the GPRS-136 packet data service. An overview of the network reference model, BS and MS protocols, channel types, and options are provided. In addition, an overview of the 30 kHz 136+ bearer is provided.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-330	0-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.5.4 136-331

##### Packet-data service – 136+ physical layer

This part provides the 30 kHz 136+ physical layer specification including slot formats, frame structure, modulation, and channel coding.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-331	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.5.5 136-332

##### Packet-data service – 136+ medium access control

This part provides the 30 kHz 136+ packet data MAC layer specification including MAC PDUs, transaction management, error recovery, and random access control.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-332	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.6 136-333****Packet-data service – Logical-link control**

This part defines the logical link control (LLC) layer protocol to be used for packet data transfer between the MS and serving GPRS support node (SGSN).

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-333	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.7 136-334****Packet-data service – Subnetwork dependent convergence protocol**

This part provides the description of the subnetwork dependent convergence protocol (SNDCCP). The user of the services provided by SNDCCP is a packet data protocol (PDP) at the MS or the relay at the serving GPRS support node (SGSN).

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-334	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.8 136-335****Packet-data service – Radio resource management**

This part specifies the radio resource management in a GPRS-136 packet data system. The entities in a GPRS-136 MS and BS that are used to achieve the goals of radio resource management are the radio resource management entity (RRME) and the broadcast management entity (BME) and are both described in this part.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-335	0-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.9 136-336****Packet-data service – Mobility management**

This part describes GPRS-136 mobility management and functions such as location tracking and user-identity confidentiality. The GPRS-136 packet data network combines TIA/EIA-41 circuit switched network elements with GPRS network elements.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-336	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.10 136-337****Packet-data service – Tunnelling of signalling messages**

This part specifies procedures to provide coordination between the TIA/EIA-136 circuit switched services controlled at the mobile switching centre (MSC)/visitors location register (VLR) and the GPRS-136 packet switched services controlled at the serving GPRS support node (SGSN).

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-337	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.11 136-340****Packet-data service – 136HS Outdoor overview**

This part provides an overview of the 200 kHz 136HS outdoor bearer.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-340	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.12 136-341****Packet-data service – 136HS Outdoor physical layer**

This part provides the 200 kHz 136HS Outdoor bearer physical layer specification including slot formats, frame structure, modulation, and channel coding.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-341	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.13 136-342****Packet-data service – 136HS Outdoor RLC/MAC**

This part provides the 200 kHz 136HS Outdoor bearer RLC/MAC layer specification including RLC blocks, MAC protocol data units (PDUs), transaction management, error recovery, and random access control.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-342	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.14 136-350****Data-service control**

This part provides a description of the user-network commands and responses used to access async data service, fax data service, and other services running over radio link protocol 1.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-350	C	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.15 136-351****EGPRS-136 AT Command Set**

This part describes of the user-network commands and responses used to access the EGPRS-136 packet data service.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-351	0	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.16 136-360****Packet-data service – 136HS Indoor overview**

This part provides an overview of the 1.6 MHz 136HS indoor bearer.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-360	0-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.17 136-361****Packet-data service – 136HS Indoor physical layer**

This part provides the 1.6 MHz 136HS Indoor bearer physical layer specification including slot formats, frame structure, modulation, and channel coding.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-361	0-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.18 136-362****Packet-data service – 136HS Indoor RLC/MAC**

This part provides the 1.6 MHz 136HS indoor bearer RLC/MAC layer specification including RLC blocks, MAC PDUs, transaction management, error recovery, and random access control.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-362	0-1	Approved	Apr 09	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.19 136-370****Enhanced General Packet Data Service (EGPRS-136) Overview**

This part provides an overview of the Enhanced General Packet Data Service (EGPRS-136).

ATIS	ATIS.3GPP.29.060V8150-2012	8.15.0	Approved	Jul 12	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
TIA	Included in TIA/EIA-136-370 as ETSI TS 129 060 v8.15.0	D-1	Published ANS	Aug 12	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.5.32 3GPP TS 01.61**

**GPRS ciphering algorithm requirements**

This document provides the requirements for the General Packet Radio ciphering algorithms. Standalone ciphering aspects for GSM GPRS are not specified beyond Release 4. For the latest available information see section 5.4.2.13.37.

#### 5.4.2.5.49 3GPP TR 49.995

##### General Packet Radio Service (GPRS); Interworking between modified Public Land Mobile Network (PLMN) supporting GPRS and legacy GPRS mobiles

This report describes issues relating to the GPRS specifications, which lead to the specifications being modified after the placement of GPRS compliant mobiles into the market place. Where possible the report clarifies any recommended measures which may be adopted by the GPRS infrastructure to enable interworking to be obtained between the GPRS infrastructure and legacy Mobile Station (MS) implementations of the GPRS specifications.

**Release 8**

ATIS ATIS.3GPP.49.995V800-2010 8.0.0 Approved Jul 10 <https://www.atis.org/docstore/default.aspx>

**5.4.2.6 Voice coders****5.4.2.6.1 136-410****ACELP**

This part gives a bit exact description of the ACELP speech and channel codec for a TIA enhanced full rate codec. The codec consists of a 7.4 kbit/s ACELP speech codec and two channel codecs (forward error correction): channel coding 1 (CC1) a 5.6 kbit/s channel codec and channel coding 2 (CC2), a 6.5 kbit/s channel codec. This standard includes a software distribution.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-410	0	Published ANS	Nov 99	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.6.2 136-420****VSELP**

The speech coding algorithm described in this part is a member of a class of speech codecs known as code excited linear predictive coding (CELP), stochastic coding or vector excited speech coding. These techniques use codebooks to vector quantize the excitation (residual) signal. The speech coding algorithm is a variation on CELP called vector-sum excited linear predictive coding (VSELP).

SDO (2)	Document No.	Version	Status	Issued date	Location (1)

**5.4.2.6.3 136-430****US1**

This part gives a bit exact description of an enhanced ACELP voice coder which runs over a 136+ 8-PSK DTC. The codec consists of a 12.2 kbit/s ACELP speech codec and a 7.75 kbit/s channel codec.

**5.4.2.6.13 3GPP TS 26.101****Mandatory speech codec speech processing functions; Adaptive Multi Rate (AMR) speech codec frame structure**

This document describes a generic frame format for the Adaptive Multi-Rate (AMR) speech codec and the Enhanced Full Rate (GSM-EFR) speech codec. This format is used as a common reference point when interfacing speech frames between different elements of the 3G system and between different systems. Appropriate mappings to and from this generic frame format is used within and between each system element.

**5.4.2.6.19 3GPP TS 26.226****Cellular text telephone modem; General description**

This document specifies the Cellular Text Telephone Modem (CTM) which allows reliable transmission of a text telephone conversation alternating with a speech conversation through the existing speech communication paths in cellular mobile phone systems. This reliability is achieved by an improved modulation technique, including error protection, interleaving and synchronization.

### 5.4.2.6.23 3GPP TS 26.244

#### Transparent end-to-end packet switched streaming service (PSS); 3GPP file format (3GP)

This document defines the 3GPP file format (3GP) as an instance of the ISO base media file format. The definition addresses 3GPP specific features such as codec registration and conformance within the MMS and PSS services. The 3GPP file format can contain timing, structure and media data for multimedia streams and is used by MMS and PSS for timed visual and aural multimedia.

**5.4.2.6.64 3GPP TS 26.204****Speech codec speech processing functions; Adaptive Multi Rate-Wideband (AMR-WB) Speech Codec; ANSI-C code**

This document contains an electronic copy of the ANSI\_C code for the Floating-point Adaptive Multi-Rate Wideband codec. This floating-point codec specification is mainly targeted to be used in multimedia applications or in packet-based applications. The bit-exact fixed-point ANSI-C code in 3GPP TS 26.173 remains the preferred implementation for all applications, but the floating-point codec may be used instead of the fixed-point codec when the implementation platform is better suited for a floating-point implementation.

**5.4.2.6.68 3GPP TS 26.290****Audio codec processing functions; Extended Adaptive Multi Rate-Wideband (AMR-WB+) speech codec; Transcoding functions**

This document describes the detailed mapping from input blocks of monophonic or stereophonic audio samples in 16 bit uniform PCM format to encoded blocks and from encoded blocks to output blocks of reconstructed monophonic or stereophonic audio samples. The coding scheme is an extension of the AMR-WB coding scheme and is referred to as extended AMR-WB or AMR-WB+ codec. It comprises all AMR-WB speech codec modes including VAD/DTX as well as extended functionality for encoding general audio signals such as music, speech, mixed, and other signals.

#### 5.4.2.6.70 3GPP TS 26.401

##### General audio codec audio processing functions; Enhanced aacPlus general audio codec; General description

This document describes the detailed mapping from an MPEG-4 bitstream containing Enhanced aacPlus coded audio to PCM sample output. The Enhanced aacPlus audio codec is based on the AAC, SBR and Parametric Stereo coding tools defined in the MPEG-4 Audio standard. In addition it includes further tools such as error concealment, spline resampler, and stereo-to-mono downmix. Also described is the detailed mapping from a PCM sample input to an MPEG-4 bitstream containing Enhanced aacPlus coded audio.

#### 5.4.2.6.81 3GPP TR 26.935

##### Packet Switched (PS) conversational Multimedia applications; Performance characterisation of default codecs

This document provides information on the performances of default speech codecs in packet switched conversational multimedia applications. The codecs under test are AMR-NB (Adaptive Multi-Rate Narrowband) and AMR-WB (Adaptive Multi-Rate Wideband). In addition, several ITU-T codecs (G.723.1, G.729, G.722 and G.711) are included in the testing. Experimental test results from the speech quality testing are reported to illustrate the behaviour of these codecs.

#### 5.4.2.6.84 3GPP TR 26.946

##### Multimedia Broadcast/Multicast Service (MBMS) user service guidelines

This document provides an overview of the MBMS System, and describes how the MBMS User Services use the MBMS Bearer Services and how MBMS user services can be built on top of the MBMS bearer service. The document describes the usage of the two delivery methods, streaming and download. Examples of applications using the download delivery method are news and software upgrades. Delivery of live music is an example of an application using the streaming delivery method.

**5.4.2.6.86 3GPP TS 45.914****Circuit switched voice capacity evolution for GSM/EDGE Radio Access Network (GERAN)**

The present document is an output of the 3GPP study item “Multi-User Reusing-One-Slot” (MUROS). It contains a section describing the objectives of the Circuit Switched Voice Capacity Evolution, and further sections presenting candidate techniques, which are evaluated according to their potential related to voice capacity improvement in GERAN. For this the design of a new set of training sequences with improved cross correlation properties to the existing set of training sequences is foreseen and expected to be evaluated. The study will also include the investigation of different optimized pulse shapes for MUROS for both the uplink and the downlink.

### 5.4.2.8 Teleservice transport

#### 5.4.2.8.1 136-610

#### R-DATA/SMDPP transport

This part describes the transport of TIA/EIA-136 teleservice messages using a combination of the R-DATA message air interface transport and the TIA/EIA-41 SMDPP transport.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-610	B	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.8.2 136-620

#### Teleservice segmentation and reassembly (TSAR)

This part describes teleservice segmentation and reassembly (TSAR). TSAR provides a mechanism to deliver TIA/EIA-136 teleservice messages that are not constrained by any message length limitations imposed by the air interface, or network layers supporting the teleservice. The service consists of the application of segmentation and reassembly, and retransmission of errored segments.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-620	A	Published ANS	May 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.8.3 136-630

#### Broadcast teleservice transport – Broadcast air-interface transport service (BATS)

This part describes a broadcast teleservice transport. The BATS teleservice transport operates between a teleservice server and MS using both TIA/EIA-136 and TIA/EIA-41 based protocol stacks along with relay functions in the BS, mobile switching centre and interworking function.

BATS is a general-purpose broadcast transport mechanism that can be used by existing teleservices as well as other future teleservices/applications requiring broadcast transport support.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-630	0	Published ANS	Nov 99	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.8.4 136-670

#### Teleservice over GSM SMS (TOGS)

This part describes support of TIA/EIA-136 teleservices over a GSM Short Message Service delivery mechanism.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-670	0	Published ANS	May 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.9 Teleservices

##### 5.4.2.9.1 136-700

#### Introduction to teleservices

This part provides an introduction to TIA/EIA-136 based teleservices including the teleservice protocol stack, transport, and higher layer protocol identifiers.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-700	D	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

##### 5.4.2.9.2 136-710

#### Short message service – Cellular messaging teleservice

This part describes the procedures, message set, and information elements necessary to provide short message service in TIA/EIA-136 based systems.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-710	C	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

##### 5.4.2.9.3 136-711

#### GSM Hosted SMS Teleservice (GHOST)

This part describes the procedures, message set, and information elements necessary to deliver GSM SMS Protocol Data Units (PDUs) to and from a mobile station operating in a TIA/EIA-136 network.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-711	0	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.9.4 136-720

##### Over-the-air activation teleservice (OATS)

This part describes a teleservice that is designed to support over-the-air activation (OTA). The over-the-air activation teleservice (OATS) supports data exchange between a MS and a customer service centre (CSC)/over-the-air activation function (OTAF) which enables downloading information to the MS number assignment module.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-720	C	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.9.5 136-730

##### Over-the-air programming teleservice (OPTS)

This part describes a teleservice that is designed to support downloading of non-NAM programming information (e.g. intelligent roaming database or IRDB) to an MS. The over-the-air programming teleservice (OPTS) provides a sequence of messages exchanged between the over-the-air service provisioning function (OTASP) and the MS for the delivery of information.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-730	A	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

#### 5.4.2.9.6 136-740

##### System Assisted Mobile Positioning through Satellite (SAMPS)

This part describes a teleservice that facilitates the exchange of information between a network entity and a mobile station to provide geographic positioning.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-740	0	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.9.7 136-741****System Assisted Mobile Positioning through Satellite (SAMPS) in Analog Systems**

This part describes the procedures, signaling, and transport on analog channels (ACC, AVC) that facilitates the exchange of information between a network entity and a mobile station to provide geographic positioning.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-741	0	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.9.8 136-750****General UDP transport service (GUTS)**

This part describes the general UDP transport service (GUTS), which is a teleservice to support the transport of user datagram protocol (UDP) PDUs between a teleservice server and an MS.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-750	0	Published ANS	Nov 99	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.9.9 136-760****Charge indication teleservice (CIT)**

This part describes a teleservice that is designed to provide the MS user with charge information for a call.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-760	A	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.9.10 3GPP TS 22.011****Service Accessibility**

This document describes the service access procedures as presented to the user.

<b>Release 8</b>					
ATIS	ATIS.3GPP.43.246V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

### 5.4.2.9.29 3GPP TS 26.141

#### IP Multimedia System (IMS) Messaging and Presence; Media formats and codecs

This document defines the minimal baseline and optional media codecs and message container format to be used by IMS Messaging and associated Presence service.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 6</b>					
ATIS	ATIS.3GPP.26.141V630-2007	6.3.0	Approved	Oct 07	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.26.141V710-2008	7.1.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.26.141V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

### 5.4.2.10 Annexes/Appendices

#### 5.4.2.10.1 136-900

##### Introduction to Annexes and Appendices

This part contains information concerning the 900 series of parts which contain additional normative and informative information related to the TIA/EIA-136 standard.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-900	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.2 136-905****Normative information**

This part contains additional normative information related to the TIA/EIA-136 standard.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-905	A	Published ANS	Jan 04	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.3 136-910****Informative information**

This part provides additional informative information to aid the user to understand the use or application of the TIA/EIA-136 standard. Information such as frame formats, calculation of R\_DATA message lengths and addressing is provided.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-910	C	Published ANS	Apr 02	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.4 136-932****Packet-data service – Stage 2 description**

This informative part of TIA/EIA-136 contains stage 2 descriptions for the GPRS-136 packet data service. It describes the main traffic scenarios and the message flows between different network elements.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-932	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.5 136-933****Packet-data service – Fixed coding mode MAC**

This part describes the fixed-coding mode of the 136+ medium access control (MAC) function specified in TIA/EIA-136-332. Higher layers may use the MAC to transport data across a GPRS-136 radio interface using the 136+ bearer.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-933	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.6 136-940****Capacity and performance characteristics of UWC-136**

This informative part contains additional information concerning the voice capacity, spectrum efficiency, and throughput performance for the UWC-136 system.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-940	0	Published ANS	Mar 00	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.10.7 136-972****Enhanced General Packet Data Service (EGPRS-136) Stage 2 Description**

This informative part provides a Stage-2 description of the Enhanced General Packet Data Service (EGPRS\_136).

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
TIA	TIA/EIA-136-972	0	Published ANS	Apr 01	<a href="http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access">http://www.tiaonline.org/standards/strategic-initiatives/code-division-multiple-access</a>

**5.4.2.11 Other Procedures and Signalling****5.4.2.11.1 3GPP TS 23.007****Restoration procedures**

This document describes the restoration procedures for the Location Register (HLR or VLR) data.

ATIS	ATIS.3GPP.23.292V880-2012	8.8.0	Approved	Jul 12	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.35 3GPP TS 23.327

##### Mobility between 3GPP-Wireless Local Area Network (WLAN) interworking and 3GPP systems

This document specifies the stage 2 system description for providing mobility between 3GPP Wireless Local Area Network Interworking (I\_WLAN) and 3GPP Systems. It is to define a technical solution based on the working principles of DSMIPv6 with necessary enhancement of the I\_WLAN architecture for supporting mobility and roaming between 3GPP\_WLAN Interworking system and 3GPP Systems so that ongoing 3GPP PS based services can be maintained with minimal impact on the end-user's perceived quality on the services at a change of the access network (between I\_WLAN and 3GPP Access Systems).

<b>Release 8</b>					
ATIS	ATIS.3GPP.23.327V840-2010	8.4.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.36 3GPP TR 23.840

##### Study into routeing of MT-SMs via the HPLMN

This document provides a study into the current core network architecture for inter-PLMN short message delivery and provides a study into how such an architecture can be improved for the modern day. Wherever possible, backwards compatibility is maintained and impacts are only upon the home network of the destined subscriber.

<b>Release 7</b>					
ATIS	ATIS.3GPP.23.840V710-2008	7.1.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.37 3GPP TR 23.892

##### IP Multimedia Subsystem (IMS) centralized services

This document contains the results of the feasibility study into the architectural requirements and alternatives for the delivery of consistent services to the user mainly via IMS centralized services regardless of the attached access type; e.g. CS domain access or IP-CAN. Considerations include overall requirements, architectural requirements, alternative architectures and evaluation of potential architectural solutions.

#### 5.4.2.11.38 3GPP TR 23.919

##### Direct tunnel deployment guidelines

This document provides the deployment guidelines for the use of direct tunneling of user plane data between the RNC and the GGSN (earlier known as the One Tunnel approach).

These guidelines highlight the impacts of the 3GPP Release 7 Direct Tunnel solution to the current UMTS system in order to guide equipment development and network deployment.

<b>Release 5</b>					
ATIS	ATIS.3GPP.29.329V5110-2006	5.11.0	Approved	Apr 06	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 6</b>					
ATIS	ATIS.3GPP.29.329V670-2007	6.7.0	Approved	Oct 07	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.29.329V780-2009	7.8.0	Approved	Jul 09	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.29.329V880-2012	8.8.0	Approved	Jul 12	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

**5.4.2.11.61 3GPP TS 29.364****IP Multimedia Subsystem (IMS) Application Server (AS) service data descriptions for AS interoperability**

This specification standardizes the structure and the coding of the service data that are transported over the Sh interface between an Application Server supporting Multimedia Telephony supplementary services as defined in 3GPP TS 22.173 and the HSS. Two optional formats are specified. One is based on a binary coding of the service data and supports the subset of MMTEL services corresponding to PSTN/ISDN and CS supplementary services. The other uses an XML format and supports the full set of MMTEL Services.

#### 5.4.2.11.63 3GPP TS 43.318

##### Generic Access Network (GAN); Stage 2

This document describes the overall architecture for a Generic Access Network (GAN). It describes the system concepts, documents the reference architecture, functional entities, network interfaces, and high-level procedures of GAN.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 6</b>					
ATIS	ATIS.3GPP.43.318V6120-2008	6.12.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.43.318V750-2008	7.5.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.43.318V840-2010	8.4.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.64 3GPP TS 43.902

##### Enhanced Generic Access Networks (EGAN) study

The present document contains the results of the feasibility study into the enhancements to Generic Access Networks or GAN. Considerations include overall requirements for enhancements, architectural requirements, evaluation of potential architectural solutions and alternative architectures.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 8</b>					
ATIS	ATIS.3GPP.43.902V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.65 3GPP TS 43.903

##### A-Interface over IP study (AINTIP)

The present document contains the result from the study of introduction of support for A-interface over IP. High level areas that are studied are e.g. potential placement of transcoders in the core network, effective bandwidth utilization at the A-interface, impact on call related messages, payload formats.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 8</b>					
ATIS	ATIS.3GPP.43.903V830-2010	8.3.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.11.66 3GPP TS 44.318

##### Generic access Network (GAN); Mobile GAN interface layer 3 specification

This document describes the procedures used over a generic access interface, namely the Up interface. It specifies the handling of secure connection, Discovery and Registration, CS domain and PS domain signalling and voice and data. These procedures are defined in terms of messages exchanged over a generic access interface.

#### 5.4.2.12.15 3GPP TS 48.071

### Location Services (LCS); Serving Mobile Location Centre – Serving Base Station System (SMLC – BSS) Interface; Layer 3 specification

This document contains the SMLC-BSS layer 3 specification for location services.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 99</b>					
ATIS	ATIS.3GPP.08.71V860-2008	8.6.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 5</b>					
ATIS	ATIS.3GPP.48.071V520-2007	5.2.0	Approved	Oct 07	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 6</b>					
ATIS	ATIS.3GPP.48.071V690-2007	6.9.0	Approved	Oct 07	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.48.071V720-2008	7.2.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.48.071V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

#### 5.4.2.12.16 3GPP TS 48.103

### Base Station System – Media GateWay (BSS-MGW) interface; User plane transport mechanism

The present document specifies the User Plane data transport protocols used between BSSs and the Core Network (MGWs) across the A interface. The main purpose of the present document is the AoIP description, however for the sake of completeness the AoTDM case is described as well.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 8</b>					
ATIS	ATIS.3GPP.48.103V830-2012	8.3.0	Approved	Jul 12	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

**5.4.2.12.17 3GPP TS 49.008****Application of the Base Station System application part (BSSAP) on E interface**

This document describes the BSSAP protocol on the E interface.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 99</b>					
ATIS	ATIS.3GPP.09.08V820-2005	8.2.0	Approved	Apr 05	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 5</b>					
ATIS	ATIS.3GPP.49.008V510-2005	5.1.0	Approved	Apr 05	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 6</b>					
ATIS	ATIS.3GPP.49.008V610-2006	6.1.0	Approved	Apr 06	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.49.008V700-2008	7.0.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.49.008V811-2010	8.1.1	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

**5.4.2.12.18 3GPP TS 49.031****Location Services (LCS); Base Station System application part LCS extension (BSSAP-LE)**

This document describes the LCS extension to the BSS application part.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 99</b>					
ATIS	ATIS.3GPP.09.31V871-2005	8.7.1	Approved	Apr 05	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 5</b>					
ATIS	ATIS.3GPP.49.031V540-2005	5.4.0	Approved	Apr 05	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 6</b>					
ATIS	ATIS.3GPP.49.031V650-2006	6.5.0	Approved	Apr 06	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.49.031V760-2008	7.6.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.49.031V810-2010	8.1.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

**5.4.2.12.19 3GPP TS 23.226****Global text telephony (GTT); Stage 2;**

This document gives the stage 2 description of the architecture of the real time Text Conversation Feature called Global Text Telephony, GTT and identifies the functional capabilities needed to support the service.

<b>Release 7</b>					
ATIS	ATIS.3GPP.23.271V7100-2010	7.10.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.23.271V810-2010	8.1.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

### 5.4.2.12.22 3GPP TS 24.030

#### Location Services (LCS); Supplementary service operations; Stage 3

This document gives the stage 3 description of the Location Service (LCS) operations for the mobile station. These operations apply to both CS and PS domain.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 5</b>					
ATIS	ATIS.3GPP.24.030V510-2006	5.1.0	Approved	Apr 06	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 6</b>					
ATIS	ATIS.3GPP.24.030V640-2007	6.4.0	Approved	Oct 07	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.24.030V720-2008	7.2.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 8</b>					
ATIS	ATIS.3GPP.24.030V800-2010	8.0.0	Approved	Jul 10	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

### 5.4.2.12.23 3GPP TR 25.901

#### Network Assisted Cell Change (NACC) from UTRAN to GERAN; Network side aspects

This document gives the stage 3 description of the Location Service (LCS) operations for the mobile station. These operations apply to both CS and PS domain.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
<b>Release 6</b>					
ATIS	ATIS.3GPP.25.901V610-2008	6.1.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>
<b>Release 7</b>					
ATIS	ATIS.3GPP.25.901V700-2008	7.0.0	Approved	Oct 08	<a href="https://www.atis.org/docstore/default.aspx">https://www.atis.org/docstore/default.aspx</a>

### 5.4.2.13 Other System aspects

The IMT-2000 TDMA-SC specification also includes the following documents which are useful and related to this Recommendation.

#### 5.4.2.13.1 3GPP TS 22.002

##### Circuit bearer services (BS) supported by a Public Land Mobile Network (PLMN)

This document describes the services supported by the circuit switched bearer on the 200 kHz channel.

**5.4.2.13.2 3GPP TS 22.048****Security mechanisms for the (U)SIM Application Toolkit; Stage 1**

This document provides functional description for the security mechanisms employed for the SIM or USIM Application Toolkit.

**5.4.2.13.3 3GPP TS 22.053****Tandem Free Operation (TFO); Service Description; Stage 1**

This document provides a stage 1 description for vocoder tandem free operation.

**5.4.2.13.4 3GPP TS 22.057****Mobile Execution Environment (MExE); Stage 1 description**

This document provides a stage 1 functional description of the mobile execution environment.

**5.4.2.13.5 3GPP TS 22.066****Support of Mobile Number portability (MNP); Service description; Stage 1**

This document provides a stage 1 description of mobile number portability.

**5.4.2.13.6 3GPP TS 22.067****Enhanced Multi-level Precedence and Pre-emption (eMLPP) service; Stage 1**

This document provides a stage 1 description of the enhanced multi-level precedence and pre-emption (eMLPP) function, which provides different call priorities in combination with fast set-up and pre-emption.

**5.4.2.13.7 3GPP TS 22.071****Location Services (LCS); Service description; Stage 1**

This document provides a stage 1 description of location services.

**5.4.2.13.8 3GPP TS 22.072****Call deflection (CD) service description; Stage 1**

This document provides a stage 1 description of the call deflection supplementary service.

**5.4.2.13.9 3GPP TS 22.078****Customised Applications for Mobile network Enhanced Logic (CAMEL); Service description; Stage 1**

This document provides a stage 1 description of the CAMEL functionality.

**5.4.2.13.10 3GPP TS 22.079****Support of Optimal Routing (SOR); Service definition; Stage 1**

This document provides a stage 1 of the optimal routing function.

**5.4.2.13.11 3GPP TS 22.081****Line Identification Supplementary service; Stage 1**

This document provides a stage 1 description of the calling line identification supplementary service.

**5.4.2.13.12 3GPP TS 22.082****Call Forwarding (CF) Supplementary services; Stage 1**

This document provides a stage 1 description of the call forwarding supplementary service.

**5.4.2.13.13 3GPP TS 22.083****Call Waiting (CW) and Call Hold (HOLD); Supplementary services; Stage 1**

This document provides a stage 1 description of the call waiting and call hold supplementary service.

**5.4.2.13.14 3GPP TS 22.084****Multi-party (MPTY) Supplementary service; Stage 1**

This document provides a stage 1 description of the multi-party supplementary service.

**5.4.2.13.15 3GPP TS 22.085****Closed User Group (CUG) Supplementary services; Stage 1**

This document provides a stage 1 description of the multi-party supplementary service.

**5.4.2.13.16 3GPP TS 22.086****Advice of Charge (AoC) Supplementary services; Stage 1**

This document provides a stage 1 description of the advice of charge supplementary service.

**5.4.2.13.17 3GPP TS 22.087****User-to-User Signalling (UUS) Service description; Stage 1**

This document provides a stage 1 description of the user-to-user signalling supplementary service.

**5.4.2.13.18 3GPP TS 22.088****Call Barring (CB)Supplementary services; Stage 1**

This document provides a stage 1 description of the call barring supplementary service.

**5.4.2.13.19 3GPP TS 22.090****Unstructured Supplementary Service Data (USSD); Stage 1**

This document provides a stage 1 description of unstructured supplementary service data.

**5.4.2.13.20 3GPP TS 22.091****Explicit call transfer (ECT) Supplementary Service; Stage 1**

This document provides a stage 1 description of the explicit call transfer supplementary service.

**5.4.2.13.21 3GPP TS 22.093****Completion of Calls to Busy Subscriber (CCBS); Service description; Stage 1**

This document provides a stage 1 service description of the explicit call transfer supplementary service.

**5.4.2.13.22 3GPP TS 22.094****Follow me Service description; Stage 1**

This document provides a stage 1 description of the follow me supplementary service.

**5.4.2.13.23 3GPP TS 22.096****Name Identification Supplementary Services; Stage 1**

This document provides a stage 1 description of the name identification supplementary service.

**5.4.2.13.24 3GPP TS 22.097****Multiple Subscriber Profile (MSP) phase 2; Service description; Stage 1**

This document provides a stage 1 service description of the phase 1 multiple subscriber profile service.

**5.4.2.13.25 3GPP TS 22.226****Global Text Telephony (GTT); Stage 1**

This document provides a stage 1 service description of the Global text telephony service.

**5.4.2.13.26 3GPP TS 22.228****Service requirements for the Internet Protocol (IP) Multimedia Core Network Subsystem (IMS); Stage 1**

This document provides the stage 1 service requirements of the IP Multimedia Subsystem.

**5.4.2.13.27 3GPP TS 23.121****Architectural requirements for Release 99**

This document provides architectural requirements for Release 99.

**5.4.2.13.28 3GPP TS 23.221****Architectural requirements**

This document provides architectural requirements for GERAN and UTRAN Releases 5, 6, 7 and 8.

**5.4.2.13.29 3GPP TS 23.236****Intra-domain connection of Radio Access Network (RAN) nodes to multiple Core Network (CN) nodes**

This document describes the connection of RAN nodes to multiple CN nodes such as MSCs.

**5.4.2.13.30 3GPP TS 29.278****Customized Applications for Mobile network Enhanced Logic (CAMEL) Phase 4; CAMEL Application part (CAP) specification for IP Multimedia Subsystems (IMS)**

This document describes the CAMEL application part for IP multimedia subsystems.

**5.4.2.13.31 3GPP TS 41.031****Fraud information gathering system (FIGS);Service requirements; Stage 0**

This document provides a description of the fraud information gathering system for the GSM/EDGE system.

**5.4.2.13.32 3GPP TS 41.033****Lawful interception requirements for GSM/EDGE**

This document provides a description of the lawful interception requirements the GSM/EDGE system.

**5.4.2.13.33 3GPP TS 42.019****Subscriber Identity Modules, Application programming interface; Stage 1**

This document provides the functional description for the SIM Application Programming Interface (API) used in the GSM/EDGE specifications.

**5.4.2.13.34 3GPP TS 22.031****3G Security; Fraud information gathering system (FIGS); Service description; Stage 1**

This document provides a stage 1 description of the fraud information gathering system for GERAN/UTRAN systems.

**5.4.2.13.35 3GPP TS 42.033****Lawful interception; Stage 1**

This document provides a stage 1 description of the lawful interception functions for the GSM/EDGE system.

**5.4.2.13.36 3GPP TS 43.030****Radio network planning aspects**

This document describes the aspects of planning a radio network.

**5.4.2.13.37 3GPP TS 41.061****GPRS ciphering algorithm requirements**

This document provides the requirements for the General Packet Radio ciphering algorithms.

**5.4.2.13.38 3GPP TS 42.009****Security aspects**

This document provides a description of the security aspects for the GSM/EDGE system.

**5.4.2.13.39 3GPP TS 42.017****Subscriber Identity Modules, Functional characteristics**

This document defines the functional characteristics for the SIM used in the GSM/EDGE specifications.

**5.4.2.13.40 3GPP TS 51.010-4****Mobile Station conformance specification, Part 4- SIM Application Toolkit conformance specification**

This document provides a conformance specification for the SIM Application toolkit

**5.4.2.13.41 3GPP TS 51.011****Specification of SIM-ME interface**

This document describes the interface between the mobile equipment and the subscriber identity module.

**5.4.2.13.42 3GPP TS 31.122****USIM conformance test specification**

This document provides a conformance specification for the USIM.

**5.4.2.13.43 3GPP TS 22.048****Security mechanisms for the (U)SIM application toolkit; Stage 1**

This document provides the stage 1 description of the security mechanisms for the SIM/USIM application toolkits for GERAN/UTRAN systems.

**5.4.2.13.44 3GPP TS 23.031****3G Security; Fraud Information Gathering System (FIGS); Technical realization; Stage 2**

This document provides the stage 2 description of the fraud information gathering system for GERAN/UTRAN systems.

**5.4.2.13.45 3GPP TS 23.066****Support of GSM Mobile Number Portability (MNP); Stage 2**

This document provides the stage 2 description of the GSM mobile number portability functionality.

**5.4.2.13.46 3GPP TS 23.278****Customised Applications for Mobile network Enhanced Logic (CAMEL) Phase 4; Stage 2; IM CN Interworking**

This document specifies the stage 2 description for the Customized Applications for Mobile network Enhanced Logic (CAMEL) feature which provides the mechanisms to support services for the IP Multimedia Core Network (IM CN) Subsystem.

**5.4.2.13.47 3GPP TS 24.002****GSM-UMTS Public Land Mobile Network (PLMN) Access Reference Configuration**

This document describes the reference configuration for access to a PLMN. A user accesses a PLMN via a number of interfaces, including the MS-BS (in A/Gb mode and GERAN Iu mode) and UE-UTRAN (in UTRAN Iu mode) interface. The purpose of this document is to indicate the possible access arrangements that may be used in conjunction with the MS-BS (in A/Gb mode and GERAN Iu mode) and UE-UTRAN (in UTRAN Iu mode) interface.

**5.4.2.13.48 3GPP TS 31.103****Characteristics of the IP Multimedia Services Identity Module (ISIM) application**

This document defines the IP Multimedia Services Identity Module (ISIM) application. This application resides on the UICC IC card. In particular, this document specifies the application independent properties of the UICC/terminal interface such as the physical characteristics and the logical structure.

**5.4.2.13.49 3GPP TS 31.116****Remote APDU Structure for (Universal) Subscriber Identity Module (U)SIM Toolkit applications**

This document defines the remote management of files and applets on the SIM/USIM/ISIM. The present document is the result of a split of TS 23.048 Release 5 between the generic part and the bearers specific application. The generic part has been transferred to SCP. This document contains the bearers specific part.

**5.4.2.13.50 3GPP TS 31.130****(U)SIM Application Programming Interface (API); (U)SIM API for Java Card**

This document defines the (U)SIM Application Programming Interface extending the “UICC API for Java Card™” which allows the development of a (U)SAT application running together with a (U)SIM application and using GSM/3G network features.

**5.4.2.13.51 3GPP TS 34.131****Test Specification for C-language binding to Universal Subscriber Identity Module (U)SIM Application Programming Interface (API)**

This document describes the technical characteristics and methods of test for testing the SIM API for the C programming language 3GPP TS 31.131 implemented in the subscriber identity modules for GSM and 3G networks.

**5.4.2.13.52 3GPP TS 42.068****Voice Group Call Service (VGCS); Stage 1**

This document contains the stage one description of the Voice Group Call Service (VGCS) which allows speech conversation of a predefined group of service subscribers in half duplex mode on the radio link taking into account multiple mobile service subscribers involved in the VGCS call per cell.

**5.4.2.13.53 3GPP TS 42.069****Voice Broadcast Service (VBS); Stage 1**

This document contains the stage one description of the Voice Broadcast Service (VBS) which allows the distribution of speech (or other signals which can be transmitted via the speech codec), generated by a service subscriber, into a predefined geographical area to all or a group of service subscribers located in this area.

**5.4.2.13.54 3GPP TS 43.068****Voice Group Call Service (VGCS); Stage 2**

This document contains the stage 2 description of the Voice Group Call Service (VGCS) which allows speech conversation of a predefined group of service subscribers in half duplex mode on the radio link taking into account multiple mobile service subscribers involved in the VGCS call per cell.

**5.4.2.13.55 3GPP TS 43.069****Voice Broadcast Service (VBS); Stage 2**

This document contains the stage2 description of the Voice Broadcast Service (VBS) which allows the distribution of speech (or other signals which can be transmitted via the speech codec), generated by a service subscriber, into a predefined geographical area to all or a group of service subscribers located in this area.

**5.4.2.13.56 3GPP TS 43.130****Iur-g interface; Stage 2**

This document provides an overview of the Iur-g interface. It describes the motivation, principles and functionality of this interface.

## 5.5 IMT-2000 FDMA/TDMA

### 5.5.1 Overview of the radio interface

#### 5.5.1.1 Introduction

The IMT-2000 radio interface specifications for FDMA/TDMA technology are defined by a set of ETSI standards. This radio interface is called digital enhanced cordless telecommunications (DECT).

Figure 61 shows the layers of this radio interface.

The individual layers are defined in different parts of the common interface (CI) standard. The standard specifies a TDMA radio interface with TDD. The radio-frequency bit rates for the specified modulation schemes are 1.152 Mbit/s, 2.304 Mbit/s, 3.456 Mbit/s, 4.608 Mbit/s and 6.912 Mbit/s. The standard supports symmetric and asymmetric connections, connection oriented and connectionless data transport. Using multi-carrier-operation with, e.g. 3 carriers allows bit rates up to 20 Mbit/s. The network layer contains the protocols for call control, supplementary services, connection oriented message service, connectionless message service and mobility management, including the security and confidentiality services.

FIGURE 61

#### Protocol layered structure

Network (NWK) Layer (3)
Data Link Control (DLC) Layer (2b)
Medium Access Control (MAC) Layer (2a)
Physical Layer (PHL) (1)

M.1457-61

In addition to the CI standard, access profile standards define minimum requirements for accessing specific networks and the interworking to these networks. For example, the generic access profile (GAP) standard defines the requirements when using the speech service and the DECT packet radio service (DPRS) standard defines the requirements for packet data transport.

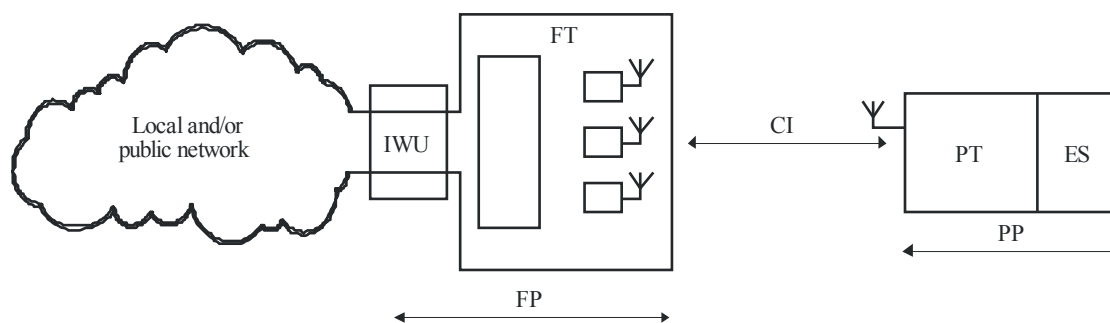

A high-level description of features and how the relevant ETSI standards interrelate to the different applications can be found in the ETSI Technical Report TR 101 178: – A high-level guide to the DECT standardization.

This radio interface is a general radio access technology for wireless telecommunications. It is a high capacity digital technology, for wide cell radii ranging from a few metres to several kilometres, depending on application and environment. It provides telephony quality voice services, and a broad range of data services, including ISDN and packet data. It can be effectively implemented in a range from simple residential cordless telephones up to large systems providing a wide range of telecommunications services, including fixed wireless access.

#### 5.5.1.2 General access technology

This technology provides a comprehensive set of protocols which provide the flexibility to interwork between numerous different applications and networks. Thus a local and/or public network is not part of this specification. Figure 62 illustrates this.

FIGURE 62  
The CI structure

M.1457-62

The radio interface covers, in principle, only the air interface between the fixed part (FP) and portable part (PP). The interworking unit (IWU) between a network and the fixed radio termination (FT) is network specific and is not part of the CI specification, but the profile specifications define IWUs for various networks. Similarly, the end system (ES), the application(s) in a PP is also excluded. The CI specification contains general end-to-end compatibility requirements, e.g. on speech transmission. The IWU and ES are also subject to general attachment requirements for the relevant public network, e.g. the PSTN/ISDN.

NOTE 1 – An ES depends on the application supported in a PP. For a speech telephony application the ES may be a microphone, speaker, keyboard and display. The ES could equally well be a serial computer port, a fax machine or whatever the application requires.

For each specific network, local or global, the specific services and features of that network are made available via the air interface to the users of PPs/handsets. Except for cordless capability and mobility, this standard does not offer a specific service; it is transparent to the services provided by the connected network.

Thus the CI standard is, and has to be, a tool box with protocols and messages from which a selection is made to access any specific network, and to provide means for market success for simple residential systems as well as for much more complex systems, e.g. office ISDN services.

IMT-2000 FDMA/TDMA is very suitable to be used as radio access system to connect to mobile networks. Specifically the access to GSM/UMTS networks has been specified in detail, which allows the provision of GSM/UMTS services via DECT. The multipart TS 101 863 contains the UMTS interworking specification.

The detailed requirements that have governed the standardization efforts of this interface are provided by the ETR 043 – DECT Common Interface Services and Facilities Requirements Specification – where one requirement is flexibility for additions and evolutionary applications. The CI standard has a layered structure as indicated in § 5.5.2. It contains a complete set of requirements, procedures and messages. The messages also contain codes that are reserved for evolutionary applications and proprietary extensions. The authentication algorithm and the encryption algorithm are not part of the CI standard, but are obtained from ETSI through a special legal procedure. The administration of global unique identity codes for manufacturing, installation and public operation are also handled by ETSI.

### 5.5.1.3 Summary of the physical layer

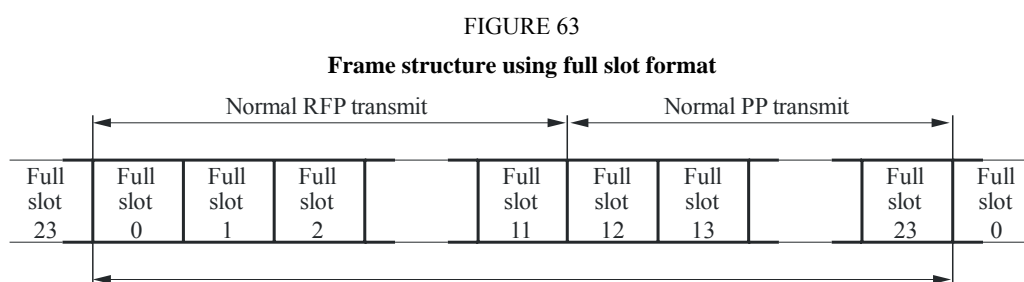

The specification for the physical layer is given in § 5.5.2.1. The tasks of the physical layer can be grouped into five categories:

- to modulate and demodulate radio carriers with a bit stream of a defined rate to create a radio frequency channel;

- to acquire and maintain bit and slot synchronization between transmitters and receivers;
- to transmit or receive a defined number of bits at a requested time and on a particular frequency;
- to add and remove the synchronization field and the Z-field used for rear end collision detection;
- to observe the radio environment to report signal strengths.

**5.5.1.3.1 The physical channels**

The radio access frequency channels as well as a time structure are defined. The carrier spacing is 1.728 MHz. To access the medium in time, a regular TDMA structure with a frame length of 10 ms is used. Within this frame 24 full-slots are created, each consisting of two half-slots. A double slot has a length of two full slots, and starts concurrently with an even numbered full slot.

M.1457-63

Data is transmitted within the frequency, time, and space dimensions using physical packets. Physical packets shall be of one of the following four types:

- short physical packet P00 (D-field contains 64 symbols):

M.1457-64

- basic physical packet P32 (the D-field contains 388 symbols):

M.1457-65

- low capacity physical packet P08 (the D-field contains 148 symbols):

FIGURE 66

**Packet P08**

M.1457-66

- high capacity physical packet P80 (the D-field contains 868 symbols):

FIGURE 67

**Packet P80**

M.1457-67

Each physical packet contains a synchronization field S and a data field D. The packets P80, P32 and P08 may contain an optional collision detection field, Z.

The synchronization field S may be used by the receiver for clock and packet synchronization of the radio link. The first 16 bits are a preamble, and the last 16 bits are the packet synchronization word. A prolonged preamble field which extends the preamble bit pattern by 16 bits is optional. This prolonged preamble field may be used by a receiver for implementation of an antenna selection diversity algorithm.

### 5.5.1.3.2 The RF carrier modulation

The modulation method is either Gaussian frequency shift keying (GFSK), with a bandwidth-bit period product of nominally 0.5 or differential phase shift keying (DPSK) or phase amplitude modulation (QAM). Equipment is allowed to use 4-level and/or 8-level and/or 16-level and/or 64-level modulation in addition to 2-level modulation. This increases the bit rate of single radio equipment by a factor 2 or 3 or 4 or 6, which allows for 4 Mbit/s services. For example, the asymmetric double-slot service with modulation configuration 3 provides up to 5.76 Mbit/s B-field data rate per carrier. The 4-level modulation shall be  $\pi/4$ -DQPSK, the 8-level modulation  $\pi/8$ -D8PSK, the 16-level modulation 16-QAM and the 64-level modulation 64-QAM. It is only allowed to use 4-level and/or 8-level modulation in the B + Z or the A + B + Z fields, whereby the S + A or the S field respectively shall use the  $\pi/2$ -DBPSK 2-level modulation. It is only allowed to use 16-level and/or 64-level modulation in the B + Z fields, whereby the S + A field shall use the  $\pi/2$ -DBPSK 2-level modulation. The allowed combinations of modulation schemes are defined in Table 7.

TABLE 7

**Allowed combinations of modulation schemes**

Configuration	S-field	A-field	B + Z-field
1a	GFSK	GFSK	GFSK
1b	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK
2	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK	$\pi/4$ -DQPSK
3	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK	$\pi/8$ -D8PSK
4a	$\pi/2$ -DBPSK	$\pi/4$ -DQPSK	$\pi/4$ -DQPSK
4b	$\pi/2$ -DBPSK	$\pi/8$ -D8PSK	$\pi/8$ -D8PSK
5	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK	16-QAM
6	$\pi/2$ -DBPSK	$\pi/2$ -DBPSK	64-QAM

Schemes 2, 3, 5 and 6 ensure that equipment with basic 2-level modulation, and equipment with a higher rate option, can efficiently share a common BS infrastructure. The GFSK modulation can be detected for instance in a non-coherent  $\pi/2$ -DPSK receiver, and the  $\pi/2$ -DPSK modulation can be detected in a GFSK receiver. Therefore all A-field information including broadcast system information, paging and call control can be received independently of whether configuration 1, 2, 3, 5 or 6 is used.

**5.5.1.4 Summary of the MAC layer**

The specification for the MAC layer is given in § 5.5.2.2. The MAC layer offers three groups of services to the upper layers and to the management entity:

- broadcast message control (BMC);
- connectionless message control (CMC);
- multi-bearer control (MBC).

The BMC provides a set of continuous point-to-multipoint connectionless services. These are used to carry internal logical channels, and are also offered to the higher layers. These services operate in the direction FT to PT, and are available to all PTs within range.

The CMC provides connectionless point-to-point or point-to-multipoint services to the higher layers. These services may operate in both directions between one specific FT and one or more PTs.

Each instance of MBC provides one of a set of connection oriented point-to-point services to the higher layers. An MBC service may use more than one bearer to provide a single service.

Four types of MAC bearer are defined:

- Simplex bearer: a simplex bearer is created by allocating one physical channel for transmissions in one direction.
- Duplex bearer: a duplex bearer is created by a pair of simplex bearers, operating in opposite directions on two physical channels.
- Double simplex: a double simplex bearer is created by a pair of long simplex bearers operating in the same direction on two physical channels.
- Double duplex bearer: a double duplex bearer is composed by a pair of duplex bearers referring to the same MAC connection.

A bearer can exist in one of three operational states:

- Dummy bearer: where there are normally continuous transmissions (i.e. one transmission in every frame).
- Traffic bearer: where there are continuous point-to-point transmissions. A traffic bearer is a duplex bearer or a double simplex bearer or a double duplex bearer.
- Connectionless bearer: where there are discontinuous transmissions. A connectionless bearer is either a simplex or a duplex bearer.

The MAC layer defines a logical structure for the physical channels. The user bit rate depends on the selected slot-type, modulation scheme, level of protection and number of slots. Table 8 gives the user bit rates for unprotected single slot operation.

TABLE 8

**Bit rates for single slot operation**

	<b>2-level modulation (kbit/s)</b>	<b>4-level modulation (kbit/s)</b>	<b>8-level modulation (kbit/s)</b>	<b>16-level modulation (kbit/s)</b>	<b>64-level modulation (kbit/s)</b>
Half slot	8	16	24	32	48
Full slot	32	64	96	128	192
Long slot	64	128	192	256	384
Double slot	80	160	240	320	480

#### **5.5.1.5 Summary of the data link control (DLC) layer**

The specification for the DLC layer is given in § 5.5.2.3. The DLC layer contains two independent planes of protocol, the C-plane and the U-plane. The C-plane is the control plane of the protocol stacks. The U-plane is the user plane of the protocol stacks.

##### **5.5.1.5.1 C-plane services**

The C-plane data link service is provided by two protocol entities called LAPC and Lc. These two protocol entities separate the link access protocol functions from the lower link control functions. The upper LAPC entity uses a protocol derived from the ISDN LAPD protocol. The lower Lc entity buffers and fragments complete LAPC frames (LAPC protocol data units) to/from the MAC layer.

The Lb entity provides a broadcast service in the direction FP to PP. It operates on simple fixed length frames and uses the dedicated MAC layer broadcast service.

##### **5.5.1.5.2 U-plane services**

The U-plane services are all optional, in the sense that each service corresponds to a particular requirement, and for any given application only selected services may be implemented. Each U-plane service is divided into two entities, an upper (LUX) entity and a lower (FBX) entity. The upper (LUX) entity contains all of the service dependent functions, and therefore defines the majority of the procedures. The lower (FBX) entity buffers and fragments the complete U-plane frames (LUX protocol data units) to/from the MAC layer. The following family members have been defined:

- LU1: Transparent unprotected service (TRUP)
- LU2: Frame relay service (FREL)

LU3:	Frame switching service (FSWI)
LU4:	FEC service
LU5:	Basic rate adaption service (BRAT)
LU6:	Secondary rate adaption service (SRAT)
LU7:	64 kbit/s data bearer service with ARQ mechanism
LU8:	64 kbit/s data bearer service without ARQ mechanism
LU9:	Unprotected rate adaption for V series equipment (RAVE) service
LU10:	Enhanced data service
LU11:	64 kbit/s data bearer service when A and B fields are both modulated at 4 level
LU12 to LU15:	Reserved for standard family member
LU16:	Escape for non-standard family (ESC).

#### 5.5.1.6 Summary of the network layer

The specification for the C-plane of the Summary of the network (NWK) layer is given in § 5.5.2.4. It contains no specification for the U-plane (user plane) because the U-plane is null for all services at the NWK layer.

The NWK layer (Layer 3) protocol contains the following groups of functions:

*Link control entity (LCE):* The establishment, operation and release of a C-plane link between the fixed termination and every active portable termination.

*Call control (CC) entity:* The establishment, maintenance and release of circuit-switched calls.

*Call independent supplementary services (CISS) entity:* The support of call independent supplementary services.

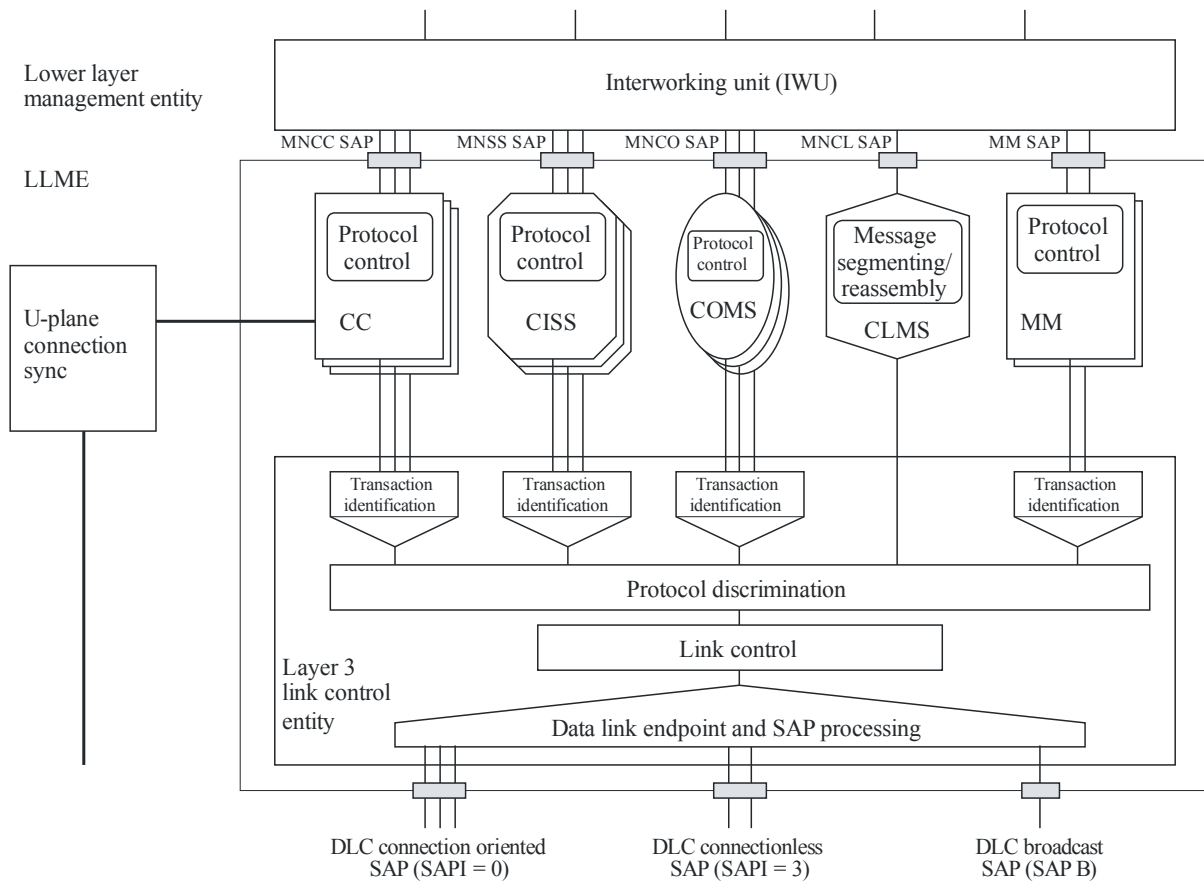

*Connection oriented message service (COMS) entity:* The support of connection-oriented messages.

*Connectionless message service (CLMS) entity:* The support of connectionless messages.

*Mobility management (MM) entity:* The management of identities, authentication, location updating, on-air subscription and key allocation.

In addition all of these C-plane entities interface to the lower layer management entity (LLME). This provides coordination of the operations between different NWK layer entities and also between the NWK layer and the lower layers.

FIGURE 68  
Network layer

M.1457-68

### 5.5.1.7 Summary of identities and addressing

The specifications for the identities and addressing mechanisms are given in § 5.5.2.5. FP identities are used to inform PPs about the identity of a FP and the access rights to that FP and thereby reduce the number of access attempts from unauthorized portables. A FP broadcasts this information. A PP needs to be able to interpret necessary parts of this broadcast information to detect the access rights to a system or even access rights agreements between system operators, i.e. operators A and B have a bilateral agreement permitting their users to roam between their systems. These agreements can change and cannot therefore be stored in PPs without updating them frequently. Therefore the FP handles access rights information which is embedded in the identity structure. The identity structure provides solutions for residential, public and private environments. This can also be extended to combinations between these environments, e.g. private groups of users within a public network built using this standard, and, e.g. public users access to private networks.

PP identities have two main purposes, first to enable a PP to select a valid FP and second to uniquely identify the PP within that FP. For these purposes there are two identities defined. These identities are the portable access rights key (PARK) and the IPUI.

Connection related identities are associated with the peer-to-peer communication. That means that every layer-to-layer connection has an identity. These identities serve the purpose of handshake, protection against co-channel interference, avoiding loss of a connection during bearer and connection handover, etc.

#### **5.5.1.8 Summary of security features**

The specifications for the security architecture, the types of cryptographic algorithms required, the way in which they are to be used, and the requirements for integrating the security features provided by the architecture are given in § 5.5.2.6. It also describes how the features can be managed and how they relate to certain fixed systems and local network configurations.

The security architecture is defined in terms of the security services which are to be supported at the CI, the mechanisms which are to be used to provide the services, and the cryptographic parameters, keys and processes which are associated with these mechanisms.

Two basic security services are specified, which are authentication and encryption. The authentication is used to verify the provided identity. There are four forms defined, which are portable authentication, fixed part authentication, mutual authentication and user authentication. Encryption is used to obtain confidentiality of the data which is transmitted over the air.

#### **5.5.1.9 Coexistence of uncoordinated installations on a common frequency band**

The mandatory instant dynamic channel selection messages and procedures provide effective coexistence of uncoordinated private and public systems on the common designated frequency band and avoid any need for traditional frequency planning. Each device has access to all channels (time/frequency combinations).

When a connection is needed, the channel is selected, that at that instant and at that locality, is least interfered of all the common access channels. This avoids any need for traditional frequency planning, and greatly simplifies the installations. This procedure also provides higher and higher capacity by closer and closer BS installation, while maintaining a high radio link quality. Not needing to split the frequency resource between different services or users gives a very efficient use of the allocated spectrum. There is a large spectrum efficiency gain in sharing spectrum between applications and between operators.

Much unique knowledge and experience is available on the subject of sharing spectrum between uncoordinated installations. Information on this subject has been collected in an ETSI Technical Report, TR 101 310, which describes configurations for typical applications and relevant mixes of these, including residential, office, public and radio local loop (RLL) applications, and the traffic capacity is analysed, mainly by advanced simulations.

#### **5.5.1.10 Access to different systems by the same PP**

Each system, FP, has a broadcasted globally unique access rights identity (ARI). To each ARI are linked the available services, the related protocols and when required, e.g. a cipher-key and/or authentication-key. For each service suitable protocols have been selected from the CI tool box to efficiently provide these services.

Similarly each PP (handset) has one or more portable access rights keys (PARKs). One PARK relates to one FP or a group of FPs belonging to the same operator. To each PARK are linked the corresponding FP ARIs, related services and protocols, and when required, e.g. a ciphering-key and/or authentication-key.

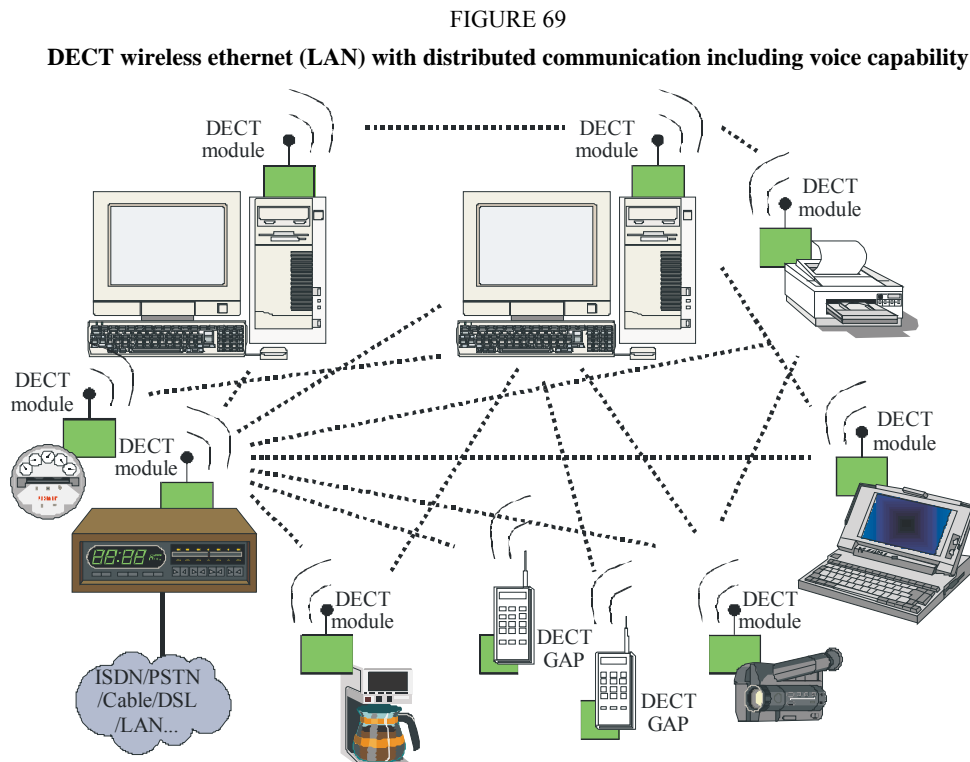

Thus the same PP will have access to several different types of systems, if equipped with the relevant PARKs and associated protocols. Thus, it is basically not a common protocol for all systems that provide intersystem roaming, but it is that the PP is equipped with access rights and related protocols to the wanted systems. A detailed description of the flexible and powerful identity provisions are found in Part 6 of the CI standard.

### 5.5.1.11 Access to several applications through the same BS

This radio interface also provides the means for sharing BS or systems between different operators or applications, e.g. hosting private user groups in a large public system, providing public access through a privately owned system, or hosting public access to several service providers in one system owned by one of the service providers.

### 5.5.1.12 DECT Packet Radio Service (DPRS)

This standard defines the requirements and procedures for packet data transport over the DECT air interface. It specifies the interworking to ISO/IEC 8802-3 (Ethernet), ISO/IEC 8802-5 (Token Ring), Internet Protocol (IP), Point-to-Point Protocol (PPP) and V.24. Figure 69 gives an example of a DECT wireless Ethernet LAN with Distributed Communication and additional voice capability.

### 5.5.1.13 DECT access to IP-networks

This technical specification defines how DECT can use mobile IP for roaming and how the DECT signalling can be interworked with the “Session Initiation Protocol” (SIP).

### 5.5.1.14 Open data access profile (ODAP)

This technical specification defines a common architecture and protocol to support home and industrial sensors, alarms, telematics and other machine-to-machine (M2M) messages. The profile provides a low rate (up to 28 kbit/s) protected data service utilizing a single symmetric DECT channel with an option of switching the service to a high data rate.

### 5.5.1.15 New Generation DECT Part 1: Wideband Speech

This technical specification is the first part of a multi-part standard for “New Generation DECT”. It defines the DECT application profile for wideband speech. In traditional telephony applications the supported bandwidth is 3.1 kHz. Increasing the bandwidth from narrow-band (300 Hz-3 400 Hz) to at least 150 Hz-7 000 Hz range (“wideband”) will allow to increase the speech quality with a

feeling of more transparent communication and an increased intelligibility and listening comfort. One typical usage of this profile is for voice over IP.

#### 5.5.1.16 New Generation DECT Part 2: Support of transparent IP packet data

The document describes the packet-mode data service supporting Internet Protocol with efficient spectrum usage and high data rate. The aim is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT data applications, with the features of the document being a common fall-back option available in all equipment, which is compliant to this profile.

#### 5.5.1.17 New Generation DECT Part 3: Extended Wideband Speech Services

The Part 3 “Extended wideband speech services” is defined as an extension of Part 1 “Wideband speech service”. All devices compliant to Part 3 specification shall implement at least all mandatory features defined in Part 1 “Wideband speech” and all mandatory features of the “Generic Access Profile (GAP)”.

The aim of the present document is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT wideband speech applications, with the features of the present document being a common fall-back option available in all equipment, which is compliant to this profile.

#### 5.5.1.18 New Generation DECT Part 4: Light Data Services; Software Update Over The Air (SUOTA), content downloading and HTTP based applications

The Light Data Services defined by this document have been designed as a complement to voice service terminals. The services defined have been optimized to be a natural complement of New Generation DECT; Part 1: wideband speech, and New Generation DECT: Part 3: extended wideband speech services. The application scenario assumes that there is a data connection that allows the connectivity to external application servers that participate in the service from application point of view. Such data connectivity is typically via the Internet, however other scenarios of connectivity may exist.

#### 5.5.1.19 Summary of major technical parameters

TABLE 9

Technical parameter	Value	Reference to § 5.5.2
Multiple access technique	TDMA	5.5.2.2
Duplexing scheme	TDD	5.5.2.2
Frame length	10 ms	5.5.2.2
Number of time slots in a frame	12 double slots 24 full slots 48 half slots	5.5.2.2
Modulation	GFSK, $\pi/2$ -DBPSK, $\pi/4$ -DQPSK, $\pi/8$ -D8PSK, 16-QAM, 64-QAM	5.5.2.2

TABLE 9 (continued)

Technical parameter	Value	Reference to § 5.5.2	
RF bit rate	1 152 kbit/s for 2-level modulation 2 304 kbit/s for 4-level modulation 3 456 kbit/s for 8-level modulation 4 608 kbit/s for 16-level modulation 6 912 kbit/s for 64-level modulation	5.5.2.2	
Channel spacing	1 728 kHz	5.5.2.2	
Transmit power	Peak power Level 1: 2.5 mW (4 dBm) Level 2: 250 mW (24 dBm)	5.5.2.2	
Frequency stability	For the portable part the centre frequency accuracy shall be within $\pm 50$ kHz at extreme conditions either relative to an absolute frequency reference or relative to the received carrier, except during the first one second after the transition from the idle-locked state to the active-locked state the centre frequency accuracy shall be within $\pm 100$ kHz at extreme conditions relative to the received carrier. At an RFP the transmitted RF carrier frequency corresponding to RF channel $C$ shall be in the range $F_C \pm 50$ kHz at extreme conditions. The maximum rate of change of the centre frequency at both the RFP and the PP while transmitting, shall not exceed 15 kHz per slot.	5.5.2.2	
Adjacent channel leakage power	1 channel: 160 $\mu$ W 2 channel: 1 $\mu$ W 3 channel: 80 nW >3 channel: 40 nW	5.5.2.2	
Transmit linearity requirements	The power level of intermodulation products that are on any of this standard's physical channel when any combination of the transmitters at a radio end point are in calls on the same slot on different frequencies shall be less than 1 $\mu$ W. The power level is defined by integration over the 1 MHz centred on the nominal centre frequency of the afflicted channel and averaged over the time period.	5.5.2.2	
Reference sensitivity	better than $-83$ dBm $-86$ dBm for speech service according to Generic Access Profile (GAP) Sensitivity is measured at $1 \times 10^{-3}$ raw BER	5.5.2.2 5.5.2.11	
Intermodulation sensitivity	The level of the interfering signals is $-48$ dBm, wanted signal is $-80$ dBm and $1 \times 10^{-3}$ raw BER	5.5.2.2	
Spurious response and blocking	With the desired signal set at $-80$ dBm, the BER shall be maintained below $1 \times 10^{-3}$ in the presence of any one of the signals shown in the table below; where: $F_L$ and $F_U$ : lower and the upper edges of the allocated frequency band; $F_C$ : centre frequency of the allocated frequency band.		
	Frequency	Interferer level for radiated measurements (dB( $\mu$ V/m))	Interferer level for conducted measurements (dBm)
	$25 \text{ MHz} < f < F_L - 100 \text{ MHz}$	120	$-23$

TABLE 9 (end)

Technical parameter	Value			Reference to § 5.5.2
	$F_L - 100 \text{ MHz} < f < F_L - 5 \text{ MHz}$	110	-33	
	$ f - F_C  > 6 \text{ MHz}$	100	-43	
	$F_U$ $+ 5 \text{ MHz} < f < F_U + 100 \text{ MHz}$	110	-33	
	$F_U + 100 \text{ MHz} < f < 12.75 \text{ GHz}$	120	-23	
Adjacent channel selectivity	With a received signal strength of -73 dBm (i.e. 70 dB( $\mu$ V/m)) on RF channel M, the BER in the D-field shall be maintained better than $1 \times 10^{-3}$ when a modulated, reference interferer of the indicated strength is introduced on the RF channels shown below:			5.5.2.2
	Interferer on RF channel Y	Interferer signal strength		
		(dB( $\mu$ V/m))	(dBm)	
	$Y = M$	59	-84	
	$Y = M \pm 1$	83	-60	
	$Y = M \pm 2$	104	-39	
$Y = \text{any other channel}$	110	-33		
Handover	Seamless handover, mobile controlled, triggered when another BS becomes stronger.			5.5.2.3, 5.5.2.4, 5.5.2.5
Random access	Instant dynamic channel selection for every set-up using the least interfered channel measured at the mobile.			5.5.2.3
Pilot structure	Broadcast system information available on each active downlink, at least one downlink is active on every BS.			5.5.2.3
Dynamic channel allocation	Supported.			5.5.2.3

### 5.5.2 Detailed specification of the radio interface

The standards contained in this section are derived from the global core specifications for IMT-2000 contained at <http://ties.itu.int/u/itu-r/IMT-2000/GCS/GCSRev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

- 1) The relevant SDOs should make their reference material available from their Web site.
- 2) This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

#### 5.5.2.1 EN 300 175-1

##### Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 1: Overview

This standard gives an introduction and overview of the complete Digital Enhanced Cordless Telecommunications (DECT) Common Interface (CI). This part of the DECT CI contains an abstract of the other parts of the DECT standard together with a general description of the objectives of the present document; the DECT Common Interface and the protocol architecture of DECT. The present document also provides an extensive vocabulary, in particular it contains the common definitions of all the technical terms used in different parts of the present document.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
ETSI	EN 300 175-1	V2.4.1	Published	2012-04	<a href="http://pda.etsi.org/pda/home.asp?wki_id=1cVhG_ZGQ-jmkropC13D8">http://pda.etsi.org/pda/home.asp?wki_id=1cVhG_ZGQ-jmkropC13D8</a>

#### 5.5.2.2 EN 300 175-2

##### Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 2: Physical Layer (PHL)

This standard specifies the physical channel arrangements. The tasks of the PHL are to modulate and demodulate radio carriers with a bit stream of a defined rate to create a radio-frequency channel, to acquire and maintain bit and slot synchronization between transmitters and receivers, to transmit or receive a defined number of bits at a requested time and on a particular frequency, to add and remove the synchronization field and the Z-field used for rear end collision detection and to observe the radio environment to report signal strengths.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)

### 5.5.2.3 EN 300 175-3

#### Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 3: Medium Access Control (MAC) layer

This standard specifies the Layer 2a of the DECT protocol stack. It defines three groups of MAC services: the broadcast message control service, the connectionless message control service and the multi-bearer control service. It also specifies the logical channels that are used by the above-mentioned services, and how they are multiplexed and mapped into the Service Data Units that are exchanged with the Physical Layer.

ETSI	EN 300 175-3	V2.4.1	Published	2012-04	<a href="http://pda.etsi.org/pda/home.asp?wki_id=HV_kh7.DttMPNURUQO50A">http://pda.etsi.org/pda/home.asp?wki_id=HV_kh7.DttMPNURUQO50A</a>

### 5.5.2.4 EN 300 175-4

#### Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 4: Data Link Control (DLC) layer

This standard specifies the Layer 2b of the DECT protocol stack. Two planes of operation are specified for this DLC (sub)layer. These planes are called the Control plane (C-plane) and the User plane (U-plane). The C-plane is mostly concerned with the DECT signalling aspects. It provides a reliable point-to-point service that uses a link access protocol to offer error protected transmission of network layer messages. The C-plane also provides a separate point-to-multipoint (broadcast) service. The U-plane is only concerned with end-to-end user information. This plane contains most of the application dependent procedures of DECT. Several alternative services (both circuit-mode and packet-mode) are defined as a family of independent entities. Each service provides one or more point-to-point U-plane data links, where the detailed characteristics of those links are determined by the particular needs of each service. The defined services cover a wide range of performance, from unprotected with low delay for speech applications to highly protected with variable delay, for local area network applications.

### 5.5.2.5 EN 300 175-5

#### Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 5: Network (NWK) layer

This standard specifies the Layer 3 of the DECT protocol stack. It contains the following groups of functions: Link Control Entity (LCE), Call Control (CC) entity, Call Independent Supplementary Services (CISS) entity, Connection Oriented Message Service (COMS) entity, Connectionless Message Service (CLMS) entity and the Mobility Management (MM) entity.

### 5.5.2.6 EN 300 175-6

#### **Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 6: Identities and addressing**

This standard specifies the identities and addressing structure of the DECT Common Interface. There are four categories of identities defined, which are Fixed Part (FP), Portable Part (PP), connection-related, and equipment-related identities.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
ETSI	EN 300 175-6	V2.4.1	Published	2012-04	<a href="http://pda.etsi.org/pda/home.asp?wki_id=XnM_dFqBdVhkipnig7Zfa">http://pda.etsi.org/pda/home.asp?wki_id=XnM_dFqBdVhkipnig7Zfa</a>

### 5.5.2.7 EN 300 175-7

#### **Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 7: Security features**

This part of the DECT CI specifies the security architecture, the types of cryptographic algorithms required, the way in which they are to be used, and the requirements for integrating the security features provided by the architecture into the DECT CI. It also describes how the features can be managed and how they relate to certain DECT fixed systems and local network configurations. The security architecture is defined in terms of the security services which are to be supported at the CI, the mechanisms which are to be used to provide the services, and the cryptographic parameters, keys and processes which are associated with these mechanisms.

### 5.5.2.8 EN 300 175-8

#### **Digital Enhanced Cordless Telecommunications (DECT); Common Interface (CI); Part 8: Speech coding and transmission**

This part of the DECT CI specifies the speech coding and transmission requirements. In order to ensure satisfactory interworking of different portable and fixed units, it is necessary to specify the transmission performance of the analogue information over the digital link. This requires not only use of a common speech algorithm, but also standardization of frequency responses, reference speech levels (or loudness) at the air interface and various other parameters.

**5.5.2.9 EN 300 176-1****Digital Enhanced Cordless Telecommunications (DECT); Approval test specification; Part 1: Radio**

This standard specifies radio tests for DECT equipment. It covers testing of radio-frequency parameters, security elements and those DECT protocols that facilitate the radio-frequency tests and efficient use of frequency spectrum. The aims of this document are to ensure efficient use of frequency spectrum and that no harm is done to other radio networks and services.

**5.5.2.11 EN 300 444****Digital Enhanced Cordless Telecommunications (DECT); Generic Access Profile**

The objective of the standard is to ensure inter-operability of DECT equipment capable of 3.1 kHz telephony applications. The profile consists of the minimum mandatory requirements that allow a 3.1 kHz teleservice connection to be established, maintained and released between a Fixed Termination (FT) and a Portable Termination (PT) with the appropriate access rights.

### 5.5.2.15 TS 102 527-1

#### Digital Enhanced Cordless Telecommunications (DECT); New Generation DECT; Part 1: Wideband Speech

New Generation DECT improves audio quality by implementing wideband enhanced quality audio codecs. The document defines the wideband voice service for DECT with the aim to guarantee interoperability. All New Generation DECT wideband speech devices are backward compatible with traditional DECT voice devices.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
ETSI	TS 102 527-1	V1.3.1	Published	2012-01	<a href="http://pda.etsi.org/pda/home.asp?wki_id=MSjpiSu5f3JMKROLp1rqC">http://pda.etsi.org/pda/home.asp?wki_id=MSjpiSu5f3JMKROLp1rqC</a>

**5.5.2.16 TS 102 527-2****Digital Enhanced Cordless Telecommunications (DECT); New Generation DECT; Part 2: Support of transparent IP packet data**

The document describes the packet-mode data service supporting Internet Protocol with efficient spectrum usage and high data rate. The aim is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT data applications, with the features of the document being a common fall-back option available in all equipment, which is compliant to this profile.

SDO (2)	Document No.	Version	Status	Issued date	Location (1)
ETSI	TS 102 527-2	V1.1.1	Published	04/06/2007	<a href="http://pda.etsi.org/pda/home.asp?wki_id=0M65@xsp57IKNNMNGijs">http://pda.etsi.org/pda/home.asp?wki_id=0M65@xsp57IKNNMNGijs'</a>

**5.5.2.17 TS 102 527-3****Digital Enhanced Cordless Telecommunications (DECT); New Generation DECT; Part 3: Extended Wideband Speech Services**

The Part 3 “Extended wideband speech services” is defined as an extension of Part 1 “Wideband speech service”. All devices compliant to Part 3 specification shall implement at least all mandatory features defined in Part 1 “Wideband speech” and all mandatory features of the “Generic Access Profile (GAP)”.

The aim of the present document is to guarantee a sufficient level of interoperability and to provide an easy route for development of DECT wideband speech applications, with the features of the present document being a common fall-back option available in all equipment, which is compliant to this profile.

## **5.6 IMT-2000 OFDMA TDD WMAN**

### **5.6.1 Overview of the set of radio interface FDD/TDD components**

#### **5.6.1.1 TDD component**

##### **5.6.1.1.1 Introduction**

The IEEE standards relevant for IMT-2000 OFDMA TDD WMAN, designated as IEEE Std 802.16 and IEEE Std 802.16.1, are developed and maintained by the IEEE 802.16 Working Group on Broadband Wireless Access. They are published by the IEEE Standards Association (IEEE-SA) of the Institute of Electrical and Electronics Engineers (IEEE).

The radio interface technology specified in IEEE Standard 802.16 is flexible, for use in a wide variety of applications, operating frequencies, and regulatory environments. IEEE 802.16 includes multiple physical layer specifications, one of which is known as WirelessMAN-OFDMA. OFDMA TDD WMAN is a special case of WirelessMAN-OFDMA specifying a particular interoperable radio interface. The component of OFDMA TDD WMAN defined here operates in TDD mode.

The OFDMA TDD WMAN radio interface comprises the two lowest network layers – the physical layer (PHY) and the data link control layer (DLC). The lower element of the DLC is the medium access control layer (MAC); the higher element in the DLC is the logical link control layer (LLC). The PHY is based on orthogonal frequency division multiple access (OFDMA) suitable for use in a 5 MHz, 10 MHz, 7 MHz, or 8.75 MHz channel allocation. The MAC is based on a connection-oriented protocol designed for use in a point-to-multipoint configuration. It is designed to carry a wide range of packet-switched (typically IP-based) services while permitting fine and instantaneous control of resource allocation to allow full carrier-class Quality of Service (QoS) differentiation. In addition, a multihop relay (MR) specification details the functionality of relay stations in conjunction with multihop relay base stations in order to provide additional coverage or performance advantage. Also, a license-exempt (LE) specification delineates the improved mechanisms, as policies and MAC enhancements, to enable coexistence among LE systems based on OFDMA TDD WMAN and to facilitate the coexistence of such systems with primary users.

As a technological evolution of OFDMA TDD WMAN, WirelessMAN-Advanced has been introduced for providing the performance improvements necessary to support future advanced services and applications for next generation broadband mobile communications. WirelessMAN-Advanced incorporates innovative communications technologies such as multi-user MIMO (MU-MIMO), multicarrier operation, and cooperative communications, as well as femto-cells, self-organizing networks, and relays. It also supports scalable bandwidth operation up to 20 MHz.

##### **5.6.1.1.2 Radio access network architecture**

The OFDMA TDD WMAN radio interface is designed to carry packet-based traffic, including IP. It is flexible enough to support a variety of higher-layer network architectures for fixed, nomadic, or fully mobile use, with handover support. It can readily support functionality suitable for generic data as well as time-critical voice and multimedia services, broadcast and multicast services, and mandated regulatory services.

The radio interface standard specifies Layers 1 and 2; the specification of the higher network layers is not included. It offers the advantage of flexibility and openness at the interface between Layers 2 and 3 and it supports a variety of network infrastructures. The radio interface is compatible with the network architectures defined in ITU-T Recommendation Q.1701. In particular, a network architecture design to make optimum use of IEEE Standard 802.16 and the OFDMA TDD WMAN

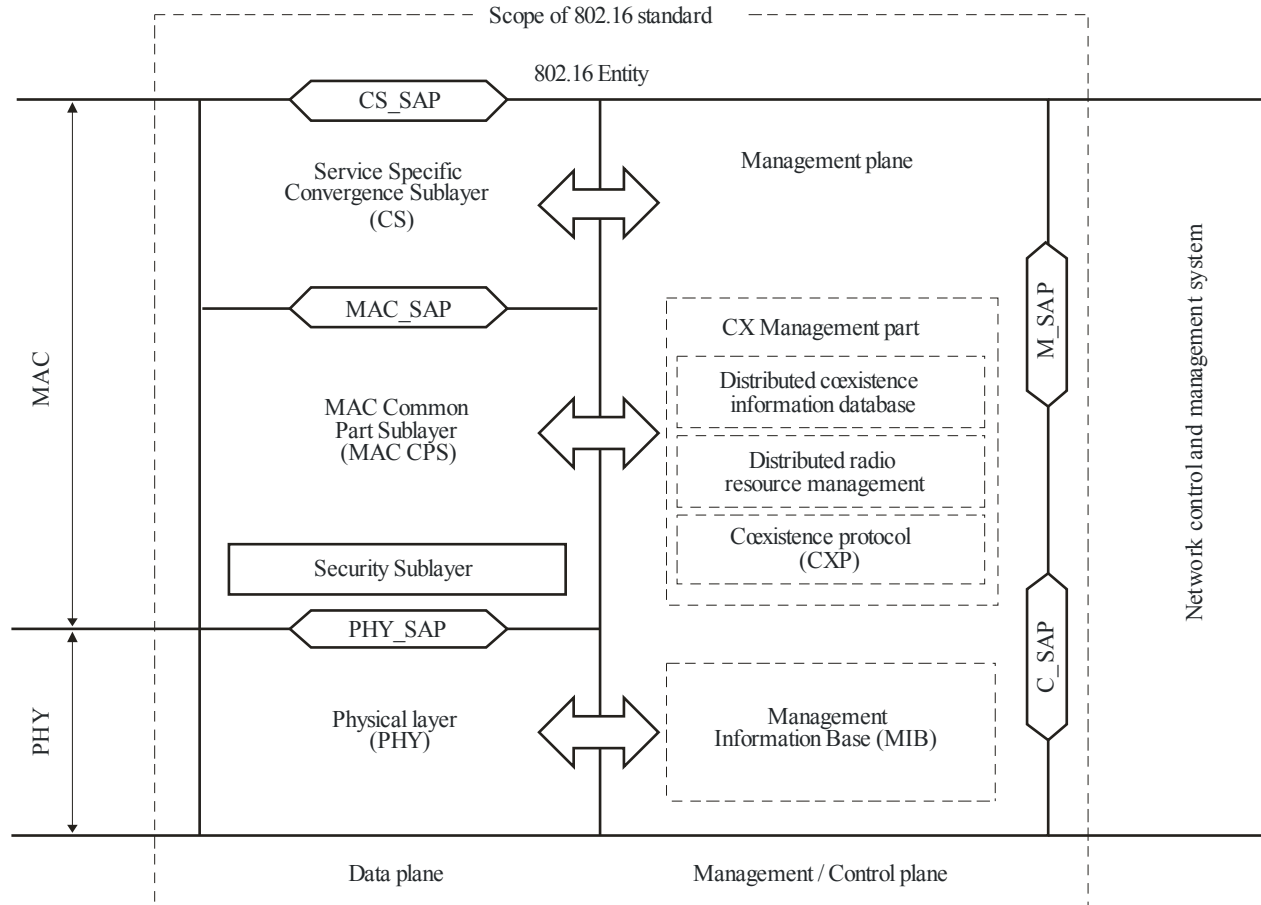

radio interface is described in the “WiMAX End to End Network Systems Architecture Stage 2-3”, available from the WiMAX Forum<sup>3</sup>.

The protocol layering is illustrated in Fig. 70. The MAC comprises three sub-layers. The service-specific convergence sublayer (CS) provides any transformation or mapping of external network data, received through the CS service access point (SAP), into MAC service data units (SDUs) received by the MAC common part sublayer (CPS) through the MAC SAP. This includes classifying external network SDUs and associating them to the proper MAC service flow identifier (SFID) and connection identifier (CID). It may also include such functions as payload header suppression (PHS). Multiple CS specifications are provided for interfacing with various protocols. The internal format of the CS payload is unique to the CS, and the MAC CPS is not required to understand the format of or parse any information from the CS payload.

---

<sup>3</sup> <http://www.wimaxforum.org/resources/documents/technical/release>

FIGURE 70  
**OFDMA TDD WMAN protocol layering, showing service access points (SAPs)**

The MAC CPS provides the core MAC functionality of system access, bandwidth allocation, connection establishment, and connection maintenance. It receives data from the various CSs, through the MAC SAP, classified to particular MAC connections.

Quality of service (QoS) is applied to the transmission and scheduling of data over the PHY.

The MAC also contains a separate security sublayer providing authentication, secure key exchange, and encryption.

Data, PHY control, and statistics are transferred between the MAC CPS and the PHY via the PHY SAP (which is implementation specific).

The 802.16 devices can include Mobile Stations (MS) or Base Stations (BS). As the 802.16 devices may be part of a larger network and therefore would require interfacing with entities for management and control purposes, a Network Control and Management System (NCMS) abstraction has been introduced in this standard as a “black box” containing these entities. The NCMS abstraction allows the PHY/MAC layers specified in 802.16 to be independent of the network architecture, the transport network, and the protocols used at the backend and therefore allows greater flexibility. NCMS logically exists at BS side and MS side of the radio interface, termed NCMS(BS) and NCMS(MS), respectively. Any necessary inter-BS coordination is handled through the NCMS(BS).

This specification includes a Control SAP (C-SAP) and Management SAP (M-SAP) that expose control plane and management plane functions to upper layers. The NCMS uses the C-SAP and M-SAP to interface with the 802.16 entity. In order to provide correct MAC operation, NCMS shall be present within each MS. The NCMS is a layer independent entity that may be viewed as a management entity or control entity. General system management entities can perform functions through NCMS and standard management protocols can be implemented in the NCMS.

#### **5.6.1.1.2.1 BS and MS Functionality**

The system architecture consists of two logical entities, the base station (BS) and the mobile station (MS), with an optional relay station (RS). The basic architectural assumption is of a base station (BS) communicating in point-to-multipoint fashion with a number of fixed or mobile stations (MSs). The BS is connected to an IP-based backhaul network. It controls and allocates the resources in spectrum and time. Transmissions on the downlink (BS to MS) are divided in both time and frequency (using the multiple sub-carriers provide by OFDMA) for assigning communications to individual MSs. Transmissions on the uplink (from MS to BS) take place according to the schedule and in the sub-channels assigned by the BS.

In brief, the BS is responsible for:

- configuring and updating basic parameters;
- performing bandwidth allocation for DL (per connection) and UL traffic (per MS) and performing centralized QoS scheduling, based on the QoS/service parameters and the active resource requests from the MS;
- communicating to all MSs, through the maps, the schedule of each frame and supporting other data and management broadcast and multicast services;
- transmitting/receiving traffic data and control information as MAC protocol data units (PDUs);
- performing connection admission control and other connection management functions;
- providing other MS support services such as ranging, clock synchronization, power control, and handover.

The MS is responsible for:

- identifying the BS, obtaining MAC parameters, and joining the network;
- establishing basic connectivity, setting up additional data and management connections, and negotiating any optional parameters as needed;
- generating resource requests for connections that require them, based on the connection profiles and traffic;
- receiving broadcast/multicast PDUs and unicast PDUs and forwarding them appropriately;
- making local scheduling decisions based on the current demand and history of resource requests/grants;
- transmitting only when instructed by the BS to do so or the MS has some information that qualifies for transmission in one of the allowed contention slots;
- unless in sleep mode, receiving all schedule and channel information broadcast by the BS and obeying all medium access rules;
- performing initial ranging, maintenance ranging, power control, and other housekeeping functions.

Figure 70 is limited to describing a system including a BS and the MSs with which it communicates. However, the radio interface also provides specifications to allow handover of an MS from one BS to another. Such handover would typically occur as a mobile device moves toward an adjacent cell. However, it might also occur due to system-wide efforts at load balancing.

#### **5.6.1.1.2 RS Functionality**

Multihop relay (MR) is an optional deployment that may be used to provide additional coverage or performance advantage in an access network. In MR networks, the BS may be replaced by a multihop relay BS and one or more relay stations (RSs). Traffic and signalling between the MS and the multihop relay BS are relayed by the RS, thereby extending the coverage and performance of the system in areas where RSs are deployed. Each RS is under the supervision of a multihop relay BS. In a system providing more than two hops, traffic and signalling between an access RS and the multihop relay BS may also be relayed through intermediate RSs.

#### **5.6.1.1.3 Layer 1: Physical layer (PHY)**

The radio interface is a special case of the Wireless MAN-OFDMA air interface specified in § 8.4 of IEEE Standard 802.16. It uses orthogonal frequency-division multiple access (OFDMA), which is an extension of orthogonal frequency-division multiplexing (OFDM).

##### **5.6.1.1.3.1 OFDMA technology overview**

OFDM divides the channel by frequency into orthogonal sub-carriers. Data to be transmitted is divided into parallel streams of reduced data rate (and therefore longer symbol duration) and each stream is modulated and transmitted on a separate sub-carrier. The lengthened symbol duration improves the robustness of OFDM to delay spread. Furthermore, the introduction of a cyclic prefix (CP) eliminates intersymbol interference if the CP duration is longer than the channel delay spread.

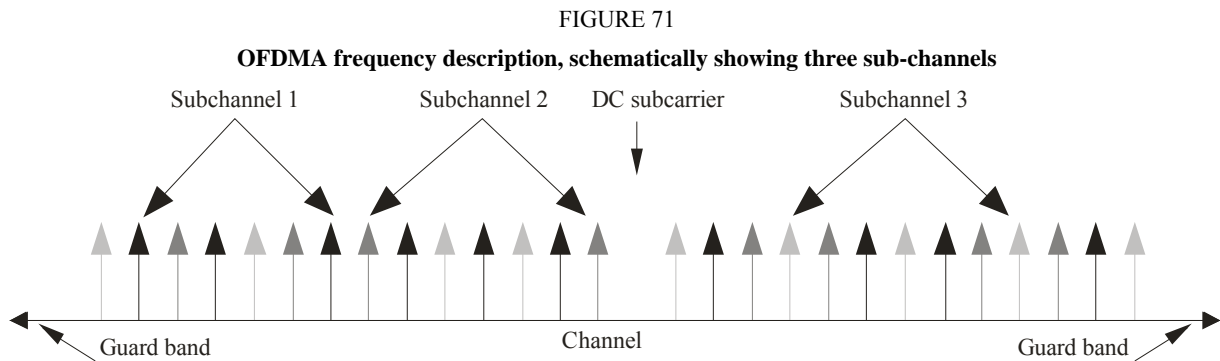

In a typical OFDM implementation, all of the transmitter's sub-carriers are, at any given time, addressed to a single receiver; multiple access is provided solely by TDMA time slotting. OFDMA, however, divides the sub-carrier set into subsets, known as sub-channels. Each sub-channel can address a different receiver at any given time. In the downlink, each sub-channel may be intended for a different receiver or group of receivers. In the uplink, multiple MSs may transmit simultaneously as long as they are assigned different sub-channels.

Sub-carriers are used for three purposes:

- Data transmission
- Pilot transmission, for various estimation purposes
- Null transmission, for guard bands and at DC.

The concept is illustrated in Fig. 71. As indicated, the sub-carriers forming one sub-channel need not be adjacent.

Sub-channelization is a multiple access technique. It provides OFDMA systems increased scheduling flexibility and a number of performance advantages, including enhanced scalability and advanced antenna array processing capabilities.

M.1457-71

### 5.6.1.1.3.2 OFDMA TDD WMAN physical layer details

The PHY utilizes OFDMA with either 512 sub-carriers in a 5 MHz channel or 1 024 sub-carriers in a 7 MHz or 10 MHz channel. In addition, 1 024 sub-carriers in a 8.75 MHz channel is also utilized for TDD. The primitive PHY parameters for TDD mode are listed in Table 10A.

TABLE 10A

OFDMA TDD WMAN primitive PHY parameters, TDD mode

FFT size ( $N_{\text{FFT}}$ )	512	1 024	1 024	1024
System channel bandwidth ( $BW$ )	5 MHz	10 MHz	8.75 MHz	7 MHz
Sampling frequency ( $F_s$ )	5.6 MHz	11.2 MHz	10 MHz	8 MHz
Sub-carrier frequency spacing ( $\Delta f = F_s / N_{\text{FFT}}$ )	10.9375 kHz		9.77 kHz	7.8125 kHz
Useful symbol time ( $T_b = 1 / \Delta f$ )	~91.43 $\mu\text{s}$		~102.4 $\mu\text{s}$	128 $\mu\text{s}$
Guard (CP) time ( $T_g = T_b / 8$ )	~11.43 $\mu\text{s}$		~12.8 $\mu\text{s}$	16 $\mu\text{s}$
OFDMA symbol duration ( $T_s = T_b + T_g$ )	~102.9 $\mu\text{s}$		~115.2 $\mu\text{s}$	144 $\mu\text{s}$
Frame duration	5 ms		5 ms	5 ms
OFDMA symbols per frame (including TTG and RTG)	~48		~43	~34
OFDMA symbols per frame (excluding TTG and RTG)	47		42	33

### 5.6.1.1.3.3 Framing and sub-channelization

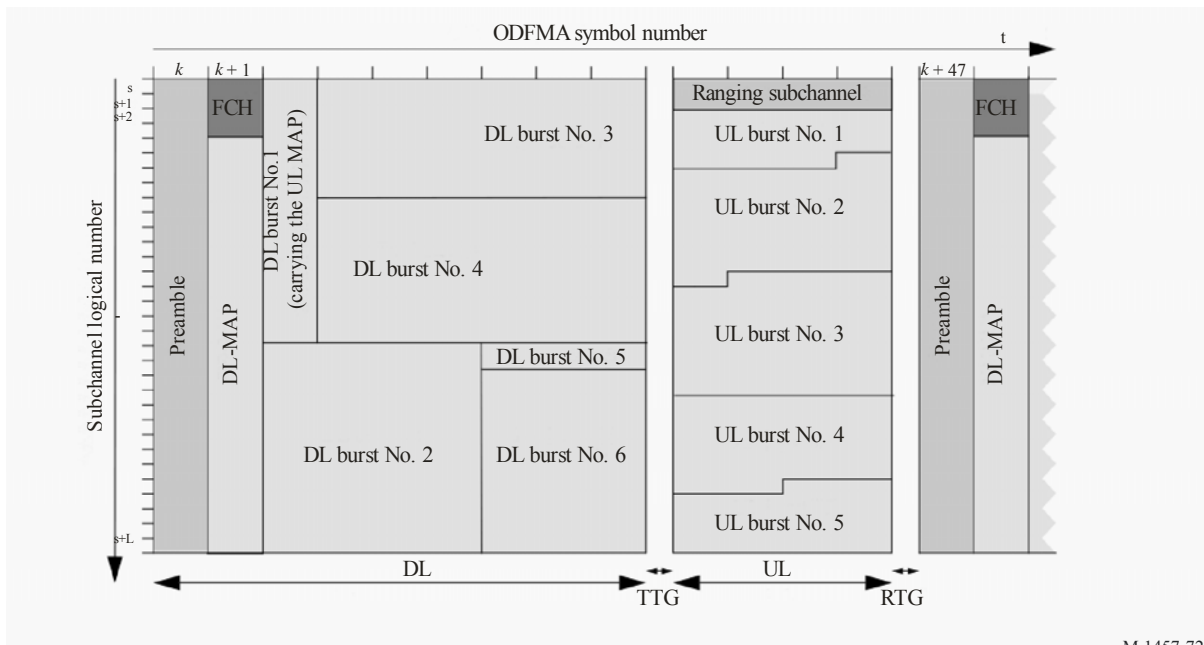

In the case of TDD, OFDMA TDD WMAN PHY utilizes a 5 ms TDD frame. The frame includes first downlink and then uplink sub-frames, divided by time gaps to allow the transceivers to switch between receive and transmit. The two gaps (TTG and RTG) are both included in the 5 ms duration. The asymmetry between the uplink and downlink sub-frame durations is configurable on a system-wide basis.

The TDD frame structure is illustrated schematically in Fig. 72A.

The frame is shown in two dimensions. The horizontal dimension represents time, which maps directly into the OFDM symbol sequence. The vertical dimension represents the list of available logical sub-channels. This maps into frequency, although only indirectly, since the sub-carriers in a given logical channel are not arranged in sequential order.

FIGURE 72A

Schematic illustration of TDD frame structure

M.1457-72

The frame begins with a preamble for synchronization. The following OFDM symbol contains the frame control header (FCH) and the downlink map (DL\_MAP), transmitted simultaneously on different sub-channels. The FCH includes frame configuration data. The DL-MAP indicates the use of the DL sub-frame, in time and sub-channel allocation. The UL-MAP that follows provides similar information for the uplink, though the allocation is relevant not to the current frame but to a subsequent one, in order to allow the MS time to prepare an appropriate transmission or in accordance with the UL-MAP.

The construction of the sub-channel from individual sub-carriers is called the permutation. OFDMA TDD WMAN provides a number of possible permutations. The optimal choice depends on the deployment scenario and instantaneous circumstances; therefore, the permutation may differ from one OFDM symbol to the next. The specification supports a sequence of permutation zones in the frame, so that different mobile stations can be served with different permutations.

#### **5.6.1.1.3.4 Adaptive modulation and coding**

OFDMA TDD WMAN supports a variety of modulation and coding alternatives. The control is adaptive and dynamic, so that the BS may select different options for communicating with different MSs and may order the MS to alter the choices in order to optimize the trade-off of robustness versus capacity.

The BS selects the modulation from among QPSK, 16-QAM, and 64-QAM. For forward error correction, Convolutional Coding and Convolutional Turbo Coding with variable code rate and repetition coding are specified. Block Turbo Code and Low Density Parity Check Code (LDPC) are supported as optional features.

Data randomization is specified in order to reduce the peak-to-average power ratio. Interleaving is specified to increase frequency diversity.

#### **5.6.1.1.3.5 Fast feedback and hybrid ARQ**

OFDMA TDD WMAN specifies an uplink fast-feedback channel to provide time-critical PHY parameter data to the BS. Parameters include signal-to-noise ratio, MIMO coefficients, and MIMO configuration parameters.

Additional UL acknowledgment channels may be allocated by the BS to support hybrid automatic repeat request (HARQ).

#### **5.6.1.1.4 Layer 2: Medium access control layer**

The medium access control layer (MAC) functionality controls access to the medium, which in this case is the radio spectrum. The MAC is also responsible for basic functions such as data encapsulation, fragmentation, radio resource control, radio link control, error detection and retransmission, QoS, security, sleep mode, and handover.

Although the radio interface is designed primarily to support a connectionless network layer, such as IP, the MAC is connection-oriented. All services, including inherently connectionless services, are mapped to a connection. The connection provides a mechanism for requesting resource allocation, associating QoS and traffic parameters, transporting and routing data, and all other actions associated with the terms of the service. A 16-bit connection identifier (CID) is assigned to designate each connection. The MAC uses the CID to identify all information exchanged between BS and MS, including management and broadcast data. The CID provides a simple and direct way to differentiate traffic. All MAC-level QoS functions, such as the classifier and QoS scheduler, use the CID to identify and differentiate traffic in order to maintain the service level and fairness among connections.

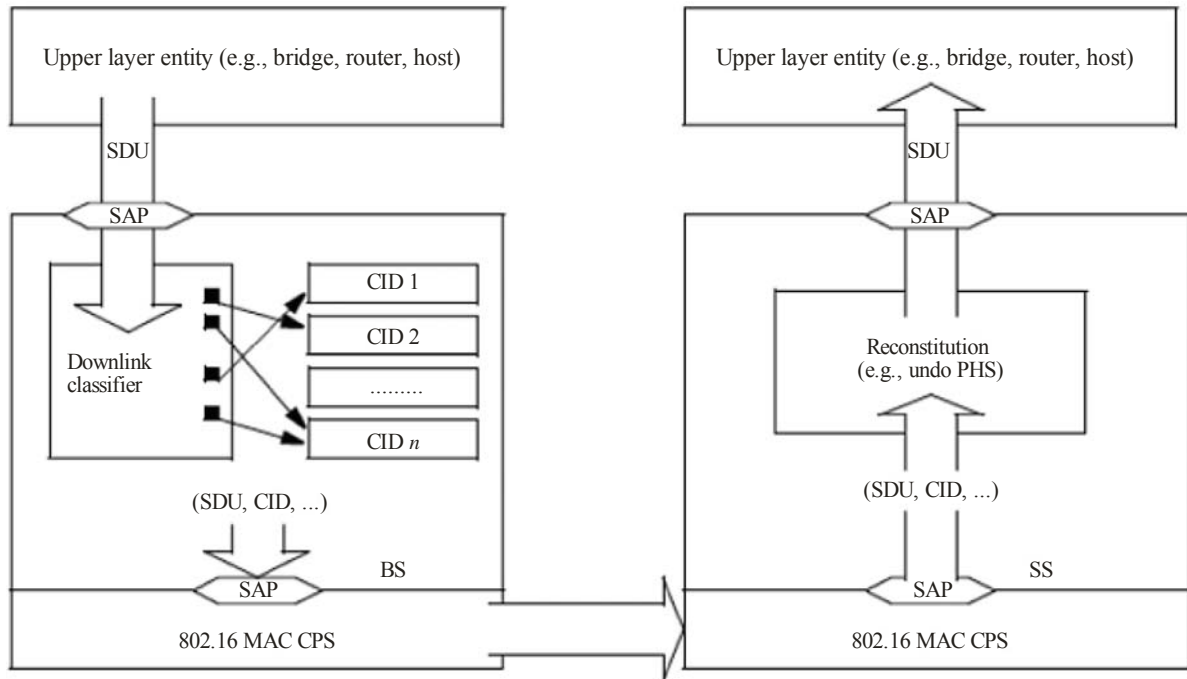

##### **5.6.1.1.4.1 Convergence sub-layer**

At the transmitter side, the Convergence sub-layer (CS) is responsible for transforming packet-based protocol data units from the higher layer protocol into MAC service data unit (SDUs), possibly using payload header suppression (PHS) to suppress some of the packet headers and reduce the burden of carrying them over the air. The CS then classifies each MAC SDU, assigning it to a particular connection, and passes it to the MAC CPS. At the receiver side, the CS is responsible for the inverse operations, including reassembly of packets into their original format with complete headers.

The CS contains a classification function that determines on which connection a particular packet shall be carried and which PHS rule applies for that packet. The operation is illustrated in Fig. 73, which shows the downlink case. Classifier parameters are configured during dynamic service signalling.

FIGURE 73

## Classification and CID mapping (downlink)

M.1457-73

#### 5.6.1.1.4.2 MAC common part sub-layer

The MAC common part sub-layer (CPS) is responsible for performing the core MAC functions. It receives MAC service data units (SDUs) from the CS and encapsulates them in its native MAC PDU format for transmission over the PHY. The MAC CPS also manages the transport connections and QoS, controlling access to the radio spectrum by the MSs.

Encapsulation may be as simple as adding necessary information to the SDU. However, the MAC CPS also has the possibility of dividing a single SDU into multiple fragments before transmission, for reassembly at the receiving MAC CPS. Fragmentation allows more efficient support of higher layer protocols with variable-size SDUs, given that the underlying PHY used a fixed frame size. The MAC CPS also has the complementary option to pack multiple higher layer payloads into a single PDU. Since MAC encapsulation introduces some fixed overhead per PDU, this can improve the efficiency of carrying small SDUs.

A MAC PDU consists of a six-byte MAC header, a variable-length payload, and an optional cyclic redundancy check. Four header formats, distinguished by the HT field, are defined. The generic header is shown in Fig. 74.

MAC PDUs generally contain either MAC management messages or convergence sub-layer data. However, one header type is reserved for uplink PDUs that contain no payload, conveying their information (such as a resource request) in the content of the header itself. Additional sub-headers are also defined. For example, the MS can use the grant management sub-header to convey bandwidth management needs to the BS. The fragmentation sub-header contains information that indicates the presence and orientation in the payload of any fragments of SDUs. The packing subheader is used to indicate the packing of multiple SDUs into a single PDU. The grant management and fragmentation sub-headers may be inserted in MAC PDUs immediately following the generic header if so indicated by the Type field. The packing sub-header may be inserted before each MAC SDU if so indicated by the Type field.

FIGURE 74

Generic MAC header format

M.1457-74

#### 5.6.1.1.4.2.1 Uplink scheduling services

The scheduling algorithm is not specified in the standard but is critical to efficient multimedia delivery when the BS supports a variety of disparate connections. The BS is presumed capable of scheduling its own downlink transmissions based on QoS information developed in the CS. Uplink scheduling is more complicated because, while resource allocation is under the control of the BS, only the MSs know in real time their immediate transmission demands.

In order to allow efficient QoS-based scheduling, a number of uplink scheduling services are defined, with a specific service assigned to each connection. The QoS categories are summarized in Table 11.

Resource requests, for transmission slots, are initiated by a specific connection at the MS. However, grants are allocated not to the connection but to the supporting MS. The MS is required to manage the slots allocated to it, assigning them to the multiple connections it supports. By distributing the management and permitting local resource allocation, over-the-air negotiation is minimized and rescheduling decisions are made more quickly and effectively.

#### 5.6.1.1.4.2.2 Radio link control

As noted in § 5.6.1.3.2, OFDMA TDD WMAN supports adaptive modulation and coding. The MAC CPS is responsible for radio link control. This involves managing the modulation and coding selection at the MS through interactive message exchange based on monitoring the ratio of carrier signal to noise and interference.

TABLE 11

**OFDMA TDD WMAN Uplink scheduling services**

<b>QoS category</b>	<b>Typical applications</b>	<b>QoS specifications</b>
<b>UGS</b> Unsolicited grant service	VoIP	Maximum sustained rate Maximum latency tolerance Jitter tolerance
<b>rtPS</b> Real-time packet service	Streaming audio or video	Minimum reserved rate Maximum sustained rate Maximum latency tolerance Traffic priority
<b>ErtPS</b> Extended real-time packet service	Voice with activity detection (VoIP)	Minimum reserved rate Maximum sustained rate Maximum latency tolerance Jitter tolerance Traffic priority
<b>nrtPS</b> Non-real-time packet service	File transfer protocol (FTP)	Minimum reserved rate Maximum sustained rate Traffic priority
<b>BE</b> Best-effort service	Data transfer, web browsing, etc.	Maximum sustained rate Traffic priority

**5.6.1.1.4.2.3 Energy conservation in the MS**

The MAC CPS controls two energy-saving modes – Sleep Mode and Idle Mode – to conserve energy in the MS. During Sleep Mode, the MS observes pre-negotiated periods without transmission. Idle Mode is intended as a mechanism to allow the MS to become periodically available for DL broadcast messaging without registration at a specific BS as the MS traverses an air link environment populated by multiple BSs, typically over a large geographic area.

**5.6.1.1.4.2.4 Handover**

The MAC CPS supports optimized hard handover.

**5.6.1.1.4.3 Security sub-layer**

The security sub-layer, which operates between the PHY and the MAC CPS, is responsible for providing strong encryption, decryption, mutual authentication, and secure key exchange. Security is maintained as a separate sub-layer so that it may be upgraded as necessary. Also, the key functionality internal to the sub-layer is also modular, to provide easy maintenance upgrade. For example, the protocol provides a means of identifying one from a set of supported cryptographic suites, each of which specifies data encryption and authentication algorithms, and the rules for applying those algorithms to a MAC PDU payload.

The security sub-layer utilizes a security association (SA), which is a set of information shared between the transmitter and receiver. Each SA contains information on the cryptographic suite used for that SA and may also contain keys, such as the traffic encryption keys (TEKs), along with the key lifetimes and other associated state information. Prior to transmission, the MAC PDUs are mapped to an SA. The receiver uses the CID to determine the correct SA and applies the corresponding processing to the received PDU.

Device and user authentication use the IETF EAP protocol. OFDMA TDD WMAN encrypts user data using the AES-CCM cryptographic suite, with the Advanced Encryption Standard (AES) algorithm in the counter with CBC-MAC (CCM) mode, with 128-bit keys. The keys are generated using EAP authentication and managed by a Traffic Encryption Key (TEK) state machine. MAC management messages are AES encrypted and authenticated. A three-way handshake scheme is supported to optimize re-authentication during handover.

#### 5.6.1.1.5 Smart antennas

OFDMA TDD WMAN specifies the use of smart antenna technologies, including antenna beamforming, space-time coding, and spatial multiplexing, which increase the cell size, data throughput, and spectral efficiency. These techniques reduce the sensitivity of the system to fading and multipath transmission effects.

#### 5.6.1.1.6 Summary of major technical parameters

TABLE 12A

#### OFDMA TDD WMAN parameters and capabilities, TDD mode

Parameter/Capability	Value				IEEE 802.16 Subclause
Duplex method	TDD				§ 8.4.4
Physical layer mode	OFDMA				§ 8.4
System channel bandwidth	5 MHz	10 MHz	8.75 MHz	7 MHz	§ 8.4.1
FFT size	512	1 024	1 024	1024	
Frame duration	5 ms	5 ms	5 ms		§ 8.4.5.2
Transmit transition gap (TTG)	105.714 $\mu$ s	87.2 $\mu$ s	188 $\mu$ s		§ 8.4.5.2
Receive transition gap (RTG)	60 $\mu$ s	74.4 $\mu$ s	60 $\mu$ s		§ 8.4.5.2
Modulation, downlink	QPSK, 16-QAM, 64-QAM				§ 8.4.9.4.2
Modulation, uplink	QPSK, 16-QAM				§ 8.4.9.4.2
Forward error correction coding	Convolutional Coding and Convolutional Turbo Coding				§§ 8.4.9.2.1; 8.4.9.2.3 excluding § 8.4.9.2.3.5
Encryption	AES-CCM, AES Key Wrap, 128-bit keys				§ 11.9.14
Authentication	EAP				§ 11.8.4.2
Privacy key management	PKMv2				§ 7.2.2
Management message integrity protection	CMAC				§ 7.5.4.4

#### 5.6.1.1.7 LE operation

The non-exclusive nature of the license-exempt (LE) spectrum introduces additional interference and coexistence issues. Also, regulatory constraints limit the allowed radiated power as well as imposing other restrictions. The PHY and MAC introduce mechanisms to facilitate the detection, avoidance, and mitigation of interference among users including specific spectrum users identified by regulation. This includes a mechanism for regulatory compliance called dynamic frequency selection (DFS).

LE systems identify both victims and sources of interference and coordinate with neighbour systems in the interference community to proceed with interference prevention procedures. The LE base stations in all neighbouring systems within an interference community utilize interference information gathered on a coexistence control channel to negotiate the proper allocation of shared and dedicated channel access that minimizes co-channel interference. This negotiation uses subscriber stations to forward messages between the base stations, specifying coexistence primitives for communication over the infrastructure network.

The coexistence control channel is based on a series of globally synchronized time slots, divided into four subchannels dedicated for coexistence functions such as passive and active scanning of the radio environment, interferer identification, and interference resolution.

#### **5.6.1.1.8 WirelessMAN-Advanced**

An overview of the WirelessMAN-Advanced radio interface technology is provided in Annex 2 of Recommendation ITU-R M.2012.

#### **5.6.1.2 FDD component**

##### **5.6.1.2.1 Introduction**

The IEEE standards relevant for IMT-2000 OFDMA TDD WMAN, designated as IEEE Std 802.16 and IEEE Std 802.16.1, are developed and maintained by the IEEE 802.16 Working Group on Broadband Wireless Access. They are published by the IEEE Standards Association (IEEE-SA) of the Institute of Electrical and Electronics Engineers (IEEE).

The radio interface technology specified in IEEE Standard 802.16 is flexible, for use in a wide variety of applications, operating frequencies, and regulatory environments. IEEE 802.16 includes multiple physical layer specifications, one of which is known as WirelessMAN-OFDMA. OFDMA TDD WMAN is a special case of WirelessMAN-OFDMA specifying a particular interoperable radio interface. The component of OFDMA TDD WMAN defined here operates in FDD mode.

The OFDMA TDD WMAN radio interface comprises the two lowest network layers – the physical layer (PHY) and the data link control layer (DLC). The lower element of the DLC is the medium access control layer (MAC); the higher element in the DLC is the logical link control layer (LLC). The PHY is based on orthogonal frequency division multiple access (OFDMA) suitable for use in a 5 MHz, 10 MHz or 7 MHz channel allocation. The MAC is based on a connection-oriented protocol designed for use in a point-to-multipoint configuration. It is designed to carry a wide range of packet-switched (typically IP-based) services while permitting fine and instantaneous control of resource allocation to allow full carrier-class QoS differentiation. In addition, a multihop relay specification details the functionality of relay stations in conjunction with multihop relay base stations in order to provide additional coverage or performance advantage.

As a technological evolution of OFDMA TDD WMAN, WirelessMAN-Advanced has been introduced for providing the performance improvements necessary to support future advanced services and applications for next generation broadband mobile communications. WirelessMAN-Advanced incorporates innovative communications technologies such as multi-user MIMO (MU-MIMO), multicarrier operation, and cooperative communications, as well as femto-cells, self-organizing networks, and relays. It also supports scalable bandwidth operation up to 20 MHz.

##### **5.6.1.2.2 Radio access network architecture**

The OFDMA TDD WMAN radio interface is designed to carry packet-based traffic, including IP. It is flexible enough to support a variety of higher-layer network architectures for fixed, nomadic, or fully mobile use, with handover support. It can readily support functionality suitable for generic

data as well as time-critical voice and multimedia services, broadcast and multicast services, and mandated regulatory services.

The radio interface standard specifies Layers 1 and 2; the specification of the higher network layers is not included. It offers the advantage of flexibility and openness at the interface between Layers 2 and 3 and it supports a variety of network infrastructures. The radio interface is compatible with the network architectures defined in ITU-T Recommendation Q.1701. In particular, a network architecture design to make optimum use of IEEE Standard 802.16 and the OFDMA TDD WMAN radio interface is described in the “WiMAX End to End Network Systems Architecture Stage 2-3”, available from the WiMAX Forum<sup>4</sup>.

The protocol layering is illustrated in Fig. 70. The MAC comprises three sub-layers. The service-specific convergence sublayer (CS) provides any transformation or mapping of external network data, received through the CS service access point (SAP), into MAC service data units (SDUs) received by the MAC common part sublayer (CPS) through the MAC SAP. This includes classifying external network SDUs and associating them to the proper MAC service flow identifier (SFID) and connection identifier (CID). It may also include such functions as payload header suppression (PHS). Multiple CS specifications are provided for interfacing with various protocols. The internal format of the CS payload is unique to the CS, and the MAC CPS is not required to understand the format of or parse any information from the CS payload.

The MAC CPS provides the core MAC functionality of system access, bandwidth allocation, connection establishment, and connection maintenance. It receives data from the various CSs, through the MAC SAP, classified to particular MAC connections.

QoS is applied to the transmission and scheduling of data over the PHY.

The MAC also contains a separate security sublayer providing authentication, secure key exchange, and encryption.

Data, PHY control, and statistics are transferred between the MAC CPS and the PHY via the PHY SAP (which is implementation specific).

The 802.16 devices can include Mobile Stations (MS) or Base Stations (BS). As the 802.16 devices may be part of a larger network and therefore would require interfacing with entities for management and control purposes, a Network Control and Management System (NCMS) abstraction has been introduced in this standard as a “black box” containing these entities. The NCMS abstraction allows the PHY/MAC layers specified in 802.16 to be independent of the network architecture, the transport network, and the protocols used at the backend and therefore allows greater flexibility. NCMS logically exists at BS side and MS side of the radio interface, termed NCMS(BS) and NCMS(MS), respectively. Any necessary inter-BS coordination is handled through the NCMS(BS).

This specification includes a Control SAP (C-SAP) and Management SAP (M-SAP) that expose control plane and management plane functions to upper layers. The NCMS uses the C-SAP and M-SAP to interface with the 802.16 entity. In order to provide correct MAC operation, NCMS shall be present within each MS. The NCMS is a layer independent entity that may be viewed as a management entity or control entity. General system management entities can perform functions through NCMS and standard management protocols can be implemented in the NCMS.

---

<sup>4</sup> <http://www.wimaxforum.org/resources/documents/technical/release>.

#### 5.6.1.2.2.1 BS and MS functionality

The system architecture consists of two logical entities, the base station (BS) and the mobile station (MS), with an optional relay station (RS). The basic architectural assumption is of a base station (BS) communicating in point-to-multipoint fashion with a number of fixed or mobile stations (MSs). The BS is connected to an IP-based backhaul network. It controls and allocates the resources in spectrum and time. Transmissions on the downlink (BS to MS) are divided in both time and frequency (using the multiple sub-carriers provide by OFDMA) for assigning communications to individual MSs. Transmissions on the uplink (from MS to BS) take place according to the schedule and in the sub-channels assigned by the BS.

In brief, the BS is responsible for:

- configuring and updating basic parameters;
- performing bandwidth allocation for DL (per connection) and UL traffic (per MS) and performing centralized QoS scheduling, based on the QoS/service parameters and the active resource requests from the MS;
- communicating to all MSs, through the maps, the schedule of each frame and supporting other data and management broadcast and multicast services;
- transmitting/receiving traffic data and control information as MAC protocol data units (PDUs);
- performing connection admission control and other connection management functions;
- providing other MS support services such as ranging, clock synchronization, power control, and handover.

The MS is responsible for:

- identifying the BS, obtaining MAC parameters, and joining the network;
- establishing basic connectivity, setting up additional data and management connections, and negotiating any optional parameters as needed;
- generating resource requests for connections that require them, based on the connection profiles and traffic;
- receiving broadcast/multicast PDUs and unicast PDUs and forwarding them appropriately;
- making local scheduling decisions based on the current demand and history of resource requests/grants;
- transmitting only when instructed by the BS to do so or the MS has some information that qualifies for transmission in one of the allowed contention slots;
- unless in sleep mode, receiving all schedule and channel information broadcast by the BS and obeying all medium access rules;
- performing initial ranging, maintenance ranging, power control, and other housekeeping functions.

Figure 70 is limited to describing a system including a BS and the MSs with which it communicates. However, the radio interface also provides specifications to allow handover of an MS from one BS to another. Such handover would typically occur as a mobile device moves toward an adjacent cell. However, it might also occur due to system-wide efforts at load balancing.

#### 5.6.1.1.2.2 RS functionality

Multihop relay (MR) is an optional deployment that may be used to provide additional coverage or performance advantage in an access network. In MR networks, the BS may be replaced by a multihop relay BS and one or more relay stations (RSs). Traffic and signalling between the MS and

the multihop relay BS are relayed by the RS, thereby extending the coverage and performance of the system in areas where RSs are deployed. Each RS is under the supervision of a multihop relay BS. In a system providing more than two hops, traffic and signalling between an access RS and the multihop relay BS may also be relayed through intermediate RSs.

### **5.6.1.2.3 Layer 1: Physical layer (PHY)**

The radio interface is a special case of the Wireless MAN-OFDMA air interface specified in § 8.4 of IEEE Standard 802.16. It uses orthogonal frequency-division multiple access (OFDMA), which is an extension of orthogonal frequency-division multiplexing (OFDM).

#### **5.6.1.2.3.1 OFDMA technology overview**

OFDM divides the channel by frequency into orthogonal sub-carriers. Data to be transmitted is divided into parallel streams of reduced data rate (and therefore longer symbol duration) and each stream is modulated and transmitted on a separate sub-carrier. The lengthened symbol duration improves the robustness of OFDM to delay spread. Furthermore, the introduction of a cyclic prefix (CP) eliminates intersymbol interference if the CP duration is longer than the channel delay spread.

In a typical OFDM implementation, all of the transmitter's sub-carriers are, at any given time, addressed to a single receiver; multiple access is provided solely by TDMA time slotting. OFDMA, however, divides the sub-carrier set into subsets, known as sub-channels. Each sub-channel can

address a different receiver at any given time. In the downlink, each sub-channel may be intended for a different receiver or group of receivers. In the uplink, multiple MSs may transmit simultaneously as long as they are assigned different sub-channels.

Sub-carriers are used for three purposes:

- Data transmission.
- Pilot transmission, for various estimation purposes.
- Null transmission, for guard bands and at DC.

The concept is illustrated in Fig. 71. As indicated, the sub-carriers forming one sub-channel need not be adjacent.

Sub-channelization is a multiple access technique. It provides OFDMA systems increased scheduling flexibility and a number of performance advantages, including enhanced scalability and advanced antenna array processing capabilities.

#### **5.6.1.2.3.2 OFDMA TDD WMAN physical layer details**

The PHY utilizes OFDMA with either 512 sub-carriers in a 5 MHz channel or 1 024 sub-carriers in a 7 MHz or 10 MHz channel. The primitive PHY parameters for FDD mode are listed in Table 10B.

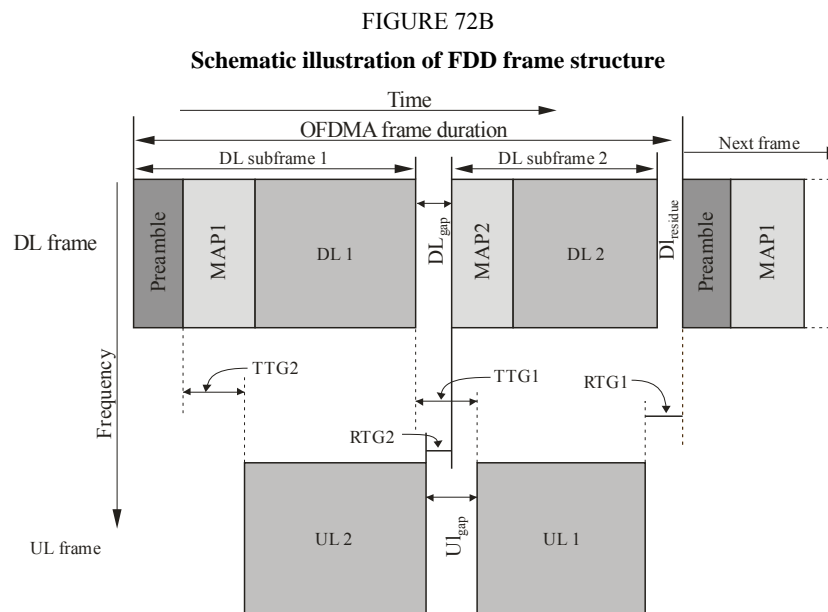

TABLE 10B

**OFDMA TDD WMAN primitive PHY parameters, FDD mode**

FFT size ( $N_{\text{FFT}}$ )	512	1 024	1024
System channel bandwidth (BW)	5 MHz	10 MHz	7 MHz
Sampling frequency ( $F_s$ )	5.6 MHz	11.2 MHz	8 MHz
Sub-carrier frequency spacing ( $\Delta f = F_s/N_{\text{FFT}}$ )	10.9375 kHz		7.8125 kHz
Useful symbol time ( $T_b = 1/\Delta f$ )	~91.43 $\mu\text{s}$		128 $\mu\text{s}$
Guard (CP) time ( $T_g = T_b/8$ )	~11.43 $\mu\text{s}$		16 $\mu\text{s}$
OFDMA symbol duration ( $T_s = T_b + T_g$ )	~102.9 $\mu\text{s}$		144 $\mu\text{s}$
Frame duration	5 ms		5 ms
OFDMA symbols per frame	~48		~34

**5.6.1.2.3.3 Framing and sub-channelization**

The FDD frame structure is illustrated in Fig. 72B. This frame structure can concurrently support both Full Duplex FDD (F-FDD) and Half Duplex FDD (H-FDD) Mobile Stations. The frame is partitioned using MAP1 and MAP2 control structures for H-FDD Mobile Stations.

M.1457-72b

For systems that serve only F-FDD MSs, the frame structure is configured by allocating the whole down link and uplink frames to the F-FDD MSs without partitioning of frames.

**5.6.1.2.3.4 Adaptive modulation and coding**

OFDMA TDD WMAN supports a variety of modulation and coding alternatives. The control is adaptive and dynamic, so that the BS may select different options for communicating with different MSs and may order the MS to alter the choices in order to optimize the trade-off of robustness versus capacity.

The BS selects the modulation from among QPSK, 16-QAM, and 64-QAM. For forward error correction, Convolutional Coding and Convolutional Turbo Coding with variable code rate and

repetition coding are specified. Block Turbo Code and Low Density Parity Check Code (LDPC) are supported as optional features.

Data randomization is specified in order to reduce the peak-to-average power ratio. Interleaving is specified to increase frequency diversity.

#### **5.6.1.2.3.5 Fast feedback and hybrid ARQ**

OFDMA TDD WMAN specifies an uplink fast-feedback channel to provide time-critical PHY parameter data to the BS. Parameters include signal-to-noise ratio, MIMO coefficients, and MIMO configuration parameters.

Additional UL acknowledgment channels may be allocated by the BS to support hybrid automatic repeat request (HARQ).

#### **5.6.1.2.4 Layer 2: Medium access control layer**

The medium access control layer (MAC) functionality controls access to the medium, which in this case is the radio spectrum. The MAC is also responsible for basic functions such as data encapsulation, fragmentation, radio resource control, radio link control, error detection and retransmission, QoS, security, sleep mode, and handover.

Although the radio interface is designed primarily to support a connectionless network layer, such as IP, the MAC is connection-oriented. All services, including inherently connectionless services, are mapped to a connection. The connection provides a mechanism for requesting resource allocation, associating QoS and traffic parameters, transporting and routing data, and all other actions associated with the terms of the service. A 16-bit connection identifier (CID) is assigned to designate each connection. The MAC uses the CID to identify all information exchanged between BS and MS, including management and broadcast data. The CID provides a simple and direct way to differentiate traffic. All MAC-level QoS functions, such as the classifier and QoS scheduler, use the CID to identify and differentiate traffic in order to maintain the service level and fairness among connections.

##### **5.6.1.2.4.1 Convergence sub-layer (CS)**

At the transmitter side, the Convergence sub-layer is responsible for transforming packet-based protocol data units from the higher layer protocol into MAC service data unit (SDUs), possibly using payload header suppression (PHS) to suppress some of the packet headers and reduce the burden of carrying them over the air. The CS then classifies each MAC SDU, assigning it to a particular connection, and passes it to the MAC CPS. At the receiver side, the CS is responsible for the inverse operations, including reassembly of packets into their original format with complete headers.

The CS contains a classification function that determines on which connection a particular packet shall be carried and which PHS rule applies for that packet. The operation is illustrated in Fig. 73, which shows the downlink case. Classifier parameters are configured during dynamic service signalling.

##### **5.6.1.2.4.2 MAC common part sub-layer**

The MAC common part sub-layer (CPS) is responsible for performing the core MAC functions. It receives MAC service data units (SDUs) from the CS and encapsulates them in its native MAC PDU format for transmission over the PHY. The MAC CPS also manages the transport connections and QoS, controlling access to the radio spectrum by the MSs.

Encapsulation may be as simple as adding necessary information to the SDU. However, the MAC CPS also has the possibility of dividing a single SDU into multiple fragments before transmission, for reassembly at the receiving MAC CPS. Fragmentation allows more efficient support of higher layer protocols with variable-size SDUs, given that the underlying PHY used a fixed frame size. The MAC CPS also has the complementary option to pack multiple higher layer payloads into a single PDU. Since MAC encapsulation introduces some fixed overhead per PDU, this can improve the efficiency of carrying small SDUs.

A MAC PDU consists of a six-byte MAC header, a variable-length payload, and an optional cyclic redundancy check. Four header formats, distinguished by the HT field, are defined. The generic header is shown in Fig. 74.

MAC PDUs generally contain either MAC management messages or convergence sub-layer data. However, one header type is reserved for uplink PDUs that contain no payload, conveying their information (such as a resource request) in the content of the header itself. Additional sub-headers are also defined. For example, the MS can use the grant management sub-header to convey bandwidth management needs to the BS. The fragmentation sub-header contains information that indicates the presence and orientation in the payload of any fragments of SDUs. The packing subheader is used to indicate the packing of multiple SDUs into a single PDU. The grant management and fragmentation sub-headers may be inserted in MAC PDUs immediately following the generic header if so indicated by the Type field. The packing sub-header may be inserted before each MAC SDU if so indicated by the Type field.

#### **5.6.1.2.4.2.1 Uplink scheduling services**

The scheduling algorithm is not specified in the standard but is critical to efficient multimedia delivery when the BS supports a variety of disparate connections. The BS is presumed capable of scheduling its own downlink transmissions based on QoS information developed in the CS. Uplink scheduling is more complicated because, while resource allocation is under the control of the BS, only the MSs know in real time their immediate transmission demands.

In order to allow efficient QoS-based scheduling, a number of uplink scheduling services are defined, with a specific service assigned to each connection. The QoS categories are summarized in Table 11.

Resource requests, for transmission slots, are initiated by a specific connection at the MS. However, grants are allocated not to the connection but to the supporting MS. The MS is required to manage the slots allocated to it, assigning them to the multiple connections it supports. By distributing the management and permitting local resource allocation, over-the-air negotiation is minimized and rescheduling decisions are made more quickly and effectively.

#### **5.6.1.2.4.2.2 Radio link control**

As noted in § 5.6.1.3.2, OFDMA TDD WMAN supports adaptive modulation and coding. The MAC CPS is responsible for radio link control. This involves managing the modulation and coding selection at the MS through interactive message exchange based on monitoring the ratio of carrier signal to noise and interference.

TABLE 11

**OFDMA TDD WMAN Uplink scheduling services**

<b>QoS category</b>	<b>Typical applications</b>	<b>QoS specifications</b>
<b>UGS</b> Unsolicited grant service	VoIP	Maximum sustained rate Maximum latency tolerance Jitter tolerance
<b>rtPS</b> Real-time packet service	Streaming audio or video	Minimum reserved rate Maximum sustained rate Maximum latency tolerance Traffic priority
<b>ErtPS</b> Extended real-time packet service	Voice with activity detection (VoIP)	Minimum reserved rate Maximum sustained rate Maximum latency tolerance Jitter tolerance Traffic priority
<b>nrtPS</b> Non-real-time packet service	File transfer protocol (FTP)	Minimum reserved rate Maximum sustained rate Traffic priority
<b>BE</b> Best-effort service	Data transfer, web browsing, etc.	Maximum sustained rate Traffic priority

**5.6.1.2.4.2.3 Energy conservation in the MS**

The MAC CPS controls two energy-saving modes – Sleep Mode and Idle Mode – to conserve energy in the MS. During Sleep Mode, the MS observes pre-negotiated periods without transmission. Idle Mode is intended as a mechanism to allow the MS to become periodically available for DL broadcast messaging without registration at a specific BS as the MS traverses an air link environment populated by multiple BSs, typically over a large geographic area.

**5.6.1.2.4.2.4 Handover**

The MAC CPS supports optimized hard handover.

**5.6.1.2.4.3 Security sub-layer**

The security sub-layer, which operates between the PHY and the MAC CPS, is responsible for providing strong encryption, decryption, mutual authentication, and secure key exchange. Security is maintained as a separate sub-layer so that it may be upgraded as necessary. Also, the key functionality internal to the sub-layer is also modular, to provide easy maintenance upgrade. For example, the protocol provides a means of identifying one from a set of supported cryptographic suites, each of which specifies data encryption and authentication algorithms, and the rules for applying those algorithms to a MAC PDU payload.

The security sub-layer utilizes a security association (SA), which is a set of information shared between the transmitter and receiver. Each SA contains information on the cryptographic suite used for that SA and may also contain keys, such as the traffic encryption keys (TEKs), along with the key lifetimes and other associated state information. Prior to transmission, the MAC PDUs are mapped to an SA. The receiver uses the CID to determine the correct SA and applies the corresponding processing to the received PDU.

Device and user authentication use the IETF EAP protocol. OFDMA TDD WMAN encrypts user data using the AES-CCM cryptographic suite, with the Advanced Encryption Standard (AES)

algorithm in the counter with CBC-MAC (CCM) mode, with 128-bit keys. The keys are generated using EAP authentication and managed by a Traffic Encryption Key (TEK) state machine. MAC management messages are AES encrypted and authenticated. A three-way handshake scheme is supported to optimize re-authentication during handover.

#### 5.6.1.2.5 Smart antennas

OFDMA TDD WMAN specifies the use of smart antenna technologies, including antenna beamforming, space-time coding, and spatial multiplexing, which increase the cell size, data throughput, and spectral efficiency. These techniques reduce the sensitivity of the system to fading and multipath transmission effects.

#### 5.6.1.2.6 Summary of major technical parameters

TABLE 12B  
OFDMA TDD WMAN parameters and capabilities, FDD mode

Parameter/Capability	Value			IEEE 802.16 Subclause
Duplex method	FDD			§ 8.4.4
Physical layer mode	OFDMA			§ 8.4
System channel bandwidth (Uplink/Downlink)	5 MHz	10 MHz	7 MHz	§ 8.4.1
FFT size	512	1 024	1 024	
Frame duration	5 ms			
Modulation, downlink	QPSK, 16-QAM, 64-QAM			§ 8.4.5.2
Modulation, uplink	QPSK, 16-QAM			§ 8.4.9.4.2
Forward error correction coding	Convolutional coding and convolutional turbo coding			§ 8.4.9.4.2
Encryption	AES-CCM, AES Key Wrap, 128-bit keys			§§ 8.4.9.2.1; 8.4.9.2.3 excluding § 8.4.9.2.3.5
Authentication	EAP			§ 11.9.14
Privacy key management	PKMv2			§ 11.8.4.2
Management message integrity protection	CMAC			§ 7.2.2

#### 5.6.1.2.7 WirelessMAN-Advanced

An overview of the WirelessMAN-Advanced radio interface technology is provided in Recommendation ITU-R M.2012.

### 5.6.2 Detailed specification of the set of radio interface FDD/TDD components

#### 5.6.2.1 TDD component

The standards contained in this section are derived from the global core specifications for IMT-2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

1. The relevant SDOs should make their reference material available from their website.
2. This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

The entries in the Tables in the elements of § 5.6.2.1.x.2 that contain “Y” or interoperable options (IO-BF or IO-MIMO) are part of the detailed specifications for OFDMA TDD WMAN. The “N” entries in the Tables in the elements of § 5.6.2.1.x.2 are for information only and are not included in the OFDMA TDD WMAN specification. The specifications for OFDMA TDD WMAN are provided in the elements of § 5.6.2.1.x.1 that are specifically included in the corresponding elements of § 5.6.2.1.x.2. Anything in § 5.6.2.1.x.1 that is not mentioned in § 5.6.2.1.x.2 is excluded.

**5.6.2.1.1 Release 1**

**5.6.2.1.1.1 IEEE Std 802.16: Standard for local and metropolitan area networks – Air interface for broadband wireless access systems**

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support multiple PHY specifications, each suited to a particular operational environment.

**5.6.2.1.1.1.1 IEEE Std 802.16-2004**

**IEEE Standard for local and metropolitan area networks – Part 16: Air interface for fixed broadband wireless access systems**

This revised standard specifies the air interface, including the medium access control layer and multiple physical layer specifications, of fixed BWA systems supporting multiple services. It consolidates IEEE Std 802.16™, IEEE Std 802.16a™, and IEEE Std 802.16c™, retaining all modes and major features without adding modes. Content is added or revised to improve performance, ease deployment, or replace incorrect, ambiguous, or incomplete material, including system profiles.

SDO	Document No.	Status	Issued date	Location
IEEE	IEEE Std 802.16-2004	Published; superseded by IEEE Std 802.16-2009	2004-10-01	<a href="http://standards.ieee.org/getieee802/802.16.html">http://standards.ieee.org/getieee802/802.16.html</a>

**5.6.2.1.1.1.2 IEEE Std 802.16e-2005 and Cor1**

**IEEE Standard for local and metropolitan area networks – Part 16: Air interface for fixed and mobile broadband wireless access systems – Amendment 2: Physical and medium access control layers for combined fixed and mobile operation in licensed bands**

This document provides enhancements to IEEE Std 802.16-2004 to support subscriber stations moving at vehicular speeds and thereby specifies a system for combined fixed and mobile broadband wireless access. Functions to support higher layer handover between base stations or sectors are specified. Operation is limited to licensed bands suitable for mobility below 6 GHz. Fixed IEEE 802.16 subscriber capabilities are not compromised. In addition to mobility enhancements, this document contains substantive corrections to IEEE 802.16-2004 regarding fixed operation.

### 5.6.2.1.2 Release 1.5

#### 5.6.2.1.2.1 IEEE Std 802.16: Standard for Air Interface for Broadband Wireless Access Systems

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support multiple PHY specifications, each suited to a particular operational environment.

#### 5.6.2.1.2.1.1 IEEE Std 802.16-2009

#### Standard for local and metropolitan area networks – Part 16: Air interface for broadband wireless access systems

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support multiple PHY specifications, each suited to a particular operational environment.

### 5.6.2.2 FDD component

The standards contained in this section are derived from the global core specifications for IMT-2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

1. The relevant SDOs should make their reference material available from their website.
2. This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

The entries in the Tables in the elements of § 5.6.2.2.x.2 that contain “Y” or interoperable options (IO-BF or IO-MIMO) are part of the detailed specifications for OFDMA TDD WMAN. The “N” entries in the Tables in the elements of § 5.6.2.2.x.2 are for information only and are not included in the OFDMA TDD WMAN specification. The specifications for OFDMA TDD WMAN are provided in the elements of § 5.6.2.2.x.1 that are specifically included in the corresponding elements of § 5.6.2.2.x.2. Anything in § 5.6.2.2.x.1 that is not mentioned in § 5.6.2.2.x.2 is excluded.

#### 5.6.2.2.1 Release 1

(This section is intentionally left blank.)

#### 5.6.2.2.2 Release 1.5

##### 5.6.2.2.2.1 IEEE Std 802.16: Standard for local and metropolitan area networks – Air interface for broadband wireless access systems

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support multiple PHY specifications, each suited to a particular operational environment.

##### 5.6.2.2.2.1.1 IEEE Std 802.16-2009

##### Standard for local and metropolitan area networks – Part 16: Air interface for broadband wireless access systems

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support multiple PHY specifications, each suited to a particular operational environment.

**5.6.2.2.1.2 IEEE Std 802.16j-2009****Multihop Relay Specification**

This amendment updates and expands IEEE Std 802.16-2009, specifying physical layer and medium access control layer enhancements to IEEE Std 802.16 for licensed bands to enable the operation of relay stations. Subscriber station specifications are not changed.

**5.6.2.2.1.3 IEEE Std 802.16-2012****Standard for Air Interface for Broadband Wireless Access Systems**

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support the WirelessMAN-SC, WirelessMAN-OFDM, and WirelessMAN-OFDMA PHY specifications, each suited to a particular operational environment.

**5.6.2.2.2 WiMAX Forum® Profile**

The complete WiMAX Forum® Mobile System Profile, Release 1.5 is included in the following volumes.

**5.6.2.2.2.1 WiMAX Forum® Mobile System Profile specification: Release 1.5 – Common part**

This specification describes the features of the WiMAX Forum® Mobile System Profile, Release 1.5. It includes the features common to both the TDD and FDD operational modes. It has the following table of contents:

### 5.6.2.2.3 Release 2

#### 5.6.2.2.3.1 IEEE Std 802.16-2012

##### Standard for Air Interface for Broadband Wireless Access Systems

This standard specifies the air interface, including the medium access control layer (MAC) and physical layer (PHY), of combined fixed and mobile point-to-multipoint broadband wireless access (BWA) systems providing multiple services. The MAC is structured to support the WirelessMAN-SC, WirelessMAN-OFDM, and WirelessMAN-OFDMA PHY specifications, each suited to a particular operational environment.

#### 5.6.2.2.3.2 IEEE Std 802.16.1-2012

##### Standard for WirelessMAN-Advanced Air Interface for Broadband Wireless Access Systems

This standard specifies the WirelessMAN-Advanced air interface, including the medium access control layer (MAC) and physical layer (PHY), of a broadband wireless access (BWA) system supporting multiple services. The WirelessMAN-Advanced air interface supports ITU's IMT-Advanced requirements.

## 6 Recommendations on unwanted emission limits

### 6.1 Terrestrial radio interfaces

The information on emissions limits is recommended in Recommendation ITU-R M.1581 – Generic unwanted emission characteristics of mobile stations using the terrestrial radio interfaces of IMT-2000, and in Recommendation ITU-R M.1580 – Generic unwanted emission characteristics of base stations using the terrestrial radio interfaces of IMT-2000.

## Annex 1

### Abbreviations

AES	Advanced encryption standard
ARQ	Automatic repeat request
BCMCS	Broadcast multicast services
BE	Best-effort
BMC	Broadcast/multicast control
BS	Base station
BWA	Broadband wireless access
CCM	Cipher block chaining message authentication code
CDMA	Code division multiple access
CID	Connection identifier
CN	Core network
CP	Cyclic prefix
CS	Convergence sub-layer
DECT	Digital Enhanced Cordless Telecommunications
DL	Downlink
DLC	Data link control layer
DL_MAP	Downlink map
DPRS	DECT packet radio service
DRC	Data rate control

DS-CDMA	Direct Spread CDMA
E-UTRAN	Evolved UTRAN
EAP	Extensible authentication protocol
EDGE	Enhanced data rates for GSM evolution
EDGE/GPRS	(EGPRS2) – EDGE evolution – Evolved enhanced data rates for GSM evolution
ErtPS	Extended real-time packet service
FBSS	Fast base station switching
FCH	Frame control header
FDD	Frequency division duplex
FDMA	Frequency division multiple access
FEC	Forward error correction
FER	Frame error ratio
FFT	Fast Fourier Transform
FLO	Flexible layer one
GERAN	GSM/EDGE radio access network
H-ARQ	Hybrid – ARQ
HHO	Hard handover
HRPD	High rate packet data
HSDPA	High-speed downlink packet access
IEEE	Institute of Electrical and Electronics Engineers
IMS	IP multimedia subsystems
IWU	Inter-working unit
LAC	Link access control
LDPC	Low density parity check code
LLC	Logical link control layer
MAC	Medium access control
MAC CPS	Common part sub-layer
MBMS	Multimedia broadcast/multicast service
MC	Multi-carrier
MDHO	Macro diversity handover
MEID	Mobile equipment identifier
MIMO	Multiple-input/multiple-output
MM	Mobility management
nrtPS	Non-real-time packet service
OFDM	Orthogonal frequency-division multiplexing
OFDMA	Orthogonal frequency-division multiple access
PDCP	Packet data convergence protocol
PDU	Protocol data unit
PHS	Payload header suppression
PHY	Physical layer

QoS	Quality of Service
RLC	Radio link control
RNC	Radio network controller
RNS	Radio network sub-systems
RRC	Radio resource control
RRI	Reverse rate indicator
RTG	Receive/transmit transition gap
rtPS	Real-time packet service
R-UIM	Removable UIM
SA	Security association
SAP	Service access points
SC	Single-carrier
SDO(s)	Standards development organization(s)
SDU	Service data unit
SIR	Signal-to-interference ratio
SIM	Subscriber identity module
SMS	Short message service
SS	Subscriber station
TEK	Traffic encryption key
TDD	Time division duplex
TDMA	Time division multiple access
TPC	Transmit power control
TTG	Transmit/receive transition gap
TTI	Transmission time interval
UE	User equipment
UGS	Unsolicited grant service
UL	Uplink
UL_MAP	Uplink map
U-Plane	User plane
USIM	Universal SIM
UTRA	Universal Terrestrial Radio Access
UTRAN	UMTS terrestrial radio access network
WCDMA	Wideband CDMA
WMAN	Wireless metropolitan area network

---
