

Robotic Remote Surgery: Application of ICTs for Craniotomy

Ahmad R. Sharafat, Nader Mokari Yamchi, Mahdi Orooji

Tarbiat Modares University (TMU)

Tehran, Iran

Outline

- Motivation
- Epidural Hematoma
- Architecture at a Glance
- Requirements
- Apparatus for Robotic Remote Surgery
- Human Head Phantom
- Wireless Communication Platform
- Conclusion

Motivation

Ultra Urgent Surgery

Ultra-Reliable and
Low-Latency
Communication

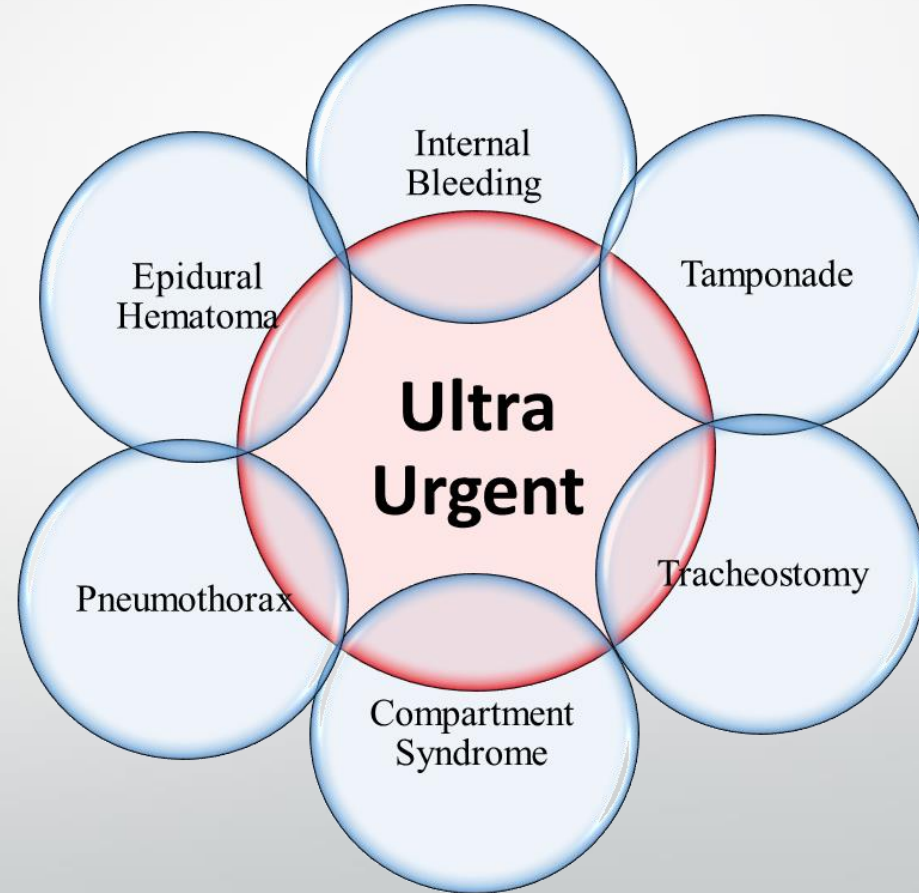

Motivation

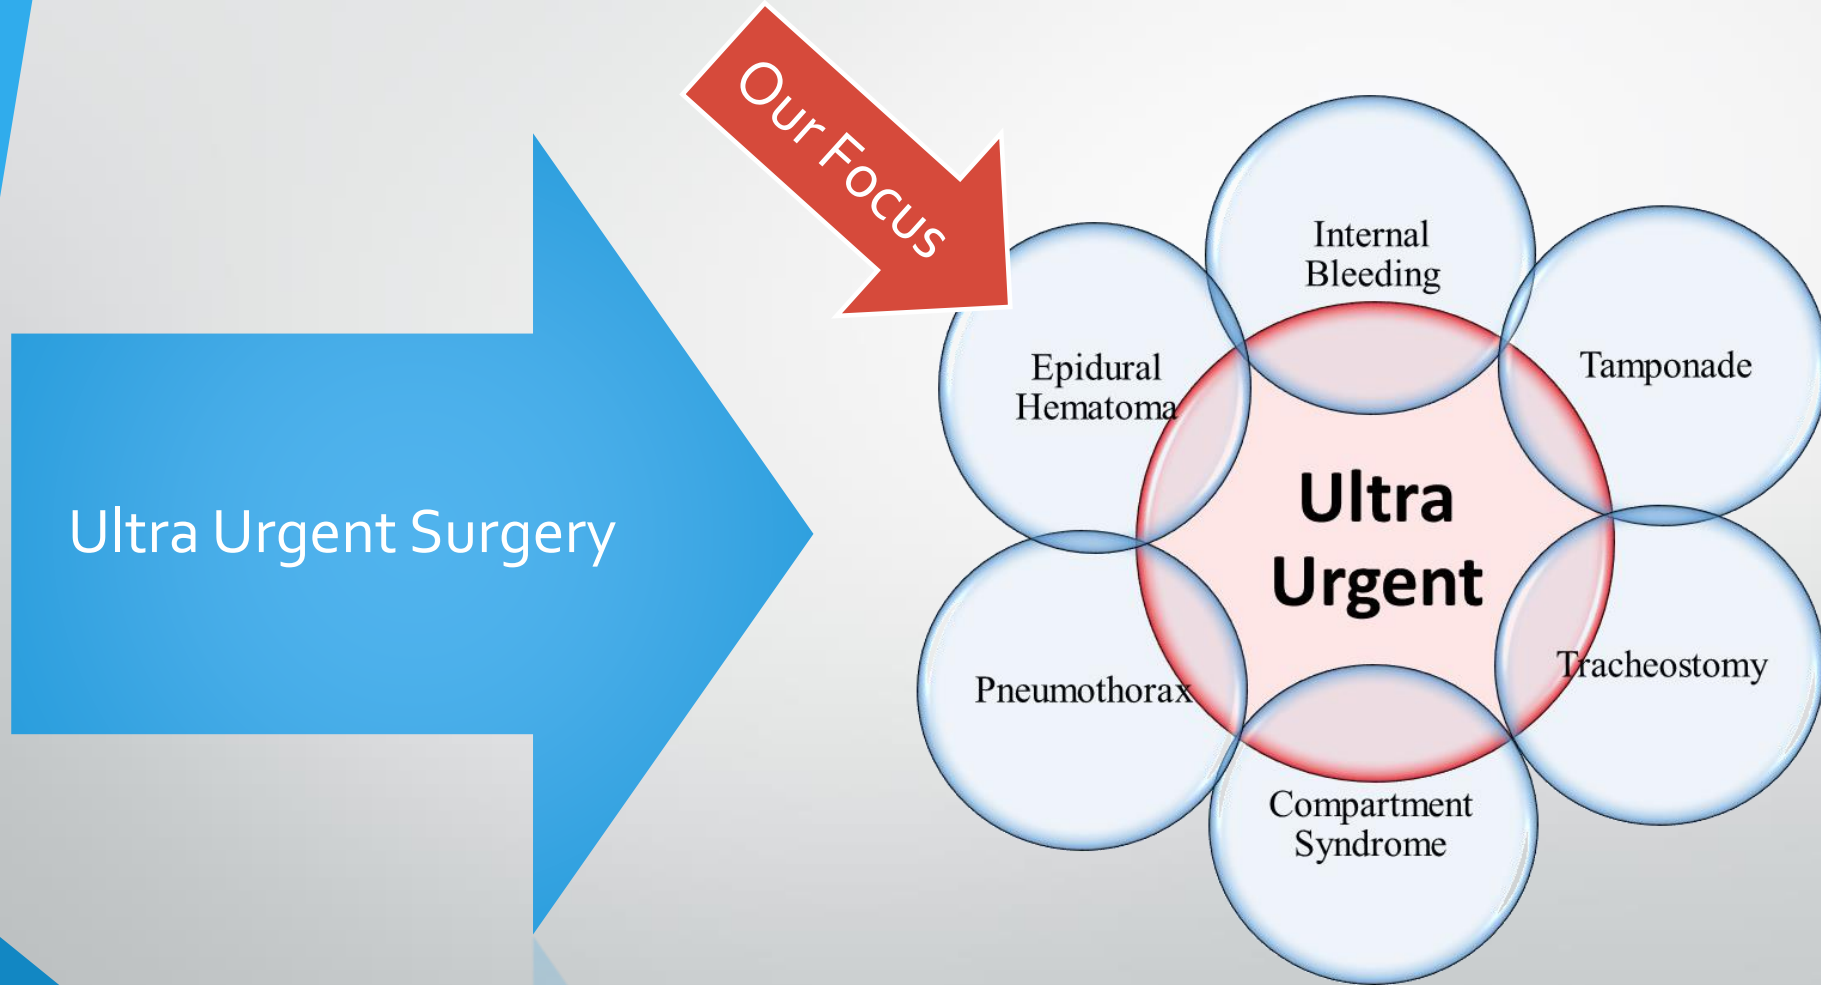

Motivation

Ultra Urgent Surgery

Motivation

Epidural Hematoma

- Intracranial bleeding is an example of ultra-emergency surgery
 - Bleeding Inside the Brain

Epidural Hematoma:

bleeding between the tough outer membrane covering the brain (dura mater) and skull

When head is hit in an accident, about 10% of patients suffer moderate to severe head injury

Example of Epidural Hematoma
Ref: Noor Private Radiology Clinic, Tehran, Iran

Immediate Action for Epidural Hematoma

To prevent death, the accumulated blood should be drained as soon as possible

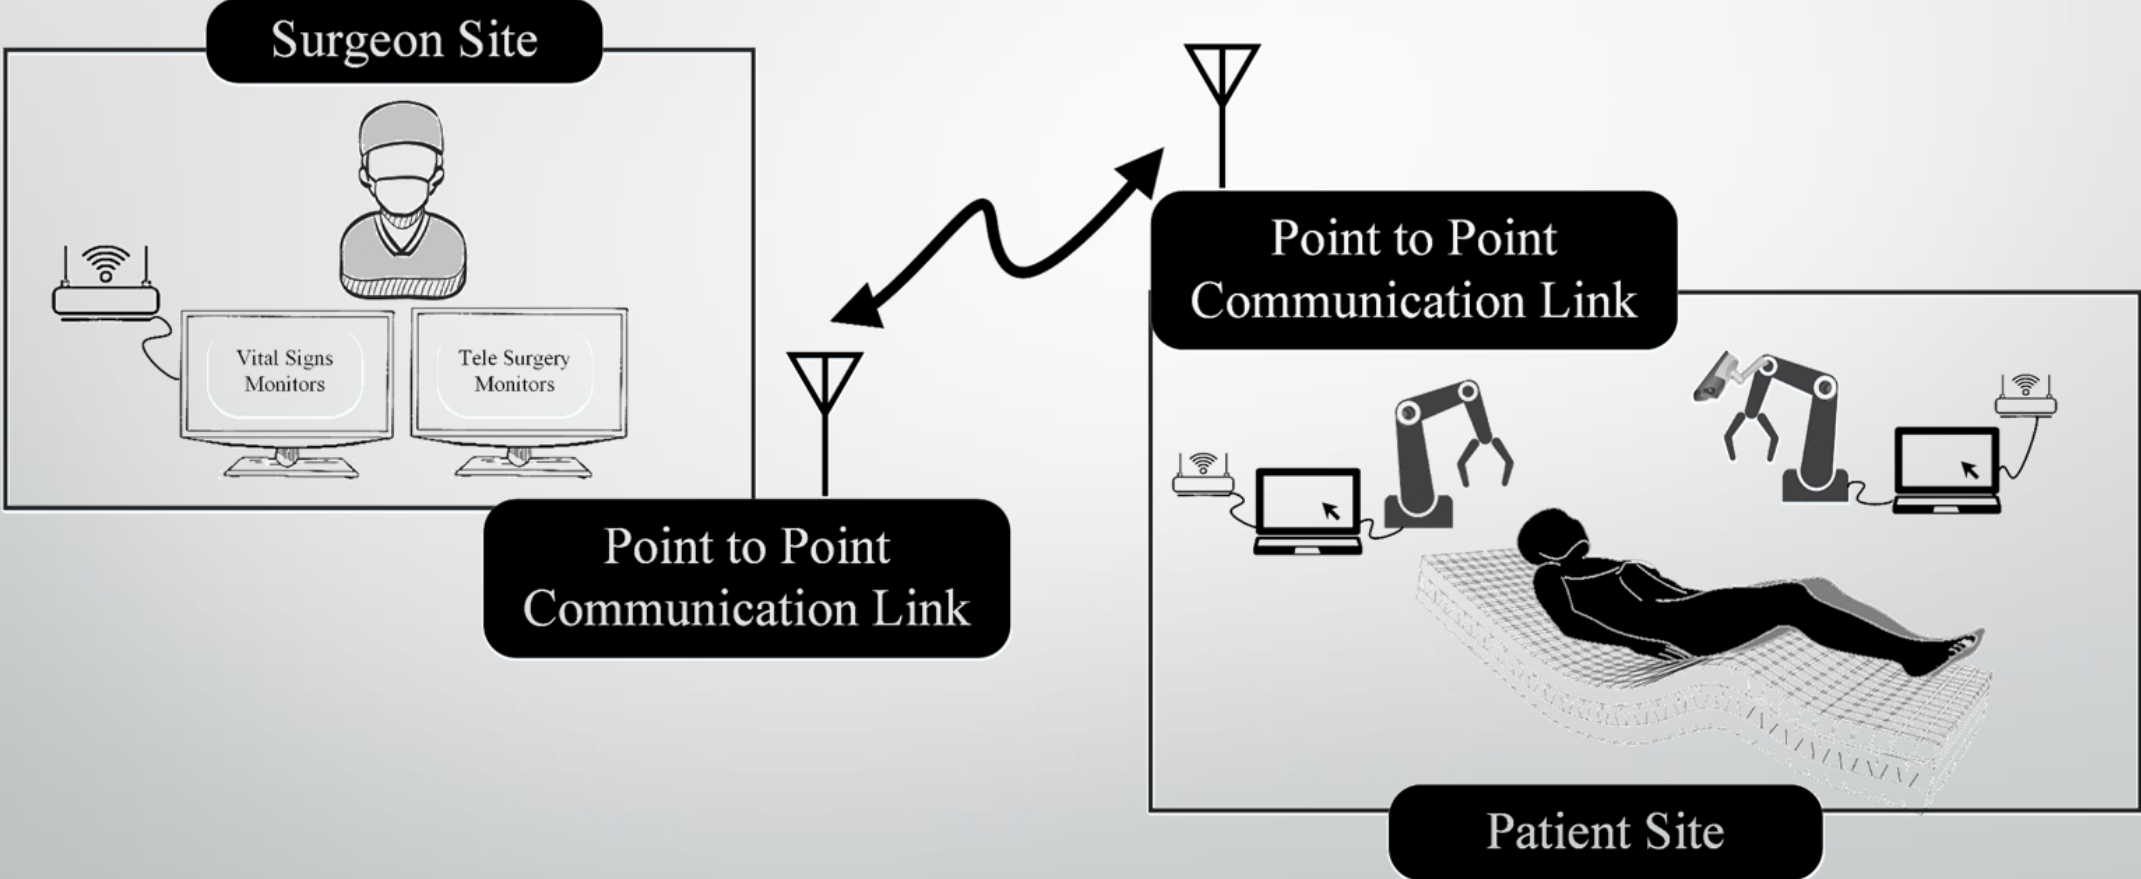

Craniotomy Surgery

- cutting and removing a bone flap from the skull
- 

Steps:

- Identify the affected region of the brain
- Cut the skin of that region
- Create 2 to 4 holes on the skull using surgery drill
- Remove the bone between the holes

Architecture at a Glance

Requirements

Remote surgeon

Trained personnel

Robotic system with two arms

Image processing

Ultra reliable low latency wireless link

Remote surgeon

Trained personnel

Robotic system with two arms

Image processing

Ultra reliable low latency wireless link

Robotic Remote Surgery Apparatus

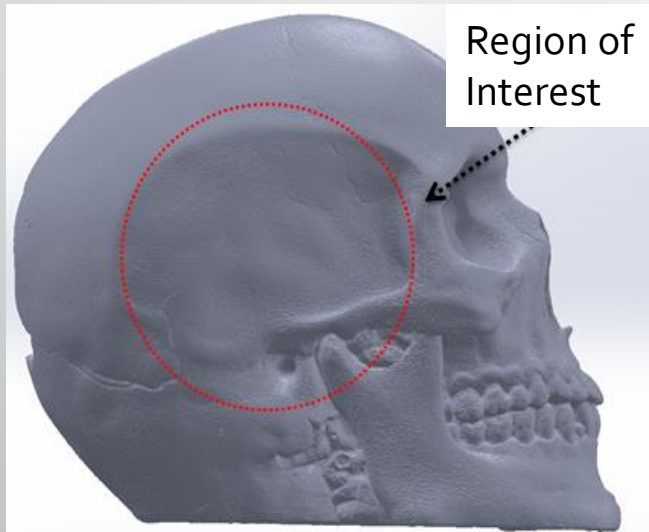

Robotic Remote Surgery Apparatus

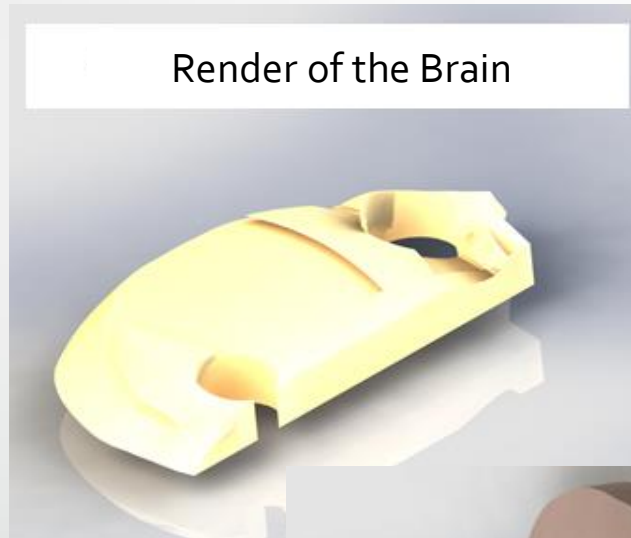

Human Head Phantom

To evaluate the performance and functionality of our apparatus for robotic remote surgery, we designed and implemented a 3D-printed phantom of the human head

3D Render of the actual human skull

Human Head Phantom

Sensor

Failure Detection

Robotic system with two arms

Image processing

Ultra reliable low latency wireless link

Wireless Communication Platform

- Maximum end-to-end delay: 300 ms
- Video frame rate: 25 fps
- Encoding H.265, 720p
- VHF UART link for the command link
- Dedicated point-to-point 5 GHz link for the video link

Dedicated Video Link

| Radio | |
|-----------------------|----------------------------------|
| Frequency Range | 400-470MHZ |
| Frequency Accuracy | ±2.5ppm, -30 to +60 °C Ambient |
| Transmitter | |
| TX Power | 0.01 to 5W (+10dBm to +37dBm) |
| Modulation | Filtered Narrow-Band RCFSK, GMSK |
| TX Spurs | Less than 45dB |
| Receiver | |
| Sensitivity | -116dBm for 12dB SINAD |
| Selectivity | Better than 60dB |
| Node/ Network Address | Can be Filtered |
| Connections | |
| Serial Data Port | RS232 , 9600b/s |
| Interface port | Serial RS232 9600b/s |
| Antenna | 1 N-Type female |
| LED Display | Pwr, Lock-Detect, TX, RX- Sync, |
| Modem | |
| Bit Error Rate | < 1x10-6 @ -107dBm (9600b/s) |
| General | |
| Power Supply | 12VDC nominal (9 – 14VDC) |
| Transmitter Current | 1500mA nominal @5W |
| Receiver Current | < 150mA @ 12VDC |
| Dimensions | 153x104x64mm |
| Weight | < 500gr |

VHF Command
Link

| Antenna | Patched , Gain > 20dBi |
|------------------------------|---|
| Modulation | QPSK |
| Coding | RS(255,223) |
| Digital pulse shaping Filter | Square-root-Raised-Cosine, Roll-Off=0.1 |
| Bit rate | 20Mb/s |
| Symbol Rate | 10MS/s |
| RF Bandwidth | 11MHz |
| TX - RF Output Power | +18dBm |
| RF Frequency | 5 ~ 6 GHz |
| Interface | Ethernet(10/100 Mb/s) |
| GUI interface port | RS232 Serial Port |
| Antenna Gain | 23 dBi |
| 3dB Beamwidth | 9° (typ) |

Conclusion

- In ultra urgent cases, immediate action is crucial to prevent death.
- Epidural Hematoma is an example of ultra urgent cases.
- An apparatus for robotic remote surgery was designed and implemented to drain the accumulated blood.
- To evaluate the performance of the designed system, a human head phantom was designed and used.
- The performance was satisfactory.
