

## **Mobile broadband technology opportunities in emerging markets**

### Abstract:

Asia represents a rapidly expanding market for broadband communications with opportunities for the widespread adoption of mobile broadband technologies such as 3G/UMTS and Evolution to meet the market demand. Furthermore, mobile broadband technologies enable economic and social development. A combination of radio spectrum band planning, suitable regulation and policy setting will allow governments, industry and consumers to extract the maximum benefit from mobile broadband technologies.

The UMTS forum highlights the radio spectrum bands, policy and regulation conducive to the development of mobile broadband solutions, and the development of associated technologies in emerging markets.
