Implementors' Guide for G.729

(Coding of speech at 8 kbit/s using CS-ACELP)
Summary
This document was approved by ITU-T Study Group 16 on 13 April 2006 and obsoletes the earlier version of this Implementors’ Guide approved on 15 Feb 2002 and 25 Oct 2002.

ANNEX: G.729 DEFECT REPORT FORM ................................................................................................................6
IMPLEMENTORS’ GUIDE FOR ITU-T REC. G.729:
“CODING OF SPEECH AT 8 KBIT/S USING CS-ACELP”

1 Scope
This guide resolves defects in the following categories:
- editorial errors
- technical errors, such as omissions and inconsistencies
- ambiguities
In addition, the Implementors' Guide may include explanatory text found necessary as a result of interpretation difficulties apparent from the defect reports.
This Guide will not address proposed additions, deletions, or modifications to the Recommendations that are not strictly related to implementation difficulties in the above categories. Proposals for new features should be made through contributions to the ITU-T.

2 Introduction
This Implementors’ Guide contains all identified defects for ITU-T Rec. G.729. This version consolidates and supersedes all earlier Implementors’ Guides for G.729.

3 Defect Resolution Procedure
Upon discovering technical defects with any components of G.729, please provide a written description directly to the applicable contact point (listed above). The template for a defect report is located in the Annex to the Guide. Contact information for these parties is included at the front of the document. Return contact information should also be supplied so a dialogue can be established to resolve the matter and an appropriate reply to the defect report can be conveyed. This defect resolution process is open to any interested party. Formal membership in the ITU is not required to participate in this process.

4 References
This document refers to the approved elements for G.729:
- G.729 (03/1996) – Coding of speech at 8 kbit/s using conjugate-structure algebraic-code-excited linear prediction (CS-ACELP)
- G.729 Appendix II (08/2005) – G.729 Annex B enhancements in voice-over-IP applications - Option 1

5 Nomenclature

In addition to traditional revision marks, the following marks and symbols are used to indicate to the reader how changes to the text of a Recommendation should be applied:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Begin Correction]</td>
<td>Identifies the start of revision marked text based on extractions from the published Recommendations affected by the correction being described.</td>
</tr>
<tr>
<td>[End Correction]</td>
<td>Identifies the end of revision marked text based on extractions from the published Recommendations affected by the correction being described.</td>
</tr>
<tr>
<td>...</td>
<td>Indicates that the portion of the Recommendation between the text appearing before and after this symbol has remained unaffected by the correction being described and has been omitted for brevity.</td>
</tr>
</tbody>
</table>
6 Technical and Editorial Corrections

6.1 Modifications to fixed-point C source codes in G.729 Annexes F, G, H and I

In February 2000, SG16 approved G.729 Annexes F, G, H and I. As described in COM16-D219, discrepancies between the G.729 annexes F, G, H and I fixed point source codes and the G729 main body and annex B fixed point source codes were found. Initialization of some variables is performed differently in these annexes than in the former G729 recommendations fixed point source codes.

The modifications are in the coder initialization functions Init_Coder_ld8x() (in files cod_ld8x.c, where x stands for f, g, h for Annexes F, G and H, respectively) and Init_Coder_ld8c() (in file codld8cp.c for annex I).

The following two lines are deleted:

```c
/* to tame the coder */
static Word32 L_exc_err[4];
```

And the line:

```c
for(i=0; i<4; i++) L_exc_err[i] = 0x00004000L;   /* Q14 */
```

is replaced by two lines:

```c
/* to tame the coder */
Init_exc_err();
```

The call of the Init_Cod_cng() routine is inserted at the end of the set of instructions below

```c
if(dtx_enable == 1) {
    pastVad = 1;
    ppastVad = 1;
    seed = INIT_SEED;
    vad_init();
    Init_lsfq_noise();
    Init_Cod_cng();
}
```

Table 1 gives the numbers of the lines affected by these initialization modifications.

6.2 Corrections to Annexes B, F, G, I and C+

6.2.1 Description of the needed changes

As described in COM16-D244 (2001-2004), the problem is caused by the lack of safe initialization of LSFs indices, and the search for the SID optimal indices may terminate abnormally, resulting in a possible crash of the simulation program. The problem was identified on G.729 Annex I, but it is applicable also for Annexes B, F, G, and C+.

6.2.2 Modifications to fixed-point C source codes in G.729 Annexes B, F, G, I and C+

In the file qsidlsf.c, in the routine New_ML_Search_1 at line 195, and in the routine New_ML_Search_2 at line 264, add two lines, changing both blocks of identical code from:

```c
for (q=0; q<K; q++){
    for (p=0; p<J; p++)
        for (m=0; m<MQ; m++)
            if (sub(sum[p*MQ+m], min[q]) < 0){
                min[q] = sum[p*MQ+m];
                min_indx_p[q] = p;
                min_indx_m[q] = m;
            }
        sum[min_indx_p[q]*MQ+min_indx_m[q]] = MAX_16;
}
```

to the new code:

```c
for (q=0; q<K; q++){
    min_indx_p[q] = 0;
    min_indx_p[q] = 0;
    for (p=0; p<J; p++)
        for (m=0; m<MQ; m++)
            if (sub(sum[p*MQ+m], min[q]) < 0){
                min[q] = sum[p*MQ+m];
                min_indx_p[q] = p;
                min_indx_m[q] = m;
            }
        sum[min_indx_p[q]*MQ+min_indx_m[q]] = MAX_16;
}
```

Note: for Annex C+, the constant FLT_MAX_G729 should be used, instead of the constant MAX_16.

6.3 Corrections to ITU-T Rec. G.729 Annexes with DTX functionality

As described in TD 119/WP3, a problem has been discovered in the ANSI-C software of G729 annex BA (G729B-A) (version 1.4) delivered to ITU-T in 2000. Further investigations have shown that this problem is also present in the software of the other annexes with DTX functionality (annexes B, C+, F, G and I).

The problem appears on the decoder side with erased frames (packet lost concealment) when the last correctly received frame is active and the current erased frame is a non transmitted frame. In
In this case, frame parameters are not extracted from the bitstream as it is a non-transmitted frame but the current frame type is set to active frame as the last valid frame was active. In this case, invalid parameters values are used that might cause a non-detection of the pitch lag error (wrong value of bad_pitch indicator) and so a call to dec_lag3 routine instead of a previous lag use.

Table 2 below gives the file name, the routine name and the proposed corrections.
