

**Recommendation ITU-R M.1457-11**  
(02/2013)

**Detailed specifications of the terrestrial  
radio interfaces of International  
Mobile Telecommunications-2000  
(IMT-2000)**

**M Series**  
**Mobile, radiodetermination, amateur  
and related satellite services**

## Foreword

The role of the Radiocommunication Sector is to ensure the rational, equitable, efficient and economical use of the radio-frequency spectrum by all radiocommunication services, including satellite services, and carry out studies without limit of frequency range on the basis of which Recommendations are adopted.

The regulatory and policy functions of the Radiocommunication Sector are performed by World and Regional Radiocommunication Conferences and Radiocommunication Assemblies supported by Study Groups.

## Policy on Intellectual Property Right (IPR)

ITU-R policy on IPR is described in the Common Patent Policy for ITU-T/ITU-R/ISO/IEC referenced in Annex 1 of Resolution ITU-R 1. Forms to be used for the submission of patent statements and licensing declarations by patent holders are available from <http://www.itu.int/ITU-R/go/patents/en> where the Guidelines for Implementation of the Common Patent Policy for ITU-T/ITU-R/ISO/IEC and the ITU-R patent information database can also be found.

\* The Administration of China did not agree to the approval of the revision of this Recommendation for inclusion of OFDMA TDD WMAN during the Radiocommunication Assembly (Geneva, 2007) (RA-07). The reasons can be found in the summary record of RA-07.

\*\* The recommended detailed specifications of the radio interfaces of IMT-2000 are contained in the core global specifications which form part of this Recommendation by means of references to uniform resource locators (URLs) at the ITU Web site. For those cases where recognized external organizations have converted these core global specifications or parts thereof into their own approved standards, a reference to the corresponding external text is included in this Recommendation by means of URLs at their Web sites. Such references do not give the external texts the status, as stand-alone texts, of ITU Recommendations. Any reference to an external text is accurate at the time of approval of this Recommendation. Since the external text may be revised, users of this Recommendation are advised to contact the source of the external text to determine whether the reference is still current. This Recommendation will be subject to periodic updates that will be coordinated with the appropriate recognized external organizations responsible for the external texts that are referenced.

## 1 Introduction<sup>1</sup>

IMT-2000, third generation mobile systems started service around the year 2000, and provide access by means of one or more radio links to a wide range of telecommunications services supported by the fixed telecommunication networks (e.g. PSTN/ISDN/Internet protocol (IP)) and to other services specific to mobile users. Since then, IMT-2000 has been continually enhanced.

A range of mobile terminal types is encompassed, linking to terrestrial and/or satellite-based networks, and the terminals may be designed for mobile or fixed use.

Key features of IMT-2000 are:

- high degree of commonality of design worldwide;
- compatibility of services within IMT-2000 and with the fixed networks;
- high quality;
- small terminal for worldwide use;
- worldwide roaming capability;
- capability for multimedia applications, and a wide range of services and terminals.

IMT-2000 systems are defined by a set of interdependent Recommendations of which this is a member.

---

<sup>1</sup> Abbreviations used in this Recommendation are listed in Annex 1.

This Recommendation forms the final part of the process of specifying the radio interfaces of IMT-2000, as defined in Recommendation ITU-R M.1225. It identifies the detailed specifications for the IMT-2000 radio interfaces.

Besides Recommendation ITU-R M.1457, there are a number of other ITU-R Recommendations for IMT (Recommendations ITU-R M.1036, ITU-R M.1580, ITU-R M.1581, ITU-R M.1579, etc.) that provide relevant implementation aspects enabling the most effective and efficient use and deployment of systems – while minimizing the impact on other systems or services in these and in adjacent bands – and facilitating the growth of IMT systems<sup>2</sup>.

This Recommendation has been developed based on consideration of the results of a defined evaluation process employed by the ITU-R on IMT-2000 radio proposals that have been submitted in response to a set of defined requirements. Further consideration was given to consensus building, recognizing the need to minimize the number of different radio interfaces and maximize their commonality keeping in mind the end-user needs, while incorporating the best possible performance capabilities in the various IMT-2000 radio operating environments.

Revisions to this Recommendation have been developed jointly by the ITU and the radio interface technology proponent organizations, global partnership projects and standards development organizations. Updates, enhancements and additions to the radio interfaces incorporated in this Recommendation have undergone a defined process of development and review to ensure consistency with the original goals and objectives established for IMT-2000 while acknowledging the obligation to accommodate the changing requirements of the global marketplace.

By updating the existing technologies, harmonizing existing interfaces, and entertaining new mechanisms, IMT-2000 remains at the forefront of mobile radio technology.

## 2 Scope

This Recommendation identifies the IMT-2000 terrestrial radio interface specifications, based on the output of activities outside ITU.

These radio interfaces support the features and design parameters of IMT-2000, including the capability to ensure worldwide compatibility, international roaming, and access to high-speed data services.

This Recommendation is complemented by other ITU-R Recommendations and Reports on IMT-2000 that provide additional details on a number of aspects including frequency arrangements and unwanted emission characteristics.

## 3 Related Recommendations

The existing IMT-2000 Recommendations that are considered to be of importance in the development of this particular Recommendation are as follows:

Recommendation ITU-R M.687:	International Mobile Telecommunications-2000 (IMT-2000)
Recommendation ITU-R M.816:	Framework for services supported on International Mobile Telecommunications-2000 (IMT-2000)
Recommendation ITU-R M.817:	International Mobile Telecommunications-2000 (IMT-2000) – Network architectures

---

<sup>2</sup> Recommendations ITU-R M.1457 and ITU-R M.2012 are two separate, independent, and self-contained Recommendations, each one with a specific Scope. Both Recommendations will evolve independently, and there could be some overlap reflected by commonality in content between the two documents.

Recommendation ITU-R M.819:	International Mobile Telecommunications-2000 (IMT-2000) for developing countries
Recommendation ITU-R M.1034:	Requirements for the radio interface(s) for International Mobile Telecommunications-2000 (IMT-2000)
Recommendation ITU-R M.1035:	Framework for the radio interface(s) and radio sub-system functionality for International Mobile Telecommunications-2000 (IMT-2000)
Recommendation ITU-R M.1036:	Frequency arrangements for implementation of the terrestrial component of International Mobile Telecommunications (IMT) in the bands identified for IMT in the Radio Regulations (RR)
Recommendation ITU-R M.1224:	Vocabulary of terms for International Mobile Telecommunications (IMT)
Recommendation ITU-R M.1225:	Guidelines for evaluation of radio transmission technologies for IMT-2000
Recommendation ITU-R M.1308:	Evolution of land mobile systems towards IMT-2000
Recommendation ITU-R M.1311:	Framework for modularity and radio commonality within IMT-2000
Recommendation ITU-R M.1579:	Global circulation of IMT-2000 terminals
Recommendation ITU-R M.1580:	Generic unwanted emission characteristics of base stations using the terrestrial radio interfaces of IMT-2000
Recommendation ITU-R M.1581:	Generic unwanted emission characteristics of mobile stations using the terrestrial radio interfaces of IMT-2000
Recommendation ITU-R M.1850:	Detailed specifications of the radio interfaces for the satellite component of International Mobile Telecommunications-2000 (IMT-2000)
Recommendation ITU-R M.2012:	Detailed specifications of the terrestrial radio interfaces of International Mobile Telecommunications Advanced (IMT-Advanced)

Recommendation ITU-T Q.1731:	Radio-technology independent requirements for IMT-2000 layer 2 radio interface
Handbook on Land Mobile (including Wireless Access), Volume 2: Principles and Approaches on Evolution to IMT-2000/FPLMTS.	

## **4 Considerations**

### **4.1 Radio interfaces for IMT-2000**

IMT-2000 consists of both terrestrial component and satellite component radio interfaces. In particular, the terrestrial radio interfaces are fully defined by information supplied within this Recommendation and by information incorporated by reference to external materials. The satellite radio interfaces are fully defined by information supplied with Recommendation ITU-R M.1850.

The radio interfaces for the terrestrial component are described in detail in § 5.

## 4.2 Incorporation of externally developed specification material

IMT-2000 is a system with global development activity and the IMT-2000 radio interface specifications identified in this Recommendation have been developed by the ITU in collaboration with the radio interface technology proponent organizations, global partnership projects and standards development organizations (SDOs). The ITU has provided the global and overall framework and requirements, and has developed the core global specifications jointly with these organizations. The detailed standardization has been undertaken within the recognized external organization (see Note 1), which operate in concert with the radio interface technology proponent organizations and global partnership projects. This Recommendation therefore makes extensive use of references to externally developed specifications.

NOTE 1 – A “recognized organization” in this context is defined to be a recognized SDO that has legal capacity, a permanent secretariat, a designated representative, and open, fair, and well-documented working methods.

This approach was considered to be the most appropriate solution to enable completion of this Recommendation within the aggressive schedules set by the ITU and by the needs of administrations, operators and manufacturers.

This Recommendation has therefore been constructed to take full advantage of this method of work and to allow the global standardization time-scales to be maintained. The main body of this Recommendation has been developed by the ITU, with references within each radio interface pointing to the location of the more detailed information. The sub-sections containing this detailed information have been developed by the ITU and the recognized external organizations. Such use of referencing has enabled timely completion of the high-level elements of this Recommendation, with change control procedures, transposition (conversion of the core specifications into SDO deliverables) and public enquiry procedures being undertaken within the recognized external organization.

The structure of the detailed specifications received from the recognized external organization has generally been adopted unchanged, recognizing the need to minimize duplication of work, and the need to facilitate and support an on-going maintenance and update process.

This general agreement, that the detailed specifications of the radio interface should to a large extent be achieved by reference to the work of recognized external organizations, highlights not only the ITU’s significant role as a catalyst in stimulating, coordinating and facilitating the development of advanced telecommunications technologies, but also its forward-looking and flexible approach to the development of this and other telecommunications standards for the 21<sup>st</sup> century.

## 5 Recommendations

The Radiocommunication Assembly recommends that the radio interfaces given in §§ 5.1 to 5.6 should be those of the terrestrial component of IMT-2000.

The terrestrial radio interface sections are identified as:

- IMT-2000 CDMA Direct Spread
- IMT-2000 CDMA Multi-Carrier
- IMT-2000 CDMA TDD
- IMT-2000 TDMA Single-Carrier
- IMT-2000 FDMA/TDMA
- IMT-2000 OFDMA TDD WMAN.

An overview of each radio interface is provided in §§ 5.1.1, 5.2.1, 5.3.1, 5.4.1, 5.5.1 and 5.6.1.

The detailed information provided and/or referenced in §§ 5.1.2, 5.2.2, 5.3.2, 5.4.2, 5.5.2 and 5.6.2 is recommended as the complete definition of the radio interfaces of the terrestrial component of IMT-2000.

## **5.1 IMT-2000 CDMA Direct Spread**

### **5.1.1 Overview of the radio interface**

#### **5.1.1.1 Introduction**

The IMT-2000 radio-interface specifications for CDMA Direct Spread technology are developed by a partnership of SDOs (see Note 1). This radio interface is called Universal Terrestrial Radio Access (UTRA) FDD or Wideband CDMA (WCDMA).

NOTE 1 – Currently, these specifications are developed within the third generation partnership project (3GPP) where the participating SDOs are the Association of Radio Industries and Businesses (ARIB), China Communications Standards Association (CCSA), the European Telecommunications Standards Institute (ETSI), Alliance for Telecommunications Industry Solutions (ATIS Committee WTSC), Telecommunications Technology Association (TTA) and Telecommunication Technology Committee (TTC).

These radio-interface specifications have been developed with the strong objective of harmonization with the TDD component (see § 5.3) to achieve maximum commonality. This was achieved by harmonization of important parameters of the physical layer. Furthermore, a common set of protocols in the higher layers is specified for both FDD and TDD.

In the development of this radio interface the CN specifications are based on an evolved GSM-MAP. However, the specifications include the necessary capabilities for operation with an evolved ANSI-41-based CN.

The radio-access scheme is Direct-Sequence CDMA (DS-CDMA) with information spread over approximately 5 MHz bandwidth using a chip rate of 3.84 Mchip/s. The radio interface is defined to carry a wide range of services to efficiently support both circuit-switched services (e.g. PSTN- and ISDN-based networks) as well as packet-switched services (e.g. IP-based networks). A flexible radio protocol has been designed where several different services such as speech, data and multimedia can simultaneously be used by a user and multiplexed on a single carrier. The defined radio-bearer services provide support for both real-time and non-real-time services by employing transparent and/or non-transparent data transport. The quality of service (QoS) can be adjusted in terms such as delay, bit error probability, and frame error ratio (FER).

The radio-interface specification includes enhanced features for High-Speed Downlink Packet Access (HSDPA), Multiple Input Multiple Output Antennas (MIMO), higher order modulation (64-QAM) and improved L2 support for high data rates allowing for downlink packet-data transmission with peak data rates approaching 42 Mbit/s and simultaneous high-speed packet data and other services such as speech on the single carrier. Features for enhanced uplink have been introduced, allowing for improved capacity and coverage, higher data rates, and reduced delay and delay variance for the uplink. The addition of higher order modulation (16-QAM) for the enhanced uplink, allows for peak data rates up to 11 Mbit/s. For efficient support of always-on connectivity whilst enabling battery saving in the UE and further increasing the air interface capacity, the specifications also include the Continuous Packet Connectivity feature (CPC). Similar to the downlink, the improved L2 support for uplink is supported to allow efficient support of high data rates and reduced L2 overhead. For fast state transitions between different states, the specifications also include Enhanced CELL\_FACH state, supporting both HSDPA and Enhanced Uplink

operation. The CS voice services are supported over HSPA. DC-HSDPA provides support for HSDPA operation on two adjacent carriers in combination with 64-QAM, supporting increased average user throughput and capacity as well as peak data rates reaching up to 42 Mbit/s. HSDPA mobility is further improved by the HS-DSCH serving cell change enhancement feature. The UE battery saving is further enhanced by introduction of DRX support to CELL\_FACH state.

In the downlink, further enhancements of DC-HSDPA in combination with the multiple input multiple output antennas (MIMO) feature support peak data rates reaching up to 84 Mbit/s. Also DC-HSDPA combined with 64-QAM makes it possible to operate on two frequencies not being in the same band, but to the same terminal, further enabling operation with DC-HSDPA in different spectrum arrangements, while the introduction of 4C-HSDPA extends the multicarrier operation up to four carriers.

In the uplink, the dual cell feature is also applicable to two adjacent frequencies in the same band with enhanced uplink in order to support peak data rates reaching up to 23 Mbit/s.

The radio access network architecture also provides support for multimedia broadcast and multicast services, i.e. allowing for multimedia content distribution to groups of users over a point-to-multipoint bearer. More efficient provision of MBMS is supported by Single Frequency Network (SFN) operation with MBSFN.

CDMA Direct Spread was originally specified for the IMT-2000 bands identified in WARC-92 and using 1 920-1 980 MHz as uplink and 2 110-2 170 MHz as downlink. At WRC-2000 additional spectrum for IMT-2000 was identified and subsequently as a complement to 3GPP Release 99 the relevant specifications have been updated to also include the 3.5 GHz, 2.6 GHz, 1 900 MHz, 1 800 MHz, 1 700 MHz, 1 500 MHz, 900 MHz, 850 MHz, and 800 MHz bands as well as a pairing of parts, or whole, of 1 710-1 770 MHz as uplink with whole, or parts, of 2 110-2 170 MHz as downlink. In addition a more general study has been performed considering the viable deployment of CDMA Direct Spread in additional and diverse spectrum arrangements.

Evolved UTRA (E-UTRA) has been introduced for the evolution of the radio-access technology towards a high-data-rate, low-latency and packet-optimized radio-access technology.

The downlink transmission scheme is based on conventional OFDM to provide a high degree of robustness against channel frequency selectivity while still allowing for low-complexity receiver implementations also at very large bandwidths.

The uplink transmission scheme is based on SC-FDMA (Single Carrier-FDMA), more specifically DFT-spread OFDM (DFTS-OFDM). It also supports multi-cluster assignment of DFTS-OFDM. The use of DFTS-OFDM transmission for the uplink is motivated by the lower Peak-to-Average Power Ratio (PAPR) of the transmitted signal compared to conventional OFDM. This allows for more efficient usage of the power amplifier at the terminal, which translates into an increased coverage and/or reduced terminal power consumption. The uplink numerology is aligned with the downlink numerology.

Channel coding is based on rate-1/3 Turbo coding and is complemented by Hybrid-ARQ with soft combining to handle decoding errors at the receiver side. Data modulation supports QPSK, 16QAM, and 64QAM for both the downlink and the uplink.

The E-UTRA supports bandwidths from approximately 1.4 MHz to 100 MHz, yielding peak data rates up to roughly 3 Gbit/s in the downlink and 1.5 Gbit/s in the uplink. Carrier aggregation, i.e. the simultaneous transmission of multiple component carriers in parallel to/from the same terminal, is used to support bandwidths larger than 20 MHz. Component carriers do not have to be contiguous in frequency and can even be located in different frequency bands in order to enable exploitation of fragmented spectrum allocations by means of spectrum aggregation.

Channel-dependent scheduling in both the time and frequency domains is supported for both downlink and uplink with the base-station scheduler being responsible for (dynamically) selecting the transmission resource as well as the data rate. The basic operation is dynamic scheduling, where the base-station scheduler takes a decision for each 1 ms Transmission Time Interval (TTI), but there is also a possibility for semi-persistent scheduling. Semi-persistent scheduling enables transmission resources and data rates to be semi-statically allocated to a given User Equipment (UE) for a longer time period than one TTI to reduce the control-signalling overhead.

Multi-antenna transmission schemes are an integral part of this radio interface. Multi-antenna precoding with dynamic rank adaptation supports both spatial multiplexing (single-user MIMO) and beam-forming. Spatial multiplexing with up to eight layers in the downlink and four layers in the uplink is supported. Multi-user MIMO, where multiple users are assigned the same time-frequency resources, is also supported. Finally, transmit diversity based on Space-Frequency Block Coding (SFBC) or a combination of SFBC and Frequency Switched Transmit Diversity (FSTD) is supported.

Inter-cell interference coordination (ICIC), where neighbour cells exchange information aiding the scheduling in order to reduce interference, is supported. ICIC can be used for homogenous deployments with non-overlapping cells of similar transmission power, as well as for heterogeneous deployments where a higher-power cell overlays one or several lower-power nodes.

Relaying functionality is included. The relay node (RN, Relay Node) appears as a conventional base station (e-Node B) to terminals but is wirelessly backhauled to the remaining part of the radio-access network (RN connects to an eNB called Donor eNB, DeNB) using a modified version of the E-UTRA radio interface.

The Self Organizing Networks (SON) concept has been introduced and includes several different functions from eNB activation to radio parameter tuning for self-configuration/self-optimization functions. SON includes eNB self-configuration functions, that is Dynamic S1-MME/X2 interface configuration, PCI self-configuration, Automatic Neighbour Relations (ANR), PCI selection, and eNB self-optimisation functions, that is RACH optimisation, Mobility Load Balancing (MLB) and Mobility Robustness Optimisation (MRO).

SON has been extended to UTRAN as well, with the introduction of ANR UTRAN function. Inter-RAT self-configuration/optimisation functions are defined as well.

E-UTRA supports a full set of services ranging from real-time to non real-time packet data services, including optimizations for support of emergency call VoIP and support for location services.

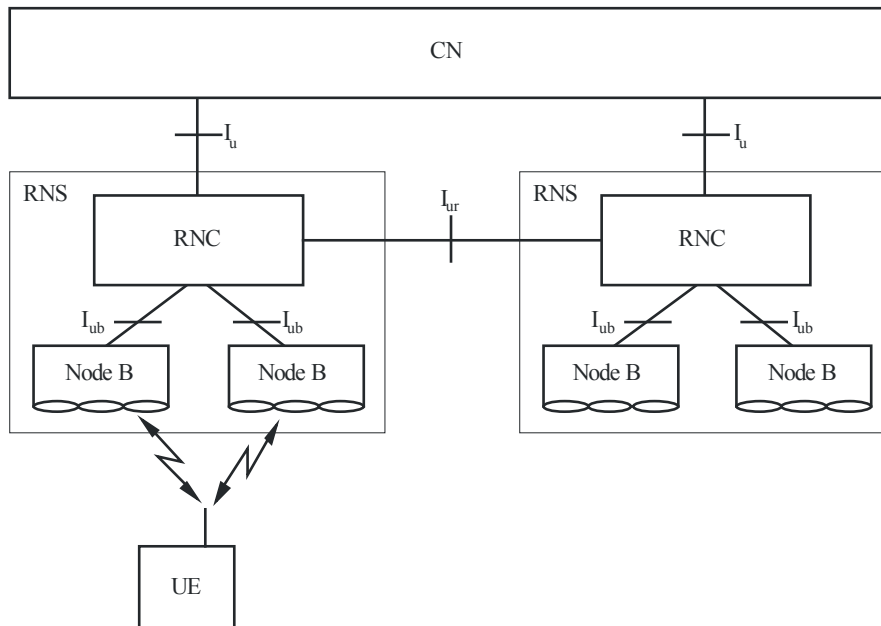

Further, the technology includes RF requirements for multicarrier and multi-RAT base stations (MSR) enabling support of all 3GPP based technologies operating in the same base station equipment.

Features are also included in support of Minimization of Drive Tests, by means of collection of UE-specific measurements using Control Plane architecture, for both UTRAN and E-UTRAN.

#### **5.1.1.2 Radio access network architecture**

The overall architecture of the Universal Terrestrial Radio Access Network (UTRAN) is shown in Fig. 1.

FIGURE 1  
**UTRAN architecture**  
 (Cells are indicated by ellipses)

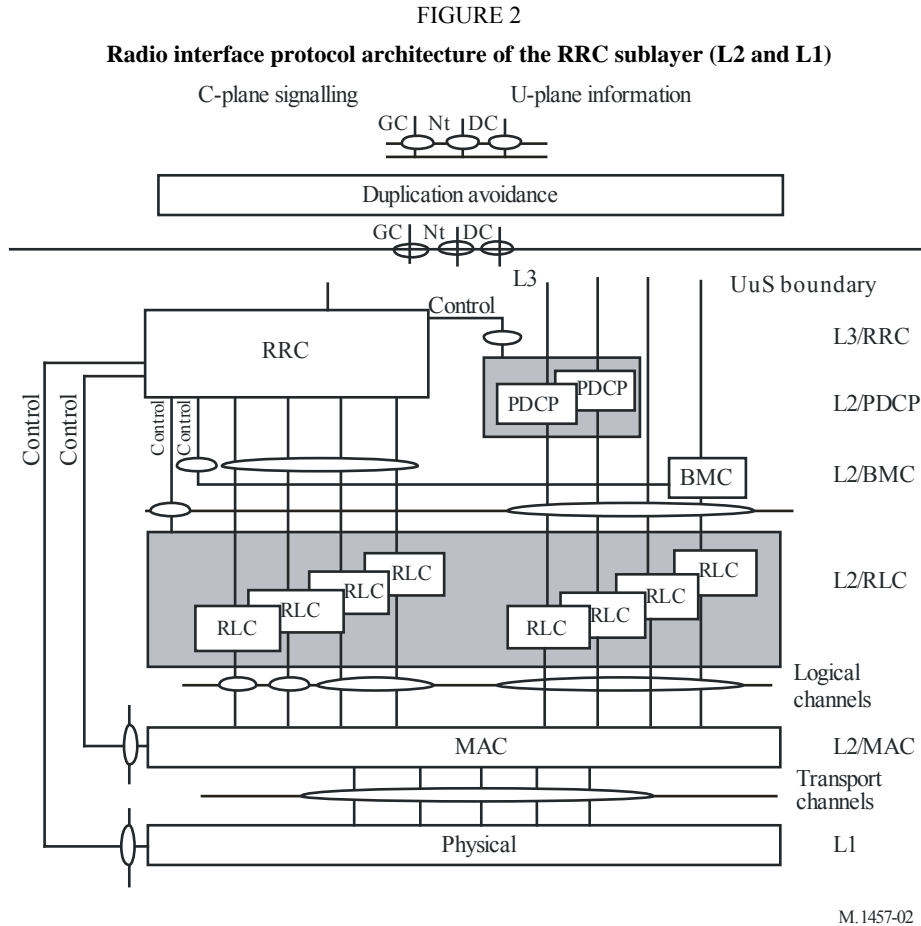

M.1457-01

The architecture of the radio access network consists of a set of radio network subsystems (RNS) connected to the CN through the I<sub>u</sub> interface. An RNS consists of a radio network controller (RNC) and one or more entities called Node B. Node B is connected to the RNC through the I<sub>ub</sub> interface. Each Node B can handle one or more cells. The RNC is responsible for the handover decisions that require signalling to the user equipment (UE). In case macro diversity between different Node Bs is to be supported, the RNC comprises a combining/splitting function to support this. Node B can comprise an optional combining/splitting function to support macro diversity within a Node B. The RNCs of the RNS can be interconnected through the I<sub>ur</sub> interface. I<sub>u</sub> and I<sub>ur</sub> are logical interfaces, i.e. the I<sub>ur</sub> interface can be conveyed over a direct physical connection between RNCs or via any suitable transport network.

UTRAN architecture includes the HNB GW entity, in case of HNBs deployment. The HNB-GW appears to the CN as an RNC and serves as a concentrator of HNB connections.

Figure 2 shows the radio interface protocol architecture for the radio access network. On a general level, the protocol architecture is similar to the current ITU-R protocol architecture as described in Recommendation ITU-R M.1035. Layer 2 (L2) is split into the following sub-layers; radio link control (RLC), medium access control (MAC), Packet Data Convergence Protocol (PDCP) and Broadcast/Multicast Control (BMC). Layer 3 (L3) and RLC are divided into control (C-plane) and user (U-plane) planes. In the C-plane, L3 is partitioned into sub-layers where the lowest sub-layer, denoted as radio resource control (RRC), interfaces with L2. The higher-layer signalling such as mobility management (MM) and call control (CC) are assumed to belong to the CN. There are no L3 elements in this radio interface for the U-plane.

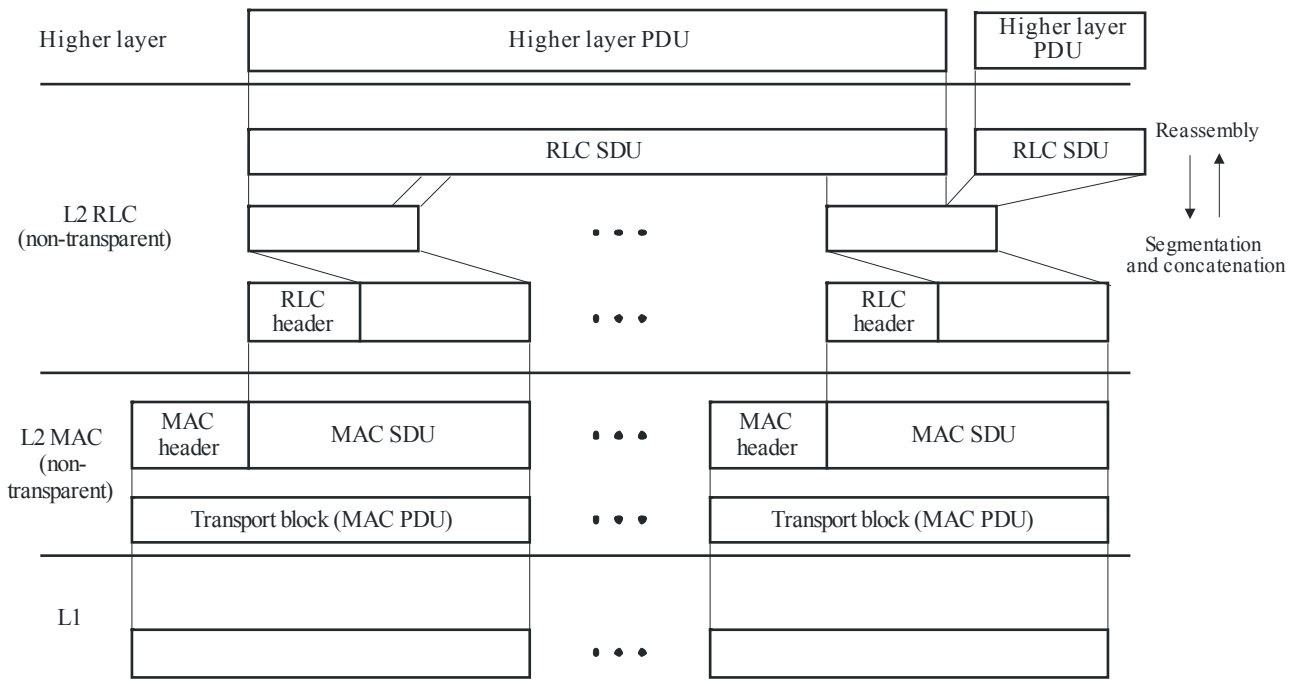

Each block in Fig. 2 represents an instance of the respective protocol. Service access points (SAPs) for peer-to-peer communication are marked with circles at the interface between sub-layers. The SAP between MAC and the physical layer provides the transport channels. A transport channel is characterized by how the information is transferred over the radio interface (see § 5.1.1.3.1 for an overview of the types of transport channels defined). The SAPs between RLC and the MAC sub-layer provide the logical channels. A logical channel is characterized by the type of information that is transferred over the radio interface. The logical channels are divided into control channels and traffic channels. The different types of logical channels are not further described in this overview. In the C-plane, the interface between RRC and higher L3 sub-layers (CC, MM) is defined by the general control (GC), notification (Nt) and dedicated control (DC) SAPs. These SAPs are not further discussed in this overview.

Also shown in Fig. 2 are connections between RRC and MAC as well as RRC and L1 providing local inter-layer control services (including measurement results). An equivalent control interface exists between RRC and the RLC sub-layer. These interfaces allow the RRC to control the configuration of the lower layers. For this purpose separate control SAPs are defined between RRC and each lower layer (RLC, MAC, and L1).

Figure 3 shows the general structure and some additional terminology definitions of the channel formats at the various sub-layer interfaces indicated in Fig. 2. The figure indicates how higher layer service data units (SDUs) and protocol data units (PDUs) are segmented and multiplexed to transport blocks to be further treated by the physical layer (e.g. CRC handling). The transmission chain of the physical layer is exemplified in the next section.

FIGURE 3

**Data flow for a service using a non-transparent RLC and non-transparent MAC**  
 (see §§ 5.1.1.4.1 and 5.1.1.4.2 for further definitions of the MAC and RLC services and functionality)

M.1457-03

The Evolved-UTRAN (E-UTRAN) has a flat architecture with a single type of node, the *eNodeB*, which is responsible for all radio-related functions in one or several cells, providing the user plane (PDCP/RLC/MAC/PHY) and control plane (RRC) protocol terminations towards the UE. The eNBs are interconnected with each other by means of the X2 interface. The eNBs are also connected by means of the S1 interface to the EPC (Evolved Packet Core), and more specifically to the MME (Mobility Management Entity) by means of the S1-MME and to the S-GW (Serving Gateway) by means of the S1-U. The S1 interface supports a many-to-many relation between MMEs/Serving Gateways and eNBs.

The E-UTRAN architecture may deploy a Home eNB Gateway (HeNB GW) to allow the S1 interface between the HeNB and the EPC to support a large number of HeNBs in a scalable manner. The HeNB GW serves as a concentrator for the C-Plane, specifically the S1-MME interface. The S1-U interface from the HeNB may be terminated at the HeNB GW, or a direct logical U-Plane connection between HeNB and S-GW may be used.

The E-UTRAN architecture (not including HeNB GW and RNs) is illustrated in Fig. 4.

FIGURE 4

## Overall architecture

M.1457-04

The eNB hosts the following functions:

- functions for Radio Resource Management: Radio Bearer Control, Radio Admission Control, Connection Mobility Control, Dynamic allocation of resources to UEs in both uplink and downlink (scheduling);
- IP header compression and encryption of user data stream;
- selection of an MME at UE attachment when no routing to an MME can be determined from the information provided by the UE;
- routing of User Plane data towards S-GW;
- scheduling and transmission of paging messages (originated from the MME);
- scheduling and transmission of broadcast information (originated from the MME or O&M);
- measurement and measurement reporting configuration for mobility and scheduling;
- scheduling and transmission of PWS (which includes ETWS and CMAS) messages (originated from the MME);
- CSG handling;
- Transport level packet marking in the uplink.

The DeNB hosts the following functions in addition to the eNB functions:

- S1/X2 proxy functionality for supporting RNs;
- S11 termination and S-GW/P-GW functionality for supporting RNs.

The MME hosts the following functions:

- NAS signalling;
- NAS signalling security;
- Inter-CN node signalling for mobility between 3GPP access networks;
- Idle mode UE Reachability (including control and execution of paging retransmission);
- Tracking Area list management (for UE in idle and active mode);
- PDN GW and Serving GW selection;
- MME selection for handovers with MME change;

- SGSN selection for handovers to 2G or 3G 3GPP access networks;
- Roaming;
- Authentication;
- Bearer management functions including dedicated bearer establishment.

The S-GW hosts the following functions:

- The local Mobility Anchor point for inter-eNB handover;
- Mobility anchoring for inter-3GPP mobility;
- E-UTRAN idle mode downlink packet buffering and initiation of network triggered service request procedure;
- Lawful Interception;
- Packet routing and forwarding;
- Transport level packet marking in the uplink and the downlink;
- Accounting on user and QCI granularity for inter-operator charging;
- UL and DL charging per UE, PDN, and QCI.

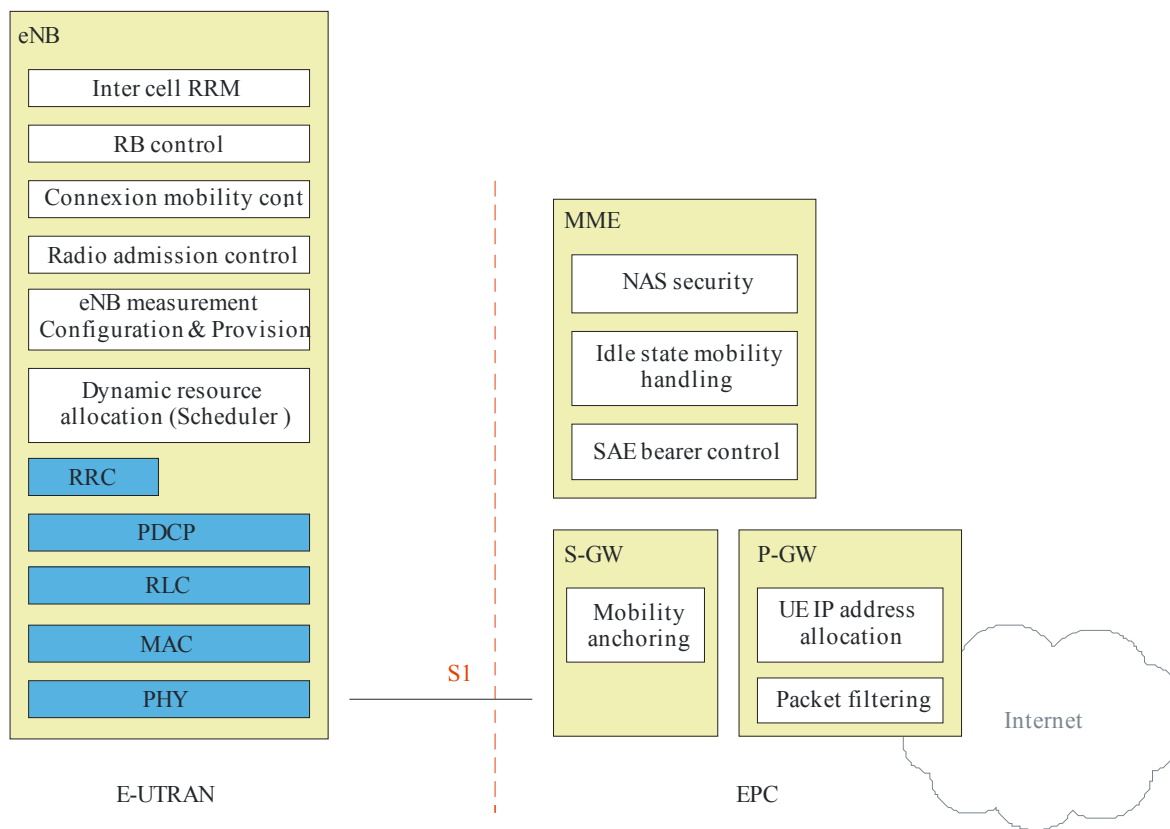

The PDN Gateway (P-GW) hosts the following functions:

- Per-user based packet filtering (by, e.g. deep packet inspection);
- Lawful Interception;
- UE IP address allocation;
- Transport level packet marking in the downlink;
- UL and DL service level charging, gating and rate enforcement;
- DL rate enforcement based on AMBR.

This is summarized in Fig. 5 where yellow boxes depict the logical nodes, white boxes depict the functional entities of the control plane and blue boxes depict the radio protocol layers.

### 5.1.1.3 Physical layer

#### 5.1.1.3.1 Transport Channels

Transport channels are the services offered by the physical layer to MAC and higher layers.

For UTRA, the general classification of transport channels is into two groups:

- Common transport channels where there is a need for explicit UE identification when a particular UE is addressed or a particular group of UEs are addressed.
- Dedicated transport channels where a UE is implicitly identified by the physical channel, i.e. code and frequency.

Common transport channel types are:

- **Random Access Channel (RACH)**

A contention based uplink channel used for transmission of relatively small amounts of data, e.g. for initial access or non-real-time dedicated control or traffic data.

- **Common Packet Channel (CPCH)\***

A contention based uplink channel used for transmission of bursty data traffic. The common packet channel is shared by the UEs in a cell and therefore, it is a common resource. The CPCH is fast power controlled.

---

\* Available only in 3GPP Rel99 and Rel4 Specifications.

- **Forward Access Channel (FACH)**  
A common downlink channel without closed-loop power control used for transmission of relatively small amount of data.
- **Downlink Shared Channel (DSCH)**  
A downlink channel shared by several UEs carrying dedicated control or traffic data.
- **High-speed Downlink Shared Channel (HS-DSCH)**  
A downlink channel served by several UEs carrying dedicated control or traffic data. HS-DSCH offers the possibility for high-speed downlink packet access through the support of higher-order modulation, adaptive modulation and coding, fast channel-dependent scheduling, and hybrid ARQ with soft combining.
- **Broadcast Channel (BCH)**  
A downlink channel used for broadcast of system information into an entire cell.
- **Paging Channel (PCH)**  
A downlink channel used for broadcast of control information into an entire cell allowing efficient UE sleep mode procedures. Currently identified information types are paging and notification. Another use could be UTRAN notification of change of BCCH information.

Dedicated transport channel types are:

- **Dedicated Channel (DCH)**  
A channel dedicated to one UE used in uplink or downlink.
- **Enhanced Dedicated Channel (E-DCH)**  
A channel dedicated to one UE used in uplink, supporting hybrid ARQ and scheduling to provide high data rates.

On each transport channel, a number of Transport Blocks are delivered to/from the physical layer once every *Transmission Time Interval (TTI)*. To each transport channel, there is an associated *Transport Format* or set of transport formats. The transport format describes the physical properties of the transport channel, such as the TTI, the number of transport blocks per TTI, the number of bits per transport blocks, the coding scheme and coding rate, and the modulation scheme.

For E-UTRA, the following transport channels are defined.

Downlink transport channel types are:

- **Broadcast Channel (BCH)** characterized by:
  - fixed, pre-defined transport format;
  - requirement to be broadcast in the entire coverage area of the cell.
- **Downlink Shared Channel (DL-SCH)** characterized by:
  - support for HARQ;
  - support for dynamic link adaptation by varying the modulation, coding and transmit power;
  - possibility to be broadcast in the entire cell;
  - possibility to use beamforming;
  - support for both dynamic and semi-static resource allocation;
  - support for UE discontinuous reception (DRX) to enable UE power saving;
  - support for MBMS transmission (FFS).

- **Paging Channel (PCH)** characterized by:
  - support for UE discontinuous reception (DRX) to enable UE power saving (DRX cycle is indicated by the network to the UE);
  - requirement to be broadcast in the entire coverage area of the cell;
  - mapped to physical resources which can be used dynamically also for traffic/other control channels.
- **Multicast Channel (MCH)** characterized by:
  - requirement to be broadcast in the entire coverage area of the cell;
  - support for SFN combining of MBMS transmission on multiple cells;
  - support for semi-static resource allocation, e.g. with a time-frame of a long cyclic prefix.

Uplink transport channel types are:

- **Uplink Shared Channel (UL-SCH)** characterized by:
  - possibility to use beamforming (likely no impact on specifications);
  - support for dynamic link adaptation by varying the transmit power and potentially modulation and coding;
  - support for HARQ;
  - support for both dynamic and semi-static resource allocation.
- **Random Access Channel(s) (RACH)** characterized by:
  - limited control information;
  - collision risk.

#### 5.1.1.3.2 Physical layer functionality and building blocks

For UTRA, the physical layer includes the following functionality:

- error detection on transport channels and indication to higher layers;
- forward error correction (FEC) encoding/decoding of transport channels;
- multiplexing of transport channels and demultiplexing of coded composite transport channels;
- rate matching;
- mapping of coded composite transport channels on physical channels;
- data modulation and demodulation of physical channels;
- spreading and de-spreading of physical channels;
- radio characteristics measurements including FER, Signal-to-Interference (SIR), Interference Power Level, etc. and indication to higher layers;
- frequency and time (chip, bit, slot, frame) synchronization;
- power weighting and combining of physical channels;
- closed-loop power control;
- RF processing;
- support of UE positioning methods;
- beamforming;
- MIMO antenna processing;

- macro-diversity distribution/combining and soft handover execution (excluding E-UTRAN).

For E-UTRA, the physical layer includes the following functionalities:

- error detection on the transport channel and indication to higher layers;
- FEC encoding/decoding of the transport channel;
- Hybrid ARQ soft-combining;
- rate matching of the coded transport channel to physical channels;
- mapping of the coded transport channel onto physical channels;
- power weighting of physical channels;
- modulation and demodulation of physical channels;
- frequency and time synchronization;
- radio characteristics measurements and indication to higher layers;
- Multiple Input Multiple Output (MIMO) antenna processing;
- Transmit Diversity (TX diversity);
- beamforming;
- RF processing;
- frequency domain multiplexing with users;
- single frequency combining from multiple cells.

Figure 6 gives the physical layer transmission chain for the UTRA DCH transport channel. The figure shows how several transport channels can be multiplexed onto one or more dedicated physical data channels (DPDCH).

The cyclic redundancy check (CRC) provides for error detection of the transport blocks for the particular transport channel. The CRC can take the length zero (no CRC), 8, 12, 16 or 24 bits depending on the service requirements.

The transport block concatenation and code block segmentation functionality performs serial concatenation of those transport blocks that will be sent in one transmission time interval and any code block segmentation if necessary.

The types of channel coding defined are convolutional coding, turbo coding and no coding. Real-time services use only FEC encoding while non-real-time services uses a combination of FEC and ARQ. The ARQ functionality resides in the RLC sub-layer of Layer 2. The convolutional coding rates are 1/2 or 1/3 while the rate is 1/3 for turbo codes. The possible interleaving depths are 10, 20, 40 or 80 ms.

The radio frame segmentation performs padding of bits. The rate matching adapts any remaining differences of the bit rate so the number of outgoing bits fit to the available bit rates of the physical channels. Repetition coding and/or puncturing is used for this purpose.

The transport channel multiplexing stage combines transport channels in a serial fashion. This is done every 10 ms. The output of this operation is also called coded composite transport channels.

If several physical channels will be used to transmit the data, the split is made in the physical channel segmentation unit.

The downlink can use DTX on a slot-to-slot basis for variable rate transmission. The insertions could either be at fixed or at flexible positions.

For other transport-channel types, the physical-layer transmission chain is similar although not necessarily identical to that of DCH in Fig. 6.

FIGURE 6

DCH transport channel multiplexing structure (left: uplink; right: downlink)

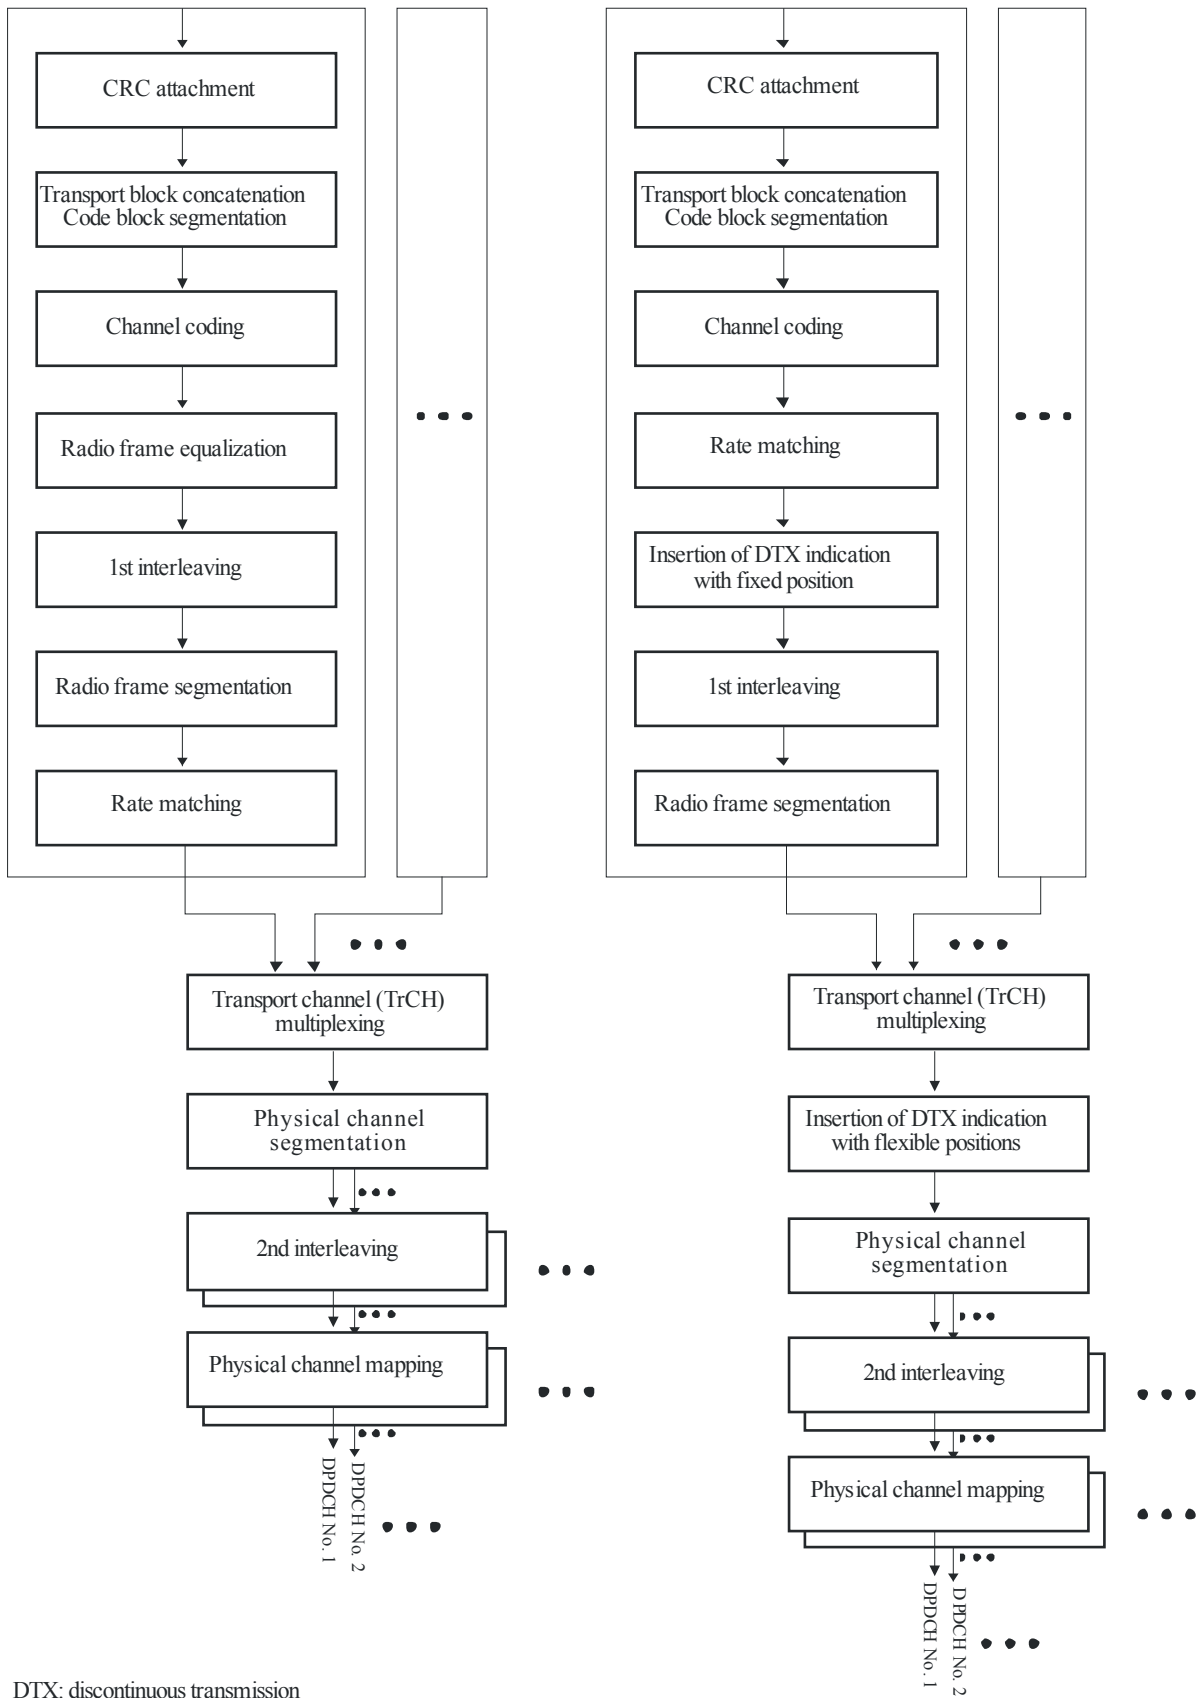

Figure 6A gives the physical transmission chain for the E-UTRA UL-SCH and DL-SCH transport channels (top and bottom respectively).

The following coding steps can be identified for each transport block of an UL cell:

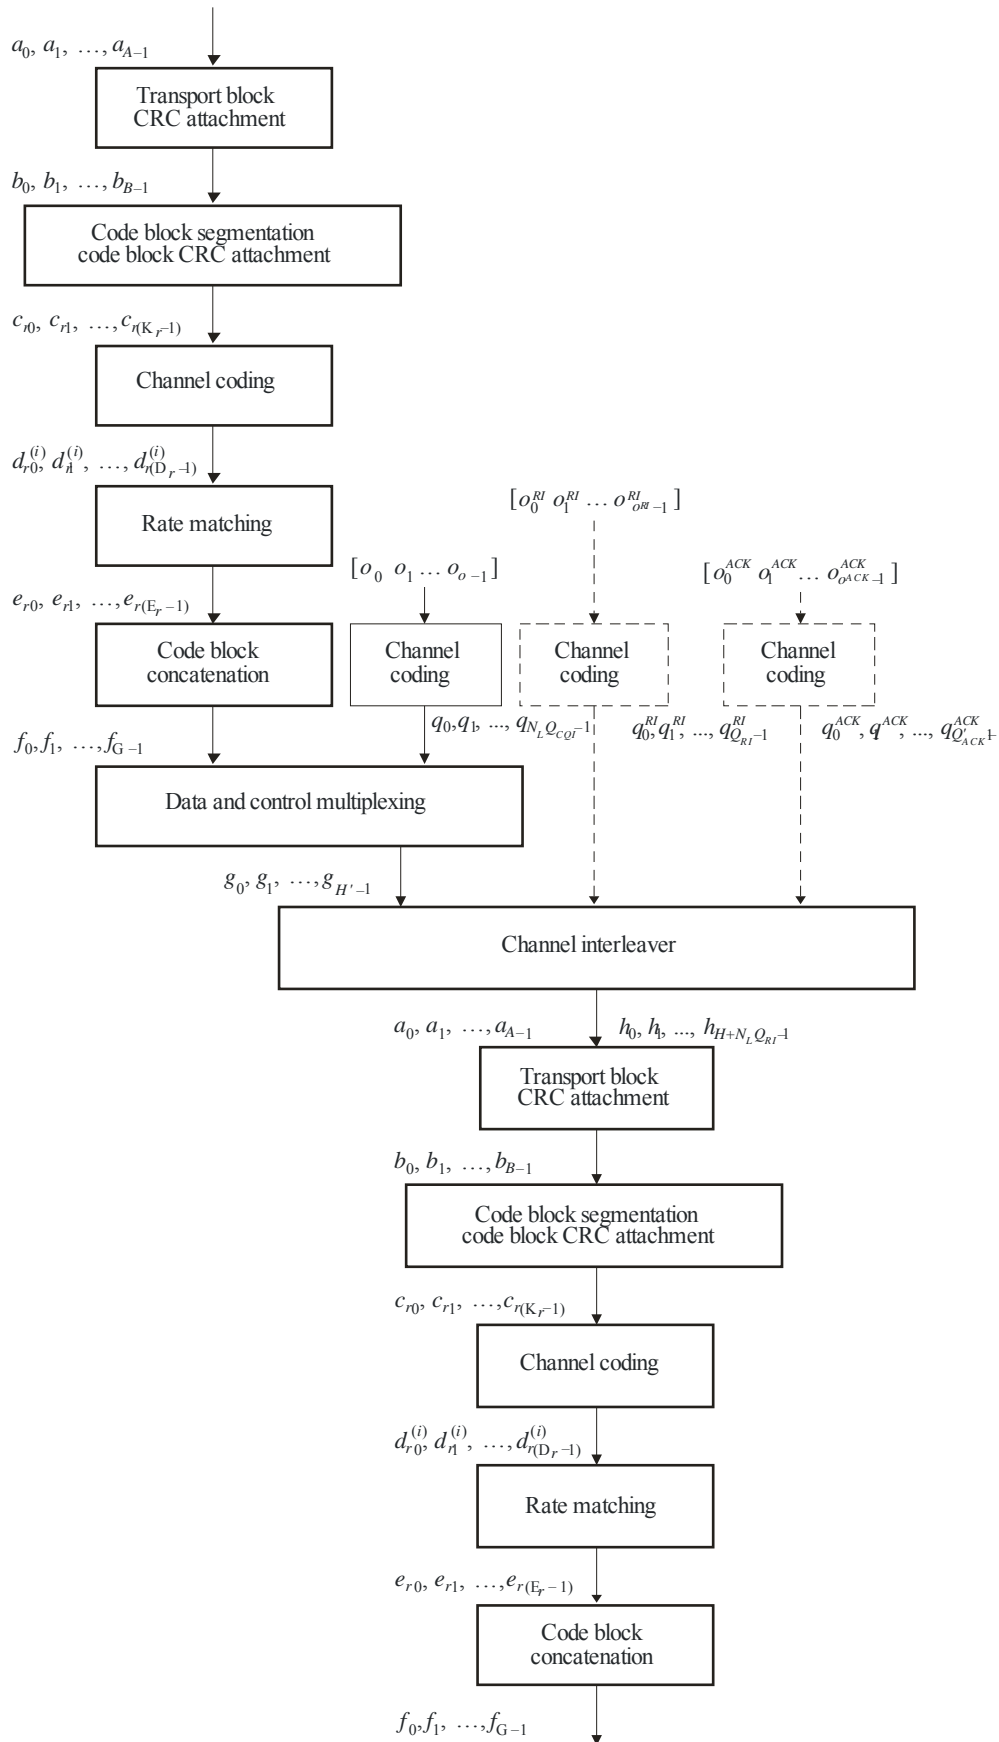

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding of data and control information
- Rate matching
- Code block concatenation
- Multiplexing of data and control information
- Channel interleaver.

The following coding steps can be identified for each transport block of a DL cell:

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding
- Rate matching
- Code block concatenation.

FIGURE 6A

UL-SCH and DL-SCH transport channel multiplexing structure (top and bottom respectively)

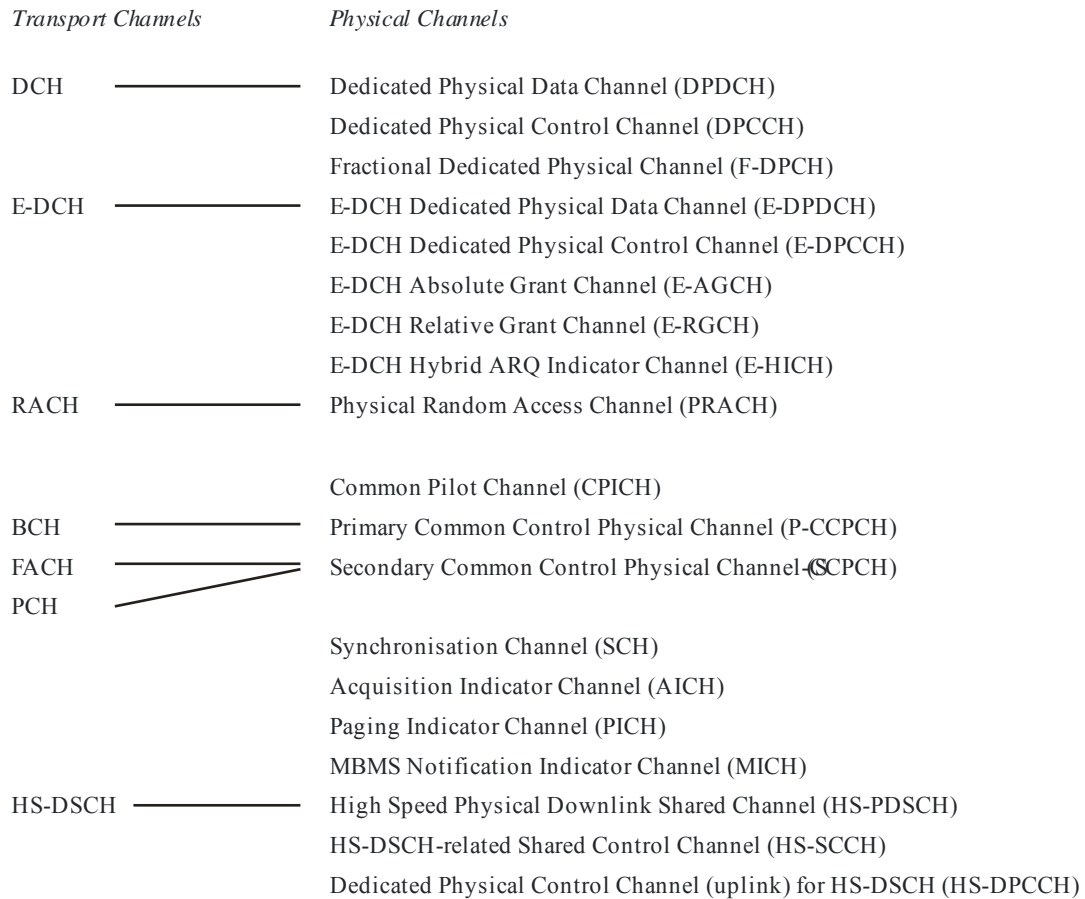

**5.1.1.3.3 Transport channels to physical channel mapping**

The transport channels are mapped onto the physical channels. Figure 7 shows the different physical channels and summarizes the mapping of transport channels onto physical channels for UTRA. Each UTRA physical channel has its tailored slot content. The slot content for the uplink and downlink DPDCH/DPCCH, on to which the uplink and downlink DCH is mapped, is shown in § 5.1.1.3.4.

FIGURE 7

**Transport channels, physical channels and their mapping**

M.1457-07

Figures 8 and 9 depict the mapping between transport and physical channels for E-UTRA:

FIGURE 8

**Mapping between downlink transport channels and downlink physical channels**

M.1457-08

FIGURE 9  
Mapping between uplink transport channels and uplink physical channels

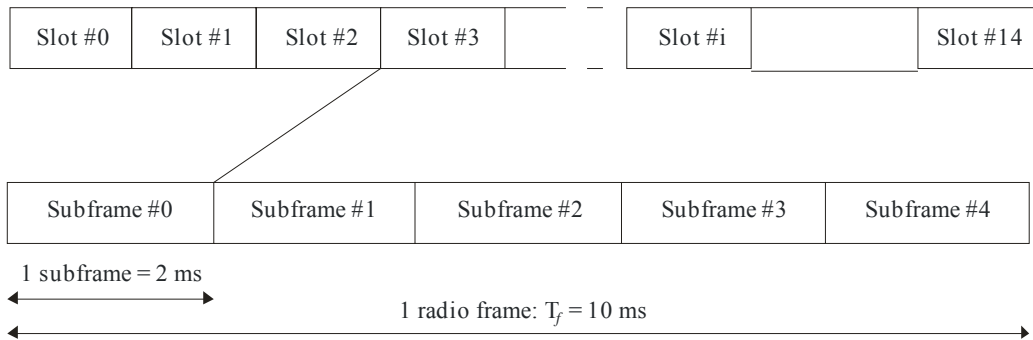

M.1457-09

### 5.1.1.3.4 Physical frame structure

For UTRA the basic physical frame rate is 10 ms with 15 slots. Figure 10 shows the frame structure.

FIGURE 10  
Basic frame structure

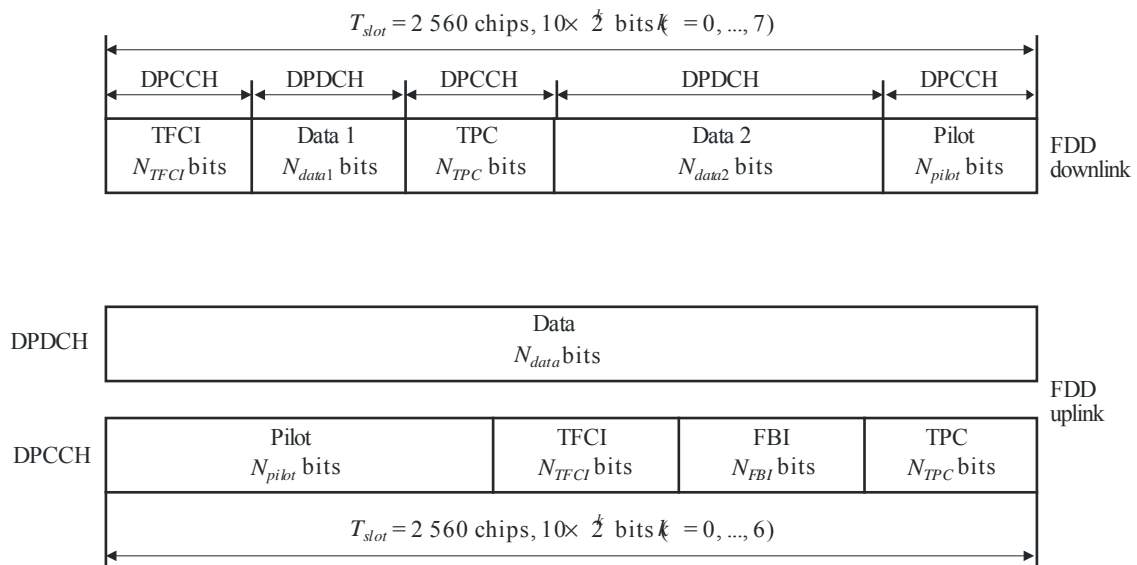

M.1457-10

Figure 11 shows the content for a slot used by the DCH. The uplink physical channels DPDCH and DPCCCH are I/Q multiplexed while the downlink channels are time multiplexed. The DPDCH, the channel where the user data is transmitted on, is always associated with a DPCCCH containing Layer 1 control information. The transport format combination indicator (TFCI) field is used for indicating the demultiplexing scheme of the data stream. The TFCI field does not exist for combinations that are static (i.e. fixed bit rate allocations) or blind transport format detection is employed. The feedback information (FBI) field is used for transmit functions. The transmit power control (TPC) bits are used for power control. HSDPA has a 2 ms frame structure and E-DCH supports both a 2 ms and 10 ms frame structure with corresponding TTIs.

FIGURE 11

Slot content for the DPDCH/DPCCH

M.1457-11

For the uplink, the DPDCH bit rate can vary between 15 up to 960 kbit/s using spreading factors (SFs) 256 down to 4. To obtain higher bit rates for a user several physical channels can be used. The bit rate of the DPCCH is fixed to 15 kbit/s. For the downlink the DPDCH bit rate is variable between 15 up to 1 920 kbit/s with a SF ranging from 512 down to 4. Note that the symbol bit rate is equal to the channel bit rate for the uplink while it is half of the channel bit rate for the downlink.

A CPICH is defined. It is an unmodulated downlink channel, that is the phase reference for other downlink physical channels. There is always one primary CPICH in each cell. There may also be additional secondary CPICHs in a cell.

To be able to support inter-frequency handover as well as measurements on other carrier frequencies or carriers of other systems, like GSM, a compressed mode of operation is defined. The function is implemented by having some slots empty, but without deleting any user data. Instead the user data is transmitted in the remaining slots. The number of slots that is not used can be variable with a minimum of three slots (giving minimum idle lengths of at least 1.73 ms). The slots can be empty either in the middle of a frame or at the end and in the beginning of the consecutive frame. If and how often is controlled by the RRC functionality in Layer 3.

E-UTRAN FDD uses a frame structure type 1. Frame structure type 1 is applicable to both full duplex and half duplex FDD. Each radio frame is  $T_f = 307200 \times T_s = 10$  ms long and consists of 20 slots of length  $T_{slot} = 15360 \times T_s = 0.5$  ms, numbered from 0 to 19. A subframe is defined as two consecutive slots where subframe  $i$  consists of slots  $2i$  and  $2i + 1$ .

For FDD, 10 subframes are available for downlink transmission and 10 subframes are available for uplink transmissions in each 10 ms interval. Uplink and downlink transmissions are separated in the frequency domain.

FIGURE 12

**Frame structure type 1**

M.1457-12

**5.1.1.3.5 Spreading, modulation and pulse shaping****Uplink**

In UTRA, spreading consists of two operations. The first is the channelization operation, which transforms every data symbol into a number of chips, thus increasing the bandwidth of the signal. The number of chips per data symbol is called the SF. The second operation is the scrambling operation, where a scrambling code is applied to the spread signal.

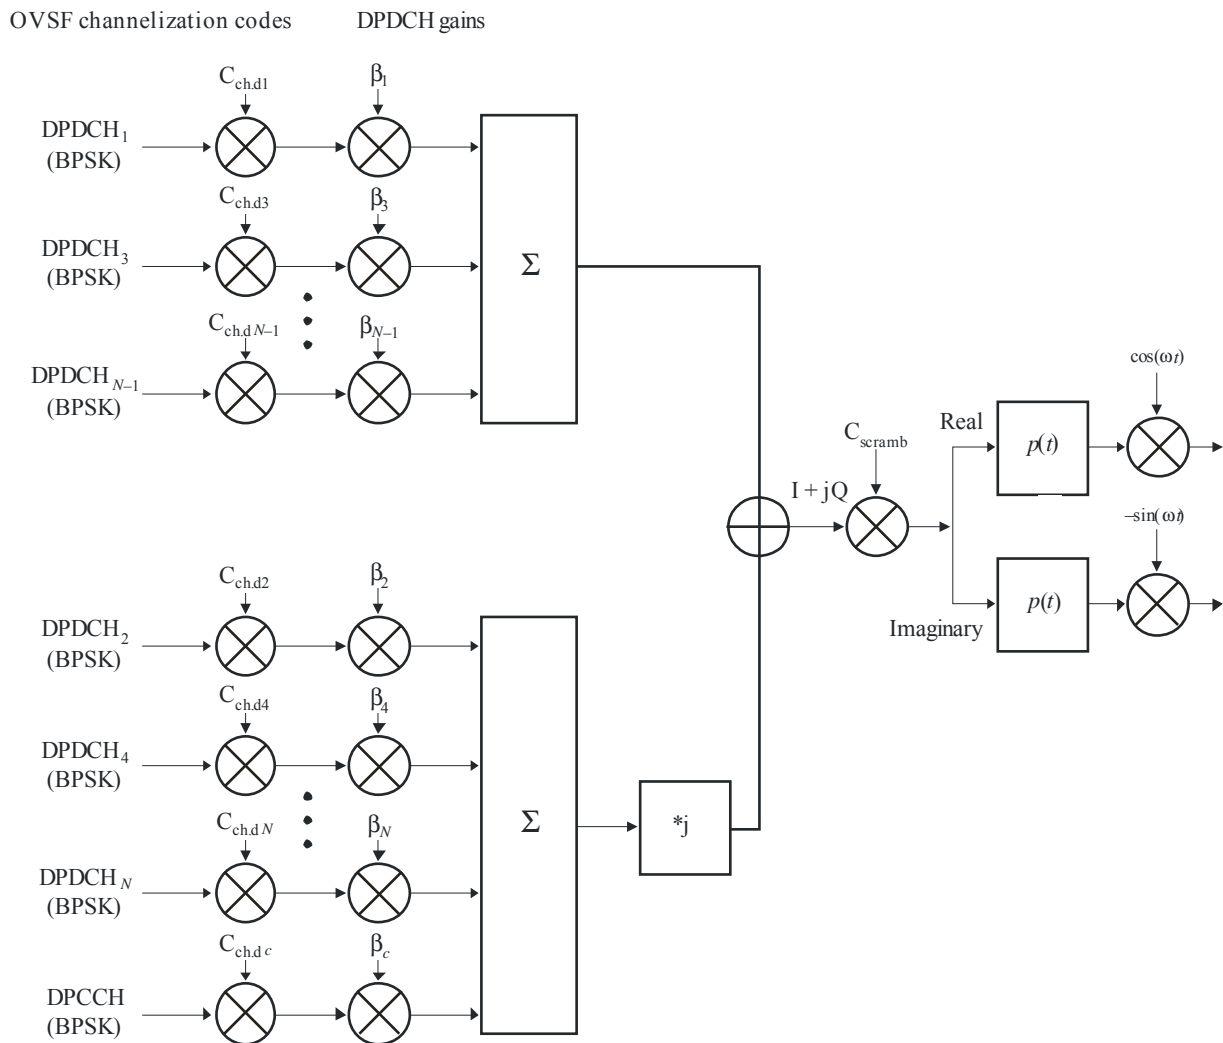

In the channelization operation, data symbols on so-called I- and Q-branches are independently multiplied with a code. The channelization codes are orthogonal variable spreading factor (OVSF) codes that preserve the orthogonality between a user's different physical channels. With the scrambling operation, the resultant signals on the I- and Q-branches are further multiplied by complex-valued scrambling code, where I and Q denote real and imaginary parts, respectively. Note that before complex multiplication binary values 0 and 1 are mapped to +1 and -1, respectively. Figure 13 illustrates the spreading and modulation for the case of multiple uplink DPDCHs. Note that this figure only shows the principle, and does not necessarily describe an actual implementation. Modulation is dual-channel QPSK (i.e. separate BPSK on I- and Q-channel), where the uplink DPDCH and DPCCH are mapped to the I and Q branch respectively. The I and Q branches are then spread to the chip rate with two different channelization codes and subsequently complex scrambled by a UE specific complex scrambling code  $C_{scramb}$ . There are 224 uplink-scrambling codes. Either short (256 chips from the family of S(2) codes) or long (38 400 chips equal to one frame length, gold code-based) scrambling codes is used on the uplink. The short scrambling code is typically used in cells where the BS is equipped with an advanced receiver, such as a multi-user detector or interference canceller whereas the long codes gives better interference averaging properties.

The pulse-shaping filters are root-raised cosine with roll-off  $\alpha = 0.22$  in the frequency domain.

In E-UTRA, the uplink radio access scheme is based on Single Carrier FDMA, more specifically, DFTS-OFDM. It also supports multi-cluster assignment of DFTS-OFDM. The sub-carrier spacing is 15 kHz. The antenna configuration for uplink supports both SU-MIMO and MU-MIMO. The modulation scheme for the uplink is up to 16-QAM and optionally 64-QAM.

FIGURE 13

Spreading/modulation for uplink DPDCH/DPCCH in UTRA

M.1457-13

**Downlink**

Figure 14 illustrates the spreading and modulation for the downlink DPDCH/DPCCH in UTRA. Data modulation is QPSK where each pair of two bits are serial-to-parallel (S/P) converted and mapped to the I- and Q-branch respectively. The I- and Q-branch are then spread to the chip rate with the same channelization code  $C_{ch}$  (real spreading) and subsequently scrambled by the scrambling code  $C_{scramb}$  (complex scrambling).

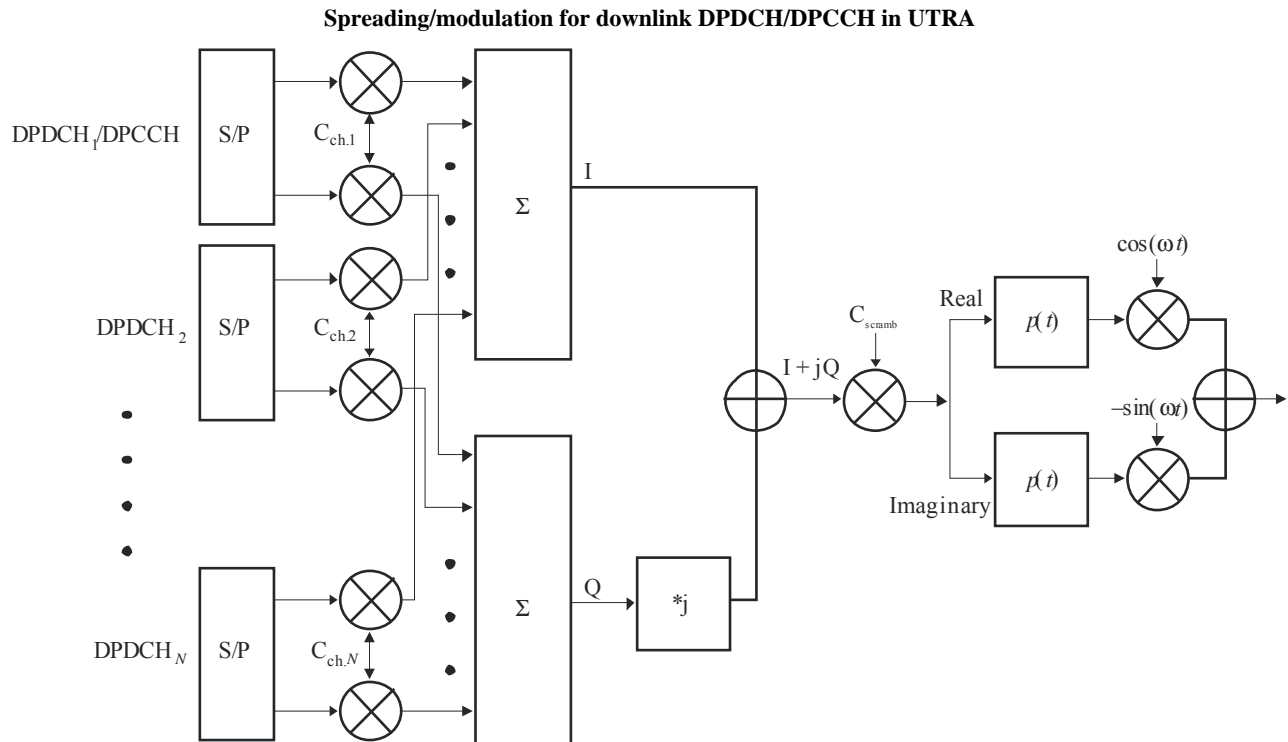

The channelization codes are the same codes as used in the uplink that preserve the orthogonality between downlink channels of different rates and SFs. There are a total of  $512 \times 512 = 262\,144$  scrambling codes, numbered 0 to 262 143. The scrambling codes are divided into 512 sets each of a primary scrambling code and 511 secondary scrambling codes. Each cell is allocated one and only one primary scrambling code. The primary CCPCH is always transmitted using the primary scrambling code. The other downlink physical channels can be transmitted with either the primary scrambling code or a secondary scrambling code from the set associated with the primary scrambling code of the cell.

The pulse-shaping filters are root-raised cosine with roll-off  $\alpha = 0.22$  in the frequency domain.

Downlink spreading for downlink physical channels other than the downlink DPCH is very similar. For the physical channel to which HS-DSCH is mapped, higher-order data modulation can be used in addition to QPSK.

The downlink radio access scheme of E-UTRA is based on conventional OFDM using cyclic prefix. The OFDM sub-carrier spacing is 15 kHz. In addition, there is also a reduced sub-carrier spacing of 7.5 kHz only for MBMS-dedicated cell. Single-User MIMO and Multi-User MIMO with 2, 4 and 8 transmit antennas are supported.

FIGURE 14

#### 5.1.1.4 Layer 2

##### 5.1.1.4.1 MAC sub-layer

The MAC sub-layer is responsible for the handling of the data streams coming from the RLC and RRC sub-layers. It provides an unacknowledged transfer mode service to the upper layers. The interface to the RLC sub-layer is through logical channel service access points. It also re-allocates radio resources on request by the RRC sub-layer as well as provides measurements to the upper layers. The logical channels are divided into control channels and traffic channels. Thus, the functionality handles issues like:

- mapping of the different logical channels to the appropriate transport channels and selection of appropriate transport format for the transport channels based on the instantaneous source bit rate, and optimization of the HS-DSCH, DL-SCH (E-UTRA) and UL-SCH (E-UTRA) transport channel;
- multiplexing/demultiplexing of the PDUs to/from transport blocks which are thereafter further treated by the physical layer;
- dynamic switching between common and dedicated transport channels based on information from the RRC sub-layer;
- priority issues for services to one UE according to information from higher layers and physical layer (e.g. available transmit power level) as well as priority handling between UEs by means of dynamic scheduling in order to increase spectrum efficiency;
- monitoring of traffic volume that can be used by the RRC sub-layer;

- hybrid ARQ with soft combining in case of the HS-DSCH, DL-SCH (E-UTRA) or UL-SCH (E-UTRA) transport channel;
- segmentation in case improved L2 support for high data rates is used;
- Padding (E-UTRA).

Figure 15 shows the possibilities of mapping the logical dedicated traffic channel (DTCH) onto transport channels. There are possibilities to map onto common transport channels as well as dedicated transport channels. The choice of mapping could be determined on, e.g. the DTCH traffic intensity.

FIGURE 15  
The possible transport channel mappings of the dedicated traffic channel (DTCH)

M.1457-15

Figures 16 and 17 similarly show the possibilities of mapping the logical channels onto transport channels for E-UTRA.

M.1457-17

#### 5.1.1.4.2 RLC sub-layer

The RLC sub-layer provides three different types of data transfer modes:

- *Transparent data transfer.* This service transmits higher layer PDUs without adding any protocol information, possibly including segmentation/reassemble functionality.
- *Unacknowledged data transfer.* This service transmits higher layer PDUs without guaranteeing delivery to the peer entity. The unacknowledged data transfer mode has the following characteristics:
  - a) *Detection of erroneous data:* The RLC sub-layer shall deliver only those SDUs to the receiving higher layers that are free of transmission errors by using the sequence-number check function;
  - b) *Unique delivery:* The RLC sub-layer shall deliver each SDU only once to the receiving upper layer using duplication detection function;
  - c) *Immediate delivery:* The receiving RLC sub-layer entity shall deliver a SDU to the higher layer receiving entity as soon as it arrives at the receiver.
- *Acknowledged data transfer.* This service transmits higher layer PDUs and guarantees delivery to the peer entity. In case RLC is unable to deliver the data correctly, the user of RLC at the transmitting side is notified. For this service, both in-sequence and out-of-sequence delivery are supported. In many cases a higher layer protocol can restore the order of its PDUs. As long as the out-of-sequence properties of the lower layer are known and controlled (i.e. the higher layer protocol will not immediately request retransmission of a missing PDU) allowing out-of-sequence delivery can save memory space in the receiving RLC. The acknowledged data transfer mode has the following characteristics:
  - a) *Error-free delivery:* error-free delivery is ensured by means of retransmission. The receiving RLC entity delivers only error-free SDUs to the higher layer;
  - b) *Unique delivery:* the RLC sub-layer shall deliver each SDU only once to the receiving upper layer using duplication detection function;
  - c) *In-sequence delivery:* RLC sub-layer shall provide support for in-order delivery of SDUs, i.e. RLC sub-layer should deliver SDUs to the receiving higher layer entity in the same order as the transmitting higher layer entity submits them to the RLC sub-layer;
  - d) *Out-of-sequence delivery:* alternatively to in-sequence delivery, it shall also be possible to allow that the receiving RLC entity delivers SDUs to higher layer in different order than submitted to RLC sub-layer at the transmitting side.

It also provides for RLC connection establishment/release. As well as QoS setting and notification to higher layers in case of unrecoverable errors.

An example of the data flow for non-transparent (acknowledged/unacknowledged) data transfer is shown in Fig. 3.

#### 5.1.1.4.3 PDCP sub-layer

PDCP provides transmission and reception of Network PDUs in acknowledged, unacknowledged and transparent RLC mode.

It is responsible for the mapping of Network PDUs from one network protocol to one RLC entity and it provides compression in the transmitting entity and decompression in the receiving entity of redundant Network PDU control information (header compression/decompression).

For E-UTRAN, PDCP is also responsible for in-sequence delivery of upper layer PDUs at hand-over, duplicate detection of lower layer SDUs and retransmission of PDCP SDUs at handover.

#### 5.1.1.4.4 BMC sub-layer

In UTRA, the BMC provides a broadcast/multicast transmission service in the user plane on the radio interface for common user data in transparent or unacknowledged mode.

It can handle functionalities such as storage, scheduling and transmission of BMC messages.

#### 5.1.1.5 Layer 3 (RRC sub-layer)

The RRC sub-layer handles the control plane signalling of Layer 3 between the UEs and the radio interface. In addition to the relation with the upper layers (such as CN) the following main functions are performed:

- *Broadcast of information provided by the non-access stratum (CN)* – The RRC layer performs system information broadcasting from the network to all UEs. The system information is normally repeated on a regular basis. This function supports broadcast of higher layer (above RRC) information. This information may be cell specific or not. As an example RRC may broadcast CN location service area information related to some specific cells.
- *Broadcast of information related to the access stratum* – The RRC layer performs system information broadcasting from the network to all UEs. This function supports broadcast of typically cell-specific information.
- *Establishment, maintenance and release of an RRC connection between the UE and the radio access network* – The establishment of an RRC connection is initiated by a request from higher layers at the UE side to establish the first signalling connection for the UE. The establishment of an RRC connection includes an optional cell re-selection, an admission control, and a Layer 2 signalling link establishment.
- *Establishment, reconfiguration and release of radio access bearers* – The RRC layer will, on request from higher layers, perform the establishment, reconfiguration and release of radio access bearers in the user plane. A number of radio access bearers can be established to an UE at the same time. At establishment and reconfiguration, the RRC layer performs admission control and selects parameters describing the radio access bearer processing in Layer 2 and Layer 1, based on information from higher layers.
- *Assignment, reconfiguration and release of radio resources for the RRC connection* – The RRC layer handles the assignment of radio resources (e.g. codes) needed for the RRC connection including needs from both the control and user plane. The RRC layer may reconfigure radio resources during an established RRC connection. This function includes coordination of the radio resource allocation between multiple radio bearers related to the

same RRC connection. RRC controls the radio resources in the uplink and downlink such that UE and the radio access network can communicate using unbalanced radio resources (asymmetric uplink and downlink). RRC signals to the UE to indicate resource allocations for purposes of handover to GSM or other radio systems.

- *RRC connection mobility functions* – The RRC layer performs evaluation, decision and execution related to RRC connection mobility during an established RRC connection, such as handover, preparation of handover to GSM or other systems, cell re-selection and cell/paging area update procedures, based on, e.g. measurements done by the UE.
- *Paging/notification* – The RRC layer can broadcast paging information from the network to selected UEs. The RRC layer can also initiate paging during an established RRC connection.
- *Control of requested QoS* – This function ensures that the QoS requested for the radio access bearers can be met. This includes the allocation of a sufficient number of radio resources.
- *UE measurement reporting and control of the reporting* – The measurements performed by the UE are controlled by the RRC layer, in terms of what to measure, when to measure and how to report, including both this radio interface and other systems. The RRC layer also performs the reporting of the measurements from the UE to the network.
- *Outer loop power control* – The RRC layer controls setting of the target of the closed-loop power control.
- *Control of ciphering* – The RRC layer provides procedures for setting of ciphering (on/off) between the UE and the radio access network.
- *Initial cell selection and re-selection in idle mode* – Selection of the most suitable cell based on idle mode measurements and cell selection criteria.
- *Arbitration of the radio resource allocation between the cells* – This function shall ensure optimal performance of the overall radio access network capacity.

#### 5.1.1.6 Summary of major technical parameters

Parameter	Value	Reference to § 5.1.2
Multiple access technique and duplexing scheme	Multiple access: DS-CDMA (E-UTRAN) OFDM in DL. SC-FDMA in UL Duplexing: FDD	5.1.2.1.1 5.1.2.3.1
Chip rate (Mchip/s)	3.84	5.1.2.1.4
Frame length and structure	Frame length: 10 ms (E-UTRAN) Sub-frame length; 1 ms Slot length: 10/15 ms. (E-UTRAN) 0.5 ms TTI: 10 ms, 20 ms, 40 ms, 80 ms, 2 ms (E-UTRAN) 1 ms	5.1.2.1.2 5.1.2.3.1
Occupied bandwidth	Less than 5 MHz (E-UTRAN) 1.4 MHz, 3 MHz, 5 MHz, 10 MHz, 15 MHz and 20 MHz	5.1.2.4.1, 5.1.2.4.4 5.1.2.9.1, 5.1.2.9.2

Parameter	Value	Reference to § 5.1.2
Adjacent channel leakage power ratio (ACLR) (transmitter side)	UE (UE power class: 21 dBm and 24 dBm, (E-UTRAN) 23 dBm): ACLR (5 MHz) = 33 dB ACLR (10 MHz) = 43 dB BS: ACLR (5 MHz) = 45 dB ACLR (10 MHz) = 50 dB	5.1.2.4.1, 5.1.2.9.1  5.1.2.4.4, 5.1.2.9.2
Adjacent channel selectivity (ACS) (receiver side)	UE: ACS (5 MHz) = 33 dB BS: ACS (5 MHz) = 45 dB	5.1.2.4.1, 5.1.2.9.1 5.1.2.4.4, 5.1.2.9.2
Random access mechanism	Acquisition indication based random-access mechanism with power ramping on preamble followed by message	5.1.2.1.2 5.1.2.1.5
Pilot structure	Uplink: dedicated pilots Downlink: common and/or dedicated pilots	5.1.2.1.2
Inter-base station asynchronous/synchronous operation	Asynchronous; synchronous	5.1.2.1.5

### 5.1.2 Detailed specification of the radio interface

The standards contained in this section are derived from the global core specifications for IMT 2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

- 1) The relevant SDOs should make their reference material available from their web site.
- 2) This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

**5.1.2.1.2 TS 25.211****Physical channels and mapping of transport channels onto physical channels (FDD)**

This specification describes the characteristics of the Layer 1 transport channels and physical channels in the FDD mode of UTRA. The main objectives of the specification are to be a part of the full description of the UTRA Layer 1, and to serve as a basis for the drafting of the actual technical specification.

### 5.1.2.2 25.300 series

#### 5.1.2.2.1 TS 25.301

#### Radio interface protocol architecture

This specification describes an overview and overall description of the UE-UTRAN radio interface protocol architecture. Details of the radio protocols will be specified in companion documents.

### 5.1.2.2.3 TS 25.303

#### Interlayer procedures in Connected Mode

This specification describes informative interlayer procedures to perform the required tasks. This specification attempts to provide a comprehensive overview of the different states and transitions within the connected mode of universal mobile telecommunications system (UMTS) terminal.

#### 5.1.2.2.4 TS 25.304

##### User Equipment (UE) procedures in idle mode and procedures for cell reselection in connected mode

This specification describes the overall idle mode process for the UE and the functional division between the non-access stratum and access stratum in the UE. The UE is in idle mode when the connection of the UE is closed on all layers, e.g. there is neither an MM connection nor an RRC

connection. This specification presents also examples of inter-layer procedures related to the idle mode processes and describes idle mode functionality of a dual mode UMTS/GSM UE.

## 5.1.2.2.13 TS 25.323

**Packet Data Convergence Protocol (PDCP) specification**

This document provides the description of the Packet Data Convergence Protocol (PDCP). PDCP provides its services to the NAS at the UE or the relay at the Radio Network Controller (RNC). PDCP uses the services provided by the Radio Link Control (RLC) sublayer.

### 5.1.2.3.10 TS 25.420

#### UTRAN Iur interface general aspects and principles

This specification describes an introduction to the TSG RAN TS 25.42x series of technical specifications that define the Iur interface. It is a logical interface for the interconnection of two RNC components of the UTRAN.

### 5.1.2.3.16 TS 25.426

#### UTRAN Iur and Iub interface data transport & transport signalling for DCH data streams

This specification describes the transport bearers for the DCH data streams on UTRAN Iur and Iub interfaces. The corresponding transport network control plane is also specified. The physical layer for the transport bearers is outside the scope of this TS.

### 5.1.2.3.18 TS 25.430

#### UTRAN Iub Interface: general aspects and principles

This specification describes the TSG RAN TS 25.43x series of UMTS technical specifications that define the Iub interface. The Iub interface is a logical interface for the interconnection of Node B and RNC components of the UTRAN.

**5.1.2.3.20 TS 25.432****UTRAN Iub interface: signalling transport**

This specification describes the signalling transport related to the Node B application part (NBAP) signalling to be used across the Iub interface. The Iub interface is a logical interface for the interconnection of Node B and RNC components of the UTRAN. The RNC signalling between these nodes is based on NBAP.

**5.1.2.3.30 TS 25.460****UTRAN Iuant interface: General aspects and principles**

This document is an introduction to the TSG RAN TS 25.46x series of UMTS Technical Specifications that define the Iuant Interface. The logical Iuant interface is a Node B internal interface between the implementation specific O&M function and the Remote Electrical Tilting (RET) Antenna Control unit function of the Node B.

### 5.1.2.3.33 TS 25.466

#### UTRAN Iuant interface: Application part

This document specifies the Remote Electrical Tilting Application Part (RETAP) between the implementation specific O&M transport function and the RET Antenna Control unit function of the Node B. The document also specifies the Tower Mounted Amplifier Application Part (TMAAP) between the implementation specific O&M transport function and the TMA control function of the Node B. It defines the Iuant interface and its associated signaling procedures.

### 5.1.2.4 25.100 series

#### 5.1.2.4.1 TS 25.101

#### User Equipment (UE) radio transmission and reception (FDD)

This document establishes the minimum RF characteristics of the UTRA User Equipment (UE) operating in the FDD mode. The values in the TS make no allowance for measurement uncertainty in conformance testing. Test limits to be used for conformance testing are specified separately in the UE conformance test specifications TS 34.121.

### 5.1.2.4.3 TS 25.133

#### Requirements for support of radio resource management (FDD)

This specification describes the requirements for support of radio resource management for FDD including requirements on measurements in UTRAN and the UE as well as on node dynamic behaviour and interaction, in terms of delay and response characteristics.

**5.1.2.4.4 TS 25.104****Base Station (BS) radio transmission and reception (FDD)**

This specification describes the base station minimum RF characteristics of the FDD mode of UTRA. The values in the TS make no allowance for measurements uncertainties in conformance testing. Test limit to be used for conformance testing are specified separately in the BS conformance test Specification TS 25.141.

**5.1.2.4.5 TS 25.141****Base Station (BS) conformance testing (FDD)**

This specification describes the RF test methods and conformance requirements for UTRA base transceiver stations (BTS) operating in the FDD mode. These have been derived from, and are consistent with, the core UTRA specifications specified in the requirements reference subclause of each test. The maximum acceptable measurement uncertainty is specified in the TS for each test, where appropriate.

**5.1.2.5.3 TS 34.121****Terminal conformance specification, Radio transmission and reception (FDD)**

This document specifies the Radio Frequency (RF) test methods and conformance requirements for UTRA User Equipment (UE) operating in the FDD mode. These have been derived from, and are consistent with, the core UTRA specifications. The maximum acceptable measurement uncertainty is specified in the TS for each test, where appropriate.

**5.1.2.5.5 TS 34.123-2****User Equipment (UE) conformance specification; Part 2: Implementation conformance statement (ICS) proforma specification**

This document provides the Implementation Conformance Statement (ICS) proforma for 3rd Generation User Equipment (UE), in compliance with the relevant requirements, and in accordance with the relevant guidance given in ISO/IEC 9646-7 and ETS 300 406. This document also specifies a recommended applicability statement for the test cases included in TS 34.123-1. These applicability statements are based on the features implemented in the UE.

### 5.1.2.7.11 TS 36.305

#### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); Stage 2 functional specification of User Equipment (UE) positioning in E-UTRAN

This document specifies the stage 2 of the UE positioning function of E-UTRAN, which provides the mechanisms to support or assist the calculation of the geographical position of a UE. The purpose of this stage 2 specification is to define the E-UTRAN UE Positioning architecture, functional entities and operations to support positioning methods. This description is confined to the E-UTRAN Access Stratum. This stage 2 specification covers the E-UTRAN positioning methods, state descriptions, and message flows to support UE positioning.

### 5.1.2.8.12 TS 36.440

#### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); General aspects and principles for interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN

This document describes the overall architecture of the interface for the provision of MBMS in the E-UTRAN. This includes also a description of the general aspects, assumptions and principles guiding the architecture and interface. The MBMS functions to be provided within that architecture are summarized. It provides an introduction to the TSG RAN TS 36.44x series of UMTS technical specifications that define the different interfaces introduced for MBMS provision in E-UTRAN.

#### 5.1.2.8.14 TS 36.442

### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); Signalling Transport for interfaces supporting Multimedia Broadcast Multicast Service (MBMS) within E-UTRAN

This document specifies the standards for signalling transport to be used across M2 and M3 interfaces. M2 interface is a logical interface between the eNodeB and the MCE. M3 interface is a logical interface between the MCE and the MME. This document describes how the M2-AP signalling messages are transported over M2, and how the M3-AP signalling messages are transported over M3.

#### 5.1.2.8.15 TS 36.443

### Evolved Universal Terrestrial Radio Access Network (E-UTRAN); M2 Application Protocol (M2AP)

This document specifies the E-UTRAN radio network layer signalling protocol for the M2 interface. The M2 Application Protocol (M2AP) supports the functions of M2 interface by signalling procedures defined in this document.

### 5.1.2.9.8 TS 36.133

#### Evolved Universal Terrestrial Radio Access (E-UTRA); Requirements for support of radio resource management

This specification specifies requirements for support of Radio Resource Management for the FDD and TDD modes of Evolved UTRA. These requirements include requirements on measurements in UTRAN and the UE as well as requirements on node dynamical behaviour and interaction, in terms of delay and response characteristics.

**5.1.2.11 Multiple radio access technology aspects specifications****5.1.2.11.1 TS 37.104****E-UTRA, UTRA and GSM/EDGE; Multi-Standard Radio (MSR) Base Station (BS) radio transmission and reception**

This specification establishes the minimum RF characteristics of E-UTRA, UTRA and GSM/EDGE Multi-Standard Radio (MSR) Base Station (BS). Requirements for multi-RAT and single-RAT operation of MSR BS are covered in this document. The requirements in this document for E-UTRA and UTRA single-RAT operation of MSR BS are also applicable to E-UTRA and UTRA multi-carrier capable single-RAT BS. Requirements for GSM BS that are only single-RAT capable are not covered.

**5.1.2.11.2 TS 37.113****E-UTRA, UTRA and GSM/EDGE; Multi-Standard Radio (MSR) Base Station (BS) Electromagnetic Compatibility (EMC)**

This document covers the assessment of E-UTRA, UTRA and GSM/EDGE Multi-Standard Radio (MSR) Base Stations and associated ancillary equipment in respect of Electromagnetic Compatibility (EMC). This document specifies the applicable test conditions, performance assessment and performance criteria for E-UTRA, UTRA and GSM/EDGE Base Stations and associated ancillary equipment in one of the following categories: (i)

Multi-Standard Radio (MSR) Base Stations for E-UTRA, UTRA and GSM/EDGE meeting the requirements of TS 37.104, with conformance demonstrated by compliance to TS 37.141; (ii) Base Stations for E-UTRA meeting the requirements of TS 36.104, with conformance demonstrated by compliance to TS 36.141; (iii) Base Stations for UTRA FDD meeting the requirements of TS 25.104, with conformance demonstrated by compliance to TS 25.141; (iv) Base Stations for UTRA TDD meeting the requirements of TS 25.105, with conformance demonstrated by compliance to TS 25.142; (v) Base Stations for GSM/EDGE meeting the requirements of TS 45.005, with conformance demonstrated by compliance to TS 51.021. The environment classification used in this document refers to the environment classification used in IEC 61000-6-1 and IEC 61000-6-3. The EMC requirements have been selected to ensure an adequate level of compatibility for apparatus at residential, commercial and light industrial environments. The levels, however, do not cover extreme cases which may occur in any location but with low probability of occurrence.

#### 5.1.2.11.4 TS 37.320

### Universal Terrestrial Radio Access (UTRA) and Evolved Universal Terrestrial Radio Access (E-UTRA); Radio measurement collection for Minimization of Drive Tests (MDT); Overall description; Stage 2

This document provides an overview and overall description of the minimization of drive tests functionality. The document describes functions and procedures to support collection of UE-specific measurements for MDT using Control Plane architecture, for both UTRAN and E-UTRAN.

#### 5.1.2.12 Core network and Terminal aspects

##### 5.1.2.12.1 TS 21.111

### USIM and IC card requirements

This document defines the requirements of the USIM (Universal Subscriber Identity Module) and the IC card for 3G (UICC). These are derived from the service and security requirements defined in TS 22.100 and TS 22.101. The USIM is a 3G application on an IC card. It inter-operates with a 3G terminal and provides access to 3G services. This document is intended to serve as a basis for the detailed specification of the USIM and the UICC, and the interface to the 3G terminal.

### 5.1.2.12.3 TS 23.007

#### Restoration procedures

The data stored in location registers are automatically updated in normal operation; the main information stored in a location register defines the location of each mobile station and the subscriber data required to handle traffic for each mobile subscriber. The loss or corruption of these data will seriously degrade the service offered to mobile subscribers; it is therefore necessary to define procedures to limit the effects of failure of a location register, and to restore the location register data automatically. This document defines the necessary procedures.

## 5.1.2.12.5 TS 23.009

**Handover procedures**

This document contains a detailed description of the handover procedures to be used in PLMNs. The purpose of the handover procedures are to ensure that the connection to the Mobile Station (MS) or User Equipment (UE) is maintained as it moves from one cell or radio network to another. The document defines the circuit switched handover functionality based on the service requirements in 3GPP TS 22.129. For the circuit switched handover functionality related to SRVCC, it is based on the service requirements in 3GPP TS 23.216.

### 5.1.2.12.6 TS 23.018

#### Basic call handling; Technical realization

This document specifies the technical realization of the handling of calls originated by a UMTS or GSM mobile subscriber and calls directed to a UMTS or GSM mobile subscriber, up to the point where the call is established. Normal release of the call after establishment is also specified. Trunk Originated call is also modelled.

**5.1.2.12.7 TS 23.034****High Speed Circuit Switched Data (HSCSD); Stage 2**

This document contains the stage 2 service description for a High Speed Circuit Switched Data (HSCSD) on GSM/GERAN in A/Gb mode and Iu mode. HSCSD utilizes the multislot mechanism, i.e. using multiple traffic channels (/bearers) for the communication. Additionally, this document specifies some HSCSD related requirements for multi system mobile stations operating in UTRAN Iu mode. In UTRAN Iu mode one bearer can provide all needed data rates, and the multislot mechanism is therefore not needed. However, for inter-system handover to GERAN, certain information has to be provided by the mobile station during the service negotiation.

### 5.1.2.12.9 TS 23.040

#### Technical realization of the Short Message Service (SMS)

This document describes the Short Message Service (SMS) for GSM/UMTS networks. It defines:

- the services and service elements;
- the network architecture;
- the Service Centre functionality;
- the SMS Router functionality;
- the MSC functionality (with regard to the SMS);
- the SGSN functionality (with regard to the SMS);
- the routing requirements;
- the protocols and protocol layering;

for the Mobile Originated and Mobile Terminated Short Message Service Teleservices, as specified in 3GPP TS 22.003 and 3GPP TS 22.105.

The use of radio resources for the transfer of short messages between the MS and the MSC or the SGSN is described in 3GPP TS 24.011.

## 5.1.2.12.10 TS 23.041

**Technical realization of Cell Broadcast Service (CBS)**

This document describes the Cell Broadcast short message service (CBS) for GSM and UMTS.

For GSM it defines the primitives over the Cell Broadcast Centre – Base Station System (CBC-BSS) interface and the message formats over the Base Station System – Mobile Station (BSS-MS) interface for Teleservice 23 as specified in 3GPP TS 22.003. For UMTS it defines the interface requirements for the Cell Broadcast Center – UMTS Radio Network System (RNS) interface and the radio interface requirements for UMTS Radio Access Networks to support CBS as specified in 3GPP TS 22.003. The document also describes the Public Warning System (PWS) for GSM, UMTS and E-UTRAN, see 3GPP TS 22.268.

### 5.1.2.12.12 TS 23.057

#### Mobile Execution Environment (MExE); Functional description; Stage 2

This document defines stage 2 and stage 3 of the Mobile Execution Environment (MExE). Stage 2 identifies the functional capabilities and information flows needed to support the service described in stage 1. MExE uses a number of technologies to realize the requirements of the stage 1 description (3GPP TS 22.057). The document describes how the service requirements are realized with the selected technologies. The specification covers areas of MExE common to all technologies.

**5.1.2.12.14 TS 23.066****Support of Mobile Number Portability (MNP); Technical realization; Stage 2**

This document describes several alternatives for the realization of Mobile Number Portability. It is left to operator and implementation decisions which option, or combination of options, is used, taking into account the regulatory and architectural constraints that may prevail.

## 5.1.2.12.15 TS 23.078

**Customised Applications for Mobile network Enhanced Logic (CAMEL) Phase 4; Stage 2**

This document specifies the stage 2 description for the fourth phase (see 3GPP TS 22.078) of the Customized Applications for Mobile network Enhanced Logic (CAMEL) feature which provides the mechanisms to support services of operators which are not covered by standardized services even when roaming outside the HPLMN.

### 5.1.2.12.16 TS 23.090

#### Unstructured Supplementary Service Data (USSD); Stage 2

This document gives the stage 2 description of Unstructured Supplementary Service Data (USSD). The unstructured supplementary service data (USSD) mechanism allows the Mobile Station (MS) user and a PLMN operator defined application to communicate in a way which is transparent to the MS and to intermediate network entities. The mechanism allows development of PLMN specific supplementary services. This document defines the requirements for handling USSD at the MS and network entities.

### 5.1.2.12.17 TS 23.108

#### Mobile radio interface layer 3 specification, core network protocols; Stage 2

This specification describes the procedures used at the radio interface for Call Control (CC), Mobility Management (MM) and Session Management (SM). It contains examples of the structured procedures.

**5.1.2.12.18 TS 23.110****Universal Mobile Telecommunications System (UMTS) access stratum; Services and functions**

This specification describes the detailed specifications of the protocols which rule the information flows, both control and user data, between the access stratum and the parts of UMTS outside the access stratum, and of the detailed specifications of the UTRAN. These detailed specifications are to be found in other technical specifications.

### 5.1.2.12.19 TS 23.122

#### Non-Access-Stratum (NAS) functions related to Mobile Station (MS) in idle mode

This specification provides an overview of the tasks undertaken by a Mobile Station (MS) when in idle mode, that is, switched on but not having a dedicated channel allocated, e.g. not making or receiving a call, or when in group receive mode, that is, receiving a group call or broadcast call but having a dedicated connection. It also describes the corresponding network functions.

### 5.1.2.12.21 TS 23.153

#### Out of band transcoder control; Stage 2

This document specifies the stage 2 description of the Out-of-Band Transcoder Control for speech services. It describes the principles and procedures to support Transcoder Free Operation, Tandem Free Operation and the interworking between TrFO and TFO. Transcoder at the edge is also part of this document.

**5.1.2.12.22 TS 23.205****Bearer-independent circuit-switched core network; Stage 2**

This document defines the stage 2 description for the bearer independent CS core network. The stage 2 covers the information flow between the GMSC server, MSC server and media gateways. The document shows the CS core network termination of the Iu interface in order to cover the information flow stimulus to the core network and describe the interaction with the supplementary and value added services and capabilities.

The protocol used over the Nc interface is an enhanced call control protocol supporting call bearer separation such as BICC. The protocol used over the Mc interface is H.248. SIP-I based CS core network is further specified in 3GPP TS 23.231.

Local Call Local Switch (LCLS) functionality is further specified in 3GPP TS 23.284.

This document is applicable only for ATM or IP transport in the CS core network.

**5.1.2.12.25 TS 23.231****SIP-I based circuit-switched core network; Stage 2**

This document defines the stage 2 description for the SIP-I based CS core network. The logical architecture for the SIP-I based CS core network is defined in 3GPP TS 23.205. Stage 2 covers the information flows between the GMSC server, MSC server and media gateways that are required to support a SIP-I based Nc interface. The document shows the CS core network termination of the Iu and A interfaces in order to cover the information flow stimulus to the core network and describe the interaction with the supplementary and value added services and capabilities.

The Nc interface profile is based on ITU-T Q.1912.5 SIP-I profile C and is specified in 3GPP TS 29.231. The Mc interface profile is based on ITU-T H.248.1 and is specified in 3GPP TS 29.232. Local Call Local Switch (LCLS) functionality is further specified in 3GPP TS 23.284.

This document is applicable only for IP transport in the CS core network.

### 5.1.2.12.28 TS 23.333

#### Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) Mp interface: Procedures descriptions

This specification describes the functional requirements and information flows that generate procedures between the Multimedia Resource Function Controller (MRFC) and the Multimedia Resource Function Processor (MRFP), the Mp Interface. This specification is limited to information flows relevant to the Mp Interface; in order to define these procedures and make the functional requirements clear some triggers from an external interface may be described; these may be specified within the Mr interface for example or within an AS in which the MRFC function resides. However for the overall stage 2 procedures of IMS. The protocol on the Mp interface is defined to comply with ITU-T H.248.1 Gateway Control Protocol.

### 5.1.2.12.29 TS 23.334

#### IP Multimedia Subsystem (IMS) Application Level Gateway (IMS-ALG) – IMS Access Gateway (IMS-AGW) interface: Procedures descriptions

Annex G of 3GPP TS 23.228 gives out an IMS Application Level Gateway (IMS-ALG) and IMS Access Media Gateway (IMS-AGW) based reference model to support NAPT-PT, gate control and traffic policing between IP-CAN and IMS domain. The Iq reference point is between the P-

CSCF (IMS-ALG) and the IMS-AGW. It conveys the necessary information that is needed to allocate, modify and release (IP) transport addresses. This document defines the stage 2 description for the Iq reference point. Stage 2 covers the information flow between the P-CSCF (IMS-ALG) and IMS-AGW. The protocol used over the Iq interface is the gateway control protocol according ITU-T Recommendation H.248 (which is specified for Iq by an H.248 profile according 3GPP TS 29.334).

### 5.1.2.12.30 TS 23.335

#### User Data Convergence (UDC); Technical realization and information flows; Stage 2

This document describes the procedures and signalling flows associated to the technical realization of the 3GPP User Data Convergence (UDC). It furthermore indicates some requirements for the Stage 3 specifications. Special consideration is put in the following areas: – reference architecture for the UDC concept; – general description of procedures for the user data manipulation (e.g. create, delete, update, etc.); – identification of the requirements on the UDC for the applicability of the mechanisms described in this document. User data convergence is an optional concept to ensure data consistency and simplify creation of new services by providing easy access to the user data, as well as to ensure the consistency of storage and data models and to have minimum impact on traffic mechanisms, reference points and protocols of network elements.

#### GSM – UMTS Public Land Mobile Network (PLMN) Access Reference Configuration

This document describes the reference configuration for access to a PLMN. A user accesses a PLMN via a number of interfaces, including the MS-BS (in A/Gb mode and GERAN Iu mode), UE-UTRAN (in UTRAN Iu mode) and UE-E-UTRAN interface. The purpose of this document is to indicate the possible access arrangements that may be used in conjunction with the MS-BS (in A/Gb mode and GERAN Iu mode), UE-UTRAN (in UTRAN Iu mode) and UE-E – UTRAN interface.

### 5.1.2.12.33 TS 24.007

#### Mobile radio interface signalling layer 3; General Aspects

This specification describes the principal architecture of Layer 3 and its sub-layers on the GSM Um interface, i.e. the interface between mobile station (MS) and network; for the CM sub-layer, the description is restricted to paradigmatic examples, CC, supplementary services, and short message services for non-general packet radio service (GPRS) services. It also defines the basic message format and error handling applied by the Layer 3 protocols.

**5.1.2.12.34 TS 24.008****Mobile radio interface Layer 3 specification; Core network protocols; Stage 3**

This specification describes the procedures used at the radio interface for Call Control, Mobility Management and Session Management. The procedures currently described are for the CC of circuit-switched connections, SM for GPRS services, MM and radio resource management for circuit-switched and GPRS services. MBMS is also added.

### 5.1.2.12.37 TS 24.022

#### Radio Link Protocol (RLP) for circuit switched bearer and teleservices

This specification describes the RLP for data transmission over the UMTS public land mobile network (PLMN). RLP covers the Layer 2 functionality of the ISO OSI reference model (IS 7498). It is based on ideas contained in IS 3309, IS 4335 and IS 7809 (HDLC of ISO) as well as ITU-T Recommendations X.25, Q.921 and Q.922 (LAP-B and LAP-D, respectively). RLP has been tailored to the special needs of digital radio transmission. RLP provides to its users the OSI data link service (IS 8886).

**5.1.2.12.39 TS 24.081****Line Identification supplementary services; Stage 3**

This document specifies the procedures used at the radio interface for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of line identification supplementary services. Provision and withdrawal of supplementary services is an administrative matter between the mobile subscriber and the service provider and cause no signalling on the radio interface.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.081 is related specially to line identification supplementary services:

- Calling line identification presentation (CLIP)
- Calling line identification restriction (CLIR)
- Connected line identification presentation (COLP)
- Connected line identification restriction (COLR).

**5.1.2.12.40 TS 24.082****Call Forwarding (CF) supplementary services; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, interrogation, and network invocation of call offering supplementary services.

In 3GPP TS 24.010, the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.082 is related specially to call offering supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.082 is related specially to call offering supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call offering supplementary services and are described in this document:

- Call forwarding unconditional (CFU)
- Call forwarding on mobile subscriber busy (CFB)
- Call forwarding on no reply (CFNRy)

– Call forwarding on mobile subscriber not reachable (CFNRc).

### 5.1.2.12.41 TS 24.083

#### Call Waiting (CW) and Call Hold (HOLD) supplementary services; Stage 3

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call completion supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.083 is related specially to call completion supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and GSM 03.8x and GSM 03.9x series.

3GPP TS 23.083 is related specially to call completion supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call completion supplementary services and are described in this document:

- Call waiting (CW)
- Call hold (HOLD).

**5.1.2.12.42 TS 24.084****Multi Party (MPTY) supplementary service; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation and invocation of MultiParty supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and the 3GPP TS 22.08x and 3GPP TS 22.09x series.

3GPP TS 22.084 is related specially to MultiParty supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and the 3GPP TS 23.08x and 3GPP TS 23.09x series.

3GPP TS 23.084 is related specially to MultiParty supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary service belongs to the MultiParty supplementary services and is described in this document:

– MultiParty service (MPTY).

TTC	TS-3GA-24.084(Rel10)v10.0.0	10.0.0	Published	Jun 11	<a href="http://www.ttc.or.jp/j/document_list/free/3gpps2011/TS/TS-3GA-24.084(Rel10)v10.0.0.pdf">http://www.ttc.or.jp/j/document_list/free/3gpps2011/TS/TS-3GA-24.084(Rel10)v10.0.0.pdf</a>

**5.1.2.12.43 TS 24.085****Closed User Group (CUG) supplementary service; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of community of interest supplementary services.

In 3GPP TS 24.010, the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x-series. 3GPP TS 22.085 is related to the community of interest supplementary services.

Technical realization of supplementary services is described in technical specifications 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x-series. 3GPP TS 23.085 is related to the community of interest supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

Signalling interworking for supplementary services between 3GPP TS 29.002 and 3GPP TS 24.008 and between 3GPP TS 29.002 and 3GPP TS 24.080 is defined in 3GPP TS 29.011.

The following supplementary services belong to the community of interest supplementary services and are described in this TS:

- Closed User Group (CUG).

### 5.1.2.12.44 TS 24.086

#### Advice of Charge (AoC) supplementary services; Stage 3

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of charging supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.024 and 02.86 are related to the charging supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.086 is related to the charging supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the charging supplementary services and are described in this document:

- Advice of Charge (Information) (AoCI)
- Advice of Charge (Charging) (AoCC).

**5.1.2.12.46 TS 24.088****Call Barring (CB) supplementary service; Stage 3**

This document specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call barring supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 22.08x and 22.09x series.

Technical realization of supplementary services is described in 3GPP TS 23.011, 23.08x and 23.09x series.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call restriction supplementary services and are described in this specification:

- Barring of outgoing calls
- Barring of incoming calls

### 5.1.2.12.47 TS 24.090

#### Unstructured Supplementary Service Data (USSD); Stage 3

This document gives the stage 3 description of the Unstructured Supplementary Service Data (USSD) operations. The group of unstructured supplementary service data operations is divided into two different classes:

- Network initiated unstructured supplementary service data operations
- Mobile initiated unstructured supplementary service data operations.

**5.1.2.12.48 TS 24.091****Explicit Call Transfer (ECT) supplementary service; Stage 3**

This document gives the stage 3 description of the call transfer supplementary services. It specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of call transfer supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.091 is related specifically to call transfer supplementary services.

The technical realization of supplementary services is described in 3GPP TS 23.011, 3GPP TS 23.08x and 3GPP TS 23.09x series. 3GPP TS 23.091 is related specifically to call transfer supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call transfer supplementary services and are described in this document:

- Explicit Call Transfer (ECT).

**5.1.2.12.49 TS 24.093****Call Completion of Calls to Busy Subscriber (CCBS); Stage 3**

This document gives the stage 3 description of the Completion of Calls to Busy Subscriber (CCBS) supplementary service. It specifies the procedures used at the radio interface (reference point Um as defined in 3GPP TS 24.002) for normal operation, activation, deactivation, invocation and interrogation of the completion of calls to busy subscriber supplementary services.

In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given.

3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004, 3GPP TS 22.08x and 3GPP TS 22.09x-series. Technical specification 3GPP TS 22.093 is related specifically to the Completion of Calls to Busy Subscriber supplementary service.

The technical realization of supplementary services is described in technical specifications 3GPP TS 23.011, 3GPP TS 23.08x and 3GPP TS 23.09x-series. 3GPP TS 23.093 is related specifically to Completion of Calls to Busy Subscriber supplementary service.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the call completion supplementary services and are described in this document:

- Completion of Calls to Busy Subscriber (CCBS).

**5.1.2.12.50 TS 24.096****Name Identification supplementary services; Stage 3**

This document specifies the procedures used at the radio interface for normal operation, registration, erasure, activation, deactivation, invocation and interrogation of name identification supplementary services. In 3GPP TS 24.010 the general aspects of the specification of supplementary services at the layer 3 radio interface are given. 3GPP TS 24.080 specifies the formats and coding for the supplementary services.

Definitions and descriptions of supplementary services are given in 3GPP TS 22.004 and 3GPP TS 22.08x and 3GPP TS 22.09x series. 3GPP TS 22.096 is related specially to name identification supplementary services.

Technical realization of supplementary services is described in 3GPP TS 23.011 and 3GPP TS 23.08x and 3GPP TS 23.09x series. Technical specification 3GPP TS 23.096 is related specially to name identification supplementary services.

The procedures for Call Control, Mobility Management and Radio Resource management at the layer 3 radio interface are defined in 3GPP TS 24.007 and 3GPP TS 24.008.

The following supplementary services belong to the name identification supplementary services and are described in this TS:

- Calling name presentation (CNAP).

### 5.1.2.12.51 TS 24.109

#### Bootstrapping interface (Ub) and network application function interface (Ua); Protocol details

This document defines stage 3 for the HTTP Digest AKA based implementation of Ub interface (UE-BSF), the Disposable-Ks model based implementation of Upa interface (NAF-UE) and the HTTP Digest and the PSK TLS based implementation of bootstrapped security association usage over Ua interface (UE-NAF) in Generic Authentication Architecture (GAA) as specified in 3GPP TS 33.220. The purpose of the Ub interface is to create a security association between UE and BSF for further usage in GAA applications. The purpose of the Upa interface is to provide a push mechanism to create a bootstrapped security association between the UE and NAF for secure communication of pushed messages. The purpose of the Ua interface is to use the so created bootstrapped security association between UE and NAF for secure communication.

This document also defines stage 3 for the Authentication Proxy usage as specified in 3GPP TS 33.222.

This document also defines stage 3 for the subscriber certificate enrolment as specified in 3GPP TS 33.221 which is one realization of the Ua interface. The subscriber certificate enrolment uses the HTTP Digest based implementation of bootstrapped security association usage to enrol a subscriber certificate and the delivery of a CA certificate.

### 5.1.2.12.54 TS 24.166

#### 3GPP IP Multimedia Subsystem (IMS) conferencing Management Object (MO)

This document defines the IMS conferencing management object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELD\_DM-V1\_2. The IMS conferencing management object consists of relevant parameters that can be managed for IMS conferencing capabilities.

### 5.1.2.12.55 TS 24.167

#### 3GPP IMS Management Object (MO); Stage 3

This document defines a mobile device 3GPP IMS Management Object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELD\_DM-V1\_2. The 3GPP IMS Management Object consists of relevant parameters that can be managed for the IM CN Subsystem. This includes the basic framework defined in 3GPP TS 23.228 and 3GPP TS 24.229, and early IMS as defined in 3GPP TS 23.221. This also includes relevant parameters that can be managed for the application of SMS over IP networks defined in 3GPP TS 24.341. The IMS Management Object defines a repository of data into the ME including parameters that are provisioned from the ISIM application (i.e. 3GPP TS 31.103) or, after derivation, from the USIM application (i.e. 3GPP TS 31.102).

### 5.1.2.12.56 TS 24.171

#### Control Plane Location Services (LCS) procedures in the Evolved Packet System (EPS)

This document specifies the operations and information coding for the Non-access Stratum (NAS) layer protocol for supporting the Location Services (LCS) in the Evolved Universal Terrestrial Radio Access Network (E-UTRAN). This document is applicable to the User Equipment (UE) and to the Mobility Management Entity (MME) in the Evolved Packet System (EPS). This document is developed in accordance to the general principles stated in 3GPP TS 23.271

### 5.1.2.12.57 TS 24.173

#### IMS Multimedia telephony communication service and supplementary services; Stage 3

This specification provides the protocol details for multimedia telephony communication service and associated supplementary services in the IP Multimedia (IM) Core Network (CN) subsystem based on the requirements from 3GPP TS 22.173. Multimedia telephony and supplementary services allow users to establish communications between them and enrich that by enabling supplementary services.

#### Communication Continuity Management Object (MO)

This document defines the Communication Continuity Management Object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELED\_DM-V1\_2. The Communication Continuity Management Object consists of relevant parameters that can be managed for Communication Continuity capabilities.

### 5.1.2.12.62 TS 24.237

#### IP Multimedia (IM) Core Network (CN) subsystem IP Multimedia Subsystem (IMS) service continuity; Stage 3

This specification provides the protocol details for voice call continuity between the IP Multimedia (IM) Core Network (CN) subsystem based on the Session Initiation Protocol (SIP) and the Session Description Protocol (SDP) and the protocols of the 3GPP Circuit-Switched (CS) domain (CAP, MAP, ISUP, BICC and the NAS call control protocol for the CS access). Voice call continuity allows users to move between the CS domain and the IP Connectivity Access Network (e.g. WLAN interworking) with home IM CN subsystem functionality.

**5.1.2.12.63 TS 24.238****Session Initiation Protocol (SIP) based user configuration; Stage 3**

This document provides a Session Initiation Protocol (SIP) based protocol framework that serves as a means of user configuration of supplementary services in the IP Multimedia (IM) Core Network (CN) subsystem. The protocol framework relies upon the contents of the Request-URI in a SIP INVITE request to enable basic configuration of services without requiring use of the Ut interface.

### 5.1.2.12.65 TS 24.259

#### Personal Network Management (PNM); Stage 3

Personal Network Management (PNM) is a home network-based application and provides the home network-based management of Personal Network (PN) consisting of multiple devices belonging to a single user, as described in 3GPP TS 22.259 and 3GPP TS 23.259. This document provides the protocol details for enabling Personal Network management (PNM) services in the IP Multimedia (IM) Core Network (CN) subsystem based on the protocols of XML. Configuration Access Protocol (XCAP), Session Initiation Protocol (SIP) and the Session Description Protocol (SDP). The document provides the protocol details for enabling Personal Network management (PNM) services in Circuit Switched (CS) domain based on the protocols of CAP, MAP, ISUP, USSD and BICC.

**5.1.2.12.66 TS 24.279****Combining Circuit Switched (CS) and IP Multimedia Subsystem (IMS) services; Stage 3**

This specification provides the technical realization for the combination of Circuit Switched calls and IM sessions when using them simultaneously between the same two users. It also describes the use of CS and IM services in combination, using the existing procedures that have been defined for CS and IMS. It includes the necessary function as adding an IM session to an ongoing CS call, adding a CS call to an ongoing IM session, supplementary services as they relate to CSICS and supporting capability exchange.

## 5.1.2.12.67 TS 24.285

**Allowed Closed Subscriber Group (CSG) list; Management Object (MO)**

This document specifies an Allowed Closed Subscriber Group (CSG) List Management Object (MO). The Allowed CSG List MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELED-DM-V1\_2. The Allowed CSG List MO consists of relevant parameters for that can be used by the UE to select the appropriate CSG cell based on its subscription. The Allowed CSG List MO defines the relevant parameters related to the Allowed CSG List and to the Operator CSG List. The usage of the Allowed CSG List for in the idle mode process and the mobility management procedure is defined in 3GPP TS 23.122, 3GPP TS 24.008 and 3GPP TS 24.301.

## 5.1.2.12.68 TS 24.286

**IP Multimedia (IM) Core Network (CN) subsystem Centralized Services (ICS); Management Object (MO)**

This document defines the IMS Centralised Services Management Object (MO). The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELED\_DM-V1\_2. The IMS Centralised Services Management Object consists of relevant parameters that can be managed for ICS.

**5.1.2.12.69 TS 24.292**

**IP Multimedia (IM) Core Network (CN) subsystem Centralized Services (ICS); Stage 3**

IP Multimedia (IM) Core Network (CN) subsystem centralized services (ICS) allow for the delivery of consistent IMS services to the user regardless of the attached access type (e.g. CS domain access or IP-CAN). This document provides the protocol details for the realization of ICS based on the Session Initiation protocol (SIP), the Session Description Protocol (SDP), the I1 protocol, and the protocols of the 3GPP Circuit-Switched (CS) domain (e.g. CAP, MAP, ISUP, BICC and the NAS call control protocol for the CS access).

**5.1.2.12.70 TS 24.294****IP Multimedia Subsystem (IMS) Centralized Services (ICS) protocol via I1 interface**

This document describes the I1 interface between IMS Centralized Services (ICS) UE and Service Centralization and Continuity (SCC) Application Server (AS). This specification defines a new application layer protocol over I1 interface, specifies the interaction between the ICS UE and the SCC AS including session control procedures and supplementary services control procedures. The protocol is intended to be independent of the transport protocol used so it can be applied to a number of technologies that need different transport protocols. The overall ICS architecture is specified in 3GPP TS 23.292

**5.1.2.12.72 TS 24.302****Access to the 3GPP Evolved Packet Core (EPC) via non-3GPP access networks; Stage 3**

This document specifies the discovery and network selection procedures for access to 3GPP Evolved Packet Core (EPC) via non-3GPP access networks and includes Authentication and Access Authorization using Authentication, Authorization and Accounting (AAA) procedures used for the interworking of the 3GPP EPC and the non-3GPP access networks. The document also specifies the Tunnel management procedures used for establishing an end-to-end tunnel from the UE to the ePDG to the point of obtaining IP connectivity and includes the selection of the IP mobility mode. The non-3GPP access networks considered in this document are cdma2000® HRPD and Worldwide Interoperability for Microwave Access (WiMAX), and any access technologies covered in 3GPP TS 23.402. These non-3GPP access networks can be trusted or untrusted access networks.

### 5.1.2.12.73 TS 24.303

#### Mobility management based on Dual-Stack Mobile IPv6; Stage 3

This document specifies the signalling procedures for accessing the 3GPP Evolved Packet Core network and handling the mobility between 3GPP and non-3GPP accesses via the S2c reference point defined in 3GPP TS 23.402. The document is applicable to the User Equipment (UE) and the network node implementing the Home Agent functionality.

In addition the document specifies the procedures used for the DSMIPv6 Home Agent discovery, for bootstrapping the DSMIPv6 security association between the UE and the Home Agent and for managing the DSMIPv6 tunnel. The specification of these procedures is compliant to IETF RFCs. DSMIPv6 procedures can be used independently of the underlying access technology.

### 5.1.2.12.74 TS 24.304

#### Mobility management based on Mobile IPv4; User Equipment (UE) – foreign agent interface; Stage 3

This document describes the stage 3 aspects of mobility management for User Equipment (UE) using IETF Mobile IPv4 foreign agent mode to access the Evolved Packet Core Network (EPC) through trusted non-3GPP access networks and for mobility management of UE between the 3GPP access network and trusted non-3GPP access networks. In particular, the document describes the UE – Mobile IPv4 Foreign Agent (FA) interface stage 3 aspects, where the FA functionality is located within the access network in the non-3GPP access domain. The document is applicable to the User Equipment (UE) and the network node implementing the FA functionality.

### 5.1.2.12.75 TS 24.305

#### Selective Disabling of 3GPP User Equipment Capabilities (SDoUE) Management Object (MO)

This document specifies a mobile device Selective Disabling of 3GPP UE Capabilities (SDoUE) Management Object (MO) and the rules and corresponding behaviour of the UE with regard to the selective disabling of 3GPP UE capabilities, for example, when services or functions are disabled/enabled. The SDoUE MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The SDoUE MO consists of the relevant parameters that can be managed for selective disabling of 3GPP UE capabilities. The SDoUE MO defines a repository of data into the ME. The service requirements for selective disabling of 3GPP UE capabilities are defined in 3GPP TS 22.011.

### 5.1.2.12.76 TS 24.312

#### Access Network Discovery and Selection Function (ANDSF) Management Object (MO)

This document defines management objects that can be used by the Access Network Discovery and Selection Function (ANDSF) and the UE. The Management Object (MO) is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The MO consists of relevant parameters for intersystem mobility policy- and access network discovery information that can be managed by the ANDSF. The service requirements and the functional requirements for the access network discovery and selection are described in 3GPP TS 22.278 and in 3GPP TS 23.402 respectively.

**5.1.2.12.77 TS 24.323****3GPP IP Multimedia Subsystem (IMS) service level tracing Management Object (MO)**

This document defines the IMS service level tracing management object. The management object is compatible with OMA Device Management protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework as described in the Enabler Release Definition OMA-ERELED\_DM-V1\_2. The IMS service level tracing management object consists of relevant parameters that can be managed for IMS service level tracing capabilities.

**5.1.2.12.78 TS 24.337****IP Multimedia (IM) Core Network (CN) subsystem IP Multimedia Subsystem (IMS) inter-UE transfer; Stage 3**

IP Multimedia (IM) Core Network (CN) subsystem inter-UE transfer (IUT) provides the capability of continuing ongoing communication sessions with multiple media across different user equipments (UEs) under the control of the same or different subscribers, and as part of Service Continuity (SC). This document provides the protocol details for enabling IMS inter-UE transfer based on the Session Initiation protocol (SIP) and the Session Description Protocol (SDP).

### 5.1.2.12.80 TS 24.368

#### Non-Access Stratum (NAS) configuration Management Object (MO)

This document defines a Management Object (MO) that can be used to configure the UE with parameters related to Non-Access Stratum (NAS) functionality. The MO is compatible with the OMA Device Management (DM) protocol specifications, version 1.2 and upwards, and is defined using the OMA DM Device Description Framework (DDF) as described in the Enabler Release Definition OMA-ERELD-DM-V1\_2. The MO consists of relevant parameters for NAS related configuration of a UE.

**5.1.2.12.90 TS 24.623****Extensible Markup Language (XML) Configuration Access Protocol (XCAP) over the Ut interface for Manipulating Supplementary Services**

This document defines a protocol used for manipulating data related to supplementary services. The protocol is based on the eXtensible Markup Language (XML) Configuration Access Protocol (XCAP) RFC 4825. A new XCAP application usage is defined for the purpose of manipulating the supplementary services data. The common XCAP related aspects that are applicable to supplementary services are specified in this document. The protocol allows authorized users to manipulate service related data either when they are connected to IMS or when they are connected to non IMS networks (e.g. the public Internet).

**5.1.2.12.91 TS 24.628****Common Basic Communication procedures using IP Multimedia (IM) Core Network (CN) subsystem; Protocol specification**

This document describes the stage three protocol for basic communication procedures common to several services in the IP Multimedia (IM) Core Network (CN) subsystem when at least one Application Server (AS) is included in the communication. The common procedures are based on stage three specifications for supplementary services.

**5.1.2.12.96 TS 27.005****Use of Data Terminal Equipment – Data Circuit terminating Equipment (DTE – DCE) interface for Short Message Service (SMS) and Cell Broadcast Service (CBS)**

This document defines three interface protocols for control of SMS functions within a GSM/UMTS mobile telephone from a remote terminal via an asynchronous interface. The “block mode” protocol includes error protection and is suitable for use where the link may not be completely reliable. It is of particular use where control of remote devices is required. Efficient transfer of binary encoded user data is possible. The “text mode”, based on AT commands, is suitable for unintelligent terminals or terminal emulators, and for application software built on command structures like those defined in V.25ter. The character based “PDU mode” is suitable for software drivers based on AT command structures which do not understand the content of the message blocks and can only pass them between the MT and higher level software resident in the TE.

In all three modes, the terminal is considered to be in control for SMS/CBS transactions.

The document considers the mobile termination to be a single entity. Other 3GPP/GSM Technical Specifications describe the split of functionality between the mobile equipment and (U)SIM.

### 5.1.2.12.97 TS 27.007

#### AT command set for User Equipment (UE)

This document specifies a profile of AT commands and recommends that this profile be used for controlling Mobile Termination (MT) functions and GSM/UMTS network services from a Terminal Equipment (TE) through Terminal Adaptor (TA). The command prefix +C is reserved for Digital Cellular in ITU-T Recommendation V.250. The document has also the syntax details used to construct these extended GSM/UMTS commands. Commands from ITU-T Recommendation V.250 and existing digital cellular standards (TIA IS 99 and TIA IS 135) are used whenever applicable. Some of the new commands are defined such way that they can be easily applied to MT of networks other than GSM/UMTS. ITU-T Recommendation T.31 and ITU-T Recommendation T.32 fax AT commands may be used for GSM/UMTS fax transmission from TE. GSM/UMTS Short Message Service AT commands are defined in 3GPP TS 27.005. AT commands for GPRS and EPC are defined in this specification. The document assumes an abstract architecture comprising a TE (e.g. a computer) and a MT interfaced by a TA.

The commands described in this document may be observed on the link between the TE and the TA. However, most of the commands retrieve information about the MT, not about the TA.

## 5.1.2.12.98 TS 27.010

**Terminal Equipment to User Equipment (TE-UE) multiplexer protocol**

This document defines a multiplexing protocol between a UE and a TE. The multiplexing protocol can be used to send any data, for instance voice, SMS, USSD, fax etc. The document describes the protocol, but not the commands or data transported with it.

**5.1.2.12.99 TS 29.002****Mobile Application Part (MAP) specification**

It is necessary to transfer between entities of a Public Land Mobile Network (PLMN) information specific to the PLMN in order to deal with the specific behaviour of roaming Mobile Stations (MS)s. The Signalling System No. 7 specified by CCITT is used to transfer this information.

### 5.1.2.12.100 TS 29.016

#### General Packet Radio Service (GPRS); Serving GPRS Support Node (SGSN) – Visitors Location Register (VLR); Gs interface network service specification

This document specifies the subset of MTP and SCCP which is used for the reliable transport of BSSAP+ messages in the Gs interface. The document references 3GPP TS 29.202 which specifies alternative transport layers that can be applied instead of the MTP. The document also specifies the SCCP addressing capabilities to be provided in the Gs interface.

**5.1.2.12.101 TS 29.018****General Packet Radio Service (GPRS); Serving GPRS Support Node (SGSN) – Visitors Location Register (VLR); Gs interface layer 3 specification**

This document specifies procedures used on the Serving GPRS Support Node (SGSN) to Visitors Location Register (VLR) interface for interoperability between circuit switched services and packet data services. The document specifies the layer 3 messages and procedures on the Gs interface to allow coordination between databases and to relay certain messages related to GSM circuit switched services over the GPRS subsystem.

### 5.1.2.12.103 TS 29.061

#### Interworking between the Public Land Mobile Network (PLMN) supporting packet based services and Packet Data Networks (PDN)

This document defines the requirements for Packet Domain interworking between a: a) PLMN and PDN; b) PLMN and PLMN.

This document is valid for a PLMN in A/Gb mode as well as for a PLMN in Iu mode. If text applies only for one of these systems it is explicitly mentioned by using the terms “A/Gb mode” and “Iu mode”. The A interface does not play any role in the scope of this document although the term “A/Gb mode” is used.

### 5.1.2.12.104 TS 29.079

#### Optimal media routing within the IP Multimedia Subsystem (IMS); Stage 3

This document defines optional Optimal Media Routing (OMR) procedures that can be applied by entities in the IP Multimedia Subsystem (IMS) that control media resources and are capable of manipulating the Session Description Protocol (SDP) as defined by IETF RFC 4566. The OMR procedures relate to the handling of OMR-specific SDP attributes that are documented in TS 24.229. The OMR procedures use SDP offer/answer related procedures in IETF RFC 3264 and in 3GPP TS 24.229 in a backward-compatible manner.

### 5.1.2.12.105 TS 29.118

#### Mobility Management Entity (MME) – Visitor Location Register (VLR) SGs interface specification

CS Fallback in the Evolved Packet System (EPS) enables the provisioning of CS-domain services (e.g. voice call, Location Services (LCS) or supplementary services) by reuse of CS infrastructure when the UE is served by E-UTRAN. Additionally, SMS delivery via the CS core network is realized without CS fallback. This document specifies the procedures and the SGs Application Part (SGsAP) messages used on the SGs interface between the Mobility Management Entity (MME) in the EPS and the Visitor Location Register (VLR), to allow location management coordination and to relay certain messages related to GSM circuit switched services over the EPS system. It also specifies the use of Stream Control Transmission Protocol (SCTP) for the transport of SGsAP messages.

### 5.1.2.12.106 TS 29.162

#### Interworking between the IM CN subsystem and IP networks

The IM CN subsystem interworks with the external IP networks through the Mb reference point. This document details the interworking between the IM CN subsystem and external IP networks for IM service support. It addresses the issues of control plane interworking and, user plane interworking for specific interworking use cases. The document describes the IMS-Ix interface requirements in the form of Use Cases which require H.248 protocol procedures and also details the additional Information Elements required to perform the specific procedures.

The IP version Interworking, between IP version 4 (IETF RFC 791) and IP version 6 (IETF RFC 2460) detailed in terms of the processes and protocol mappings required in order to support both mobile originated and terminated calls.

### 5.1.2.12.107 TS 29.163

#### Interworking between the IP Multimedia (IM) Core Network (CN) subsystem and Circuit Switched (CS) networks

This document specifies the principles of interworking between the 3GPP IM CN subsystem and BICC/ISUP based legacy CS networks, in order to support IM basic voice, data and multimedia calls. This document addresses the areas of control and user plane interworking between the IM CN subsystem and CS networks through the network functions, which include the MGCF and IM-MGW. For the specification of control plane interworking, areas such as the interworking between SIP and BICC or ISUP are detailed in terms of the processes and protocol mappings required for the support of both IM originated and terminated voice and multimedia calls. Other areas addressed encompass the transport protocol and signalling issues for negotiation and mapping of bearer capabilities and QoS information.

### 5.1.2.12.108 TS 29.164

#### Interworking between the 3GPP CS domain with BICC or ISUP as signalling protocol and external SIP-I networks

This document defines interworking procedures between a 3GPP CS domain (see 3GPP TS 23.205) which applies either BICC or ISUP as signalling protocol, and external networks that use SIP-I (see ITU-T Q.1912.5, Profile C) as signalling protocol. The document also describes the related interworking architecture. The control plane interworking is performed by an interworking unit at the interconnection between the 3GPP CS domain and an external SIP-I network. The user plane interworking is performed by an MGW. The document defines stage 2 procedures for the control of the MGW.

**5.1.2.12.109 TS 29.165****Inter-IMS Network to Network Interface (NNI)**

The objective of this document addresses the Inter-IMS Network to Network Interface (II-NNI) consisting of Ici and Izi reference points between IMS networks in order to support end-to-end service interoperability. The document addresses the issues related to control plane signalling (3GPP usage of SIP and SDP protocols, required SIP header fields) as well as other interconnecting aspects like security, numbering/naming/addressing and user plane issues as transport protocol, media and codecs actually covered in a widespread set of 3GPP specifications. A profiling of the Inter-IMS Network to Network Interface (II-NNI) is also provided. Charging aspects are addressed as far as SIP signalling is concerned.

### 5.1.2.12.116 TS 29.205

#### Application of Q.1900 series to bearer independent Circuit Switched (CS) core network architecture; Stage 3

This document describes the protocols to be used when ITU-T Q.1902 “Bearer Independent Call Control” is used as call control protocol in a 3GPP Bearer Independent CS core network 3GPP TS 23.205 The Q.1902 operates between (G)MSC servers. The BICC architecture as described in ITU-T Q.1902 consists of a number of protocols. The following types of protocols are described: call control protocol, bearer control protocols and a resource control protocol for this architecture. The architecture complies with the requirements imposed by 3GPP TS 23.205 and TS 23.153.

### 5.1.2.12.117 TS 29.212

#### Policy and Charging Control (PCC) over Gx/Sd reference point

This document provides the stage 3 specification of the Gx and Gxx reference points. The functional requirements and the stage 2 specifications of the Gx and Gxx reference point are contained in 3GPP TS 23.203. The Gx reference point lies between the Policy and Charging Rule Function and the Policy and Charging Enforcement Function. The Gxx reference point lies between the Policy and Charging Rule Function and the Bearer

Binding and Event Reporting Function. Whenever possible the document specifies the requirements for the protocol by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible, extensions to Diameter are defined within the document itself.

### 5.1.2.12.118 TS 29.213

#### Policy and charging control signalling flows and Quality of Service (QoS) parameter mapping

This specification adds detailed flows of Policy and Charging Control (PCC) over the Rx, Gx, Gxx and S9 reference points and their relationship with the bearer level signalling flows over the Gn/Gp, S4, S5/S8, S2a and S2c interfaces. The call flows depicted represent usual cases, but not all situations are covered. The document also describes the binding and the mapping of QoS parameters among SDP, UMTS QoS parameters, and QoS authorization parameters, as well as PCRF addressing using DRA.

### 5.1.2.12.120 TS 29.215

#### Policy and Charging Control (PCC) over S9 reference point; Stage 3

This document provides the Stage 3 specification of the S9 reference point. The functional requirements of Stage 2 specification for the S9 reference point are contained in 3GPP TS 23.203. The S9 reference point lies between the PCRF in the home PLMN (also known as H-PCRF) and the PCRF in the visited PLMN (also known as V-PCRF). Whenever it is possible this document specifies the requirements for the protocols by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible extensions to Diameter are defined within this document.

### 5.1.2.12.123 TS 29.232

#### Media Gateway Controller (MGC) – Media Gateway (MGW) interface; Stage 3

This document describes the protocol to be used on the Media Gateway Controller (MGC) – Media Gateway (MGW) interface. The Media Gateway Controllers covered in this specification are the MSC server and the GMSC server. The basis for this interface profile is the H.248.1 protocol. The usage of this protocol is described in 3GPP TS 23.205 and 3GPP TS 29.205 for BICC circuit switched core network, in 3GPP TS 23.231 and 3GPP TS 29.231 for SIP-I circuit switched core network.

This profile includes the support for the enhanced MSC server to provide access to IMS Centralised services as described in 3GPP TS 23.292 and thus the procedures related to this interface are described in 3GPP TS 29.292. As a result the interworking with SIP and the associated MGW control procedures described in 3GPP TS 29.163 for the interworking between BICC/ISUP circuit switched core network and IP Multimedia core network are incorporated.

This specification describes the changes to H.248 which are needed to handle 3GPP specific traffic cases. This is done by using the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

### 5.1.2.12.124 TS 29.235

#### Interworking between SIP-I based circuit-switched core network and other networks

This specification defines the interworking between SIP-I based circuit-switched core network with out-of-band transcoder control related procedures and: – an external SIP-I based signalling network – an ISUP based network such as an ISUP based 3GPP CS Domain or an PSTN – an BICC based network such as an BICC based 3GPP CS Domain – an Internet Multimedia Subsystem.

### 5.1.2.12.125 TS 29.238

#### Interconnection Border Control Functions (IBCF) – Transition Gateway (TrGW) interface, Ix interface; Stage 3

This document describes the protocol to be used on the Interconnection Border Control Function (IBCF) – Transition Gateway (TrGW) interface and the CS-IBCF – CS-TrGW interface. The basis for this protocol is the H.248 protocol. The Profile provides MG control function for IMS and CS Border Control. The IMS architecture is described in 3GPP TS 23.228. The underlying reference model and stage 2 information is described in 3GPP TS 23.228 and in 3GPP TS 29.162. The CS architecture is described in 3GPP TS 29.235. This specification describes the application of H.248 Ix profile for both Ix and CS-Ix interfaces. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

### 5.1.2.12.126 TS 29.272

#### Evolved Packet System (EPS); Mobility Management Entity (MME) and Serving GPRS Support Node (SGSN) related interfaces based on Diameter protocol

This document describes the Mobility Management Entity (MME) and Serving GPRS Support Node (SGSN) related diameter-based interfaces towards the Home Subscriber Server (HSS), and the MME and the SGSN related diameter-based interface towards the Equipment Identity Register (EIR). This specification defines the Diameter application for the MME-HSS, S6a reference point, and for the SGSN-HSS, S6d reference point. The interactions between the HSS and the MME/SGSN are specified, including the signalling flows. This specification defines the Diameter application for the MME-EIR, S13 reference point, and for the SGSN-EIR, S13' reference point. The interactions between the MME/SGSN and the EIR are specified, including the signalling flows.

**5.1.2.12.128 TS 29.274****3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C); Stage 3**

This document specifies the stage 3 of the control plane of the GPRS Tunnelling Protocol, Version 2 for Evolved Packet System interfaces (GTPv2-C). In this document, unless otherwise specified the S5 interface refers always to “GTP-based S5” and S8 interface refers always to “GTP-based S8” interface.

**5.1.2.12.129 TS 29.275****Proxy Mobile IPv6 (PMIPv6) based Mobility and Tunnelling protocols; Stage 3**

This document specifies the Stage 3 of the PMIPv6 Based Mobility and Tunnelling Protocols used over the PMIP-based S2a, S2b, S5, and S8 reference points defined in 3GPP TS 23.402, and are thus applicable to the Serving GW, PDN Gateway, ePDG, and Trusted Non-3GPP Access. Protocols specifications are compliant with relevant IETF RFCs. In this specification PMIP refers to PMIPv6 as defined in IETF RFC 5213.

### 5.1.2.12.131 TS 29.280

#### Evolved Packet System (EPS); 3GPP Sv interface (MME to MSC, and SGSN to MSC) for SRVCC

This document describes the Sv interface between the Mobility Management Entity (MME) or Serving GPRS Support Node (SGSN) and 3GPP MSC server enhanced for SRVCC. Sv interface is used to support Inter-RAT handover from VoIP/IMS over EPS to CS domain over 3GPP UTRAN/GERAN access or from UTRAN (HSPA) to 3GPP UTRAN/GERAN access.

**5.1.2.12.133 S 29.292****Interworking between the IP Multimedia (IM) Core Network (CN) subsystem (IMS) and MSC Server for IMS Centralized Services (ICS)**

IMS Centralized Services (ICS) enable the delivery of IM CN subsystem based multimedia telephony and supplementary services as defined in 3GPP TS 24.173 to users regardless of the attached access network type; e.g. CS domain access or IP-CAN.

This document specifies the principles of interworking between the IM CN subsystem and CS domain in order to enable ICS for UEs using CS domain access. The document addresses the area of registration procedures interworking between the CS domain and IM CN subsystem, and the areas of control and user plane interworking between the IM CN subsystem and CS domain through an MSC Server enhanced for ICS and CS-MGW respectively. This includes the signalling procedures between the MSC Server and CS-MGW. For the specification of control plane interworking, the document defines the protocol interworking between the 3GPP profile of SIP as described in 3GPP TS 24.229 and NAS signalling as described in 3GPP TS 24.008 required for the support of IM CN subsystem based multimedia telephony and supplementary services. The document addresses the area of supplementary service configuration interworking between the CS domain and IM CN subsystem. It is applicable to the MSC Server and CS-MGW.

### 5.1.2.12.134 TS 29.311

#### Service level interworking for Messaging Services

This document specifies the protocol details of service level interworking between Instant Message (OMA-TS-SIMPLE\_IM) or Chat Session (OMA-TS-CPM\_Conv\_Funct) using the 3GPP IP Multimedia CN subsystem and the Short Message Service over both legacy CS/PS network as specified in the 3GPP TS 23.040 and a generic IP Connectivity Access Network (IP-CAN) as specified in the 3GPP TS 24.341. These include:

- Procedures to implement service level interworking between IM and SM;
- Procedures to implement service level interworking between CPM and SM;
- Enhancement of the IP-SM-GW as an Application Server to support service selection, authorization and mapping between IM or CPM and SM protocols; and
- Interaction between service level interworking and transport layer interworking.

### 5.1.2.12.135 TS 29.328

#### IP Multimedia (IM) Subsystem Sh interface; Signalling flows and message contents

This document specifies:

- The interactions between the HSS (Home Subscriber Server) and the SIP AS (Application Server) and between the HSS and the OSA SCS (Service Capability Server). This interface is referred to as the Sh reference point.
- The interactions between the SIP AS and the SLF (Subscription Locator Function) and between the OSA SCS and the SLF. This interface is referred to as the Dh reference point.

The IP Multimedia (IM) Core Network Subsystem stage 2 is specified in 3GPP TS 23.228 and the signalling flows for the IP multimedia call control based on SIP and SDP are specified in 3GPP TS 24.228.

The IP Multimedia (IM) Session Handling with the IP Multimedia (IM) call model is specified in 3GPP TS 23.218.

This document addresses the signalling flows and message contents for the protocol at the Sh and Dh interface and also addresses how the functionality of Ph interface is accomplished. The Presence Service Stage 2 description (architecture and functional solution) is specified in 3GPP TS 23.141.

**5.1.2.12.136 TS 29.329****Sh interface based on the Diameter protocol; Protocol details**

This document defines a transport protocol for use in the IP multimedia (IM) Core Network (CN) subsystem based on Diameter and is applicable to:

- The Sh interface between an AS and the HSS.
- The Sh interface between an SCS and the HSS.

Whenever it is possible this document specifies the requirements for this protocol by reference to specifications produced by the IETF within the scope of Diameter. Where this is not possible, extensions to Diameter are defined within this document.

### 5.1.2.12.137 TS 29.332

#### Media Gateway Control Function (MGCF) – IM Media Gateway; Mn interface

This document describes the protocol to be used on the Media Gateway Control Function (MGCF) – IM Media Gateway (IM-MGW) interface. This interface provides the Media Gateway Control for interworking between the IP Multimedia Subsystem (IMS) and CS domain (ISUP, BICC and SIP-I). The basis for this protocol is the H.248 protocol. The IMS architecture is described in 3GPP TS 23.228. The interaction of the MGCF-IM MGW interface signalling procedures in relation to the SIP, and BICC/ISUP signalling at the MGCF are described in 3GPP TS 29.163.

The interaction of the MGCF-IM MGW interface signalling procedures in relation to the IMS SIP and SIP-I on Nc at the MGCF are described in 3GPP TS 29.235.

This specification describes the application of H.248 on the Mn interface. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

In addition this profile provides support for PSTN/ISDN Emulation as required by ETSI TISPAN.

The main body of the specification provides an introduction to the use of the profile for the Mn interface and introduces any specific functionality (e.g. new packages) associated with the Mn.

### 5.1.2.12.138 TS 29.333

#### Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) Mp interface; Stage 3

This document describes the protocol to be used on the Multimedia Resource Function Controller (MRFC) – Multimedia Resource Function Processor (MRFP) interface (Mp interface). The IMS architecture is described in 3GPP TS 23.228, the functional requirements are described in 3G TS 23.333. This specification defines a profile of the Gateway Control Protocol (H.248.1) for controlling Multimedia Resource Function Processor supporting in-band user interaction, conferencing and transcoding for multimedia-services.

**5.1.2.12.139 TS 29.334****IMS Application Level Gateway (IMS-ALG) – IMS Access Gateway (IMS-AGW); Iq Interface; Stage 3**

This document describes the protocol to be used on the IMS Application Level Gateway (ALG) – IMS Access Gateway (IMS-AGW) interface. The basis for this protocol is the H.248 protocol as specified in ITU-T. The IMS architecture is described in 3GPP TS 23.228. The underlying reference model and stage 2 information is described in 3GPP TS 23.228 and in 3GPP TS 23.334. This specification describes the application of H.248 on the Iq interface. Required extensions use the H.248 standard extension mechanism. In addition certain aspects of the base protocol H.248 are not needed for this interface and thus excluded by this profile.

### 5.1.2.12.141 TS 29.364

#### IP Multimedia Subsystem (IMS) Application Server (AS) service data descriptions for AS interoperability

This specification standardizes the structure and the coding of the service data that are transported over the Sh interface between an Application Server supporting Multimedia Telephony supplementary services as defined in 3GPP TS 22.173 and the HSS. Two optional formats are specified. One is based on a binary coding of the service data and supports the subset of MMTEL services corresponding to PSTN/ISDN and CS supplementary services. The other uses an XML format and supports the full set of MMTEL Services.

### 5.1.2.12.142 TS 31.101

#### UICC-terminal interface; Physical and logical characteristics

This document specifies the interface between the UICC and the Terminal for 3G telecom network operation. It specifies:

- the requirements for the physical characteristics of the UICC;
- the electrical interface between the UICC and the Terminal;

- the initial communication establishment and the transport protocols;
- the model which serves as a basis for the logical structure of the UICC;
- the communication commands and the procedures;
- the application independent files and protocols.

### 5.1.2.12.144 TS 31.103

#### Characteristics of the IP Multimedia Services Identity Module (ISIM) application

This document defines the ISIM application for access to IMS services. This document specifies:

- specific command parameters;
- file structures;
- contents of EFs (Elementary Files);
- security functions;
- application protocol to be used on the interface between UICC (ISIM) and Terminal.

This is to ensure interoperability between an ISIM and Terminal independently of the respective manufacturer, card issuer or operator.

This document does not define any aspects related to the administrative management phase of the ISIM. Any internal technical realization of either the ISIM or the Terminal is only specified where these are reflected over the interface. This document does not specify any of the security algorithms that may be used.

### 5.1.2.12.145 TS 31.111

#### Universal Subscriber Identity Module (USIM) Application Toolkit (USAT)

This document defines the ISIM application for access to IMS services. It specifies:

- specific command parameters;
- file structures;
- contents of EFs (Elementary Files);

- security functions;
- application protocol to be used on the interface between UICC (ISIM) and Terminal.

This is to ensure interoperability between an ISIM and Terminal independently of the respective manufacturer, card issuer or operator. This document defines the interface between the UICC and the Mobile Equipment (ME), and mandatory ME procedures, specifically for “USIM Application Toolkit”.

The document mainly refers to ETSI TS 102 223, which describes the generic aspects of application toolkits within the UICC. USAT is a set of commands and procedures for use during the network operation phase of 3G/LTE, in addition to those defined in TS 31.101.

Specifying the interface is to ensure interoperability between a UICC and an ME independently of the respective manufacturers and operators.

This document defines for 3G/LTE technology:

- the commands;
- the application protocol;
- the mandatory requirements on the UICC and ME for each procedure.

### 5.1.2.12.146 TS 31.115

#### Secured packet structure for (Universal) Subscriber Identity Module (U)SIM Toolkit applications

This document specifies the structure of the Secured Packets in implementations using Short Message Service Point to Point (SMS-PP), Short Message Service Cell Broadcast (SMS-CB), Unstructured Supplementary Service Data (USSD) and Hyper Text Transfer Protocol (HTTP) based on ETSI TS 102 225. The structure of the Secured Packets complies with the one defined in ETSI TS 102 225. This document only contains additional requirements or explicit limitations for SIM/USIM applications. It is applicable to the exchange of secured packets between an entity in a 3G or GSM PLMN and an entity in the (U)SIM. Secured Packets contain application messages to which certain mechanisms according to ETSI TS 102 224 have been applied. Application messages are commands or data exchanged between an application resident in or behind the PLMN and on the (U)SIM. The Sending/Receiving Entity in the 3G or GSM PLMN and the UICC are responsible for applying the security mechanisms to the application messages and thus turning them into Secured Packets.

### 5.1.2.12.147 TS 31.116

#### Remote APDU Structure for (U)SIM Toolkit applications

This document defines the remote management of files and applets on the SIM/USIM/ISIM.

It describes the APDU format for remote management. Furthermore the document specifies:

- a set of commands coded according to this APDU structure and used in the remote file management on the SIM/USIM specified in TS 51.011, TS 31.101, TS 31.102, TS 31.103;
- a set of commands coded according to this APDU structure and used in the remote applet management on the SIM/USIM. This is based on ETSI TS 102 226.

The remote APDU structure for SIM/USIM/ISIM applications complies with the one defined in ETSI TS 102 226. This document only contains additional requirements or explicit limitations for SIM/USIM/ISIM applications.

### 5.1.2.12.151 TS 31.221

#### Contact Manager Application Programming Interface (API); Contact Manager API for Java Card

This document defines the internal interface characteristics of the Contact Manager for 3GPP UICC applications.

The internal interface between the Contact Manager Server application on the UICC and the Contact Manager Client application on the UICC enables Java Card™ platform based applets to invoke and register to the Contact Manager Server services. In particular, the Contact Manager Java Card™ based API provides methods to:

- Read/Update/Create/Delete contact(s) in the Contact Manager Server;
- Manage group of contacts in the Contact Manager Server;
- Search for a contact in the Contact Manager Server storage;
- manage the contacts structure;

- Register/Un-register the application to pre-defined events (e.g. application to be notified when contacts are modified in the Contact Manager Server).

### 5.1.2.13 System aspects

IMT-2000 CDMA Direct Spread specification also includes the following documents which are useful and related to this Recommendation.

#### 5.1.2.13.1 TS 21.101

#### Technical Specifications and Technical Reports for a UTRAN-based 3GPP system

The listed Specifications are required to build a system based on UTRAN radio technology.

### 5.1.2.13.10 TS 22.022

#### Personalisation of Mobile Equipment (ME); Mobile functionality specification

This specification describes functional specifications of five features to personalize UE. These features are called: – network personalization; – network subset personalization; – service provider (SP) personalization; – corporate personalization; – UMTS subscriber identity module (USIM) personalization. This specification describes requirements for UE, which provide these personalization features.

**5.1.2.13.11 TS 22.034****High Speed Circuit Switched Data (HSCSD); Stage 1**

This specification describes the Stage 1 description of HSCSD. HSCSD is a feature that allows users subscribing to the general bearer services to access user rates that can be achieved with one or more traffic channel. HSCSD also defines a flexible use of air interface resources, which makes efficient and flexible use of higher user rates feasible.

### 5.1.2.13.12 TS 22.038

#### (U)SIM Application Toolkit (USAT); Service description; Stage 1

This specification describes the Stage 1 description of the SAT primarily from the subscribers and serving environments points of view, and does not deal with the details of the human interface itself. It includes information applicable to network operators, serving environments and terminal, switch and database manufacturers and contains the core requirements for a SAT which are sufficient to provide a complete service.

**5.1.2.13.13 TS 22.057****Mobile Execution Environment (MExE); Service description; Stage 1**

This document defines the stage one description of the Mobile Execution Environment (MExE). The scope of this 3GPP TS encompasses the MExE functionality in the UE, interaction with the MExE service environment. The MExE service environment is not necessarily restricted to the PLMN, and nodes providing MExE services (i.e. MExE servers) may also exist outside the PLMN. Aspects of the support provided by MExE servers within the MExE service environment (such as charging aspects, security level classification etc.) are covered by this specification, but not the MExE servers themselves.

### 5.1.2.13.15 TS 22.067

#### Enhanced Multi Level Precedence and Pre-emption service (eMLPP); Stage 1

This specification describes the Stage 1 description of the enhanced multi-level precedence and pre-emption (eMLPP) service. This service has two parts: precedence and pre-emption. Precedence involves assigning a priority level to a call in combination with fast call set-up. Pre-emption involves the seizing of resources, which are in use by a call of a lower precedence, by a higher level precedence call in the absence of idle resources. Pre-emption can also involve the disconnection of an on-going call of lower precedence to accept an incoming call of higher precedence.

### 5.1.2.13.16 TS 22.071

#### Location Services (LCS); Service description; Stage 1

LCS is a network provided enabling technology consisting of standardized service capabilities which enables the provision of location applications. This application may be service provider specific. The description of the numerous and varied possible location applications which are enabled by this technology are outside the scope of this specification. However, clarifying examples of how the functionality being specified may be used to provide specific LCS is included in various sections of the specification.

### 5.1.2.13.17 TS 22.078

#### Customized Applications for Mobile network Enhanced Logic (CAMEL); Service description; Stage 1

This specification describes the Stage 1 description for CAMEL feature which provides the mechanisms to support services consistently independently of the serving network. The CAMEL features shall facilitate service control of operator specific services external from the serving

network. The CAMEL feature is a network feature and not a supplementary service. It is a tool to help the network operator to provide the subscribers with the operator specific services even when roaming outside the home network.

## 5.1.2.13.18 TS 22.090

**Unstructured Supplementary Service Data (USSD); Stage 1**

There are two modes of USSD: MMI-mode and application mode. MMI-mode USSD is for the transparent transport of MMI strings entered by the user to the network and for the transparent transport of text strings from the network that are displayed by the mobile for user information. Application mode USSD is for the transparent transport of data between the network and the mobile station. Application mode USSD is intended to be used by applications in the network and their peer applications in the UE. The communication over the radio interface takes place on the signalling channels using short dialogues with peak data throughput rate capabilities of up to approximately 600 bit/s outside of a call and 1 000 bit/s during a call.

**5.1.2.13.19 TS 22.100****UMTS Phase 1**

This specification describes contains how the definition of the UMTS system will be achieved in a phased approach. This document also specifies the requirements for release 99 of UMTS. Some requirements which are necessary to ensure a smooth transition to later releases are also indicated. This document should, however, be read in conjunction with the other 22.000 series documents which provide a complete description of the requirements for UMTS release 1999 and beyond.

### 5.1.2.13.21 TS 22.105

#### Services and service capabilities

Pre-UMTS systems have largely standardized the complete sets of bearer services, teleservices and supplementary services which they provide. One major difference between UMTS and pre-UMTS systems is that service capabilities rather than services are standardized for UMTS, allowing service differentiation and system continuity. This document describes how and what kind of services the UMTS user has access to.

**5.1.2.13.22 TS 22.115****Service aspects; Charging and billing**

This specification describes the service aspects of charging and billing of the UMTS. This standard is not intended to duplicate existing standards or standards being developed by other groups on these topics, and will reference these where appropriate. This standard will elaborate on the charging requirements described in the charging principles in TS 22.101 UMTS service principles. It will allow the generation of accurate charging information to be used in the commercial and contractual relationships between the parties concerned.

### 5.1.2.13.23 TS 22.129

#### Service aspects; Handover requirements between UTRAN and GERAN or other radio systems

This specification describes service requirements for handover (terms are defined below) within UMTS systems and between UMTS, other IMT\_2000 family members and second generation systems. Particular emphasis has been placed on the description of requirements for handover between UMTS and GSM but requirements specific to other systems are incorporated as required.

**5.1.2.13.24 TS 22.135**

**Multicall; Service description; Stage 1**

This specification describes multicall scenarios and requirements for UMTS phase 1 release 1999. Multicall feature specifies functionality and interactions related to usage of several simultaneous bearers between a terminal and a network. Multicall features allows both circuit-switched call(s) and packet session(s) to exist simultaneously.

### 5.1.2.13.25 TS 22.146

#### Multimedia Broadcast/Multicast Service (MBMS); Stage 1

The document describes MBMS User Services that use the capabilities of MBMS. Application scenarios including charging, QoS aspects and related service requirements derived from them are described. These scenarios and service requirements can be used as guidance for the design of codecs and bearers.

**5.1.2.13.26 TS 22.153**

**Multimedia priority service**

The document specifies the service requirements for Multimedia Priority Service (MPS). Its scope is to specify those requirements of MPS necessary to provide an end-to-end service and to interwork with external networks where needed. Service interactions with external networks are considered within the scope of this document although these interactions may be specified in other standards.

### 5.1.2.13.27 TS 22.168

#### Earthquake and Tsunami Warning System (ETWS) requirements; Stage 1

The document defines the stage one description of the Earthquake and Tsunami Warning System (ETWS) Requirements. Stage one is the set of requirements seen primarily from the users and service providers points of view. It includes information applicable to network operators, service providers, terminal and network manufacturers, in case of deployment of ETWS. ETWS deployment depends on operator decision or national regulations. The TS contains the core requirements for the Earthquake and Tsunami Warning System, which are sufficient to provide a complete service. It also contains regional requirements for Earthquake and Tsunami Warning System.

### 5.1.2.13.34 TS 22.246

#### Multimedia Broadcast/Multicast Service (MBMS) user services; Stage 1

This document describes MBMS User Services that use the capabilities of MBMS. Application scenarios including charging, QoS aspects and related service requirements derived from them are described. These scenarios and service requirements can be used as guidance for the design of codecs and bearers.

#### Service requirements for Machine-Type Communications (MTC); Stage 1

This document specifies the service requirements for Network Improvements for Machine Type Communications. In particular it will:

- identify and specify general requirements for machine type communications;
- identify service aspects where network improvements (compared to the current human-to-human oriented services) are needed to cater for the specific nature of machine-type communications;

- specify machine type communication requirements for these service aspects where network improvements are needed for machine type communication.

### 5.1.2.13.38 TR 22.971

#### Automatic establishment of roaming relationships

This report describes a proposed framework for commercial and technical interworking between UMTS home environments and serving networks who have no direct prior commercial agreements with each other. This text is applicable to UMTS standardization within ETSI, and is produced with the intent to clarify the concepts involved, and identify those areas which require standardization.

### 5.1.2.13.40 TS 23.032

#### Universal Geographical Area Description (GAD)

This document defines an intermediate universal Geographical Area Description which subscriber applications, GSM or UMTS services can use and the network can convert into an equivalent radio coverage map.

For GSM or UMTS services which involve the use of an “area”, it can be assumed that in the majority of cases the Service Requester will be forbidden access to data on the radio coverage map of a particular PLMN and that the Service Requester will not have direct access to network entities (e.g. BSC/BTS or RNC/Node B).

The interpretation by the PLMN operator of the geographical area in terms of cells actually used, cells that are partly within the given area and all other technical and quality of service aspects are out of the scope of this document.

This specification also provides a description of velocity that may be associated with a universal Geographical Area Description when both are applied to a common entity at a common time.

### 5.1.2.13.41 TS 23.101

#### General Universal Mobile Telecommunications System (UMTS) architecture

This specification describes the basic physical and functional separation of UMTS. The content of this specification is limited to those features that are common to all UMTS networks independent of their origin. It identifies and names the reference points and functional groupings appearing at this level.

#### 5.1.2.13.45 TS 23.167

##### IP Multimedia Subsystem (IMS) emergency sessions

This document defines the stage 2 service description for emergency services in the IP Multimedia Core Network Subsystem (IMS), including the elements necessary to support IP Multimedia (IM) emergency services.

This document covers also the Access Network aspects that are crucial for the provisioning of IMS emergency services. Other 3GPP specifications that are related to the IMS emergency services are TS 23.228 on IMS in general, including fixed broadband access aspects, TS 23.060 describing GPRS (UTRAN), TS 23.401, TS 23.060; TS 23.402 describing EPS (UTRAN and E-UTRAN); TS 23.234 describing 3GPP/WLAN Interworking; TS 23.271 that covers location services and TS 23.216 and TS 23.237 describing Single Radio Voice Call Continuity for IMS Emergency session. TS 25.301 contains an overall description of the UMTS Terrestrial Radio Access Network TS 36.300 contains an overall description of the Evolved Universal Terrestrial Radio Access (E-UTRA) and Evolved Universal Terrestrial Radio Access Network (E-UTRAN). Other non-3GPP specifications that are related to the IMS emergency services include 3GPP2 cdma2000 HRPD IP CAN, as specified in 3GPP2 X.S0060 when the UE is connected to a PDS core network and 3GPP2 X.S0057 A when the UE is connected to an EPC core network.

The emergency support in different IP-CANs is described in the Informative Annex E.

### 5.1.2.13.46 TS 23.171

#### Location Services (LCS); Functional description; Stage 2 (UMTS)

This document specifies the stage 2 of the Location Services (LCS) feature in UMTS, which provides the mechanisms to support mobile location services for operators, subscribers and third party service providers.

Location Services may be considered as a network provided enabling technology consisting of standardized service capabilities, which enable the provision of location applications. The application(s) may be service provider specific. The description of the numerous and varied possible location

applications which are enabled by this technology are outside the scope of this document. However, clarifying examples of how the functionality being described may be used to provide specific location services may be included.

This stage 2 service description covers the LCS system functional model for the whole system, the LCS system architecture, state descriptions, message flows, etc.

### 5.1.2.13.49 TS 23.207

#### End-to-end Quality of Service (QoS) concept and architecture

This document provides the framework for end-to-end Quality of Service involving GPRS and complements TS 23.107 which describes the framework for Quality of Service within UMTS. The document describes the interaction between the TE/MT Local Bearer Service, the GPRS Bearer Service, and the External Bearer Service, and how these together provide Quality of Service for the End-to-End Service. The document also describes IP level mechanisms necessary in providing end-to-end Quality of Service involving GPRS networks, including possible interaction between the IP level and the GPRS level, as well as the application level and the IP level.

**5.1.2.13.50 TS 23.216**

**Single Radio Voice Call Continuity (SRVCC); Stage 2**

This Technical Specification specifies the architecture enhancements for Single Radio Voice Call Continuity (SRVCC) between E-UTRAN access and 3GPP2Æs 1xCS, and between E-UTRAN access and 3GPPÆs UTRAN/GERAN accesses and between UTRAN (HSPA) access and 3GPPÆs UTRAN/GERAN accesses, for Circuit Switched (CS) calls that are anchored in the IMS.

### 5.1.2.13.51 TS 23.221

#### Architectural requirements

This document covers the architectural requirements for 3GPP systems based on UTRAN, E-UTRAN and Iu mode GERAN. In particular it details the high level requirements for the Circuit Switched (CS) Domain and the stage 2 procedures that span more than one domain/subsystem. The reference model to which these procedures apply can be found within TS 23.002. In addition, A mode to Iu mode handover for CS services is addressed. Detailed architectural requirements within the subsystems are contained within the remainder of the 23 series of specifications e.g. the requirements for the Packet Switched (PS) domain are contained within TS 23.060, TS 23.401 and the requirements for the Bearer Independent CS Core Network are contained in TS 23.205.

### 5.1.2.13.52 TS 23.226

#### Global text telephony (GTT); Stage 2

This 3GPP Technical Specification defines the stage 2 description of the real time Text Conversation Feature called Global Text Telephony, GTT. GTT Stage 2 identifies the functional capabilities needed to support the service described in GTT Stage 1.

This TS contains the core functions for a real time Text Conversation Feature GTT, to be used in combination with other media in conversational services.

GTT offers real time conversation in text, to be used alone or in combination with other conversational media, and interworking with current and emerging text conversation features in the fixed networks and other mobile networks.

GTT uses a number of functional entities to realize the requirements of the stage 1 description (TS 22.226). This TS describes how the service requirements are realized with these functional entities. As far as possible existing protocols shall be used for the realization of the Global Text Telephony Feature. This may include e.g. SIP, 3G.324, or Circuit Switched Voice service as protocol environments, and CTM, AL1 and RTP/text as transmission protocols. It also means usage of existing text presentation format ITU-T Recommendation T.140, common to all GTT text conversation environments.

### 5.1.2.13.54 TS 23.236

#### Intra-domain connection of Radio Access Network (RAN) nodes to multiple Core Network (CN) nodes

UMTS will build on the success of GSM and is likely to become even more widespread, increasing the importance of a flexible network structure to permit the different operational configurations in which these networks will be deployed. The requirements to have a RNC or BSC controlled by a single MSC server or SGSN lead to certain limitations. Allowing the BSCs and RNCs to connect to a number of MSC servers or SGSNs increases the networks performance in terms of scalability, distributing the network load amongst the serving entities, and reducing the required signalling as the user roams.

### 5.1.2.13.55 TS 23.237

#### IP Multimedia Subsystem (IMS) Service Continuity; Stage 2

This document specifies the architectural requirements and procedures for delivery of IMS Service Continuity.

The scope of the specification includes:

- Access Transfer related functionality:
- PS-CS Access Transfer;
- PS-PS Access Transfer;
- PS-PS Access Transfer in conjunction with PS-CS Access Transfer;
- Adding and/or removing media flows to support service;
- MSC Server assisted mid-call feature;
- SRVCC session transfer of IMS emergency session.
- Inter UE Transfer related functionality:
- Establishment and release of a Collaborative Session;
- Addition of media flows to, modification of media flows in, and release of media flows from a Collaborative Session;
- Transfer of media flows from one UE to another;
- Transfer of the Collaborative Session Control with or without transfer of media flows;
- Transfer of all media flows to a target UE without establishing a Collaborative Session;
- Session discovery;
- Inter-UE Transfer initiated by the target UE or by the SCC AS;
- Replication of media flows by means of Inter-UE Transfer procedures;

- Authorization and other aspects to support Inter-UE Transfer across multiple IMS subscriptions.

The solution is restricted to service continuity using IMS procedures, i.e. mobility mechanisms on the IP-CAN level are not within the scope of this specification.

### 5.1.2.13.56 TS 23.240

#### 3GPP Generic User Profile (GUP); Architecture (Stage 2)

This document defines the stage 2 architecture description to the 3GPP Generic User Profile (GUP), which includes the elements necessary to realize the stage 1 requirements in TS 22.240.

This document includes the GUP reference architecture with descriptions of functional entities, and their interfaces and procedures, as well as the high-level information model for the GUP data.

### 5.1.2.13.57 TS 23.246

#### Multimedia Broadcast/Multicast Service (MBMS); Architecture and functional description

This document describes the stage 2 description (architectural solution and functionalities) for the MBMS Bearer Service, which includes, together with MBMS User Services defined in TS 26.346, all the elements necessary to realize the stage 1 requirements in TS 22.146 and TS 22.246. This document encompasses both GPRS and EPS.

### 5.1.2.13.58 TS 23.251

#### Network sharing; Architecture and functional description

This document covers the details of Network Sharing for GERAN, UTRAN and E-UTRAN. It shows how several core network operators can share one radio access network and details the impacts on the network architecture. All UEs shall comply with existing requirements, among them PLMN selection and system information reception. This document also defines requirements for network-sharing supporting UEs

### 5.1.2.13.59 TS 23.261

#### IP flow mobility and seamless Wireless Local Area Network (WLAN) offload; Stage 2

This document specifies the Stage 2 system description for IP flow mobility between a 3GPP and a WLAN. The technical solution is based on the working principles of DSMIPv62 and it is applicable to both the Evolved Packet System and the I-WLAN mobility architecture. The specification covers the system description of seamless WLAN offload and IP flow mobility between 3GPP and WLAN as well as the respective interactions with the PCC and ANDSF frameworks. The system description for non-seamless WLAN offload is covered in 3GPP TS 23.402. This document specifies also the detailed extensions to S2c and H1 reference points for IP flow mobility. The extensions to the PCC and to the ANDSF framework are specified respectively in 3GPP TS 23.203 and in 3GPP TS 23.402.

### 5.1.2.13.61 TS 23.272

#### Circuit Switched (CS) fallback in Evolved Packet System (EPS); Stage 2

This document defines the Stage 2 architecture and specification for the CS Fallback and for SMS over SGs for EPS or CS Fallback and SMS over S102. The scope of this document includes the architecture enhancements for functionality to enable fallback from E-UTRAN access to UTRAN/GERAN CS domain access and to CDMA 1x RTT CS domain access, and functionality to reuse of voice and other CS-domain services (e.g. CS UDI video/LCS/USSD) by reuse of the CS domain. The functionality specified to support SMS over SGs does not trigger any CS Fallback to UTRAN/GERAN. The functionality specified to support SMS over S102 does not trigger any CS Fallback to CDMA 1xRTT CS domain

**5.1.2.13.63 TS 23.292****IP Multimedia Subsystem (IMS) centralized services; Stage 2**

This document specifies the architectural requirements for delivery of consistent services to the user regardless of the attached access type (e.g. CS domain access, or IP-CAN). This is achieved by implementing the services in the IP Multimedia Subsystem (IMS).

**5.1.2.13.64 TS 23.401****General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access**

This Technical Specification defines the Stage 2 service description for the Evolved 3GPP Packet Switched Domain – also called the Evolved Packet System (EPS) in this document. The Evolved 3GPP Packet Switched Domain provides IP connectivity using the Evolved Universal

Terrestrial Radio Access Network (E-UTRAN). The specification also covers mobility between E-UTRAN and pre-E-UTRAN 3GPP radio access technologies.

### 5.1.2.13.65 TS 23.402

#### Architecture enhancements for non-3GPP accesses

This Technical Specification defines the Stage 2 service description for providing IP connectivity using non-3GPP accesses to the Evolved 3GPP Packet Switched domain. In addition, for E-UTRAN and non-3GPP accesses, the specification describes the Evolved 3GPP PS Domain where the protocols between its Core Network elements are IETF based.

**5.1.2.13.66 TS 23.682****Architecture enhancements to facilitate communications with packet data networks and applications**

This document specifies architecture enhancements to facilitate communications with packet data networks and applications (e.g. Machine Type Communication (MTC) applications on the (external) network/MTC servers) as per the use cases and service requirements defined in TS 22.368, TS 22.101 and related 3GPP requirements specifications. Both roaming and non-roaming scenarios are covered.

- Device triggering by applications/servers (e.g.: MTC applications on the (external) network/MTC servers).
- PS-Only support with and without MSISDN.

**5.1.2.13.67 TR 23.930****Iu principles**

This specification describes the requirements on the Iu and studies relevant principles to guide further standardization of the related interface(s).

### 5.1.2.13.71 TS 26.092

#### Mandatory speech codec speech processing functions; Adaptive Multi-Rate (AMR) speech codec; Comfort noise aspects

This specification describes the detailed requirements for the correct operation of the background acoustic noise evaluation, noise parameter encoding/decoding and comfort noise generation for the AMR speech codec during source controlled rate (SCR) operation.

**5.1.2.13.76 TS 26.346****Multimedia Broadcast/Multicast Service (MBMS); Protocols and codecs**

This document defines a set of media codecs, formats and transport/application protocols to enable the deployment of MBMS user services either over the MBMS bearer service or other UMTS Bearer Services within the 3GPP system.

In this version of the specification, only MBMS download and streaming delivery methods are specified. This document does not preclude the use of other delivery methods.

This document includes information applicable to network operators, service providers and manufacturers.

**5.1.2.13.77 TR 26.911****Codec(s) for Circuit-Switched (CS) multimedia telephony service; Terminal implementor's guide**

This report describes non-mandatory Recommendations for the use of the different codec implementation options for the circuit-switched 3G-324M multimedia telephony service based on ITU-T Recommendation H.324, Annex C. These Recommendations address issues specific to the third generation operating environment, including guaranteeing sufficient error resilience and inter-working between terminals.

### 5.1.2.13.78 TS 32.101

#### Telecommunication management; Principles and high level requirements

This document establishes and defines the management principles and high-level requirements for the management of PLMNs. In particular, this document identifies the requirements for:

- the upper level of a management system;
- the reference model, showing the elements the management system interacts with;
- the network operator processes needed to run, operate and maintain a network;
- the functional architecture of the management system;
- the principles to be applied to management interfaces.

The requirements identified in this document are directed to the further development of management specifications as well as the development of management products. This document can be seen as guidance for the development of all other technical specifications addressing the management of PLMNs.

### 5.1.2.13.79 TS 32.102

#### Telecommunication management; Architecture

This document identifies and standardizes the most important and strategic contexts in the physical architecture for the management of PLMNs. It serves as a framework to help define a telecom management physical architecture for a planned PLMN and to adopt standards and provide products that are easy to integrate. The requirements identified in this document are applicable to all further development of 3GPP Telecom Management specifications as well as the development of PLMN Management products. This document can be seen as guidance for the development of all other technical specifications addressing the management of PLMNs, except TS 32.101.

### 5.1.2.13.84 TS 33.107

#### 3G security; Lawful interception architecture and functions

This document describes the architecture and functional requirements within a Third Generation Mobile Communication System (3GMS) and the Evolved Packet System (EPS).

The specification shows the service requirements from a Law Enforcement point of view only. The aim of this document is to define a 3GMS and EPS interception system that supports a number of regional interception regulations, but these regulations are not repeated here as they vary. Regional interception requirements shall be met in using specific (regional) mediation functions allowing only required information to be transported.

**5.1.2.13.85 TS 33.108****3G security; Handover interface for Lawful Interception (LI)**

This specification addresses the handover interfaces for Lawful Interception (LI) of Packet-Data Services, Circuit Switched Services, Multimedia Services within the UMTS network and Evolved Packet System (EPS). The handover interface in this context includes the delivery of Intercept Related Information (HI2) and Content of Communication (HI3) to the Law Enforcement Monitoring Facility.

### 5.1.2.13.86 TS 33.110

#### Key establishment between a Universal Integrated Circuit Card (UICC) and a terminal

This document describes the security features and mechanisms to provision a shared key between a UICC and a terminal that may host the UICC or be connected to the device hosting the UICC via a local interface. Candidate applications to use this key establishment mechanism include but are not restricted to secure channel between a UICC and a terminal.

The scope of this specification includes an architecture overview and the detailed procedure how to establish the shared key between the UICC and the terminal.

**5.1.2.13.88 TS 33.141****Presence service; Security**

This document is the Stage 2 specification for the security requirements, security architecture, security features and security mechanisms for the Presence Service, which includes the elements necessary to realize the requirements in TS 22.141 and TS 23.141. As far as SIP-based procedures are concerned, this specification refers to TS 33.203. The main content of this specification is the security for the Ut reference point, which is HTTP-based, as applied in presence services.

The document includes information applicable to network operators, service providers and manufacturers.

### 5.1.2.13.89 TS 33.203

#### 3G security; Access security for IP-based services

The scope for this technical specification is to specify the security features and mechanisms for secure access to the IM subsystem (IMS) for the 3G mobile telecommunication system.

Since the scope also encompasses the use of these security features and mechanisms for secure access to IMS in the context of fixed broadband networks and 3GPP2 networks, Annex L and Annex S specify how the material in the main body and other normative Annexes of this document apply to the fixed broadband networks and 3GPP2 networks respectively.

The IMS supports IP Multimedia applications such as video, audio and multimedia conferences. SIP, Session Initiation Protocol, was chosen as the signalling protocol for creating and terminating Multimedia sessions, cf. RFC 3261. This specification only deals with how the SIP signalling is protected between the subscriber and the IMS, how the subscriber is authenticated and how the subscriber authenticates the IMS.

**5.1.2.13.90 TS 33.204****3G Security; Network Domain Security (NDS); Transaction Capabilities Application Part (TCAP) user security**

This technical specification covers the security mechanisms and procedures necessary to protect all TCAP user messages which are sent between different security domains. The complete set of enhancements and extensions to facilitate security protection for the TCAP protocol is termed TCAPsec and it covers transport security in the TCAP protocol itself and the security management procedures. This technical specification contains the stage 2 specification for security protection of the TCAP protocol. The actual implementation (stage 3) specification can be found in TS 29.204.

**5.1.2.13.91 TS 33.210****3G security; Network Domain Security (NDS); IP network layer security**

This document defines the security architecture for network domain IP based control planes, which shall be applied to NDS/IP-networks (i.e. 3GPP and fixed broadband networks). The scope of network domain control plane security is to cover the control signalling on selected interfaces between network elements of NDS/IP networks.

**5.1.2.13.92 TS 33.220****Generic Authentication Architecture (GAA); Generic Bootstrapping Architecture (GBA)**

This document describes the security features and a mechanism to bootstrap authentication and key agreement for application security from the 3GPP AKA mechanism. Candidate applications to use this bootstrapping mechanism include but are not restricted to subscriber certificate distribution TS 33.221. Subscriber certificates support services whose provision mobile operator assists, as well as services that mobile operator provides. The scope of this specification includes a generic AKA bootstrapping function, an architecture overview and the detailed procedure how to bootstrap the credential. Clause 4 of this specification describes a mechanism, called GBA\_ME, to bootstrap authentication and key agreement, which does not require any changes to the UICC. Clause 5 of this specification describes a mechanism, called GBA\_U, to bootstrap authentication and key agreement, which does require changes to the UICC, but provides enhanced security by storing certain derived keys on the UICC.

### 5.1.2.13.93 TS 33.221

#### Generic Authentication Architecture (GAA); Support for subscriber certificates

This document describes subscriber certificate distribution by means of generic bootstrapping architecture (GBA) TS 33.220. Subscriber certificates support services whose provision the mobile operator assists, as well as services that are offered by the mobile operator. The scope of this specification presents signalling procedures for support of issuing certificates to subscribers and the standard format of certificates and digital signatures. It is not intended to duplicate existing standards being developed by other groups on these topics, and will reference these where appropriate.

### 5.1.2.13.94 TS 33.222

#### Generic Authentication Architecture (GAA); Access to network application functions using Hypertext Transfer Protocol over Transport Layer Security (HTTPS)

This document specifies secure access methods to Network Application Functions (NAF) using HTTP over TLS in the Generic Authentication Architecture (GAA), and provides Stage 2 security requirements, principles and procedures for the access. This document describes both direct access to an Application Server (AS) and access to an Application Server through an Authentication Proxy (AP).

**5.1.2.13.96 TS 33.224****Generic Authentication Architecture (GAA); Generic Bootstrapping Architecture (GBA) push layer**

This document specifies a generic push layer that makes use of the GBA Push Function as specified in TS 33.223. The GPL specification includes a message format, cipher suites and processing model. GPL assumes that keys and other SA parameters have been preinstalled in the Push-NAF and UE in the form of a NAF SA. GPL is a protection protocol that can be applied in a unidirectional fashion. The rationale for GPL is that having each application specify its own security mechanisms would for obvious reasons lead to duplication of work, specifications and implementations. Using a generic secure push layer avoids these problems. A generic secure push layer may also relieve the applications using the service of having to be aware of inner working of the security layer.

### 5.1.2.13.97 TS 33.234

#### 3G security; Wireless Local Area Network (WLAN) interworking security

This document specifies the security architecture; trust model and security requirements for the interworking of the 3GPP System and WLAN Access Networks. This specification is not limited to WLAN technologies. It is also valid for other IP based Access Networks that support the same security capabilities towards the interworking system as WLAN does. Specifications of the appropriate mechanisms for user and network authentication, key management, service authorization, confidentiality and integrity protection of user and signalling data are also provided.

### 5.1.2.13.98 TS 33.246

#### 3G Security; Security of Multimedia Broadcast/Multicast Service (MBMS)

The Technical Specification covers the security procedures of the Multimedia Broadcast/Multicast Service (MBMS) for 3GPP systems (UTRAN, GERAN and E-UTRAN). MBMS is a 3GPP system network bearer service over which many different applications could be carried. The actual method of protection may vary depending on the type of MBMS application.

### 5.1.2.13.99 TS 33.259

#### Key establishment between a UICC hosting device and a remote device

This document describes the security features and mechanisms to provision a shared key between a UICC Hosting Device and a Remote Device connected via a local interface. The shared secret is then intended to be used to secure the interface between the Remote Device and the UICC hosting device. Candidate applications to use this key establishment mechanism include but are not restricted to Personal Network Management (see TS 22.259). The scope of this specification includes an architecture overview and the detailed procedure how to establish the shared key between the UICC Hosting Device and the Remote Device. This is different from the Technical Specification TS 33.110 that describes an architecture overview and the detailed procedure how to establish the shared key between the UICC itself and the terminal hosting the UICC. The use cases utilizing the mechanisms described in this specification are seen to be different to the use cases where “Key establishment between a UICC and a terminal”, IETF RFC 4279 is utilized. The solution described in this document is built on the existing infrastructure defined in “GBA”, TS 33.220.

### 5.1.2.13.100 TS 33.310

#### Network Domain Security (NDS); Authentication Framework (AF)

The scope of this Technical Specification is limited to authentication of network elements, which are using NDS/IP or TLS. In the case of NDS/IP this specification includes both the authentication of Security Gateways (SEG) at the corresponding Za-interfaces and the authentication between NEs and between NEs and SEGs at the Zb-interface. Authentication of end entities (i.e. NEs and SEGs) in the intra-operator domain is considered an internal issue for operators. This is quite much in line with 3GPP TS 33.210 which states that only Za is mandatory and that the security domain operator can decide if the Zb-interface is deployed or not, as the Zb-interface is optional for implementation. Validity of certificates may be restricted to the operator's domain in case of Zb interface or in case of Za-interface between two security domains of the same operator. In the case of TLS this Specification concentrates on authentication of TLS entities across inter-operator links. For example, TLS is specified for inter-operator communications between IMS and non-IMS networks TS 33.203 and on the Zn' interface in GBA TS 33.220. Authentication of TLS entities across intra-operator links is considered an internal issue for operators. However, NDS/AF can easily be adapted to the intra-operator use case since it is just a simplification of the inter-operator case when all TLS NEs and the PKI infrastructure belong to the same operator. Validity of certificates may be restricted to the operator's domain. An Annex contains information on the manual handling of TLS certificates in case automatic enrolment and revocation according to NDS/AF for TLS is not implemented.

### 5.1.2.13.101 TS 33.320

#### Security of Home Node B (HNB)/Home evolved Node B (HeNB)

This document specifies the security architecture for the H(e)NB subsystem. This includes security requirements on Home Node Bs, Home eNode Bs, and other H(e)NB-associated network nodes (e.g. SeGW and H(e)MS), as well as the procedures and features which are provided to meet those requirements.

### 5.1.2.13.102 TS 33.328

#### IP Multimedia Subsystem (IMS) media plane security

This document presents IMS media plane security for RTP based media which is designed to meet the following three main objectives:

- to provide security for media usable across all access networks
- to provide an end-to-end (e2e) media security solution to satisfy major user categories

- to provide end-to-end (e2e) media security for important user groups like enterprises, National Security and Public Safety (NSPS) organizations and different government authorities who may have weaker trust in the inherent IMS security and/or may desire to provide their own key management service.

The media plane security in this release of the TS is based on the well-established protocol SRTP. Key management solutions for SRTP are defined in this specification.

### 5.1.2.13.107 TR 33.908

#### 3G Security; General report on the design, specification and evaluation of 3GPP standard confidentiality and integrity algorithms

This technical report is a description of the work undertaken by SAGE Task Force for the design of the standard 3GPP Confidentiality and Integrity Algorithms (SAGE TF 3GPP).

With regard to the design of the algorithms, the scope of this document is confined to a description of the design criteria, the design methodology and an outline of the content and structure of the specification and test data documents.

The standard 3GPP Confidentiality and Integrity Algorithms are based on a Block Cipher named KASUMI. The algorithms specification and associated test data are documented in the Specification of the 3GPP Confidentiality and Integrity Algorithms which consists of the following four documents:

- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 1: f8 and f9 specifications (TS 35.201).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 2: KASUMI algorithm specification (TS 35.202).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 3: Implementors' test data (TS 35.203).
- Specification of the 3GPP Confidentiality and Integrity Algorithms; Document 4: Design conformance test data (TS 35.204).

With regard to the evaluation of the algorithm, the scope of this report is restricted to a description of the evaluation criteria, the method of evaluation and the main conclusions from the evaluation that led to the Task Force approving the specification. A detailed summary of conclusions of the evaluation is provided in a public evaluation report TS 33.909 produced by the Task Force.

### 5.1.2.13.108 TR 33.909

#### 3G Security; Report on the design and evaluation of the MILENAGE algorithm set; Deliverable 5: An example algorithm for the 3GPP authentication and key generation functions

This public report contains a detailed summary of the work performed during the design and evaluation of the 3GPP Authentication Functions denoted as the MILENAGE algorithm set. It contains all results and findings from this work and should be read as a supplement to the specifications of the algorithms in TS 35.205 and the general project report, TS 35.209.

### 5.1.2.13.110 TR 33.919

#### 3G Security; Generic Authentication Architecture (GAA); System description

This 3GPP Technical Report gives an overview of the different mechanisms that mobile applications can rely upon for authentication between server and client (i.e. the UE). Additionally it provides guidelines related to the use of GAA and to the choice of authentication mechanism in a given situation and for a given application. To this end the TR puts the different 3GPP GAA related specifications into perspective. It clarifies the logic for having the technical specifications and technical reports, sketches their content and explains the inter-relation between these 3GPP TSs and TRs and their relation with this TR.

The heart of GAA consists out of the Generic Bootstrapping Architecture (GBA): The GBA core specifications consist out of TS 33.220, TS 24.109 and TS 29.109. GBA in turn is then used by many other TSs and TRs to enable specific usages e.g. HTTPS, subscriber certificates.

**5.1.2.13.112 TR 33.924****Identity management and 3GPP security interworking; Identity management and Generic Authentication Architecture (GAA) interworking**

The objective is to extend identity management as outlined in TS 33.220, TS 33.222, TS 29.109 and TR 33.980 with the latest developments on identity management outside of the 3GPP sphere. This will allow a better integration and usage of identity management for services in 3GPP and seamless integration with existing services that are not standardized in 3GPP. This report outlines the interworking of GBA and OpenID.

### 5.1.2.13.114 TR 33.980

#### Liberty Alliance and 3GPP security interworking; Interworking of Liberty Alliance Identity Federation Framework (ID-FF), Identity Web Services Framework (ID-WSF) and Generic Authentication Architecture (GAA)

This document provides guidelines on the interworking of the Generic Authentication Architecture (GAA) and the Liberty Alliance architecture. The document studies the details of possible interworking methods between the Security Assertion Markup Language v2.0, SAML v2.0 (or alternatively the Liberty Alliance Identity Federation Framework, ID-FF), the Identity Web Services Framework (ID-WSF), the Security Assertion Markup Language (SAML) and a component of GAA called the Generic Bootstrapping Architecture (GBA). This document only applies if Liberty Alliance and GBA or SAML v2.0 and GBA are used in combination.

## 5.1.2.13.117 TS 35.203

**3G Security; Specification of the 3GPP confidentiality and integrity algorithms; Document 3: Implementors' test data**

This specification gives detailed test data for implementors of the algorithm set. It provides visibility of the internal state of the algorithm to aid in the realization of the algorithms.

## 5.1.2.13.118 TS 35.204

**3G Security; Specification of the 3GPP confidentiality and integrity algorithms; Document 4: Design conformance test data**

This specification gives black-box test data for the algorithm set. The test data has been selected to give a high degree of confidence that the implementation is correct. However, no claim is made that conformance with this test data guarantees a correct implementation.

**5.1.2.13.119 TS 35.205****3G Security; Specification of the MILENAGE algorithm set: An example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 1: General**

This report is a description of the work undertaken by an ETSI SAGE Task Force on the design of the Milenage Algorithm Set: an example set of 3GPP Authentication and Key Generation Functions.

The 3GPP Authentication and Key Generation Functions are not standardized. An example set of these algorithms has been produced on request from 3GPP with the intent that it shall be offered to the UMTS operators, to utilize instead of developing their own. An ETSI SAGE Task Force has carried out this work.

The requirement specification from 3GPP SA3 stated that operator personalization of the example set must be possible and that the basic kernel must be possible to replace.

The example set is based on the block cipher Rijndael, which at the time was one of the AES candidates and the specification describes how the 7 algorithms used in 3GPP authentication and key generation are scheduled around this basic kernel. The specification and associated test data for the example algorithm set is documented in three documents:

- A formal specification of both the modes and the example kernel
- A detailed test data document, covering modes and the example kernel
- A “black box” test data document

A detailed summary of the evaluation is provided in a public evaluation report, ETSI SAGE 3GPP AF TF: “Report on the design and evaluation of 3GPP Authentication and Key Generation Functions”. This report gives an overview of the overall work by the task force.

## 5.1.2.13.122 TS 35.208

**3G Security; Specification of the MILENAGE algorithm set: An example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 4: Design conformance test data**

This document has been prepared by the 3GPP Task Force, and contains an example set of algorithms which may be used as the authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*. (It is not mandatory that the particular algorithms specified in this document are used – all seven functions are operator-specifiable rather than being fully standardized.)

**5.1.2.13.127 TR 35.909**

**3G Security; Specification of the MILENAGE algorithm set: an example algorithm set for the 3GPP authentication and key generation functions f1, f1\*, f2, f3, f4, f5 and f5\*; Document 5: Summary and results of design and evaluation**

This report contains a detailed summary of the work performed during the design and evaluation of the 3GPP Authentication Functions denoted as the MILENAGE algorithm set. It contains all results and findings from this work and should be read as a supplement to the specifications of the algorithms in ETSI/SAGE Specification of the MILENAGE Algorithm Set: an Example Algorithm Set for the 3GPP Authentication and Key generation Functions, f1, f1\*, f2, f3, f4, f5 and f5\*; Document 1: Algorithm Specification. and the general project report on the Design and Evaluation of the 3GPP Authentication and Key generation Functions.

## 5.2 IMT-2000 CDMA Multi-Carrier

### 5.2.1 Overview of the set of radio interface FDD/TDD components

#### 5.2.1.1 FDD Component

##### 5.2.1.1.1 Introduction

The IMT-2000 radio interface specifications for CDMA multi-carrier (MC) technology are developed by a partnership of SDOs (see Note 1). This radio interface is called cdma2000.

NOTE 1 – Currently, these specifications are developed within the Third Generation Partnership Project 2 (3GPP2), where the participating SDOs are ARIB, CCSA, TTA and TTC.

In the development of this radio interface the CN specifications are based on an evolved ANSI-41 and IP network, but the specifications include the necessary capabilities for operation with an evolved GSM-MAP-based CN, a CN based on IETF protocols, or the 3GPP Evolved Packet Core (EPC).

This radio interface is a wideband spread spectrum radio interface that utilizes CDMA technology in order to meet the needs of the 3G wireless communication systems and to meet the requirements for the 3G evolution of the 2G TIA/EIA-95-B family of standards.

As shown in Fig. 18, this radio interface has a layered structure that provides a combination of voice, packet data, and circuit data services, according to the ISO/OSI reference model (i.e. Layer 1 – the physical layer, and Layer 2 – the link layer). Layer 2 is further subdivided into the link access control (LAC) sub-layer and the MAC sub-layer. Applications and upper layer protocols corresponding to OSI Layers 3 through 7 utilize the services provided by the LAC services, e.g. signalling services, voice services, data services (packet data and circuit data).

In this radio interface a generalized multimedia service model is supported. This allows any combination of voice, packet data, and circuit data services to be operated. The radio interface also includes a QoS control mechanism to balance the varying QoS requirements of multiple concurrent services (e.g. to support ISDN or RSVP network layer QoS capabilities).

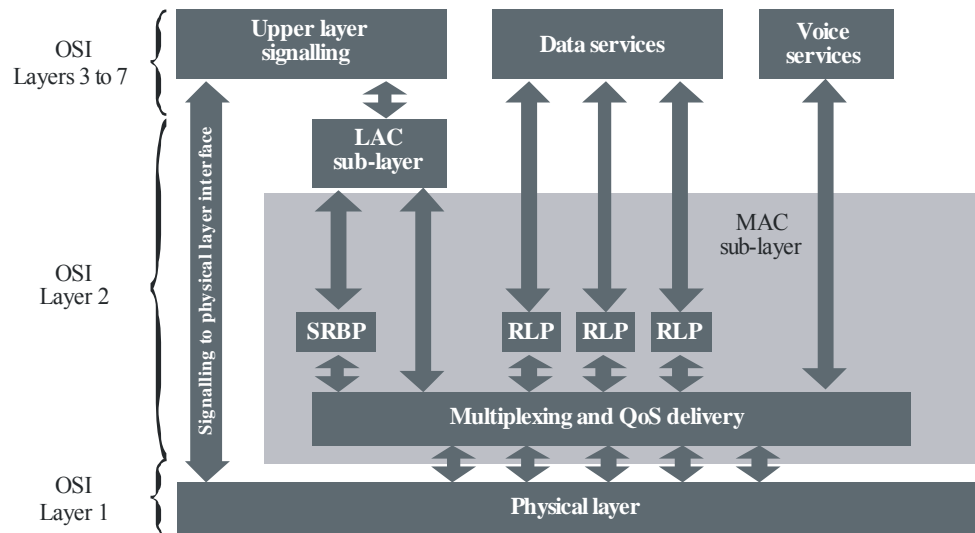

The physical layer supports RF channel bandwidths of  $N \times 1.25$  MHz, where  $N$  is the spreading rate number. The data rates, channel encoding, and modulation parameters supported on the traffic channels are specified by radio configurations. For Spreading rates 1 and 3, there are seven radio configurations for the reverse link and there are ten radio configurations for the forward link. Collectively, these radio configurations form the radio interface, which consists of the 1X and 3X components. Spreading rate 1 corresponds to 1X. Spreading rate 3 corresponds to 3X. Radio configurations 1 and 2 are specified to be backward compatible with TIA/EIA-95-B systems. The radio interface also supports a class of operational band plans as specified in the TIA/EIA/IS-2000 standard.

This family of standards supports multi-carrier systems in contiguous and non-contiguous operation with two or more carriers each with bandwidths of up to 20 MHz.

FIGURE 18

## General radio interface architecture

M.1457-18

This specification includes a flexible and efficient MAC sub-layer that supports multiple data service state machine instances, one for each active packet or circuit data service instance. Along with the multiplexing QoS control entity, the MAC realizes the complex multimedia, multi-service capabilities of 3G wireless systems with QoS management capabilities for each active service.

This specification also introduces a LAC sub-layer to provide reliable transmission over the air for signalling services. To provide flexible voice services, this radio interface provides the framework and the services to transport encoded voice data in the form of packet data or circuit data traffic, as well as in a manner that is backward compatible with the TIA/EIA-95-B family of standards (i.e. the encoded voice data is transported directly by the physical layer). In the latter case, the LAC and MAC services are null. The LAC sub-layer provides an ARQ (retransmission) protocol.

### 5.2.1.1.2 Physical layer

#### 5.2.1.1.2.1 Reverse link (uplink)

##### 5.2.1.1.2.1.1 cdma2000

cdma2000 Spreading Rate 1(1x) and Spreading Rate 3(3x) systems provide a combination of voice, packet data, and circuit data services.

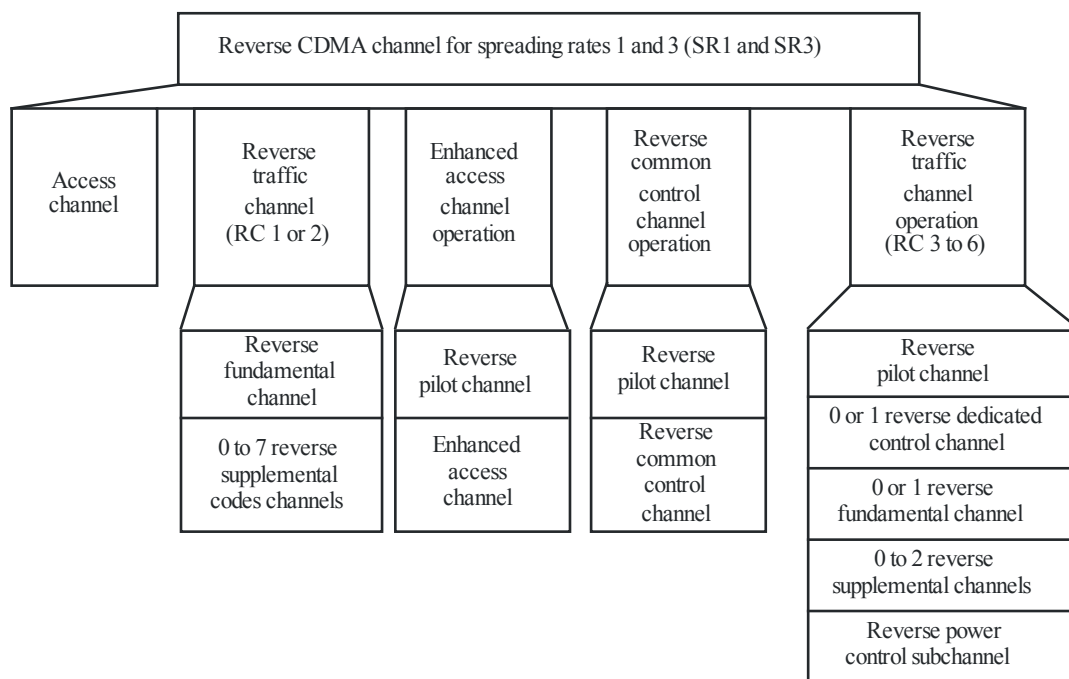

##### 5.2.1.1.2.1.1.1 cdma2000 Revisions 0, A, and B

Figure 19 shows the reverse CDMA Channels received at the BS. The reverse pilot channel is an unmodulated spread spectrum signal used to assist the BS in detecting the mobile station transmission. The mobile station also inserts a reverse power control subchannel in the reverse pilot channel. The reverse power control subchannel is used to transmit forward power control commands. The access channel is used by the mobile station to initiate communication with the BS and to respond to paging channel messages. The enhanced access channel is used by the mobile station to initiate communication with the BS or to respond to a mobile station directed message. The reverse common control channel is used for the transmission of user and signalling information to the BS when reverse traffic channels are not in use. The reverse traffic channels with radio configurations 1 and 2 include the reverse fundamental channel and reverse supplemental code

channel. The reverse traffic channels with radio configurations 3 through 6 include the reverse dedicated control channel, reverse fundamental channel, and reverse supplemental channel.

The reverse dedicated control channel and reverse fundamental channel are used for the transmission of user and signalling information to the BS during a call. The reverse supplemental channel and reverse supplemental code channel are used for the transmission of user information to the BS during a call.

FIGURE 19  
Reverse CDMA channels received at the Base Station

M.1457-19

Figure 20 shows the reverse channel structure (except the pilot channel). Channel encoded symbols are repeated and punctured to match a nominal value of data rate. Block interleaving is used on the access channel, the enhanced access channel, the reverse common control channel, and the reverse traffic channels. The channel encoded and interleaved symbols are modulated and are direct spread prior to transmission. The spreading chip rate is  $N \times 1.2288$  Mchip/s ( $N$  is the spreading rate number described above). Figure 21 shows the uplink spreading and the modulation operation for radio configurations 3 through 6.

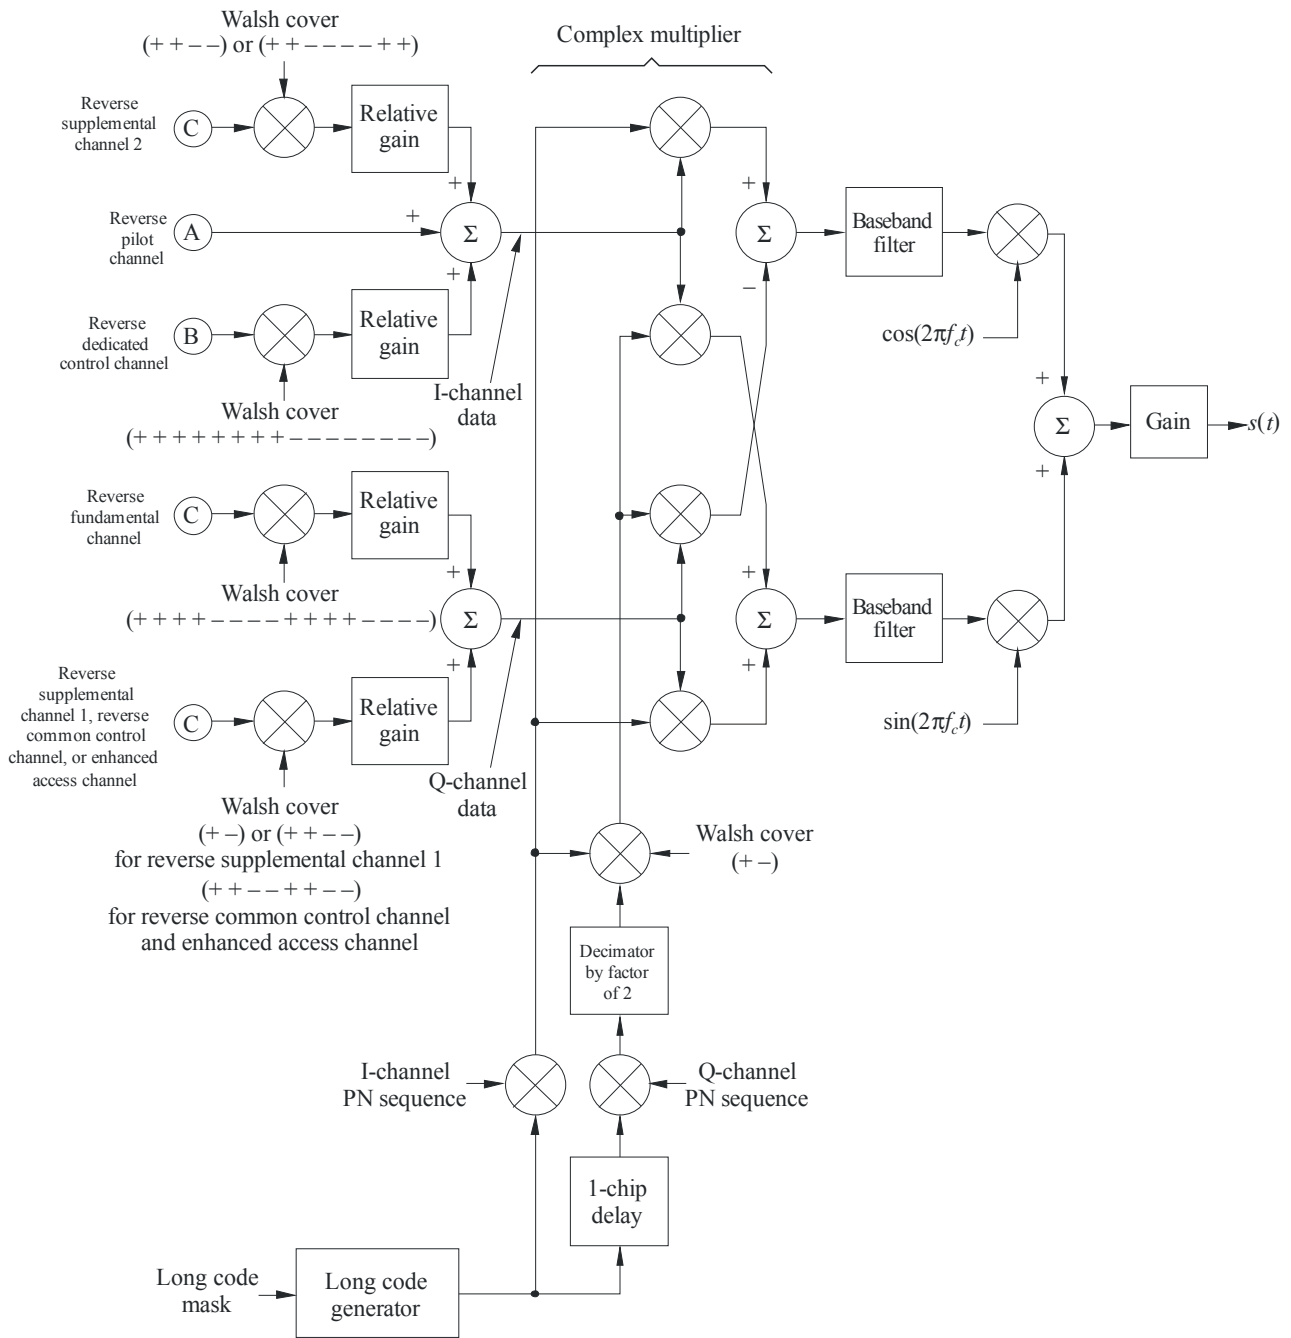

FIGURE 20  
Reverse channels structure (except the pilot channel)

M.1457-20

FIGURE 21

Uplink spreading and modulation for radio configurations 3 and above

M.1457-21

The mobile station supports three types of forward link power control based upon: 800 Hz feedback; the erasure indicator bits (EIB); and the quality indicator bits (QIB). The feedback is on the reverse power control subchannel. For the 800 Hz feedback mode, the outer loop estimates the setpoint value based on  $E_b/N_t$  to achieve the target FER on each assigned forward traffic channel.

The inner loop compares the  $E_b/N_t$  of the received forward traffic channel with the corresponding outer loop setpoint to determine the value of the power control bit to be sent on the reverse power control subchannel every 1.25 ms.

Uplink soft handoff is achieved by performing diversity or selection combining at the BS.

#### **5.2.1.1.2.1.1.2 cdma2000 Revisions C and D**

cdma2000 Revisions C and D systems, also known as 1x Evolution-Data and Voice (1xEV-DV), include enhanced features allowing for high-speed packet data transmission, higher spectral efficiency, and simultaneous high-speed packet data and real-time services, such as voice, on a single 1.25 MHz RF carrier. The high data rates are achieved with the support of key features, such as short frames, adaptive modulation and coding, higher-order modulation, fast scheduling/rate control, and hybrid ARQ (Automatic Repeat Request). The reverse link of the cdma2000 Revision D system was enhanced to provide peak rates up to 1.8 Mbit/s.

#### **5.2.1.1.2.1.1.3 cdma2000 Revision E**

The cdma2000 Revision E system, by introducing techniques such as an enhanced vocoder, virtual ARQ, and reverse link pilot gating, significantly increases the voice capacity, improves data performance and increases coverage.

#### **5.2.1.1.2.1.2 High Rate Packet Data (HRPD) Access**

The High Rate Packet Data Access system, also known as Evolution Data Optimized (EV-DO), provides full QoS and efficient support for a wide variety of applications, backward compatible multi-carrier support, broadcast/multicast, flexible duplex and hybrid frequency reuse.

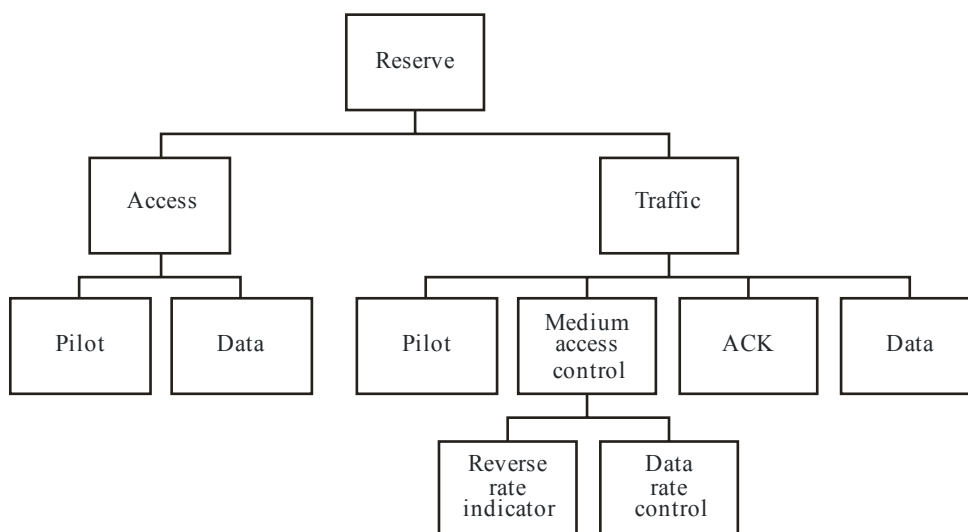

#### **5.2.1.1.2.1.2.1 High Rate Packet Data Revisions 0 and A**

The HRPD Revisions 0 and A systems deploy a Reverse CDMA Channel on a dedicated 1X RF Channel. This Reverse CDMA Channel consists of the Access Channel and the Reverse Traffic Channel as shown in Fig. 21a. The Access Channel is used by the access terminal to initiate communication with the access network or to respond to an access terminal directed message. The Access Channel consists of a Pilot Channel and a Data Channel. The Reverse Traffic Channel is used by the mobile station to transmit user-specific traffic or signalling information to the access network. The Reverse Traffic Channel comprises a Pilot Channel, a Reverse Rate Indicator (RRI) Channel, a Data Rate Control (DRC) Channel, an Acknowledgement (ACK) Channel, and a Data Channel. The RRI Channel is used to indicate the data rate transmitted on the Reverse Traffic Channel. The RRI Channel is time-multiplexed with the Pilot Channel. The DRC Channel is used by the mobile station to indicate to the access network the supportable Forward Traffic Channel data rate and the best serving sector on the Forward CDMA Channel. The ACK Channel is used by the access terminal to inform the access network whether or not the data packet transmitted on the Forward Traffic Channel has been received successfully.

For HRPD Revision A systems, physical layer H-ARQ (Hybrid Automatic Repeat Request), shorter frame sizes, fast scheduling/rate-control, and adaptive modulation and coding are included to increase the peak data rate and system throughput of the reverse link.

FIGURE 21a

## Reverse CDMA channel for high rate packet data access

M.1457-21a

### 5.2.1.1.2.1.2.2 High Rate Packet Data Revision B

The High Rate Packet Data Revision B system specifies a multi-carrier system with a bandwidth of up to 20 MHz. Each carrier is 1.25 MHz wide and terminals may support one or more carriers. Non-contiguous CDMA carrier operation is also supported. Revision B is compatible with Revision A systems, and Release 0 and Revision A terminals can operate on Revision B networks. A peak terminal transmit data rate of 27.6 Mbit/s is supported in a 20 MHz bandwidth.

### 5.2.1.1.2.1.2.3 High Rate Packet Data Revision C

The High Rate Packet Data Revision C system improves upon Revision B systems and can support Revisions 0, A, B, and C terminals simultaneously. Higher peak reverse link data rate is supported by introducing higher order modulations and reverse link MIMO transmission. A peak reverse link data rate of 129 Mbit/s is supported in a 20 MHz bandwidth. Reverse link closed-loop mobile transmit diversity is introduced to further increase reverse link coverage.

### 5.2.1.1.2.1.3 Ultra Mobile Broadband System

The Ultra Mobile Broadband (UMB) System provides high peak data rates, good spectral efficiency, low latency, improved terminal battery life, high capacity and enhanced user experience for delay-sensitive applications such as VoIP and video telephony.

The UMB system provides a unified design for full- and half-duplex FDD modes of operation with support for scalable bandwidths. The system is designed for robust mobile broadband access, and is optimized for high spectral efficiency and short latencies using advanced modulation, link adaptation, and multi-antenna transmission techniques. Fast handoff, fast power control, and inter-sector interference management are used. Adaptive coding and modulation with synchronous H-ARQ and turbo coding are used for achieving high spectral efficiencies. Sub-band scheduling provides enhanced performance on the reverse link by exploiting multi-user diversity gains for latency-sensitive traffic. The reverse link retransmission latency is approximately 7 ms and the peak data rate is over 70 Mbit/s in a 20 MHz bandwidth.

The reverse link is quasi-orthogonal. That is, it employs orthogonal transmission based on OFDMA, together with non-orthogonal user multiplexing with layered superposition or multiple receive antennas (SDMA). The reverse link also includes optional CDMA transmission for low-rate traffic. Interference management is obtained through fractional frequency reuse. An optimized

throughput/fairness trade-off is obtained through distributed power control based on other-cell interference. The reverse link employs a CDMA control segment and OFDMA control segments. The system employs fast access with reduced overhead and fast requests. The reverse link employs a broadband reference signal for power control, handoff decisions, and sub-band scheduling. Efficient handoff support is also provided.

#### **5.2.1.1.2.1.4 Extended Cell HRPD (xHRPD) System**

xHRPD is an HRPD system which has been adapted to support limited link budgets. xHRPD can also accommodate large cells with long round-trip delays. Voice services can be supported over xHRPD using a new 2 kbit/s speech codec mode. A new 640 bit/s data rate and a constraint-length eleven channel coding mode are supported on the reverse link.

#### **5.2.1.1.2.2 Forward Link (Downlink)**

##### **5.2.1.1.2.2.1 cdma2000**

The cdma2000 Spreading Rate 1(1x) and Spreading Rate 3(3x) system provides a combination of voice, packet data, and circuit data services.

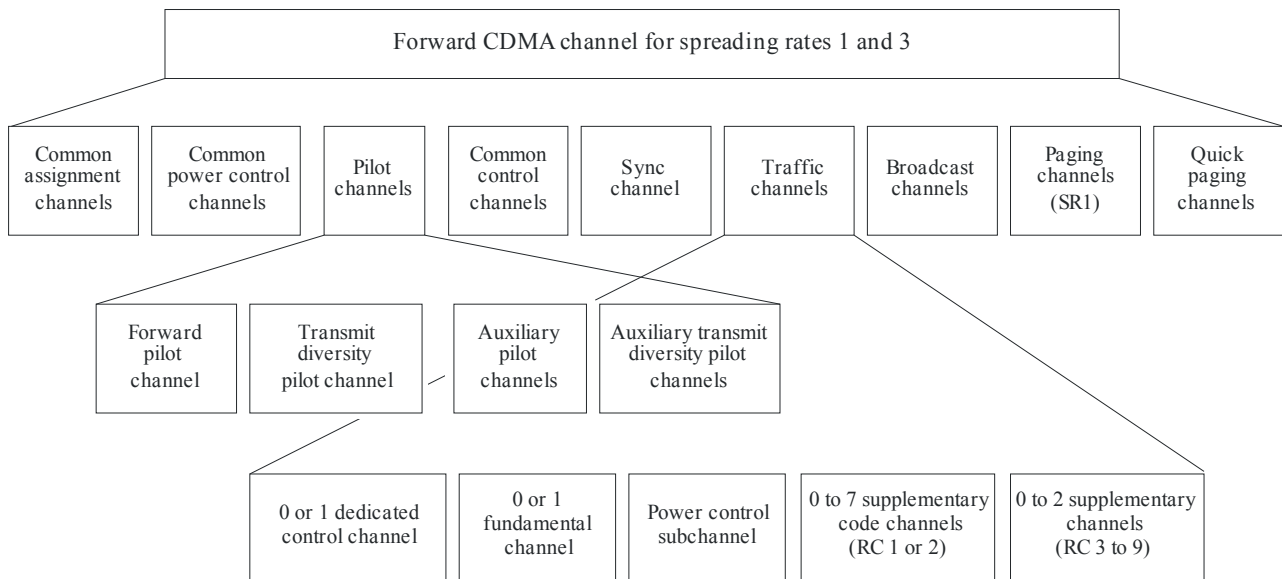

##### **5.2.1.1.2.2.1.1 cdma2000 Revisions 0, A, and B**

Figure 22 shows the forward CDMA channels received at the mobile station. The forward pilot channel, the transmit diversity pilot channel, the auxiliary pilot channels, and the auxiliary transmit diversity pilot channels are unmodulated spread spectrum signals used for synchronization by a mobile station operating within the coverage area of the BS. The forward pilot channel is transmitted at all times by the BS on each active forward CDMA channel. The auxiliary pilot channel is transmitted in a beamforming application. The transmit diversity pilot channel and the auxiliary transmit diversity pilot channel are transmitted when transmit diversity is used. The sync channel is used by mobile stations operating within the coverage area of the BS to acquire initial time synchronization. The paging channel is used by the BS to transmit system overhead information and mobile station specific messages. The broadcast channel is used by the BS to transmit system overhead information. The quick paging channel is used by the BS to inform mobile stations, operating in the slotted mode while in the idle state, whether or not to receive the forward common control channel, the broadcast channel, or the paging channel. The common power control channel is used by the BS for transmitting common power control sub channels (one bit per subchannel) for the power control of multiple reverse common control channels and enhanced access channels. The common power control sub channels are time multiplexed on the common power control channel. Each common power control subchannel controls a reverse common control channel or an enhanced access channel. The common assignment channel is used by the BS to provide quick assignment of the reverse common control channel. The forward common control channel is used by the BS to transmit mobile station-specific messages. For radio configurations 1 and 2, the forward traffic channels include the forward fundamental channel and forward supplemental code channel. For radio configurations 3 through 9, the forward traffic channels include the forward dedicated control channel, forward fundamental channel, and forward supplemental channel. Similar to the corresponding reverse traffic channels, these channels are used for transmission of user and/or signalling information to a specific mobile station during a call.

The forward traffic channels also include the forward power control subchannel. It is used to transmit reverse power control commands and is transmitted either on the forward fundamental channel or on the forward dedicated control channel.

FIGURE 22

## Forward CDMA channels received at the mobile station

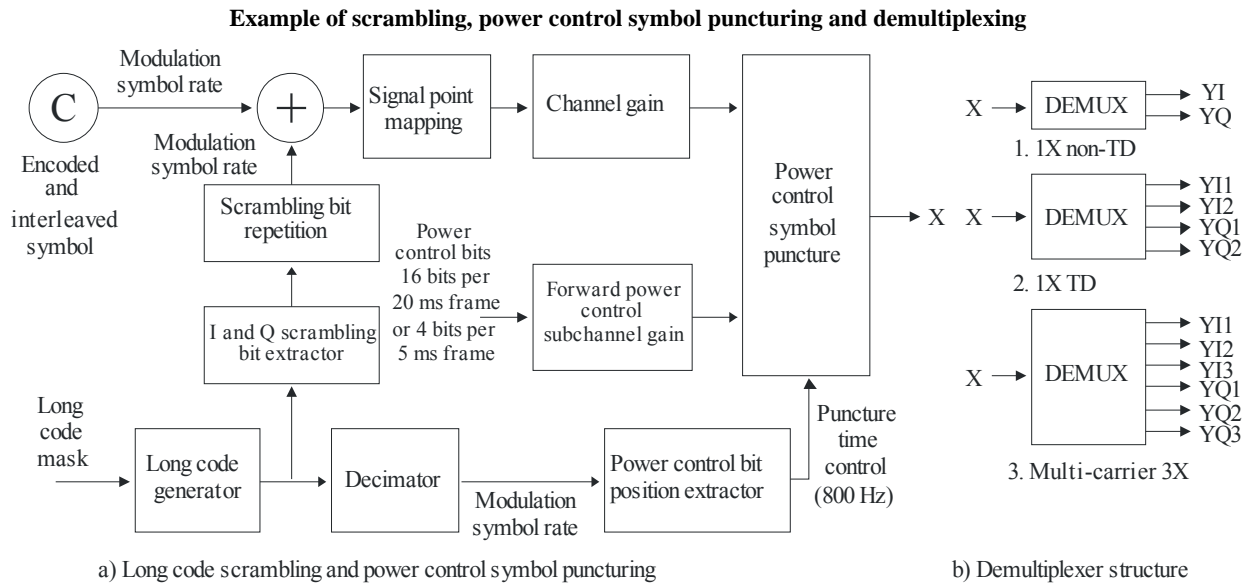

M.1457-22

The channel structure of the forward link is similar to that of the reverse link shown in Fig. 22, except that the sync channel and the paging channel do not use the frame quality indicator, and that the quick paging channel and the common power control channel do not use channel coding or interleaving. Block interleaving is used on the sync channel, the paging channels, the broadcast channel, the common assignment channel, the forward common control channel, and the forward traffic channels.

Figure 23 shows an example of scrambling, power control symbol puncturing, and demultiplexer structure for the forward traffic channels with radio configurations 3 through 9. The channel encoded and interleaved output symbols are scrambled by the long code. The power control symbols are punctured on the forward fundamental channel and forward dedicated control channel only. The DEMUX functions distribute the scrambled and punctured symbols sequentially from the top to the bottom, forming pairs of quadrature modulation symbols. When operating in SR 1 (1X) without transmit diversity (TD), each modulation symbol in a quadrature pair is spread by the appropriate Walsh or quasi-orthogonal function and is then spread by a quadrature pair of PN sequences at a fixed chip rate of 1.2288 Mchip/s. When operating in SR 1 (1X) with transmit diversity, each modulation symbol in two quadrature pairs is spread by the appropriate Walsh or quasi-orthogonal function and a quadrature pair of PN sequences to a chip rate of 1.2288 Mchip/s. Then the two quadrature pairs are transmitted on two separate antennas. When operating in the SR  $N$  multi-carrier mode, each modulation symbol in  $N$  quadrature pairs is spread by the appropriate Walsh or quasi-orthogonal function and a quadrature pair of PN sequences to a chip rate of 1.2288 Mchip/s. Then the  $N$  quadrature pairs are transmitted on  $N$  adjacent 1.25 MHz carriers.

Figure 23 shows the downlink spreading and modulation for SR 1 (1X) without transmit diversity as an example, which also shows each downlink modulation carrier for SR  $N$  multi-carrier operation. The system described in this sub-section can be deployed as an overlay on up to  $N$  carriers of TIA/EIA-95-B family of systems. This system can also be deployed in clear spectrum.

FIGURE 23

M.1457-23

The reverse traffic channels utilize an 800 Hz feedback power control mechanism similar to that for the forward traffic channel. In addition, the mobile station supports open loop power control.

Downlink soft handoff is achieved by performing diversity combining at the mobile station. Transmit diversity is achieved by transmitting modulation symbols on separate transmit antennas or by transmitting separate carriers on separate antennas.

#### 5.2.1.1.2.2.1.2 cdma2000 Revisions C and D

cdma2000 Revisions C and D systems, also known as 1x Evolution-Data and Voice (1xEV-DV), include enhanced features allowing for high-speed packet data transmission, higher spectral efficiency, and simultaneous high-speed packet data and real-time services, such as voice, on a single 1.25 MHz RF carrier. The high data rates are achieved with the support of key features, such as short frames, adaptive modulation and coding, higher-order modulation, fast scheduling/rate control, and hybrid ARQ (automatic repeat request). The forward link of cdma2000 Revision C system was enhanced to provide peak rates up to 3.1 Mbit/s.

#### 5.2.1.1.2.2.1.3 cdma2000 Revision E – 1x Advanced

The cdma2000 Revision E system, by introducing techniques such as an enhanced vocoder, virtual ARQ, and reverse link pilot gating, significantly increases the voice capacity, data performance and increases coverage.

#### 5.2.1.1.2.2.2 High Rate Packet Data Access

The High Rate Packet Data Access system, also known as Evolution Data Optimized (EV-DO), provides full QoS and efficient support for a wide variety of applications, backward compatible multi-carrier support, broadcast/multicast, flexible duplex, and hybrid frequency reuse.

#### 5.2.1.1.2.2.2.1 High Rate Packet Data Revisions 0 and A

The Revisions 0 and A systems deploy a Forward CDMA Channel on a dedicated 1X RF Channel. This Forward CDMA Channel consists of the following time-multiplexed channels: the Pilot Channel, the Forward Medium Access Control (MAC) Channel, the Control Channel and the Forward Traffic Channel as shown in Fig. 24. The Forward Traffic Channel carries user data

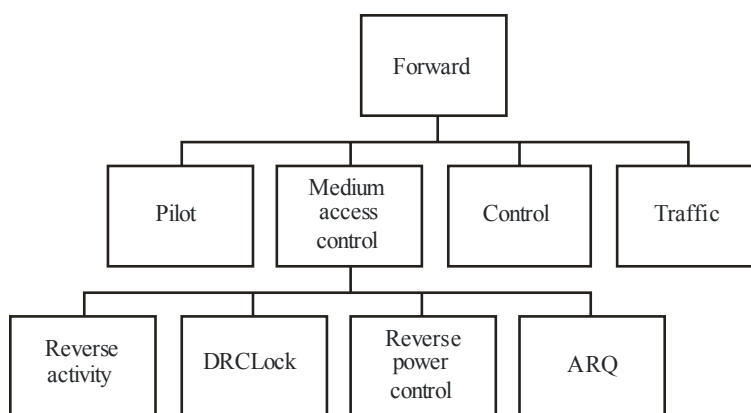

packets. The Control Channel carries control messages, and it may also carry user traffic. Each channel is further decomposed into code-division-multiplexed quadrature Walsh channels.

The MAC Channel consists of two sub channels: the Reverse Power Control (RPC) Channel and the Reverse Activity (RA) Channel. The RA Channel transmits a reverse link activity bit (RAB) stream. In Release 0, each MAC Channel symbol is BPSK modulated on one of sixty-four 64-ary Walsh codewords. In Revision A, each MAC Channel symbol is BPSK or OOK modulated on the in-phase or quadrature-phase of one of 128 128-ary Walsh codewords.

The Forward Traffic Channel is a packet-based, variable-rate channel. The user data for an access terminal is transmitted at a data rate that varies from 38.4 kbit/s to 2.4576 Mbit/s with Release 0 and from 38.4 kbit/s to 3.1 Mbit/s with Revision A.

FIGURE 24  
Forward CDMA channel for high rate packet data access

M.1457-24

The Forward Traffic Channel and Control Channel data are encoded, scrambled and interleaved. The output of the channel interleaver is fed into a QPSK/8-PSK/16-QAM modulator. The modulated symbol sequences are repeated and punctured, as necessary. Then, the resulting sequences of modulation symbols are demultiplexed to form 16 pairs (in-phase and quadrature) of parallel streams. Each of the parallel streams are covered with a distinct 16-ary Walsh function at a chip rate to yield Walsh symbols at 76.8 ksymbol/s. The Walsh-coded symbols of all the streams are summed together to form a single in-phase stream and a single quadrature stream at a chip rate of 1.2288 Mchip/s. The resulting chips are time-division multiplexed with the preamble, Pilot Channel, and MAC Channel chips to form the resultant sequence of chips for the quadrature spreading operation.

Forward Traffic Channel physical layer packets can be transmitted in 1 to 16 slots. When more than one slot is allocated, the transmitted slots use a 4-slot interlacing. That is, the transmitted slots of a packet are separated by three intervening slots, and slots of other packets are transmitted in the slots between those transmit slots. If a positive acknowledgement is received on the reverse link ACK Channel that the physical layer packet has been received on the Forward Traffic Channel before all of the allocated slots have been transmitted, the remaining untransmitted slots are not transmitted and the next allocated slot is used for the first slot of the next physical layer packet transmission.

The Control Channel is transmitted at a data rate of 76.8 kbit/s or 38.4 kbit/s. The modulation characteristics for the Control Channel are the same as those of the Forward Traffic Channel transmitted at the corresponding rate.

### 5.2.1.1.2.2.2.2 High Rate Packet Data Revision B

The High Rate Packet Data Revision B system specifies a multi-carrier system with a bandwidth of up to 20 MHz. Each carrier is 1.25-MHz wide and terminals may support one or more carriers. Non-contiguous CDMA carrier operation is also supported. Revision B is compatible with Revision A systems, and Release 0 and Revision A terminals can operate on Revision B networks. The user data for an access terminal is transmitted at a data rate that varies from 38.4 kbit/s to 4.9152 Mbit/s for each 1.25-MHz carrier with the peak data rate achieved using 64-QAM modulation. The forward link peak data rate is therefore 73.7 Mbit/s.

### 5.2.1.1.2.2.2.3 High Rate Packet Data Revision C

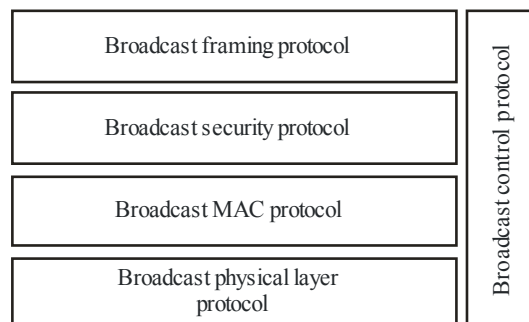

The High Rate Packet Data Revision C system improves upon Revision B systems and can support Revisions 0, A, B, and C terminals simultaneously. MIMO-OFDM slots with up to four spatial layers of transmission are introduced to improve user throughput. SIMO-OFDMA slots are introduced to improve packing efficiency by serving multiple access terminals in the same physical layer slot. Single-Carrier Multi-Link can be used to serve an access terminal from multiple base stations at the same time to improve user experience by exploiting the multi-carrier capability of the access terminal. A peak forward link data rate of 281.1 Mbit/s can be achieved over a 20 MHz channel.

### 5.2.1.1.2.2.2.4 Broadcast and Multicast Services (BCMCS)

The air interface of the high rate broadcast packet data system is comprised of a group of protocols that are collectively called the broadcast protocol suite. Figure 25 shows the protocols that comprise the broadcast protocol suite.

FIGURE 25

#### Broadcast protocol suite

M.1457-25

The Broadcast Framing Protocol fragments higher layer packets at the access network and helps the access terminal in determining higher layer packet boundaries. The Broadcast Framing Protocol also validates the integrity of higher layer packets by discarding erroneous packets with very high probability. The Broadcast Security Protocol provides encryption of Framing Packets. The Broadcast MAC Protocol defines procedures used to transmit over the Broadcast Channel. The Broadcast MAC Protocol also provides forward error correction (FEC) and multiplexing to reduce the radio link error rate as seen by the higher layers. The Broadcast Physical Layer provides the channel structure for the Broadcast Channel. The Broadcast Control Protocol defines procedures used to control various aspects of the operation of the broadcast packet data system.

The framing protocol fragments higher layer packets and packs them into framing packets. The framing protocol helps the access terminal in determining higher layer packet boundaries.

The broadcast system uses a segment-based framing protocol that has lower deframing complexity and requires a lower bandwidth expansion margin than octet-based HDLC-like framing.

Encryption of the broadcast content and distribution of decryption key only to authorized subscribers of the channel work to counter the threat of an unauthorized user getting free and convenient access to the broadcast content.

The Broadcast Security Protocol encrypts Framing packets to form Broadcast Security packets. The access network generates a Short Term Key and uses the AES (also known as Rijndael) encryption procedures to generate an encryption mask that is exclusive-ORed with the Framing packets. The Short Term Key, which changes frequently, is generated by running a hash function on a longer-term key called the Broadcast Access Key and a random number called RandomSeed. Each broadcast channel has its own Broadcast Access Key. The Broadcast Access Key is provisioned into secure memory in the access terminal when the user subscribes to the broadcast channel.

The Broadcast Access Key is changed over a longer period, which is equivalent to the subscription period to the broadcast channel. All users that subscribe to a broadcast channel share the same Broadcast Access Key. The access network broadcasts RandomSeed in the clear along with the encrypted content.

The access terminal uses the RandomSeed received with the encrypted content and the Broadcast Access Key provisioned into secure memory to compute the Short Term Key. The access terminal then uses the Short Term Key to decrypt the broadcast content.

The Broadcast MAC Protocol receives packets from the Security Protocol and adds an outer code, which in conjunction with the Physical Layer Turbo code, forms a product code. A Reed-Solomon block code is used as the outer code. Multiple Reed-Solomon Error Control Blocks are multiplexed before transmission on the Physical Layer. Each Error Control Block is made of  $N$  octet rows and  $125 \times M$  octet columns.

BCMCS uses the Reed-Solomon code as an erasure code (and not as an error-correcting code) because the Cyclic Redundancy Check (CRC) provided by the Physical Layer is used to detect and erase damaged Physical Layer packets. By relying on the CRC to provide error detection, the entire power of the Reed-Solomon code is used to recover erased octets. Also, erasure decoding is simpler than error correction because the position of the erased octets is known a priori.

The Broadcast Physical Channel is divided into several time-division-multiplexed sub-channels called interlace-multiplex pairs. An Error Control Block is transported as payload on one or more sub-channels of the Physical Layer. Thus, data from multiple Error Control Blocks is multiplexed onto the Broadcast Physical Channel. The Broadcast MAC Protocol provides the outer Reed-Solomon code, while the Physical Layer provides an inner Turbo code. Soft combining is allowed on the forward link during high speed broadcast service transmission because multiple sectors may transmit the same data.

#### **5.2.1.1.2.2.2.5 Enhanced Broadcast and Multicast Services (E-BCMCS)**

The E-BCMCS transmits an OFDM-based waveform within the High Rate Packet Data structure while maintaining the same MAC and upper-layer designs as the basic BCMCS. In the enhanced mode, broadcast data are transmitted from all sectors with identical PN spreading and they are combined at the receiver as virtual multipath components. The maximum supportable rates are on the order of 1.2 to 1.5 Mbit/s based on a typical deployment scenario with a site-to-site distance of 1.9 km over a transmission bandwidth of 1.25 MHz.

The OFDM broadcast symbols are punctured into the High Rate Packet Data slot formats without changing the legacy pilot and MAC portion of the slot structure.

In order to optimize the broadcast transmission efficiency for different deployment scenarios, different OFDM formats with different cyclic prefix lengths and numbers of pilot tones are specified. The OFDM mode with a longer cyclic prefix and more pilot tones can be deployed in a network with larger cell-to-cell distance or in a network with repeaters with large delays.

In order to support heterogeneous cell layouts with spatially non-uniform broadcast coverage, as well as to support acceptable coverage near the boundaries of broadcast areas, the access network may be configured so that different sectors broadcasting the same broadcast channel are allowed to use different transmit data rates within the same rate set. The transmission time of the first slot of each packet is synchronized across all sectors transmitting that broadcast channel. Subsequently, packets are early terminated after a different number of slots by different sectors, consistent with their transmission rates. The broadcast overhead message from each sector is used to specify the actual data rate of the broadcast channel. The access terminals attempt to decode the broadcast channel after each slot of transmission until the CRC passes, up to the data rate specified by the broadcast overhead message.

To enable HARQ, the High Rate Packet Data forward link is time division multiplexed into four interlaces, each with a duration of one slot. One or more interlaces can be occupied by different broadcast and multicast streams. This allows flexible distribution of the system resources among unicast and broadcast services.

Two OFDM formats and six rate sets are defined. The first format is designed to provide robust coverage even in a network with large repeater delays and severe adjacent channel interference, while the second OFDM format is designed with less overhead to provide higher data rates in networks without long repeater delays.

For each OFDM format, three different rate sets are defined with payload sizes ranging from 2 K to 5 K. Turbo coding is used for all the rate sets with a code rate of 1/3 for the 4 K and 5 K payload sizes and of 1/5 for the 2 K and 3 K payload sizes. The output of the Turbo channel encoder is scrambled to randomize the data prior to modulation. The scrambling sequence is generated by a 17-tap shift register with feedback. The initial seed depends on the rate set. The channel interleaver consists of a symbol-reordering stage and a matrix-interleaving stage. The interleaved sequence is then truncated/repeated to the map payload size into the OFDM transmission format. 16-QAM is used for modulation for all the rate sets. The guard tones and pilot tones are inserted according to the transmission format and staggering pattern. Frequency domain spreading is applied to randomize the pilots and data for different logic channels. The output sequence then goes through an IFFT engine and a cyclic prefix block.

### **5.2.1.1.2.2.3 UMB System**

The UMB system provides high peak data rates, good spectral efficiency, low latency, improved terminal battery life, and high capacity and enhanced user experience for delay-sensitive applications such as VoIP and video telephony.

The UMB System provides a unified design for full- and half-duplex FDD modes of operation with support for scalable bandwidths. The system is designed for robust mobile broadband access, and is optimized for high spectral efficiency and short latencies using advanced modulation, link adaptation, and multi-antenna transmission techniques. Fast handoff, fast power control, and inter-sector interference management are used. Adaptive coding and modulation with synchronous

H-ARQ and turbo coding are used for achieving high spectral efficiencies. Sub-band scheduling provides enhanced performance on both the forward link by exploiting multi-user diversity gains for latency-sensitive traffic.

The forward link retransmission latency is approximately 5.5 ms and the peak data rate is over 260 Mbit/s in a 20-MHz bandwidth.

The system employs an orthogonal frequency division multiple access (OFDMA) forward link with support for multiple-input multiple-output (MIMO) and spatial division multiple access (SDMA) antenna techniques. The system employs fast access with reduced overhead and fast requests. Efficient handoff support is also provided. The system employs beacons for early detection of in-band and out-of-band carrier for improved sector detection in single carrier or multi-carrier deployments.

#### **5.2.1.1.2.2.4 Extended Cell HRPD (xHRPD) System**

xHRPD is an HRPD system which has been adapted to support limited link budgets. xHRPD can also accommodate large cells with long round-trip delays. Voice services can be supported over xHRPD using a new 2 kbit/s speech codec mode.

#### **5.2.1.1.3 Layer 2 – MAC**

##### **5.2.1.1.3.1 Introduction**

The MAC sub-layer provides the following important functions:

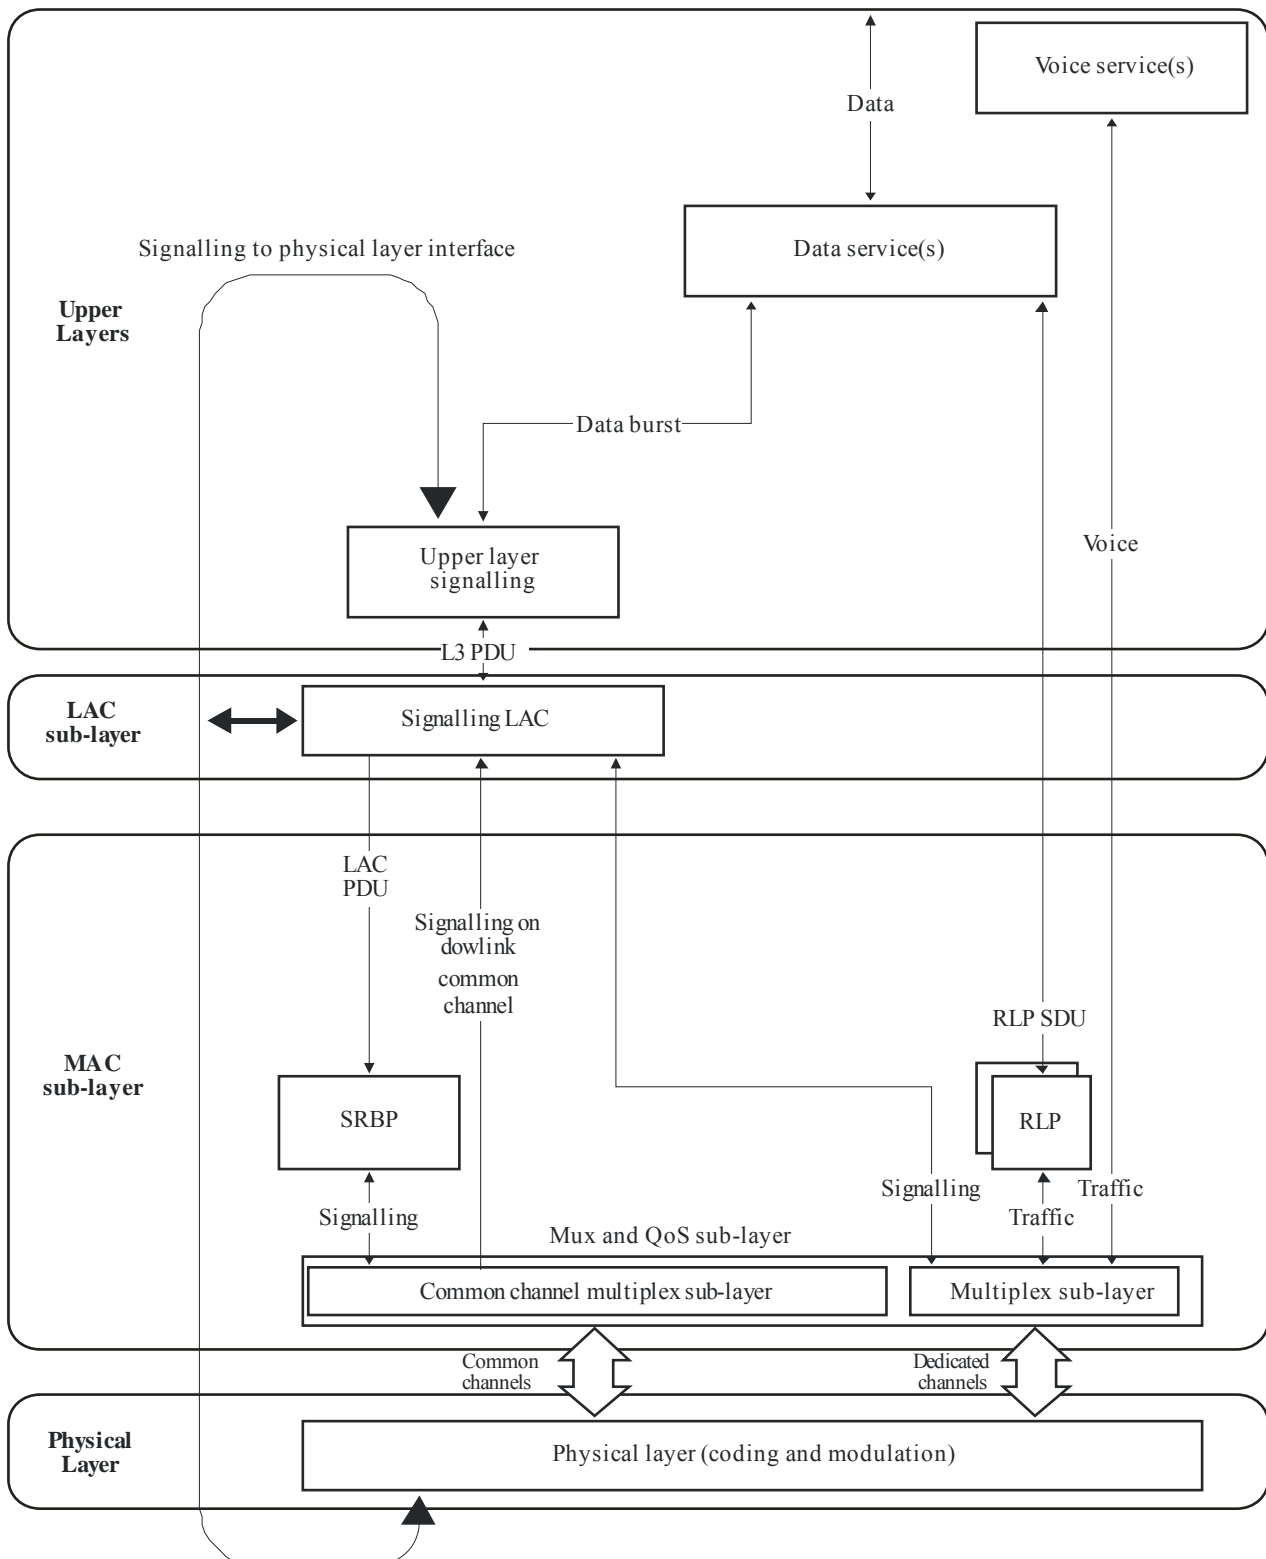

- Best effort delivery – reasonably reliable transmission over the radio link with a RLP that provides a “best effort” level of reliability.
- Rules governing access terminal transmission timing, power characteristics, and rate selection on the Access Channel.
- Rate control on both uplink and downlink traffic channels.
- Multiplexing and QoS control – enforcement of negotiated QoS levels by mediating conflicting requests from competing services and the appropriate prioritization of access requests.

##### **5.2.1.1.3.2 Layering structure and entities**

The layering structure of this radio interface is shown in Fig. 26.

FIGURE 26

Layering structure and service interfaces (Mobi

M.1457-26

**5.2.1.1.4 Layer 2 – LAC**

The LAC sub-layer performs the following important functions:

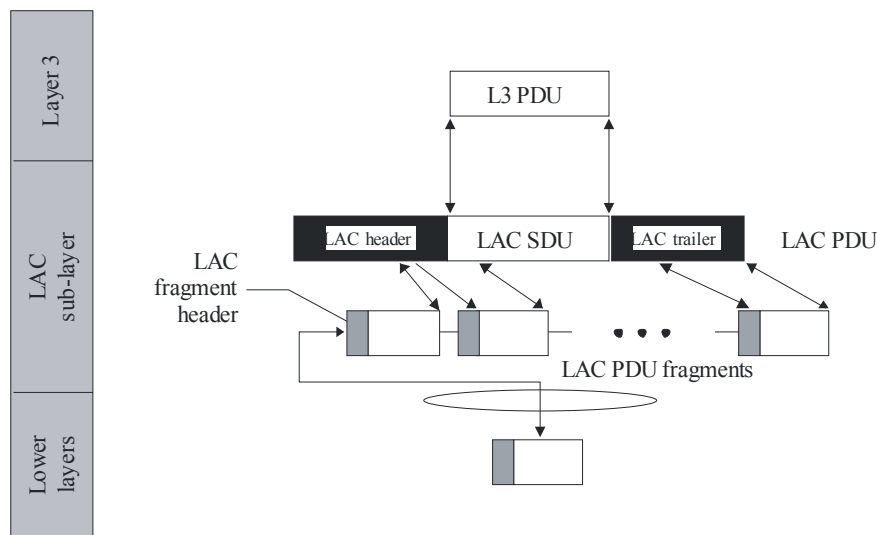

- Delivery of SDUs to Layer 3 entity using ARQ techniques, when needed, to provide reliability.

- Building and validating well-formed PDUs appropriate for carrying the SDUs.
- Segmentation of encapsulated PDUs into LAC PDU fragments of sizes suitable for transfer by the MAC Sub-layer and re-assembly of LAC PDU fragments into encapsulated PDUs.
- Access control through global challenge authentication. Conceptually, some messages failing authentication on a common channel should not be delivered to the upper layers for processing.
- Address control for delivery of PDUs based on addresses that identify particular mobile stations.

As a generated or received data unit traverses the protocol stack, it is processed by various protocol sub-layers in sequence. Each sub-layer processes only specific fields of the data unit that are associated with the sub-layer-defined functionality. The general processing of data units by the LAC sub-layer and its sub-layers is shown in Fig. 27. The LAC sub-layer provides services to Layer 3 in the data plane. SDUs are passed between Layer 3 and the LAC sub-layer. The LAC sub-layer provides the proper encapsulation of the SDUs into LAC PDUs, which are subject to segmentation and re-assembly and are transferred as LAC PDU fragments to the MAC sub-layer.

FIGURE 27

## LAC data unit processing

M.1457-27

In the data plane, Layer 3 and the LAC sub-layer send and receive signalling information on *logical channels*, thus avoiding the need to be sensitive to the radio characteristics of the physical channels. The system described in this sub-section uses the following types of logical channel to carry signalling information:

- f-csch/r-csch (forward and reverse common signalling channel, respectively);
- f-dsch/r-dsch (forward and reverse dedicated signalling channel, respectively).

Logical channels are defined for the purposes of synchronization, broadcast, general signalling, access, and dedicated signalling. Multiple instances of the same logical channel may be deployed. Figures 28 and 29 show the logical channels on the forward and reverse links, respectively.

FIGURE 28  
Downlink logical channel architecture

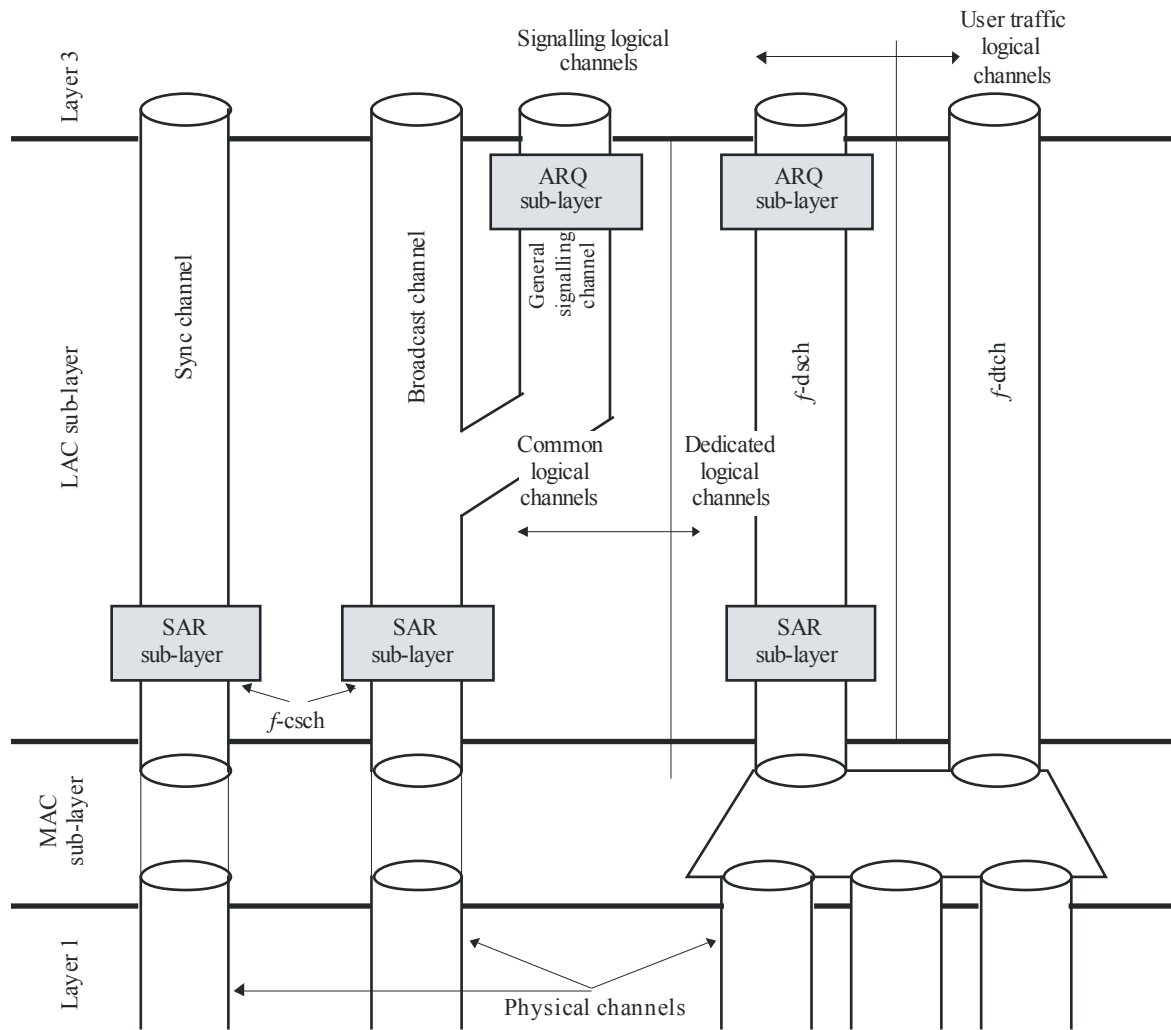

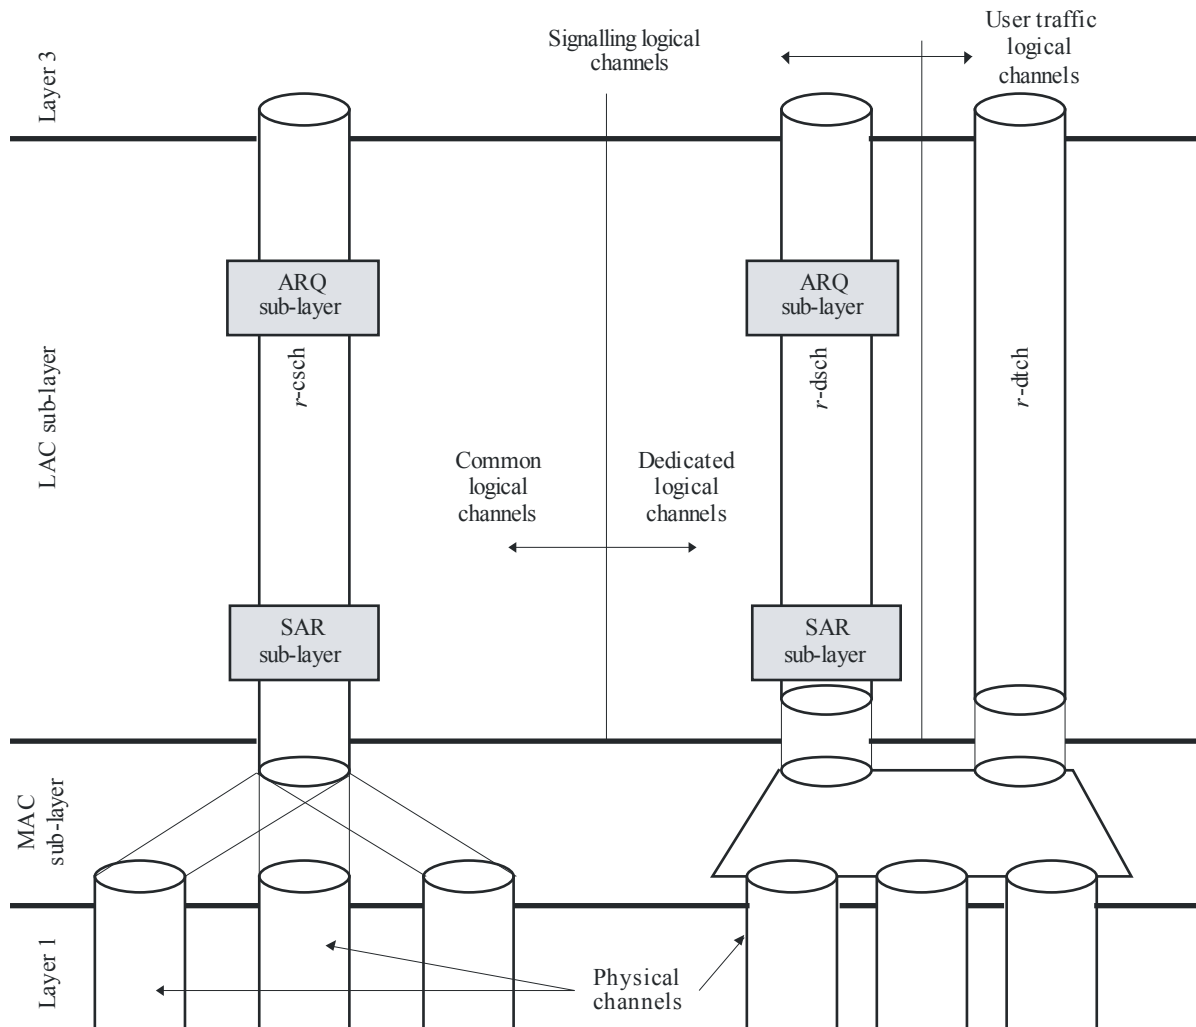

FIGURE 29  
Uplink logical channel architecture

M.1457-29

### 5.2.1.1.5 Layer 3 signalling

Layer 3 signalling provides a flexible structure designed to support a wide range of radio interface signalling alternatives:

- backward compatible to TIA/EIA-95-B Layer 3 signalling in the IS-2000 mode;
- the native upper layer signalling for this radio interface; and
- other existing or future upper layer signalling entities.

In addition to supporting the standard cellular and PCS features, Layer 3 signalling also supports the following radio related features and capabilities:

- radio configuration negotiation;
- quick paging operation (to improve battery life);
- handoff capabilities (i.e. soft handoff, hard handoff, idle handoff, access probe handoff, and access handoff);
- power control;
- high-speed data;
- enhanced access;

- broadcast control operation;
- auxiliary pilot support; and
- MAC state transitions.

### 5.2.1.1.6 Summary of major technical parameters

CDMA-MC FDD Parameter	Value	Reference to § 5.2.2
Multiple access technique and duplexing scheme	Multiple access technique: CDMA, TDMA, OFDM, OFDMA, FDMA Duplexing scheme: Full Duplex FDD, Half Duplex FDD	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80
Chip rate and bandwidth	$N \times 1.2288$ Mchip/s (currently $N = 1$ and 3 is specified, and $N$ can be easily extended to $N = 6, 9, 12$ ) HRPD Rev. B and Rev. C: $M$ carriers of 1.2288 Mchip/s can be aggregated in a multi-carrier operation, where $M = 2, 3, 4, \dots, 15$ UMB System: Native bandwidth can fit deployment of 1.25 to 20 MHz ( $M \times 1.2288 - N \times 0.1536$ MHz, $M = 1, 2, 4, 8, 16$ , $N = 0, \dots, M \times 4 - 1$ ) Multi-carrier configurations can be used to aggregate two or more carriers of possibly different native bandwidths and operating in non-contiguous spectral allocation xHRPD: Reverse link is channelized into 6.4 or 12.8 kHz bandwidth corresponding to symbol rate of 5.6 or 11.2 ksymbols/sec, respectively	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54, 5.2.2.1.1.80, and 5.2.2.1.1.102
Inter-BS asynchronous/synchronous operation	Synchronous and Asynchronous operation supported in UMB. Synchronous operation is supported in cdma2000, HRPD and xHRPD	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54, 5.2.2.1.1.80, and 5.2.2.1.1.102
Pilot structure	Code division dedicated pilot, frequency domain dedicated pilot (UL); code division common pilot; code division common or dedicated auxiliary pilot; frequency domain common or dedicated pilot; time division common pilot (DL); time division dedicated pilot (UL)	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54, 5.2.2.1.1.80, and 5.2.2.1.1.102
Frame length and interleaving	~0.91 to ~1.07, 5, 10, 20, ~23.70 to ~27.76, ~26.67, 40, 80 ms frame and channel interleaving	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80
Modulation and detection	Data modulation: BPSK; QPSK, 8-PSK, 16-QAM and 64-QAM Spreading modulation: HPSK (UL); QPSK (DL) Detection: Pilot aided coherent detection	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80

CDMA-MC FDD Parameter	Value	Reference to § 5.2.2
Channelization code	Walsh codes and PN spreading codes (UL) Walsh codes, PN spreading codes, or quasi-orthogonal codes (DL)	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80
Scrambling (spreading) code	Long code, short PN code, and other pseudo-random codes	5.2.2.1.1.2, 5.2.2.1.1.23 and 5.2.2.1.1.54
Channel coding	Convolutional code with $K = 9$ , $R = 1/2$ , $1/3$ , $1/4$ , or $1/6$ base code rates; Convolutional code with $K = 11$ , $R = 1/2$ , $2/3$ or $1/4$ base code rates; Turbo code with $K = 4$ , $R = 2/3$ , $1/2$ , $1/3$ , $1/4$ , or $1/5$ base code rates	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54, 5.2.2.1.1.80, and 5.2.2.1.1.102
Access scheme (uplink)	Basic (random) access; power controlled access; reservation access; or designated access	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80
Power control	Open loop Closed loop (800, 600, 400, 200, 150, 50 or $274/N$ Hz update rate, $N = 1, 2, 4, 8$ ) Power control steps: $0.25 \times N$ , $N = 1, 2, 3, \dots, 8$ dB	5.2.2.1.1.2, 5.2.2.1.1.23, 5.2.2.1.1.54 and 5.2.2.1.1.80

## 5.2.1.2 TDD Component

### 5.2.1.2.1 Introduction

The IMT-2000 radio interface specifications for UMB TDD in CDMA multi-carrier (MC) technology are developed by a partnership of SDOs (see Note 1). This radio interface is called cdma2000.

NOTE 1 – Currently, these specifications are developed within the third generation partnership project 2 (3GPP2), where the participating SDOs are ARIB, CCSA, TTA and TTC.

In the development of this radio interface the CN specifications are based on an evolved ANSI-41 and IP network, but the specifications include the necessary capabilities for operation with an evolved GSM-MAP-based CN or a CN based on IETF protocols.

This radio interface is a wideband spread spectrum radio interface that utilizes CDMA/OFDMA technology in order to meet the needs of the 3G wireless communication systems and to meet the requirements for the 3G evolution of the current 2G TIA/EIA-95-B family of standards.

This radio interface has a layered structure that provides a combination of voice, packet data, and circuit data services, according to the ISO/OSI reference model (i.e. Layer 1 – the physical layer, and Layer 2 – the link layer). Layer 2 is further subdivided into the link access control (LAC) sub-layer and the MAC sub-layer. Applications and upper layer protocols corresponding to OSI Layers 3 through 7 utilize the services provided by the LAC services, e.g. signalling services, voice services, data services (packet data and circuit data).

In this radio interface a generalized multimedia service model is supported. This allows any combination of voice, packet data, and circuit data services to be operated. The radio interface also

includes a QoS control mechanism to balance the varying QoS requirements of multiple concurrent services (e.g. to support ISDN or RSVP network layer QoS capabilities).

The radio interface supports a class of operational band plans as specified in the C.S0057 standard.

This family of standards supports multi-carrier systems in contiguous and non-contiguous operation with two or more carriers each with bandwidths of up to 20 MHz.

This specification includes a flexible and efficient MAC sub-layer that supports multiple data service state machine instances, one for each active packet or circuit data service instance. Along with the multiplexing QoS control entity, the MAC realizes the complex multimedia, multi-service capabilities of 3G wireless systems with QoS management capabilities for each active service.

This specification also introduces a LAC sub-layer to provide reliable transmission over the air for signalling services. To provide flexible voice services, this radio interface provides the framework and the services to transport encoded voice data in the form of packet data or circuit data traffic. The LAC sub-layer provides an ARQ (retransmission) protocol.

### **5.2.1.2.2 Physical layer**

#### **5.2.1.2.2.1 Reverse link (uplink)**

##### **5.2.1.2.2.1.1 UMB System**

The UMB system provides high peak data rates, good spectral efficiency, low latency, improved terminal battery life, high capacity and enhanced user experience for delay-sensitive applications such as VoIP and video telephony.

The UMB system provides multiple TDD duplexing modes, namely symmetric DL:UL partitioning (1:1), asymmetric partitioning options 5:3, 3:1 and 3:5, all with support for scalable bandwidths. UMB TDD also allows for co-existence between various pairs of duplexing modes within the same contiguous deployment. The system is designed for robust mobile broadband access, and is optimized for high spectral efficiency and short latencies using advanced modulation, link adaptation, and multi-antenna transmission techniques. Fast handoff, fast power control, and inter-sector interference management are used. Adaptive coding and modulation with synchronous H-ARQ and turbo coding are used for achieving high spectral efficiencies. Subband scheduling provides enhanced performance on the reverse link by exploiting multi-user diversity gains for latency-sensitive traffic. The reverse link retransmission latency is approximately 7 ms and the peak data rate is over 70 Mbit/s in a 20-MHz bandwidth.

The reverse link is quasi-orthogonal. That is, it employs orthogonal transmission based on OFDMA, together with non-orthogonal user multiplexing with layered superposition or multiple receive antennas (SDMA). The reverse link also includes optional CDMA transmission for low-rate traffic. Interference management is obtained through fractional frequency reuse. An optimized throughput/fairness tradeoff is obtained through distributed power control based on other-cell interference. The reverse link employs a CDMA control segment and OFDMA control segments.

The system employs fast access with reduced overhead and fast requests. The reverse link employs a broadband reference signal for power control, handoff decisions, and subband scheduling. Efficient handoff support is also provided.

#### **5.2.1.2.2.2 Forward Link (Downlink)**

##### **5.2.1.2.2.2.1 Ultra Mobile Broadband (UMB) System**

The UMB system provides high peak data rates, good spectral efficiency, low latency, improved terminal battery life, and high capacity and enhanced user experience for delay-sensitive applications such as VoIP and video telephony.

The UMB system provides multiple TDD duplexing modes, namely symmetric DL:UL partitioning (1:1), asymmetric partitioning options 5:3, 3:1, and 3:5, all with support for scalable bandwidths. UMB TDD also allows for co-existence between various pairs of duplexing modes within the same contiguous deployment. The system is designed for robust mobile broadband access, and is

optimized for high spectral efficiency and short latencies using advanced modulation, link adaptation, and multi-antenna transmission techniques. Fast handoff, fast power control, and inter-sector interference management are used. Adaptive coding and modulation with synchronous

H-ARQ and turbo coding are used for achieving high spectral efficiencies. Sub-band scheduling provides enhanced performance on both the forward link by exploiting multi-user diversity gains for latency-sensitive traffic.

The forward link retransmission latency is approximately 5.5 ms and the peak data rate is over 260 Mbit/s in a 20 MHz bandwidth.

The system employs an Orthogonal Frequency Division Multiple Access (OFDMA) forward link with support for multiple-input multiple-output (MIMO) and spatial division multiple access (SDMA) antenna techniques. The system employs fast access with reduced overhead and fast requests. Efficient handoff support is also provided. The system employs beacons for early detection of in-band and out-of-band carrier for improved sector detection in single carrier or multi-carrier deployments.

### **5.2.1.2.3 Layer 2 – MAC**

#### **5.2.1.2.3.1 Introduction**

The MAC sub-layer provides the following important functions:

- Best effort delivery – reasonably reliable transmission over the radio link with a RLP that provides a “best effort” level of reliability.
- Rules governing access terminal transmission timing, power characteristics, and rate selection on the Access Channel.
- Rate control on both uplink and downlink traffic channels.
- Multiplexing and QoS control – enforcement of negotiated QoS levels by mediating conflicting requests from competing services and the appropriate prioritization of access requests.

#### **5.2.1.2.3.2 Layering structure and entities**

The layering structure of this radio interface is shown in Fig. 26.

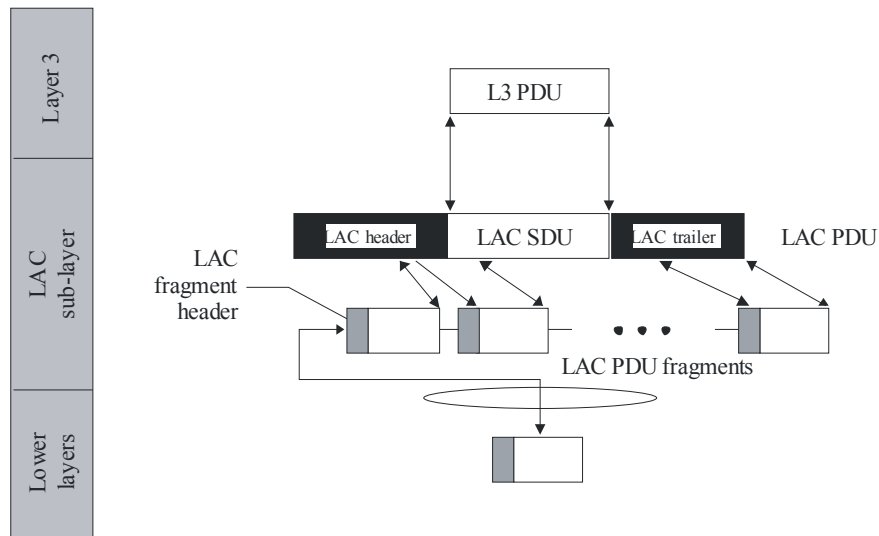

#### **5.2.1.2.4 Layer 2 – LAC**

The LAC sub-layer performs the following important functions:

- Delivery of SDUs to Layer 3 entity using ARQ techniques, when needed, to provide reliability.
- Building and validating well-formed PDUs appropriate for carrying the SDUs.
- Segmentation of encapsulated PDUs into LAC PDU fragments of sizes suitable for transfer by the MAC Sub-layer and re-assembly of LAC PDU fragments into encapsulated PDUs.
- Access control through global challenge authentication. Conceptually, some messages failing authentication on a common channel should not be delivered to the upper layers for processing.
- Address control for delivery of PDUs based on addresses that identify particular mobile stations.

As a generated or received data unit traverses the protocol stack, it is processed by various protocol sub-layers in sequence. Each sub-layer processes only specific fields of the data unit that are associated with the sub-layer-defined functionality. The general processing of data units by the LAC sub-layer and its sub-layers is shown in Fig. 30. The LAC sub-layer provides services to Layer 3 in the data plane. SDUs are passed between Layer 3 and the LAC sub-layer. The LAC sub-layer provides the proper encapsulation of the SDUs into LAC PDUs, which are subject to segmentation and re-assembly and are transferred as LAC PDU fragments to the MAC sub-layer.

FIGURE 30  
LAC data unit processing

M.1457-30

In the data plane, Layer 3 and the LAC sub-layer send and receive signalling information on *logical channels*, thus avoiding the need to be sensitive to the radio characteristics of the physical channels. The system described in this sub-section uses the following types of logical channel to carry signalling information:

- f-csch/r-csch (forward and reverse common signalling channel, respectively);
- f-dsch/r-dsch (forward and reverse dedicated signalling channel, respectively).

Logical channels are defined for the purposes of synchronization, broadcast, general signalling, access, and dedicated signalling. Multiple instances of the same logical channel may be deployed. Figures 31 and 32 show the logical channels on the forward and reverse links, respectively.

### 5.2.1.2.5 Layer 3 signalling

Layer 3 signalling provides a flexible structure designed to support a wide range of radio interface signalling alternatives:

- the native upper layer signalling for this radio interface; and
- other existing or future upper layer signalling entities.

In addition to supporting the standard cellular and PCS features, Layer 3 signalling also supports the following radio related features and capabilities:

- radio configuration negotiation;
- quick paging operation (to improve battery life);
- handoff capabilities (i.e. soft handoff, hard handoff, idle handoff, access probe handoff, and access handoff);
- power control;
- high-speed data;
- enhanced access;
- broadcast control operation;

- auxiliary pilot support; and
- MAC state transitions.

#### 5.2.1.2.6 Summary of Major Technical Parameters

CDMA-MC TDD Parameter	Value	Reference to § 5.2.2
Multiple Access Technique and Duplexing Scheme	Multiple access technique: CDMA, OFDM, OFDMA Duplexing scheme: TDD duplexing options (DL:UL) are 1:1, 5:3, 3:1 and 3:5.	5.2.2.2.1.58
Chip Rate and Bandwidth	Native bandwidth can fit deployment of 5 to 20 MHz ( $M \times 4.9152 - N \times 0.1536$ MHz, $M=1,2,4$ , $N = 0, \dots, M \times 16 - 1$ ). Multi-carrier configurations can be used to aggregate two or more carriers of possibly different native bandwidths and operating in non-contiguous spectral allocation.	5.2.2.2.1.58
Inter-BS Asynchronous/Synchronous Operation	Synchronous operation is supported in UMB TDD.	5.2.2.2.1.58
Pilot Structure	Code division dedicated pilot, frequency domain dedicated pilot (UL); code division common pilot, code division common or dedicated auxiliary pilot; frequency domain common or dedicated pilot, time division common pilot (DL)	5.2.2.2.1.58
Frame Length and Interleaving	~0.91 to ~1.07, 23.07, 24.37, 25.67, 26.98 ms frame and channel interleaving	5.2.2.2.1.58
Modulation and Detection	Data modulation: BPSK; QPSK, 8-PSK, 16-QAM, 64-QAM Spreading modulation: HPSK (UL); QPSK (DL) Detection: Pilot aided coherent detection	5.2.2.2.1.58
Channelization Code	Walsh codes and PN spreading codes (UL) Walsh codes, PN spreading codes, or quasi-orthogonal codes (DL)	5.2.2.2.1.58
Scrambling (Spreading) Code	Long code, short PN code, and other pseudo-random codes	5.2.2.2.1.58
Channel Coding	Convolutional code with $K = 9$ , $R = 1/2, 1/3, 1/4$ , or $1/6$ base code rates; Turbo code with $K = 4$ , $R = 2/3, 1/2, 1/3, 1/4$ , or $1/5$ base code rates	5.2.2.2.1.58
Access Scheme (Uplink)	Basic (random) access; power controlled access; reservation access; or designated access	5.2.2.2.1.58
Power Control	Open loop Closed loop (800, 600, 150, 50, or $274/N$ Hz update rate, $N = 1, 2, 4, 8$ ) Power control steps: $0.25 \times N$ , $N = 1, 2, 3, \dots, 8$ dB	5.2.2.2.1.58

## 5.2.2 Detailed specification of the set of radio interface FDD/TDD components

The standards contained in this section are derived from the global core specifications for IMT\_2000 contained at <http://ties.itu.int/u/itu-r/ede/rsg5/IMT-2000/GCS/GCSrev11>. Only the specifications listed below are relevant to this Recommendation.

Only the specifications listed below are relevant to this Recommendation.

The following notes apply to the sections below, where indicated:

- 1) The relevant SDOs should make their reference material available from their Web site.
- 2) This information was supplied by the recognized external organizations and relates to their own deliverables of the transposed global core specification.

### 5.2.2.1 FDD Component

#### 5.2.2.1.1 cdma2000® radio aspects specifications

##### 5.2.2.1.1.1 C.S0001

### Introduction to cdma2000 Spread Spectrum Systems

This volume provides an overview of cdma2000 standards. The general architecture of cdma2000 and its relation to TIA/EIA-95-B family of standards is described. This volume also defines some common aspects such as channel naming convention used in the standard.

**5.2.2.1.1.2 C.S0002****Physical layer standard for cdma2000 Spread Spectrum Systems**

This volume defines the physical layer of the cdma2000 standard, including the requirements for the mobile station and the BS CDMA operation. Section 1 defines the terms and numeric indications used in this document. This section also describes the time reference used in the CDMA system and the tolerances used throughout the document. Section 2 describes the physical layer requirements for mobile stations operating in the CDMA mode. Section 3 describes the requirements for CDMA base stations.

### 5.2.2.1.1.3 C.S0003

#### Medium access control (MAC) standard for cdma2000 Spread Spectrum Systems

This volume provides the detailed definitions of all component entities within the cdma2000 MAC layer, the service interfaces and primitives exchanged between entities within the MAC layer, and the service interfaces and primitives exchanged between the MAC layer and other cdma2000 layers. Section 1 contains the definitions of terms and an overview of this standard. Section 2 defines the normative behavior of the cdma2000 MAC sub-layer by describing the precise processing rules for each of the MAC sub-layer entities. Section 3 describes the service interfaces between the MAC sub-layer and other entities that are defined outside of this standards document (i.e. upper layer signalling and the physical layer). Section 4 contains a set of informative flow diagrams, which demonstrate the steps that the mobile station and the BS have to follow to make certain state transitions.

## 5.2.2.1.1.4 C.S0004

**Signalling link access control (LAC) standard for cdma2000 Spread Spectrum Systems**

This volume describes the LAC signalling protocol architecture and functionality used to provide the transport and delivery of Layer 3 signalling messages over cdma2000 radio channels. Section 1 defines the terms and numeric information used in this standard. Section 2 describes the requirements for cdma2000 mobile stations. Section 3 describes the requirements for cdma2000 BSs. Annex A describes the architectural and functional model used to develop cdma2000 LAC signalling. Annex B contains tables that give specific values for the constant identifiers found in Section 2 and Section 3.

### 5.2.2.1.1.5 C.S0005

#### Upper layer (Layer 3) signalling standard for cdma2000 Spread Spectrum Systems

This volume details the Layer 3 call processing and procedures, including the requirements for the mobile station and the BS CDMA operation. Section 1 defines the terms and numeric indications used in this document. Section 2 defines requirements that are specific to CDMA mobile station equipment and operation. Section 3 defines requirements that are specific to CDMA BS equipment and operation.
