Information technology –
Abstract Syntax Notation One (ASN.1):
Information object specification

Summary
Recommendation ITU-T X.681 | ISO/IEC 8824-2 provides the ASN.1 notation which allows information object classes as well as individual information objects and sets thereof to be defined and given reference names. An information object class defines the form of a conceptual table (an information object set) with one column for each field in the information object class, and with each complete row defining an information object.

FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had not received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at http://www.itu.int/ITU-T/ipr/.

Introduction

An application designer frequently needs to design a protocol which will work with any of a number of instances of some class of information objects, where instances of the class may be defined by a variety of other bodies, and may be added to over time. Examples of such information object classes are the "operations" of Remote Operations Service (ROS) and the "attributes" of the OSI Directory.

This Recommendation | International Standard provides notation which allows information object classes as well as individual information objects and information object sets thereof to be defined and given reference names.

An information object class is characterized by the kinds of fields possessed by its instances. A field may contain:

- an arbitrary type (a type field); or
- a single value of a specified type (a fixed-type value field); or
- a single value of a type specified in a (named) type field (a variable-type value field); or
- a non-empty set of values of a specified type (a fixed-type value set field); or
- a non-empty set of values of a type specified in a (named) type field (a variable-type value set field); or
- a single information object from a specified information object class (an object field); or
- an information object set from a specified information object class (an object set field).

A fixed-type value field of an information object class may be selected to provide unique identification of information objects in that class. This is called the identifier field for that class. Values of the identifier field, if supplied, are required to be unique within any information object set that is defined for that class. They may, but need not, serve to unambiguously identify information objects of that class within some broader scope, particularly by the use of object identifier as the type of the identifier field.

An information object class is defined by specifying:

- the names of the fields;
- for each field, the form of that field (type, fixed-type value, variable-type value, fixed-type value set, variable-type value set, object, or object set);
- optionality and default settings of fields;
- which field, if any, is the identifier field.

An individual information object in the class is defined by providing the necessary information for each field.

The notation defined herein permits an ASN.1 type to be specified by reference to a field of some information object class – the object class field type. In Rec. ITU-T X.682 | ISO/IEC 8824-3, notation is provided to enable this type to be restricted by reference to some specific information object set.

It can be useful to consider the definition of an information object class as defining the form of an underlying conceptual table (the associated table) with one column for each field, and with a completed row defining an information object. The form of the table (determined by the information object class specification) determines the sort of information to be collected and used to complete some protocol specification. The underlying conceptual table provides the link between those specifying information objects of that class and the protocol which needs that information to complete its specification. Typically, the actual information object set used to complete a particular protocol specification will be a parameter of that protocol (see Rec. ITU-T X.683 | ISO/IEC 8824-4).

The "InformationFromObjects" notation referencing a specific object or object set (probably a parameter) can be used to extract information from cells of conceptual tables.

This Recommendation | International Standard:

- Specifies a notation for defining an information object class, and for identifying it with a reference name (see clause 9).
- Specifies a notation by which the definer of an information object class can provide a defined syntax for the definition of information objects of that class; a default notation is provided for classes for which no defined syntax has been defined (see clause 10).
- Specifies a notation for defining an information object, and for assigning it to a reference name (see clause 11), and provides analogous notation for an object set (see clause 12).
- Defines the "associated table" for an object or object set of a class (see clause 13).
– Specifies notation for the object class field type and its values (see clause 14).

    NOTE – These constructs enable an ASN.1 type to be specified using a named field of a named information
    object class. Constraints on that type to restrict it to values related to a specific information object set appear in

– Specifies notation for extracting information from objects (see clause 15).

The set of information objects used in defining an object set may be partially or entirely unknown at the time of
definition of an ASN.1 specification. Such cases occur, for example, in network management where the set of managed
objects varies while the network manager is executing. This Recommendation | International Standard specifies the rules
for inclusion of an extension marker in the definition of object sets to signal to implementers the intention of the
designer that the contents of the object set is not fully defined in the ASN.1 specification. When an object set is defined
with an extension marker, the implementer must provide means, possibly outside the scope of ASN.1, for dynamically
adding objects to the object set and removing previously added objects from the object set.

Annex A, which is an integral part of this Recommendation | International Standard, specifies the information object
class whose object class reference is TYPE-IDENTIFIER. This is the simplest useful class, with just two fields, an
identifier field of type object identifier, and a single type field which defines the ASN.1 type for carrying all information
concerning any particular object in the class. It is defined herein because of the widespread use of information objects of
this form.

Annex B, which is an integral part of this Recommendation | International Standard, specifies the notation for defining
an abstract syntax (composed of the set of values of a single ASN.1 type) by the definition of an appropriate information
object.

Annex C, which is an integral part of this Recommendation | International Standard, specifies the notation for the
instance-of type (the INSTANCE OF notation).

Annex D, which is not an integral part of this Recommendation | International Standard, provides examples on how to
use the notation described in this Recommendation | International Standard.

Annex E, which is not an integral part of this Recommendation | International Standard, provides a summary of the
ASN.1 model of object set extension.

Annex F, which is not an integral part of this Recommendation | International Standard, provides a summary of the
notation defined herein.
1 Scope

This Recommendation | International Standard is part of Abstract Syntax Notation One (ASN.1) and provides notation for specifying information object classes, information objects and information object sets.

2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The Telecommunication Standardization Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

2.1 Identical Recommendations | International Standards

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply.

3.1 Specification of basic notation

This Recommendation | International Standard uses the terms defined in Rec. ITU-T X.680 | ISO/IEC 8824-1.

3.2 Constraint specification

This Recommendation | International Standard uses the following term defined in Rec. ITU-T X.682 | ISO/IEC 8824-3:

- table constraint.

3.3 Parameterization of ASN.1 specification

This Recommendation | International Standard uses the following terms defined in Rec. ITU-T X.683 | ISO/IEC 8824-4:

a) parameterized type;

b) parameterized value.
3.4 Additional definitions

3.4.1 associated table: (For some information object or information object set) an abstract table, derivable from the object or object set by flattening the hierarchical structure resulting from the presence of link fields (see 3.4.15).

NOTE – An associated table can be used to determine the precise nature of some constraint (see Rec. ITU-T X.682 | ISO/IEC 8824-3) which has been applied using an object set.

3.4.2 default syntax: The notation which shall be used for defining information objects of classes whose definers have not provided a defined syntax (see example 11.10).

3.4.3 defined syntax: A notation, provided by the definier of a class, which allows information objects of that class to be defined in a user-friendly manner.

NOTE – For example, the defined syntax for the class OPERATION might allow instances of the class to be defined by the word ARGUMENT followed by &ArgumentType, then the word RESULT followed by the &ResultType, then the word CODE followed by &operationCode (see example 11.11).

3.4.4 extensible object set: An object set with an extension marker or which has been defined using set arithmetic with object sets that are extensible.

3.4.5 field: A component of an information object class. Each field is a type field, a fixed-type value field, a variable-type value field, a fixed-type value set field, a variable-type value set field, an information object field or an information object set field.

3.4.6 field name: A name which identifies a field of some class; either the class which specifies the field directly, in which case the name is a primitive field name, or a class which has a chain of link fields to that in which the field is actually specified (see 9.13 and 9.14).

3.4.7 governing (class); governor: An information object class definition or reference which affects the interpretation of a part of the ASN.1 syntax, requiring it to reference or to specify information objects of the governing class.

3.4.8 identifier field: A fixed-type value field of a class, selected to provide unique identification of information objects in that class. Values of the identifier field, if supplied, are required to be unambiguous within any information object set that is defined for that class. They may, but need not, serve to unambiguously identify information objects of that class within some broader scope.

NOTE 1 – The identifier field has a fixed ASN.1 type, and values of that type can be carried in protocol to identify information objects within the class.

NOTE 2 – The scope within which the identifier is unambiguous is that of an information object set. It could, however, also be made unambiguous within any given abstract syntax, or within an entire application context, or could even be global across all classes and all application contexts by use of the object identifier type for the identifier field.

3.4.9 information object: An instance of some information object class, being composed of a set of fields which conform to the field specifications of the class.

NOTE – For example, one specific instance of the information object class OPERATION (mentioned in the example in 3.4.10) might be invertMatrix, which has an &ArgumentType field containing the type Matrix, a &ResultType field also containing the type Matrix, and an &operationCode field containing the value 7 (see example in 10.13).

3.4.10 information object class (class): A set of fields, forming a template for the definition of a potentially unbounded collection of information objects, the instances of the class.

NOTE – For example, an information object class OPERATION might be defined to correspond to the operation concept of Remote Operations Service (ROS). Each of the various named field specifications would then correspond to some aspect which can vary from one operation instance to another. Thus, there could be &ArgumentType, &ResultType, and &operationCode fields, the first two specifying type fields and the third specifying a value field.

3.4.11 information object field: A field which contains an information object of some specified class.

3.4.12 information object set: A non-empty set of information objects, all defined using the same information object class reference name.

NOTE – For example, one information object set, MatrixOperations, of the class OPERATION (used in the example in 3.4.10) might contain invertMatrix (mentioned in 3.4.9) together with other related operations, such as addMatrices, multiplyMatrices, etc. Such an object set might be used in defining an abstract syntax that makes provision for the invocation and result reporting of all of these operations (see example in 12.11).

3.4.13 information object set field: A field which contains an information object set of some specified class.

3.4.14 instance-of type: A type, defined by referencing an information object class which associates object identifiers with types.

3.4.15 link field: An object or object set field.
3.4.16 **object class field type**: A type specified by reference to some field of an information object class. In Rec. ITU-T X.682 | ISO/IEC 8824-3, notation is provided to enable this type to be restricted by reference to an information object set of the class.

3.4.17 **primitive field name**: The name specified directly in an information object class definition without use of a link field.

3.4.18 **recursive definition (of a reference name)**: A reference name for which resolution of the reference name, or of the governor of the definition of the reference name, requires resolution of the original reference name.

   **NOTE** – Recursive definition of an information object class is permitted. Recursive definition of an information object or an information object set is forbidden by 11.2 and 12.2 respectively.

3.4.19 **recursive instantiation (of a parameterized reference name)**: An instantiation of a reference name, where resolution of the actual parameters requires resolution of the original reference name.

   **NOTE** – Recursive instantiation of an information object class (including an encoding structure) is permitted. Recursive instantiation of an information object or an information object set is forbidden by 11.2 and 12.2 respectively.

3.4.20 **type field**: A field which contains an arbitrary type.

3.4.21 **value field**: A field which contains a value. Such a field is either of fixed-type or of variable-type. In the former case the type of the value is fixed by the field specification. In the latter case the type of the value is contained in some (specific) type field of the same information object.

3.4.22 **value set field**: A field which contains a non-empty set of values of some type. Such a field is either of fixed-type or of variable-type. In the former case the type of the values is fixed by the field specification. In the latter case the type of the values is contained in some (specific) type field of the same information object.

   **NOTE** – The set of values in a value set field for an information object constitutes a subtype of the specified type.

4 **Abbreviations**

For the purposes of this Recommendation | International Standard, the following abbreviation applies:

   ASN.1  Abstract Syntax Notation One

5 **Convention**

This Recommendation | International Standard employs the notational convention defined in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 5.

6 **Notation**

This clause summarizes the notation defined in this Recommendation | International Standard.

6.1 **Assignments**

The following notations which can be used as alternatives for "Assignment" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 13) are defined in this Recommendation | International Standard:

   – ObjectClassAssignment (see 9.1);
   – ObjectAssignment (see 11.1);
   – ObjectSetAssignment (see 12.1).

6.2 **Types**

6.2.1 The following notations which can be used as alternatives for "BuiltinType" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.2) are defined in this Recommendation | International Standard:

   – ObjectClassFieldType (see 14.1);
   – InstanceOfType (see Annex C).

6.2.2 The following notations which can be used as alternatives for "ReferencedType" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.3) are defined in this Recommendation | International Standard:

   – TypeFromObject (see clause 15);
6.3 Values

6.3.1 The following notation which can be used as an alternative for "Value" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.7) is defined in this Recommendation | International Standard:

- ObjectClassFieldValue (see 14.6);

6.3.2 The following notation which can be used as an alternative for "BuiltinValue" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.9) is defined in this Recommendation | International Standard:

- InstanceOfValue (see Annex C).

6.3.3 The following notation which can be used as an alternative for "ReferencedValue" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.11) is defined in this Recommendation | International Standard:

- ValueFromObject (see clause 15).

6.4 Elements

6.4.1 The following notation which can be used as an alternative for "Elements" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, 50.5) is defined in this Recommendation | International Standard:

- ObjectSetElements (see 12.10).

7 ASN.1 lexical items

In addition to the lexical items specified in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 12, this Recommendation | International Standard makes use of the lexical items specified in the following subclauses. The general rules applicable to these lexical items are as defined in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.1. These new lexical items make use of the ASN.1 character set, as specified in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 11, and in addition the character ampersand ("&").

NOTE – The Note in Rec. ITU-T X.680 | ISO/IEC 8824-1, 11.1, also applies to the lexical items specified in 7.1 to 7.9 below.

7.1 Information object class references

Name of lexical item – objectclassreference

An "objectclassreference" shall consist of a sequence of characters as specified for a "typereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.2, except that no lower-case letters shall be included.

7.2 Information object references

Name of lexical item – objectreference

An "objectreference" shall consist of a sequence of characters as specified for a "valuereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.4.

7.3 Information object set references

Name of lexical item – objectsetreference

An "objectsetreference" shall consist of a sequence of characters as specified for a "typereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.2.

7.4 Type field references

Name of lexical item – typefieldreference

A "typefieldreference" shall consist of an ampersand ("&") immediately followed by a sequence of characters as specified for a "typereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.2.

7.5 Value field references

Name of lexical item – valuefieldreference
A "valuefieldreference" shall consist of an ampersand ("&") immediately followed by a sequence of characters as specified for a "valuereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.4.

7.6 Value set field references
Name of lexical item – valuesetfieldreference
A "valuesetfieldreference" shall consist of an ampersand ("&") immediately followed by a sequence of characters as specified for a "typereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.2.

7.7 Object field references
Name of lexical item – objectfieldreference
An "objectfieldreference" shall consist of an ampersand ("&") immediately followed by a sequence of characters as specified for an "objectreference" in 7.2.

7.8 Object set field references
Name of lexical item – objectsetfieldreference
An "objectsetfieldreference" shall consist of an ampersand ("&") immediately followed by a sequence of characters as specified for an "objectsetreference" in 7.3.

7.9 Word
Name of lexical item – word
A "word" shall consist of a sequence of characters as specified for a "typereference" in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.2.1, except that no lower-case letters or digits shall be included.

7.10 Additional keywords
The names CLASS, INSTANCE, SYNTAX and UNIQUE are listed in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.38, as reserved words.

8 Referencing definitions
8.1 The constructs:

\[
\text{DefinedObjectClass} ::= \\
\quad \text{ExternalObjectClassReference} \\
\quad | \quad \text{objectclassreference} \\
\quad | \quad \text{UsefulObjectClassReference}
\]

\[
\text{DefinedObject} ::= \\
\quad \text{ExternalObjectReference} \\
\quad | \quad \text{objectreference}
\]

\[
\text{DefinedObjectSet} ::= \\
\quad \text{ExternalObjectSetReference} \\
\quad | \quad \text{objectsetreference}
\]

are used to reference class, information object, and information object set definitions, respectively.

8.2 References to information objects and information object sets have a governing class. It is a requirement that the referenced information object and the information objects in the referenced information object set shall be of the governing class or one obtained from it by simple reference assignment. There is no equivalent of "value mappings" (see Rec. ITU-T X.680 | ISO/IEC 8824-1, Annex C) specified for information objects, so the above statement means that the information object or information object set shall be defined using the same information object class reference as is used as the governor (or one obtained from it by simple reference assignment). Two identical (but textually distinct) instances of the information object class notation do not identify the same information object class for the purposes of this requirement.
8.3 Except as specified in Rec. ITU-T X.680 | ISO/IEC 8824-1, 13.16, the "objectclassreference", "objectreference", and "objectsetreference" alternatives shall only be used within the module in which a class or information object or information object set is assigned (see 9.1, 11.1 and 12.1) to that reference.

The "ExternalObjectClassReference", "ExternalObjectReference", and "ExternalObjectSetReference" alternatives are defined as follows:

$$\text{ExternalObjectClassReference ::= modulereference "." objectclassreference}$$

$$\text{ExternalObjectReference ::= modulereference "." objectreference}$$

$$\text{ExternalObjectSetReference ::= modulereference "." objectsetreference}$$

These alternatives shall not be used unless the corresponding "objectclassreference", "objectreference", or "objectsetreference" has been assigned a class or information object or information object set (see 9.1, 11.1 and 12.1) within the module (different from the referencing module) identified by the corresponding "modulereference". It is that class or information object or information object set respectively which is referenced.

8.4 The "UsefulObjectClassReference" alternative of "DefinedObjectClass" is defined as follows:

$$\text{UsefulObjectClassReference ::= TYPE-IDENTIFIER | ABSTRACT-SYNTAX}$$

of which the first alternative is specified in Annex A, and the second in Annex B.

NOTE – The names TYPE-IDENTIFIER and ABSTRACT-SYNTAX are listed in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.38, as reserved words.

9 Information object class definition and assignment

9.1 The construct "ObjectClassAssignment" is used to assign an information object class to a reference name ("objectclassreference"). This construct is one of the alternatives for "Assignment" in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 13, and is defined as follows:

$$\text{ObjectClassAssignment ::= objectclassreference "::=" ObjectClass}$$

9.2 The information object class is that defined by the construct "ObjectClass":

$$\text{ObjectClass ::= DefinedObjectClass | ObjectClassDefn | ParameterizedObjectClass}$$

If the "ObjectClass" is a:

a) "DefinedObjectClass", then the class definition is the same as that of the class referred to;

b) "ObjectClassDefn", then the class is defined as described in 9.3;

c) "ParameterizedObjectClass", then the class is defined as described in Rec. ITU-T X.683 | ISO/IEC 8824-4, 9.2.

9.3 Every class is ultimately defined by an "ObjectClassDefn":

$$\text{ObjectClassDefn ::= CLASS \{ " FieldSpec " | " + " \} WithSyntaxSpec?}$$
WithSyntaxSpec ::= WITH SYNTAX SyntaxList

This notation allows the definer of a class to provide the named field specifications, each of which is a "FieldSpec", as defined in 9.4. Optionally, the definer can provide an information object definition syntax ("SyntaxList"), as defined in 10.5. The definer of the class may also specify semantics associated with the definition of the class.

9.4 Each "FieldSpec" specifies and names one of the fields which shall or may be associated with instances of the class:

FieldSpec ::=  
  TypeFieldSpec  
  | FixedTypeValueFieldSpec  
  | VariableTypeValueFieldSpec  
  | FixedTypeValueSetFieldSpec  
  | VariableTypeValueSetFieldSpec  
  | ObjectFieldSpec  
  | ObjectSetFieldSpec

The various alternatives for "FieldSpec" are specified in the following subclauses.

9.5 A "TypeFieldSpec" specifies that the field is a type field (see 3.4.20):

TypeFieldSpec ::=  
  typefieldreference  
  TypeOptionalitySpec?

TypeOptionalitySpec ::= OPTIONAL | DEFAULT Type

The name of the field is "typefieldreference". If the "TypeOptionalitySpec" is absent, all information object definitions for that class are required to include a specification of a type for that field. If OPTIONAL is present, then the field can be left undefined. If DEFAULT is present, then the following "Type" provides the default setting for the field if it is omitted in a definition.

9.6 A "FixedTypeValueFieldSpec" specifies that the field is a fixed-type value field (see 3.4.21):

FixedTypeValueFieldSpec ::=  
  valuefieldreference  
  Type  
  UNIQUE ?  
  ValueOptionalitySpec ?

ValueOptionalitySpec ::= OPTIONAL | DEFAULT Value

The name of the field is "valuefieldreference". The "Type" construct specifies the type of the value contained in the field. The "ValueOptionalitySpec", if present, specifies that the value may be omitted in an information object definition, or, in the DEFAULT case, that omission produces the following "Value", which shall be of that type. The presence of the keyword UNIQUE specifies that this field is an identifier field as defined in 3.4.8 (see also Rec. ITU-T X.682 | ISO/IEC 8824-3, 10.20). If the keyword is present, the "ValueOptionalitySpec" shall not be "DEFAULT Value".

9.7 Where a value is assigned for an identifier field, that value is required to be unambiguous within any defined information object set.

9.8 A "VariableTypeValueFieldSpec" specifies that the field is a variable-type value field (see 3.4.21):

VariableTypeValueFieldSpec ::=  
  valuefieldreference  
  FieldName  
  ValueOptionalitySpec?

The name of the field is "valuefieldreference". The "FieldName" (see 9.14), which is relative to the class being specified, shall be that of a type field; the type field which is either in the same information object as the value field, or is linked by the chain of object fields whose references appear in the "FieldName", will contain the type of the value. (All link fields whose field references appear in the "FieldName" shall be object fields.) The "ValueOptionalitySpec", if present, specifies that the value may be omitted in an information object definition, or, in the DEFAULT case, that omission produces the following "Value". The "ValueOptionalitySpec" shall be such that:

a) if the type field denoted by the "FieldName" has a "TypeOptionalitySpec" of OPTIONAL, then the "ValueOptionalitySpec" shall also be OPTIONAL, and
b) if the "ValueOptionalitySpec" is "DEFAULT Value", then the type field denoted by the "FieldName" shall have a "TypeOptionalitySpec" of "DEFAULT Type", and "Value" shall be a value of that type.

9.9 A "FixedTypeValueSetFieldSpec" specifies that the field is a fixed-type value set field (see 3.4.22):

```
FixedTypeValueSetFieldSpec ::= 
  valuesetfieldreference 
  Type 
  ValueSetOptionalitySpec ?
```

```
ValueSetOptionalitySpec ::= OPTIONAL | DEFAULT ValueSet
```

NOTE – "ValueSet" is defined in Rec. ITU-T X.680 | ISO/IEC 8824-1, 16.6 and 16.7, and allows the explicit listing (in curly braces) of the set of values, or the use of a "typereference" for a subtype of the "Type".

The name of the field is "valuesetfieldreference". The "Type" construct specifies the type of the values contained in the field. The "ValueSetOptionalitySpec", if present, specifies that the field may be unspecified in information object definition, or, in the DEFAULT case, that omission produces the following "ValueSet", which shall be a subtype of that type.

9.10 A "VariableTypeValueSetFieldSpec" specifies that the field is a variable-type value set field (see 3.4.22):

```
VariableTypeValueSetFieldSpec ::= 
  valuesetfieldreference 
  FieldName 
  ValueSetOptionalitySpec?
```

The name of the field is "valuesetfieldreference". The "FieldName" (see 9.14), which is relative to the class being specified, shall be that of a type field; the type field which is either in the same information object as the value set field, or is linked by the chain of object fields whose references appear in the "FieldName", will contain the type of the values. (All link fields whose field references appear in the "FieldName" shall be object fields.) The "ValueSetOptionalitySpec", if present, specifies that the value set may be omitted in an information object definition, or, in the DEFAULT case, that omission produces the following "ValueSet". The "ValueSetOptionalitySpec" shall be such that:

a) if the type field denoted by the "FieldName" has a "TypeOptionalitySpec" of OPTIONAL, then the "ValueSetOptionalitySpec" shall also be OPTIONAL; and

b) if the "ValueSetOptionalitySpec" is "DEFAULT ValueSet", then the type field denoted by the "FieldName" shall have a "TypeOptionalitySpec" of "DEFAULT Type", and "ValueSet" shall be a subtype of that type.

9.11 An "ObjectFieldSpec" specifies that the field is an information object field (see 3.4.11):

```
ObjectFieldSpec ::= 
  objectfieldreference 
  DefinedObjectClass 
  ObjectOptionalitySpec ?
```

```
ObjectOptionalitySpec ::= OPTIONAL | DEFAULT Object
```

The name of the field is "objectfieldreference". The "DefinedObjectClass" references the class of the object contained in the field (which may be the "ObjectClass" currently being defined). The "ObjectOptionalitySpec", if present, specifies that the field may be unspecified in an information object definition, or, in the DEFAULT case, that omission produces the following "Object" (see 11.3) which shall be of the "DefinedObjectClass".

9.12 An "ObjectSetFieldSpec" specifies that the field is an information object set field (see 3.4.13):

```
ObjectSetFieldSpec ::= 
  objectsetfieldreference 
  DefinedObjectClass 
  ObjectSetOptionalitySpec ?
```

```
ObjectSetOptionalitySpec ::= OPTIONAL | DEFAULT ObjectSet
```

The name of the field is "objectsetfieldreference". The "DefinedObjectClass" references the class of the objects contained in the field. The "ObjectSetOptionalitySpec", if present, specifies that the field may be unspecified in an information object definition, or, in the DEFAULT case, that omission produces the following "ObjectSet" (see 12.3), all of whose objects shall be of "DefinedObjectClass".

9.13 The construct "PrimitiveFieldName" is used to identify a field relative to the class containing its specification:
PrimitiveFieldName ::= typefieldreference | valuefieldreference | valuesetfieldreference | objectfieldreference | objectsetfieldreference

The names of all of the fields specified in the class definition shall be distinct.

9.14 The construct "FieldName" is used to identify a field relative to some class which either contains the field specification directly or which has a chain of link fields to the containing class. The chain is indicated by a list of "PrimitiveFieldName"s separated by periods.

FieldName ::= PrimitiveFieldName "." +

9.15 If there is any chain (of length one or more) of specifications of link fields (see 3.4.15) such that:
   a) the first is in the class which is being defined and is not the field being defined; and
   b) each subsequent one is a field of the class used in defining the previous; and
   c) the last is defined using the class which is being defined,
then at least one of the field specifications shall have an "ObjectOptionalitySpec" or "ObjectSetOptionalitySpec" (as appropriate).

   NOTE – This is to prevent recursive information object class definitions (which are in general permitted) with no finite representation for an information object of that recursive class.

9.16 Examples

An expanded version of the information object class described informally as an example in 3.4.10 could be defined as follows:

OPERATION ::= CLASS
{|&ArgumentType OPTIONAL,
 &ResultType OPTIONAL,
 &Errors ERROR OPTIONAL,
 &Linked OPERATION OPTIONAL,
 &resultReturned BOOLEAN DEFAULT TRUE,
 &operationCode INTEGER UNIQUE |
}

ERROR ::= CLASS
{|&ParameterType OPTIONAL,
 &errorCode INTEGER UNIQUE |
}

NOTE 1 – This example is based upon the operation and error concepts of the Remote Operations standard, but simplified for the present purposes.

NOTE 2 – The fields specified for this class include two type fields (&ArgumentType and &ResultType), two object set fields (&Errors and &Linked) and two value fields (&resultReturned and &operationCode) the latter being an identifier field.

NOTE 3 – Any information object set made up of OPERATIONS must be such that no two objects in the set have the same value for the &operationCode field. (The same applies to object sets of ERRORS.)

NOTE 4 – The OPERATION information object class includes a chain of link fields as described in 9.15 above. The chain is of length one and is formed by the &Linked field, which is specified (recursively) by means of OPERATION. However, this is quite valid, because the field is designated OPTIONAL (see 9.15).

NOTE 5 – Neither of these examples includes a "WithSyntaxSpec". However, corresponding examples which do are provided in 10.13.

10 Syntax List

10.1 It is frequently the case that a single specification defines an information object class, for which many other independent specifications separately define information objects. It can be appropriate for the definer of the class to provide a user-friendly notation for the definition of information objects in that class.

10.2 This clause specifies a notation by which the specifier of an information object class defines the class-specific defined syntax for the specification of information objects of that class.
10.3 The notation is the syntactic construct "SyntaxList", which occurs in the syntactic construct "ObjectClassDefn" (see 9.3).

10.4 A "SyntaxList" specifies the syntax for the definition of a single information object of the class being defined. The syntax appears as the "DefinedSyntax" in the following subclause.

NOTE – It is a property of this specification that the end of any syntactic construct defined by a "SyntaxList" (an instance of "DefinedSyntax") can be determined by:
  a) ignoring ASN.1 comments;
  b) treating character string values as lexical tokens;
  c) expecting an initial "{", matching nested "{" and ""}, and terminating on an unmatched "}".

10.5 The "SyntaxList" specifies the sequence of "DefinedSyntaxToken" that is to appear in the "DefinedSyntax" (see 11.6):

SyntaxList ::= "{" TokenOrGroupSpec empty + "}"

TokenOrGroupSpec ::= RequiredToken | OptionalGroup

OptionalGroup ::= "[" TokenOrGroupSpec empty + "]"

RequiredToken ::= "[" TokenOrGroupSpec empty + "]"

Literal ::= word

PrimitiveFieldName

NOTE 1 – The writer of "SyntaxList" is not given the full power of BNF. Roughly, the notational power is equivalent to that commonly used in specifying command line syntaxes for command interpreters. The list of possible "RequiredToken"s are given in the order they are permitted; one or more consecutive tokens can be made optional by enclosing them in square brackets.

NOTE 2 – When parsing a "SyntaxList", any occurrence of "[" (or "]") is not interpreted as the lexical items "[" (or "]") respectively defined in Rec. ITU-T X.680 | ISO/IEC 8824-1, 12.23 and 12.24, but as two lexical items "]" and "]" (or "]" and "]" respectively).

10.6 A "word" token used as a "Literal" shall not be one of the following:

BIT
BOOLEAN
CHARACTER
CHOICE
DATE
DATE-TIME
DURATION
EMBEDDED
END
ENUMERATED
EXTERNAL
FALSE
INSTANCE
INTEGER
INTERSECTION
MINUS-INFINITY
NULL
OBJECT
OCTET
PLUS-INFINITY
REAL
RELATIVE-OID
SEQUENCE
SET
TIME
TIME-OF-DAY
TRUE
UNION

NOTE – This list comprises only and all those ASN.1 reserved words which can appear as the first lexical item of a "Type", "Value", "ValueSet", "Object" or "ObjectSet", and also the reserved word "END". Use of other ASN.1 reserved words does not cause ambiguity and is permitted. Where the defined syntax is used in an environment in which a "word" is also a "type" or "objectsetreference", the use as a "word" takes precedence.

10.7 A "Literal" specifies the actual inclusion of that "Literal", which is either a "word" or a comma (","), at that position in the defined syntax:

Literal ::= word
10.8 Each "PrimitiveFieldName" specifies the inclusion (at that position in the new syntax) of a "Setting" (see 11.7) for the corresponding field.

10.9 Each "PrimitiveFieldName" of the information object class shall appear precisely once.

10.10 When, in the parse process, an "OptionalGroup" is encountered, and the following lexical item is syntactically acceptable as the first lexical item in the optional group, then that group is assumed to be present. If it is not syntactically acceptable as the first lexical item in the optional group, then that group is assumed to be absent.

NOTE – In order to avoid unexpected effects, designers should normally make the first lexical item in an optional group a "Literal".

10.11 An instance of use of the "DefinedSyntax" is invalid unless it specifies all mandatory fields for the information object class.

10.12 In order to ensure easy parsing of the new syntax and to prevent abuses, the following additional restrictions are placed on the definer of new syntax:

a) Every "OptionalGroup" is required to have at least one "PrimitiveFieldName" or "OptionalGroup" within it.
   NOTE 1 – This is to help prevent the apparent collection of information which is not reflected in any field of the information object.

b) The use of "OptionalGroup"’s shall be such that at no time in the parsing process can a "Setting" appear that could potentially be a setting for more than one "FieldName".

c) If an "OptionalGroup" starts with a "Literal", then the first token following the "OptionalGroup" shall also be a "Literal" and shall be different from the first "Literal" of all immediately preceding "OptionalGroup"’s,

while the following restriction is placed upon the user of the "DefinedSyntax":

d) Whenever a "Literal" is present in a "DefinedSyntax" that occurs in an "OptionalGroup" a "Setting" for a "PrimitiveFieldName" in that "OptionalGroup" shall also be present.
   NOTE 2 – This is to help prevent the apparent collection of information which is not reflected in any field of the information object.
   NOTE 3 – The following example is a legal syntax but restriction d) prevents the user from writing LITERAL without following it by one or both of the optional groups:

   [LITERAL [A &field] [B &field2]]

10.13 Examples

The examples of class definitions from 9.16 above can be equipped with defined syntax to provide a "user-friendly" way of defining instances of the classes (this defined syntax is used in the example in 11.11):

OPERATION ::= CLASS
{  
&ArgumentType OPTIONAL,  
&ResultType OPTIONAL,  
&Errors ERROR OPTIONAL,  
&Linked OPERATION OPTIONAL,  
&resultReturned BOOLEAN DEFAULT TRUE,  
&operationCode INTEGER UNIQUE
}
WITH SYNTAX
{  
[ARGUMENT &ArgumentType]  
[RESULT &ResultType]  
[RETURN RESULT &resultReturned]  
[ERRORS &Errors]  
[LINKED &Linked]  
CODE &operationCode
}

ERROR ::= CLASS
{  
&ParameterType OPTIONAL,  
&errorCode INTEGER UNIQUE
}
WITH SYNTAX
{
  [PARAMETER &ParameterType]
  CODE &errorCode
}

11 Information object definition and assignment

11.1 The syntactic construct "ObjectAssignment" is used to assign an information object of a specified class to a reference name ("objectreference"). This construct is one of the alternatives for "Assignment" in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 13, and is defined as follows:

\[
\text{ObjectAssignment ::= objectreference DefinedObjectClass " ::=" Object}
\]

11.2 There shall be no recursive definition (see 3.4.18) of an "objectreference", and there shall be no recursive instantiation (see 3.4.19) of an "objectreference".

11.3 The information object, which shall be of the class referenced by "DefinedObjectClass", is that defined by the construct "Object":

\[
\text{Object ::= DefinedObject | ObjectDefn | ObjectFromObject | ParameterizedObject}
\]

If the "Object" is a:
   a) "DefinedObject", then the object is the same as that referred to;
   b) "ObjectDefn", then the object is as specified in 11.4;
   c) "ObjectFromObject", then the object is as specified in clause 15;
   d) "ParameterizedObject", then the object is defined as specified in Rec. ITU-T X.683 | ISO/IEC 8824-4, 9.2.

11.4 Every information object is ultimately defined by an "ObjectDefn":

\[
\text{ObjectDefn ::= DefaultSyntax | DefinedSyntax}
\]

The "ObjectDefn" shall be "DefaultSyntax" (see 11.5) if the class definition does not include a "WithSyntaxSpec" and shall be "DefinedSyntax" (see 11.6) if it does include one.

11.5 The "DefaultSyntax" construct is defined as follows:

\[
\text{DefaultSyntax ::= \{" FieldSetting "," * "}\}
\]

\[
\text{FieldSetting ::= PrimitiveFieldName Setting}
\]

There shall be precisely one "FieldSetting" for each "FieldSpec" in the class definition which is not OPTIONAL and does not have a DEFAULT, and at most one "FieldSetting" for each other "FieldSpec". The "FieldSetting"s can appear in any order. The "PrimitiveFieldName" in each "FieldSetting" shall be the name of the corresponding "FieldSpec". The construct "Setting" is specified in 11.7.

11.6 The "DefinedSyntax" construct is defined as follows:

\[
\text{DefinedSyntax ::= \{" DefinedSyntaxToken empty * "}\}
\]

\[
\text{DefinedSyntaxToken ::= Literal | Setting}
\]

The "SyntaxList" in the "WithSyntaxSpec" (see clause 10) determines the sequence of "DefinedSyntaxToken"s that are to appear in the "DefinedSyntax". The construct "Setting" is specified in 11.7; each occurrence specifies the setting for
some field of the information object. The construct "Literal" is defined in 10.7; "Literal"s are present for human readability.

11.7 A "Setting" specifies the setting of some field within an information object being defined:

   Setting ::=  
       Type  
       |  Value  
       |  ValueSet  
       |  Object  
       |  ObjectSet

If the field is:

a) a type field, the "Type" alternative;
b) a value field, the "Value" alternative;
c) a value set field, the "ValueSet" alternative;
d) an information object field, the "Object" alternative;
e) an information object set field, the "ObjectSet" alternative,

shall be selected.

NOTE – The setting is further restricted as described in the appropriate subclause of 9.5 to 9.12 above, and 11.8 to 11.9.

11.8 A setting of a variable-type value field shall be a value of the type specified by the appropriate type field of the same or linked object (that is, the value notation for an open type is not employed).

11.9 A setting of a variable-type value set field shall be a value set of the type specified by the appropriate type field of the same or linked object (that is, the value notation for an open type is not employed).

11.10 Examples (Default Syntax)

Given the information object class definitions of 9.16 above (which do not include a "WithSyntaxSpec") instances of the classes are defined using the "DefaultSyntax". For example (an expanded version of the example given in 3.4.9):

```plaintext
invertMatrix OPERATION ::=  
    {  
        &ArgumentType  Matrix,  
        &ResultType  Matrix,  
        &Errors     {determinantIsZero},  
        &operationCode  7  
    }  

determinantIsZero ERROR ::=  
    {  
        &errorCode  1  
    }
```

11.11 Examples (Defined Syntax)

In 10.13, the example classes are provided "WithSyntaxSpec" and thus, instances of the classes are defined using the "DefinedSyntax". The examples of 11.10 would be written thus:

```plaintext
invertMatrix OPERATION ::=  
    {  
        ARGUMENT Matrix  
        RESULT  
        ERRORS {determinantIsZero}  
        CODE  7  
    }  

determinantIsZero ERROR ::=  
    {  
        CODE  1  
    }
```
12 Information object set definition and assignment

12.1 The syntactic construct "ObjectSetAssignment" is used to assign a set of information objects of a specified class to a reference name ("objectsetreference"). This construct is one of the alternatives for "Assignment" in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 13, and is defined as follows:

ObjectSetAssignment ::= objectsetreference DefinedObjectClass "::=
ObjectSet

12.2 There shall be no recursive definition (see 3.4.18) of an "objectsetreference", and there shall be no recursive instantiation (see 3.4.19) of an "objectsetreference".

12.3 The information object set, which shall be of the class referenced by "DefinedObjectClass", is defined by the construct "ObjectSet":

ObjectSet ::= "{" ObjectSetSpec "}"

ObjectSetSpec ::= RootElementSetSpec |
 RootElementSetSpec "," ",..."
 |
 ",...
 |
 ",..." "," AdditionalElementSetSpec
 |
 RootElementSetSpec "," ",...", AdditionalElementSetSpec

"RootElementSetSpec" and "AdditionalElementSetSpec" are specified in Rec. ITU-T X.680 | ISO/IEC 8824-1 and enable an information object set to be specified in terms of information objects or sets thereof of the governing class. There shall be at least one information object in the set unless the third alternative ("..." ) of "ObjectSetSpec" is specified. In the latter case, the presence of the ellipses is an indication that the object set is initially empty but will have objects dynamically added to it by the application program.

NOTE 1 – The elements that are referenced by "ObjectSetSpec" are the union of the elements referenced by the "RootElementSetSpec" and "AdditionalElementSetSpec".

NOTE 2 – Unlike extensible types such as SET or SEQUENCE, or extensible subtype constraints, which are static in respect to the set of "understood" values being set for each version of the ASN.1 specification, an extensible object set can grow and contract dynamically within a given version. Indeed, it may expand and contract within a given instance of use of an application program as it dynamically defines or undefines objects (see Annex E for further discussion).

12.4 The result of set arithmetic involving information object sets that are extensible is specified in Rec. ITU-T X.680 | ISO/IEC 8824-1, clause 50.

12.5 If an extensible information object set, A, is referenced in the definition of another object set, B, its extension marker and its extensions are inherited by B.

12.6 If a "ValueSetFromObjects" (see clause 15) is defined using an extensible information object set, the resulting value set does not inherit the extension marker from that information object set.

12.7 If a type is constrained by a table constraint (see Rec. ITU-T X.682 | ISO/IEC 8824-3, 10.3) and the object set referenced in the table constraint is extensible, the type does not inherit the extension marker from the object set. If the type is meant to be extensible, then an extension marker shall be explicitly added to its "ElementSetSpecs".

12.8 If a type is constrained by an information object set that is not extensible, then a conforming implementation shall support all the information objects in that set, and shall not generate encodings using information objects not in the set.

12.9 If a type is constrained by an information object set that is extensible, then a conforming implementation may choose to support an information object in either the root or the extensions as a local decision on each instance of the constrained type. It shall not generate encodings using other information objects with values for any UNIQUE field which are those of objects in either the root or the extensions of the extensible information object set, but may otherwise generate encodings for any information object of the required class.

NOTE – In order to avoid clashes with possible future extensions or with extensions added by other implementations, the freedom to add arbitrary encodings should only be exercised if there is a UNIQUE field of type OBJECT IDENTIFIER and the encoding contains a value of that object identifier that has been allocated for such use.

12.10 The notation for "ObjectSetElements" is as follows:
ObjectSetElements ::=  
  Object  
  |  DefinedObjectSet  
  |  ObjectSetFromObjects  
  |  ParameterizedObjectSet  

The elements specified by this notation are determined by which alternative is employed, as follows:

a) If the "Object" alternative is used, then only the object so designated is specified. That object shall be of the governing class.

b) If any of the remaining alternatives is used, then all of the objects of the set so designated are specified. The objects shall be of the governing class. If the "DefinedObjectSet" alternative is used, the object set is that referred to. If the "ObjectSetFromObjects" alternative is used then the object set is as specified in clause 15. If the "ParameterizedObjectSet" alternative is used, then the object set is as specified in Rec. ITU-T X.683 | ISO/IEC 8824-4, 9.2.

12.11 Example

The information object set described informally in the Note in 3.4.12 can be specified as follows:

MatrixOperations OPERATION ::=  
  {  
    invertMatrix  
    |  addMatrices  
    |  subtractMatrices  
    |  multiplyMatrices  
  }

13 Associated tables

13.1 Every information object or information object set can be viewed as a table: its associated table. Each cell of the associated table corresponds to the setting of some field of an information object, or is empty. The set of columns of the associated table is determined by the class to which the object or objects belong; the set of rows, however, is determined by the object or objects involved.

13.2 Given the definition of a class, the set of columns is determined as follows:

a) There is one column for each field specification in the class definition. Each such column is named by the corresponding "PrimitiveFieldName".

b) There is an additional set of columns corresponding to each link field specification. This set of columns is determined by the application of these rules for the governing class of the link field, except that their names are prefixed by the "PrimitiveFieldName" of the link field, and a period (".").

NOTE – These rules are recursive, and are such that if a class is directly or indirectly self-referential the set of columns is not finite. This is not prohibited.

13.3 Given an information object of some class, the associated table is that which would result from applying 13.4 to the object set containing just that object.

13.4 Given an information object set of some class, the set of rows in the associated table are those which would result from performing the following recursive procedure:

a) Start with one row for each object in the object set. In each such row, the cells in the columns named by "PrimitiveFieldName"s will correspond to the setting of the appropriate field in the object, while all other cells will be empty.

b) For each link field appearing in some row in the set:

1) Generate the (subordinate) associated table of the contents of the link field.

2) Next, replace the row in which the link field appears by a collection of rows, one for each row of the subordinate associated table. Each of the rows in this collection is the same as that being replaced, except that the cells from the selected row of the subordinate associated table are used to fill the corresponding cells, hitherto empty, whose "FieldName"s are prefixed by the link field's "PrimitiveFieldName".

NOTE – These rules are recursive, and are such that if an information object is directly or indirectly self-referential, the procedure will not terminate. This is not prohibited. In practice it is only necessary to know the contents of cells with names of a finite length, and a bounded procedure can be devised for this.
13.5 Examples of valid "FieldName"s

The following "FieldName"s are among those which are valid for the associated table for information objects or information object sets of class OPERATION (as defined in 10.13):

- &ArgumentType
- &Errors.&Parameter
- &Errors.&errorCode
- &Linked.&ArgumentType
- &Linked.&Linked.&operationCode
The notation for defining a value of this type shall be "ObjectClassFieldValue", or when used in an "XMLTypedValue", an "XMLObjectClassFieldValue":

\[
\text{ObjectClassFieldValue ::= OpenTypeFieldVal | FixedTypeFieldVal}
\]

\[
\text{OpenTypeFieldVal ::= Type "::" Value}
\]

\[
\text{FixedTypeFieldVal ::= BuiltinValue | ReferencedValue}
\]

\[
\text{XMLObjectClassFieldValue ::= XMLOpenTypeFieldVal | XMLFixedTypeFieldVal}
\]

\[
\text{XMLOpenTypeFieldVal ::= XMLTypedValue | xmlhstring}
\]

\[
\text{XMLFixedTypeFieldVal ::= XMLBuiltinValue}
\]

14.7 For a fixed-type value or value set field defined by an "ObjectClassFieldType", the "FixedTypeFieldVal" or "XMLFixedTypeFieldVal" shall be used, and shall be a value of the "Type" specified in the definition of the information object class.

14.8 For a type field or a variable-type value or value set field defined by an "ObjectClassFieldType", the "OpenTypeFieldVal" shall be used in any "Value". The "Type" in the "OpenTypeFieldVal" shall be any ASN.1 type, and the "Value" shall be any value of that type.

14.9 For a type field or a variable-type value or value set field defined by an "ObjectClassFieldType", the "XMLOpenTypeFieldVal" shall be used in any "XMLValue".

14.9.1 When used in an ASN.1 module, the type identified by the "XMLTypedValue" shall be any ASN.1 type (but see Rec. ITU-T X.680 | ISO/IEC 8824-1, 14.3) and the "XMLValue" in the "XMLTypedValue" shall be any value of that type.

NOTE – When the notation is used as specified in Rec. ITU-T X.693 | ISO/IEC 8825-4, 8.5, the type of the "XMLTypedValue" in an "XMLOpenTypeFieldVal" is identified by the protocol (for example, by a component relation constraint), the "NonParameterizedTypeName" in the "XMLTypedValue" is derived from this, and the "XMLValue" is a value of this type.

14.9.2 The "xmlhstring" alternative of "XMLOpenTypeFieldVal" shall not be used in an ASN.1 module. This alternative can be used only as specified in Rec. ITU-T X.693 | ISO/IEC 8825-4, 8.5, when the type is identified by the protocol and the "xmlhstring" is the hexadecimal value for the encoding of that type, using some (unspecified) encoding rules.

14.10 The character sequence in the "xmlasn1typename" item for the XML value notation (for an "ObjectClassFieldType") which is a "XMLFixedTypeFieldVal" shall be the character sequence for the "Type" specified in the information object class. The XML value notation for sequence-of and set-of (see Rec. ITU-T X.680 | ISO/IEC 8824-1, Table 5) shall be determined by the "Type" specified in the information object class.

14.11 The character sequence in the "xmlasn1typename" item for the XML value notation (for an "ObjectClassFieldType") which is an "XMLOpenTypeFieldVal" shall be "OPEN_TYPE". The XML value notation for sequence-of and set-of (see Rec. ITU-T X.680 | ISO/IEC 8824-1, Table 5) shall be "XMLDelimitedItemList".

14.12 For an "XMLOpenTypeFieldVal", if the "Type" specified in the information object (after ignoring any tags) is a "typereference" or an "ExternalTypeReference", then the "NonParameterizedTypeName" shall be that "typereference" or "ExternalTypeReference", otherwise it shall be the "xmlasn1typename" specified in Rec. ITU-T X.680 | ISO/IEC 8824-1, Table 4, corresponding to the built-in type specified in the information object, after application of the subclauses of Rec. ITU-T X.680 | ISO/IEC 8824-1, 26.10, if applicable.

14.13 Example usage of "ObjectClassFieldType"

Each of the following examples is based on the example in 10.13 and shows (a) a possible "ObjectClassFieldType", (b) the type to which the example type (a) is equivalent (when used unconstrained), and (c) the notation for an example value of that type.

1
(a) OPERATION.&operationCode
(b) INTEGER
(c) 7

2
(a) OPERATION.&ArgumentType
(b) open type
Matrix:
\[
\begin{bmatrix}
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{bmatrix}
\]

(a) \texttt{OPERATION.Linked.Linked.Errors.ErrorCode}
(b) \texttt{INTEGER}
(c) 1

(a) \texttt{OPERATION.Linked.ArgumentType}
(b) \texttt{open type}
(c) \texttt{UniversalString:\{planckConstant, " and ", hamiltonOperator\}}

15 Information from objects

15.1 Information from the column of the associated table for an object or an object set can be referenced by the various cases of the "InformationFromObjects" notation:

\[
\text{InformationFromObjects ::=} \\
\quad \text{ValueFromObject} \\
\quad \text{ValueSetFromObjects} \\
\quad \text{TypeFromObject} \\
\quad \text{ObjectFromObject} \\
\quad \text{ObjectSetFromObjects}
\]

\[
\text{ValueFromObject ::=} \\
\quad \text{ReferencedObjects }".\" \\
\quad \text{FieldName}
\]

\[
\text{ValueSetFromObjects ::=} \\
\quad \text{ReferencedObjects }".\" \\
\quad \text{FieldName}
\]

\[
\text{TypeFromObject ::=} \\
\quad \text{ReferencedObjects }".\" \\
\quad \text{FieldName}
\]

\[
\text{ObjectFromObject ::=} \\
\quad \text{ReferencedObjects }".\" \\
\quad \text{FieldName}
\]

\[
\text{ObjectSetFromObjects ::=} \\
\quad \text{ReferencedObjects }".\" \\
\quad \text{FieldName}
\]

\[
\text{ReferencedObjects ::=} \\
\quad \text{DefinedObject} \\
\quad \text{ParameterizedObject} \\
\quad \text{DefinedObjectSet} \\
\quad \text{ParameterizedObjectSet}
\]

NOTE – The production "InformationFromObjects" is provided to aid understanding and for use in the English text. It is not referenced elsewhere in this Recommendation | International Standard.

15.2 This notation references the total contents of the referenced column of the associated table for the "ReferencedObjects".

15.3 Depending on the form of the "ReferencedObjects" and the "FieldName", this notation can denote a value, a value set, a type, an object, or an object set. These five cases are denoted by the constructs "ValueFromObject", "ValueSetFromObjects", "TypeFromObject", "ObjectFromObject", and "ObjectSetFromObjects" respectively. Each of these constructs is a special case of "InformationFromObjects".
15.4 The "InformationFromObjects" production can be divided into two parts. The first part is formed by deleting the final (or only) "PrimitiveFieldName" and its preceding period. If the first part denotes an object or an object set, then 15.5 to 15.13 apply. Otherwise the notation is illegal. The second part is the final (or only) "PrimitiveFieldName".

NOTE – (Tutorial) Given the following definition:

\texttt{obj. \&a. \&b. \&c. \&d}

the first part in the definition is \texttt{obj. \&a. \&b. \&c} and the second part is \texttt{\&d}.

15.5 The first column of Table 1 indicates the first part defined in 15.4. The second column indicates the second part defined in 15.4. The third column indicates which (if any) of the five cases of "InformationFromObjects" (listed in 15.3) applies.

<table>
<thead>
<tr>
<th>The first part of InformationFromObjects</th>
<th>The second part of InformationFromObjects</th>
<th>Construct</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>fixed-type value field</td>
<td>&quot;ValueFromObject&quot;</td>
</tr>
<tr>
<td>object</td>
<td>variable-type value field</td>
<td>&quot;ValueFromObject&quot;</td>
</tr>
<tr>
<td>object</td>
<td>fixed-type value set field</td>
<td>&quot;ValueSetFromObjects&quot;</td>
</tr>
<tr>
<td>object</td>
<td>variable-type value set field</td>
<td>not permitted</td>
</tr>
<tr>
<td>object</td>
<td>object field</td>
<td>&quot;ObjectFromObject&quot;</td>
</tr>
<tr>
<td>object</td>
<td>object set field</td>
<td>&quot;ObjectSetFromObject&quot;</td>
</tr>
<tr>
<td>object</td>
<td>fixed-type value field</td>
<td>&quot;ValueSetFromObjects&quot;</td>
</tr>
<tr>
<td>object</td>
<td>variable-type value field</td>
<td>not permitted</td>
</tr>
<tr>
<td>object</td>
<td>fixed-type value set field</td>
<td>&quot;ValueSetFromObjects&quot;</td>
</tr>
<tr>
<td>object</td>
<td>variable-type value set field</td>
<td>not permitted</td>
</tr>
<tr>
<td>object</td>
<td>object field</td>
<td>&quot;ObjectSetFromObject&quot;</td>
</tr>
<tr>
<td>object</td>
<td>object set field</td>
<td>&quot;ObjectSetFromObjects&quot;</td>
</tr>
</tbody>
</table>

15.6 For a "TypeFromObject" and a "ValueSetFromObjects", the XML value notation for sequence-of and set-of (see Rec. ITU-T X.680 | ISO/IEC 8824-1, Table 5) and the "xmlasn1typename" (if required) shall be determined by the "Type" specified in the information object(s), after application of the subclauses of Rec. ITU-T X.680 | ISO/IEC 8824-1, 26.10, if applicable.

15.7 If the first part references an object and the second part references a fixed-type value set field, the "ValueSetFromObjects" is equivalent to a type with a SimpleTableConstraint. The type is "\texttt{<ClassName>.<FieldName>}" where "\texttt{<ClassName>}" is the Information Object Class of the object, and "\texttt{<FieldName>}" is the field referenced by the second part. The SimpleTableConstraint consists of an object set containing only the object referenced by the first part. The object set is not extensible.

15.8 If the first part references an object set and the second part references a fixed-type value field or a fixed-type value set field, the "ValueSetFromObjects" is equivalent to a type with a "SimpleTableConstraint". The type is "\texttt{<ClassName>.<FieldName>}" where "\texttt{<ClassName>}" is the information object class of the object set referenced by the first part, and "\texttt{<FieldName>}" is the field referenced by the second part. The "SimpleTableConstraint" consists of the object set referenced by the first part.

15.9 A "ValueSetFromObjects" can be defined using an information object set that is initially empty but extensible. Such an information object set shall have at least one object in it whenever a value set defined in terms of it is used by an application. The one or more objects present in the information object set shall be sufficient to satisfy the requirements of Rec. ITU-T X.682 | ISO/IEC 8824-3, 10.6.

15.10 If object sets are involved and the final "PrimitiveFieldName" identifies an object set field, then "ObjectSetFromObjects" is the union of the selected object sets.

15.11 As shown in Table 1, the notation is not permitted if an object set is involved and the final "PrimitiveFieldName" identifies a variable-type value or value set field or a type field.
15.12 Use of the "ObjectSetFromObjects" notation when all cells in the column being referenced are empty denotes an empty inextensible object set. Empty inextensible object sets are allowed in general (such as in set arithmetic) but shall not be used directly in a table constraint.

NOTE – Subclause 15.13 implies that a "ValueSetFromObjects" may not be extracted from an empty inextensible object set.

15.13 Use of the "InformationFromObjects" notation (except when it is an "ObjectSetFromObjects") is not permitted if all cells in the column being referenced are empty, except when it is used to directly define a field of an information object which is \texttt{OPTIONAL} (or \texttt{DEFAULT}), which results in the field becoming empty (or default).

15.14 Example information from objects

Given the definitions in the examples of 11.10, 11.11 and 12.11, the following constructs (in the left column) are valid, and can be used as equivalent to the expression in the right column.

**"ValueFromObject"**

| invertMatrix.&\&operationCode | 7 |
| deterministIsZero.&\&errorCode | 1 |

**"TypeFromObject"**

| invertMatrix.&\&ArgumentType | Matrix |

**"ValueSetFromObjects"**

| invertMatrix.&\&Errors.&\&errorCode | \{1\} |
| MatrixOperations.&\&operationCode | \{7 | and others\} |

**"ObjectSetFromObjects"**

| invertMatrix.&\&Errors | \{deterministIsZero\} |
| MatrixOperations.&\&Errors | \{deterministIsZero | and others\} |
Annex A

The TYPE-IDENTIFIER information object class
(This annex forms an integral part of this Recommendation | International Standard.)

A.1 This annex specifies a useful information object class, with class reference TYPE-IDENTIFIER.

NOTE – This information object class is the simplest useful class, having just two fields, an identifier field of type OBJECT IDENTIFIER, and a type field which defines the ASN.1 type for carrying all information concerning any particular object in the class. It is defined in this Recommendation | International Standard because of the widespread use of information objects of this form.

A.2 The TYPE-IDENTIFIER information object class is defined as:

\[
\text{TYPE-IDENTIFIER ::= CLASS} \\
\{ \\
\quad &\text{id OBJECT IDENTIFIER UNIQUE,} \\
\quad &\text{&Type} \\
\} \\
\text{WITH SYNTAX {&Type IDENTIFIED BY &id}}
\]

A.3 This class is defined as a “useful” information object class, and is available in any module without the necessity for importing it.

A.4 Example

The body of a Message Handling System (MHS) communication can be defined as:

\[
\text{MHS-BODY-CLASS ::= TYPE-IDENTIFIER} \\
\text{g4FaxBody MHS-BODY-CLASS ::=} \\
\{\text{BIT STRING IDENTIFIED BY {mhsbody 3}}\}
\]

A protocol designer would typically define a component to carry an MHS-BODY-CLASS by specifying the type INSTANCE OF MHS-BODY-CLASS defined in C.10.
Annex B

Abstract syntax definitions

(This annex forms an integral part of this Recommendation | International Standard.)

B.1 This annex specifies a useful information object class, ABSTRACT-SYNTAX, for defining abstract syntaxes.

NOTE – It is recommended that an instance of this information object class be defined whenever an abstract syntax is defined as the values of a single ASN.1 type.

B.2 The ABSTRACT-SYNTAX information object class is defined as:

ABSTRACT-SYNTAX ::= CLASS
{ &id OBJECT IDENTIFIER UNIQUE,
 &Type,
 &property BIT STRING {handles-invalid-encodings(0)} DEFAULT {} }
WITH SYNTAX {
    &Type IDENTIFIED BY &id [HAS PROPERTY &property]
}

The &id field of each ABSTRACT-SYNTAX is the abstract syntax name, while the &Type field contains the single ASN.1 type whose values make up the abstract syntax. The property handles-invalid-encodings indicates that the invalid encodings are not to be treated as an error during the decoding process, and the decision on how to treat such invalid encodings is left up to the application.

B.3 This information object class is defined as being "useful" because it is of general utility, and is available in any module without the necessity for importing it.

B.4 Example

If an ASN.1 type has been defined called XXX-PDU, then an abstract syntax can be specified which contains all the values of XXX-PDU by the notation:

xxx-Abstract-Syntax ABSTRACT-SYNTAX ::= {
    XXX-PDU IDENTIFIED BY {xxx 5}
}

See Rec. ITU-T X.680 | ISO/IEC 8824-1, G.4, for a detailed example of use of the ABSTRACT-SYNTAX information object class.

B.5 It will frequently be the case that an abstract syntax will be defined in terms of a parameterized type (as defined in Rec. ITU-T X.683 | ISO/IEC 8824-4), for example with parameters providing bounds on some components of the protocol. Such parameters, subject to restrictions specified in Rec. ITU-T X.683 | ISO/IEC 8824-4, clause 10, may be resolved at the time of abstract syntax definition, or may be carried forward as parameters of the abstract syntax.
Annex C

The instance-of type

(This annex forms an integral part of this Recommendation | International Standard.)

C.1 This annex specifies type and value notation for the instance-of types (see 3.4.14). Such types are capable of carrying any value from any information object in an information object class defined to be of class TYPE-IDENTIFIER (see Annex A) using an information object class assignment (the information object class reference is specified as part of this notation).

C.2 The "InstanceOfType" notation is referenced in Rec. ITU-T X.680 | ISO/IEC 8824-1, 17.2, as one of the notations that produce a "Type", and is defined as:

\[
\text{InstanceOfType} ::= \text{INSTANCE OF DefinedObjectClass}
\]

NOTE – Rec. ITU-T X.682 | ISO/IEC 8824-3, clause 10, specifies the way in which this type can be constrained by applying a "table constraint", restricting the values of the type to those representing some specific information object set of the class.

C.3 This notation specifies a type which carries the \&id field (an OBJECT IDENTIFIER) and a value of the \&Type field from any instance of the "DefinedObjectClass".

NOTE – This construct will normally be constrained by an object set which will usually be (but is not necessarily) a dummy reference name as defined in Rec. ITU-T X.683 | ISO/IEC 8824-4, 8.3-8.11, with the actual object set defined elsewhere.

C.4 All instance-of types have a tag which is universal class, number 8.

NOTE – This is the same universal tag as for external type, and use of the instance-of type can be bit-compatible with the external type when the basic encoding rules for ASN.1 are in use.

C.5 The instance-of type has an associated sequence type which is used for defining values and subtypes of the instance-of type.

NOTE – Where this type is constrained by the constraint notation of Rec. ITU-T X.682 | ISO/IEC 8824-3, the associated sequence type is also constrained. The constraints on the associated sequence type resulting from a constraint on the instance-of type are specified in Rec. ITU-T X.682 | ISO/IEC 8824-3, Annex A.

C.6 The associated sequence type is assumed to be defined within an environment in which EXPLICIT TAGS is in force.

C.7 The associated sequence type shall be:

\[
\text{SEQUENCE} \{
\text{type-id} \ <\text{DefinedObjectClass}\.\&id, \\
\text{value} \ [0]\ <\text{DefinedObjectClass}\.\&Type
\}
\]

where "<DefinedObjectClass>" is replaced by the particular "DefinedObjectClass" used in the "InstanceOfType" notation.

C.8 The value notation "InstanceOfValue" and "XMLInstanceOfValue" for an "InstanceOfType" notation shall be the value notation for the associated sequence type.

\[
\text{InstanceOfValue ::= Value}
\]

\[
\text{XMLInstanceOfValue ::= XMLValue}
\]

C.9 The XML value notation for sequence-of and set-of (see Rec. ITU-T X.680 | ISO/IEC 8824-1, Table 5) shall be "XMLDelimitedItemList".

C.10 Example

An example, building on the example given in A.4, is as follows:

The type:

\[
\text{INSTANCE OF MHS-BODY-CLASS}
\]
has an associated sequence type of:

```
SEQUENCE
{
  type-id      MHS-BODY-CLASS.&id,
  value       [0] MHS-BODY-CLASS.&Type
}
```

An example of the application of a table constraint to this type can be found in Rec. ITU-T X.682 | ISO/IEC 8824-3, Annex A.
Annex D

Examples

(This annex does not form an integral part of this Recommendation | International Standard.)

D.1 Example usage of simplified OPERATION class

Given the following simple definition of the OPERATION and ERROR information object classes:

```plaintext
OPERATION ::= CLASS
{ 
  &ArgumentType OPTIONAL,
  &ResultType OPTIONAL,
  &Errors ERROR OPTIONAL,
  &Linked OPERATION OPTIONAL,
  &resultReturned BOOLEAN DEFAULT TRUE,
  &operationCode INTEGER UNIQUE
}

WITH SYNTAX
{ 
  [ARGUMENT &ArgumentType]
  [RESULT &ResultType]
  [RETURN RESULT &resultReturned]
  [ERRORS &Errors]
  [LINKED &Linked]
  CODE &operationCode
}

ERROR ::= CLASS
{ 
  &ParameterType OPTIONAL,
  &errorCode INTEGER UNIQUE
}

WITH SYNTAX
{ 
  [PARAMETER &ParameterType]
  CODE &errorCode
}
```

We can define the following object set that contains two OPERATION objects:

```plaintext
My-Operations OPERATION ::= { operationA | operationB }
```

```plaintext
operationA OPERATION ::= {
  ARGUMENT INTEGER
  ERRORS { { PARAMETER INTEGER CODE 1000 } | { CODE 1001 } }
  CODE 1
}
```

```plaintext
operationB OPERATION ::= {
  ARGUMENT IA5String
  RESULT BOOLEAN
  ERRORS { { CODE 1002 } | { PARAMETER IA5String CODE 1003 } }
  CODE 2
}
```

Extraction of the set of the ERROR objects from the object set above is done as follows:

```plaintext
My-OperationErrors ERROR ::= { My-Operations.&Errors }
```

The resulting object set is:

```plaintext
My-OperationErrors ERROR ::= {
  { PARAMETER INTEGER CODE 1000 } |
  { CODE 1001 } |
  { CODE 1002 } |
  { PARAMETER IA5String CODE 1003 }
}
Extraction of the set of error codes of the errors of the operations is done as follows:

\[
\text{My-OperationErrorCodes INTEGER ::= \{ My-Operations.&Errors.&errorCode }\]

The resulting value set is:

\[
\text{My-OperationErrorCodes INTEGER ::= \{ 1000 | 1001 | 1002 | 1003 }\]

**D.2 Example usage of "ObjectClassFieldType"**

The "ObjectClassFieldType" can be used in specification of types, for example:

- "ObjectClassFieldType"s are extracted from this class.
- Only the first five fields can be used in the extraction.

**EXAMPLE-CLASS ::= CLASS {**
  
  &TypeField
  &fixedTypeValueField
  &variableTypeValueField
  &FixedTypeValueSetField
  &VariableTypeValueSetField
  &objectField
  &ObjectSetField
}

**WITH SYNTAX {**
  
  [TYPE-FIELD &TypeField]
  [FIXED-TYPE-VALUE-FIELD &fixedTypeValueField]
  [VARIABLE-TYPE-VALUE-FIELD &variableTypeValueField]
  [FIXED-TYPE-VALUE-SET-FIELD &FixedTypeValueSetField]
  [VARIABLE-TYPE-VALUE-SET-FIELD &VariableTypeValueSetField]
  [OBJECT-FIELD &objectField]
  [OBJECT-SET-FIELD &ObjectSetField]
}

**SIMPLE-CLASS ::= CLASS {**
  
  &value INTEGER
}

**WITH SYNTAX {**
  
  &value
}

- This type contains components which are specified using
- "ObjectClassFieldType" notation. In case of type fields and
- variable-type value and value set fields the resulting
- component type is an open type. In case of fixed-type value and
- value set fields the resulting component type is "INTEGER"
- **NOTE** – Constraints are omitted from all the following uses of
- "ObjectClassFieldType"; you normally will use constraints when
- referencing an "ObjectClassFieldType".

**ExampleType ::= SEQUENCE {**
  
  openTypeComponent1 EXAMPLE-CLASS.&TypeField,
  integerComponent1 EXAMPLE-CLASS.&fixedTypeValueField,
  openTypeComponent2 EXAMPLE-CLASS.&variableTypeValueField,
  integerComponent2 EXAMPLE-CLASS.&FixedTypeValueSetField,
  openTypeComponent3 EXAMPLE-CLASS.&VariableTypeValueSetField
}

**exampleValue ExampleType ::= {**
  
  openTypeComponent1 BOOLEAN : TRUE,
  integerComponent1 123,
  openTypeComponent2 IA5String : "abcdef",
  integerComponent2 456,
  openTypeComponent3 BIT STRING : '0101010101'B
}

**D.3 Illustrate usage of objects and object sets**

The following uses the object class defined in D.2:
objectA EXAMPLE-CLASS ::= {
  FIXED-TYPE-VALUE-FIELD 123
  FIXED-TYPE-VALUE-SET-FIELD { 1 | 2 | 3 }
  OBJECT-FIELD { 1 }
  OBJECT-SET-FIELD { { 2 } | { 3 } }
}

objectB EXAMPLE-CLASS ::= {
  TYPE-FIELD IA5String
  FIXED-TYPE-VALUE-FIELD 456
  VARIABLE-TYPE-VALUE-FIELD "abc"
  VARIABLE-TYPE-VALUE-SET-FIELD { "d" | "e" | "f" }
}

-- The following object set contains two defined objects and one
-- builtin object.

ObjectSet EXAMPLE-CLASS ::= {
  objectA |
  objectB |
  { TYPE-FIELD INTEGER
    FIXED-TYPE-VALUE-FIELD 789
    VARIABLE-TYPE-VALUE-SET-FIELD { 4 | 5 | 6 }
  }
}

-- The following definitions extract information from the objects and
-- the object set.

integerValue INTEGER ::= objectA.&fixedTypeValueField

stringValue IA5String ::= objectB.&variableTypeValueField

IntegerValueSetFromObjectA INTEGER ::= { objectA.&FixedTypeValueSetField }

StringType ::= objectB.&TypeField

objectFromObjectA SIMPLE-CLASS ::= objectA.&objectField

ObjectSetFromObjectA SIMPLE-CLASS ::= { objectA.&ObjectSetField }

SetOfValuesInObjectSet INTEGER ::= { ObjectSet.&fixedTypeValueField }

SetOfValueSetsInObjectSet INTEGER ::= { ObjectSet.&FixedTypeValueSetField }

SetOfObjectsInObjectSet SIMPLE-CLASS ::= { ObjectSet.&objectField }

SetOfObjectSetsInObjectSet SIMPLE-CLASS ::= { ObjectSet.&ObjectSetField }
Annex E

Tutorial annex on the ASN.1 model of object set extension

(This annex does not form an integral part of this Recommendation | International Standard.)

E.1 An ASN.1 specification can define information object sets and such object sets can be marked extensible by means of an extension marker or by the inclusion of extensible object sets using set arithmetic. Use of an extension marker with object sets differs from such use with types in that it specifies that an application can dynamically add/remove objects to/from the object set in an instance of communication.

E.2 Table and component relation constraints which are not satisfied are not in themselves considered errors if the constraining object set is extensible. In such cases, it is not an error if a value of a UNIQUE field is not found in the object set, but if it is found, then it is an error if the constraint is not satisfied.
Annex F

Summary of the notation

(This annex does not form an integral part of this Recommendation | International Standard.)

The following lexical items are defined in clause 7:

- objectclassreference
- objectreference
- objectsetreference
- typefieldreference
- valuefieldreference
- valuesetfieldreference
- objectfieldreference
- objectsetfieldreference
- word
- CLASS
- INSTANCE
- SYNTAX
- UNIQUE

The following lexical items are defined in Rec. ITU-T X.681 | ISO/IEC 8824-1 and used in this Recommendation | International Standard:

- empty
- modulereference
- xmlasn1typename
- " ::="
- "{" "}"
- "'" "'"
- "['" "']"
- "','"
- "DEFAULT"
- "OF"
- "OPTIONAL"
- "WITH"

The following productions are defined in Rec. ITU-T X.680 | ISO/IEC 8824-1 and used in this Recommendation | International Standard:

- BuiltinValue
- ElementSetSpec
- NonParameterizedTypeName
- ReferencedValue
- Type
- Value
- ValueSet
- XMLBuiltinValue
- XMLTypedValue
- XMLValue

The following productions are defined in Rec. ITU-T X.683 | ISO/IEC 8824-4 and used in this Recommendation | International Standard:

- ParameterizedObjectClass
- ParameterizedObjectSet
- ParameterizedObject

The following productions are defined in this Recommendation | International Standard:

- DefinedObjectClass ::= ExpansionObjectClassReference | objectclassreference | UsefulObjectClassReference
ExternalObjectClassReference ::= modulereference "." objectclassreference

UsefulObjectClassReference ::= 
    TYPE-IDENTIFIER 
    | ABSTRACT-SYNTAX

ObjectClassAssignment ::= objectclassreference ":=" ObjectClass

ObjectClass ::= DefinedObjectClass | ObjectClassDefn | ParameterizedObjectClass

ObjectClassDefn ::= CLASS "{" FieldSpec ","," + "}" WithSyntaxSpec?

FieldSpec ::= 
    TypeFieldSpec 
    | FixedTypeValueFieldSpec 
    | VariableTypeValueFieldSpec 
    | FixedTypeValueSetFieldSpec 
    | VariableTypeValueSetFieldSpec 
    | ObjectFieldSpec 
    | ObjectSetFieldSpec

PrimitiveFieldName ::= 
    typefieldreference 
    | valuefieldreference 
    | valuesetfieldreference 
    | objectfieldreference 
    | objectsetfieldreference

FieldName ::= PrimitiveFieldName "." +

TypeFieldSpec ::= typefieldreference TypeOptionalitySpec?

TypeOptionalitySpec ::= OPTIONAL | DEFAULT Type

FixedTypeValueFieldSpec ::= valuefieldreference Type UNIQUE ? ValueOptionalitySpec ?

ValueOptionalitySpec ::= OPTIONAL | DEFAULT Value

VariableTypeValueFieldSpec ::= valuefieldreference FieldName ValueOptionalitySpec ?

FixedTypeValueSetFieldSpec ::= valuesetfieldreference Type ValueSetOptionalitySpec ?

ValueSetOptionalitySpec ::= OPTIONAL | DEFAULT ValueSet

VariableTypeValueSetFieldSpec ::= valuesetfieldreference FieldName ValueSetOptionalitySpec?

ObjectFieldSpec ::= objectfieldreference DefinedObjectClass ObjectOptionalitySpec?

ObjectOptionalitySpec ::= OPTIONAL | DEFAULT Object

ObjectSetFieldSpec ::= objectsetfieldreference DefinedObjectClass ObjectSetOptionalitySpec?

ObjectSetOptionalitySpec ::= OPTIONAL | DEFAULT ObjectSet

WithSyntaxSpec ::= WITH SYNTAX SyntaxList

SyntaxList ::= "{" TokenOrGroupSpec empty + "}"

TokenOrGroupSpec ::= RequiredToken | OptionalGroup

OptionalGroup ::= "[" TokenOrGroupSpec empty + "]"

RequiredToken ::= Literal | PrimitiveFieldName

Literal ::= word | ","

DefinedObject ::= ExternalObjectReference | objectreference

ExternalObjectReference ::= modulereference "." objectreference

ObjectAssignment ::= objectreference DefinedObjectClass ":=" Object

Object ::= DefinedObject | ObjectDefn | ObjectFromObject | ParameterizedObject
ObjectDefn ::= DefaultSyntax | DefinedSyntax

DefaultSyntax ::= "{" FieldSetting ""," * "}"

FieldSetting ::= PrimitiveFieldName Setting

DefinedSyntax ::= "{" DefinedSyntaxToken empty * "}"

DefinedSyntaxToken ::= Literal | Setting

Setting ::= Type | Value | ValueSet | Object | ObjectSet

DefinedObjectSet ::= ExternalObjectSetReference | objectsetreference

ExternalObjectSetReference ::= modulereference "." objectsetreference

ObjectSetAssignment ::= objectsetreference DefinedObjectClass "::=" ObjectSet

ObjectSet ::= "{" ObjectSetSpec "}"

ObjectSetSpec ::= RootElementSetSpec
   | RootElementSetSpec ";" ";" ";"
   | ";" ";"
   | ";" ";" AdditionalElementSetSpec
   | RootElementSetSpec ";" ";" ";" ";" ";" AdditionalElementSetSpec

ObjectSetElements ::= Object | DefinedObjectSet | ObjectSetFromObjects | ParameterizedObjectSet

ObjectClassFieldType ::= DefinedObjectClass "." FieldName

ObjectClassFieldValue ::= OpenTypeFieldVal | FixedTypeFieldVal

OpenTypeFieldVal ::= Type ":" Value

FixedTypeFieldVal ::= BuiltinValue | ReferencedValue

XMLElementFieldVal ::= XMLOpenTypeFieldVal
   | XMLFixedTypeFieldVal

XMLOpenTypeFieldVal ::= XMLTypedValue | xmlhstring

XMLFixedTypeFieldVal ::= XMLBuiltinValue

InformationFromObjects ::= ValueFromObject | ValueSetFromObjects | TypeFromObject | ObjectFromObject | ObjectSetFromObjects

ReferencedObjects ::= DefinedObject | ParameterizedObject | DefinedObjectSet | ParameterizedObjectSet

ValueFromObject ::= ReferencedObjects "." FieldName

ValueSetFromObjects ::= ReferencedObjects "." FieldName

TypeFromObject ::= ReferencedObjects "." FieldName

ObjectFromObject ::= ReferencedObjects "." FieldName

ObjectSetFromObjects ::= ReferencedObjects "." FieldName

InstanceOfType ::= INSTANCE OF DefinedObjectClass

InstanceOfValue ::= Value

XMLInstanceOfValue ::= XMLValue
