

Data processing of electronic notifications concerning the requirements for the planning exercise - Validation procedures

This paper provides a summary of the validation performed by BR's software to electronic notices submitted by administrations in order to make sure that the input data is complete and correct for further running of the RRC planning exercise software.

The validation process implemented in "**Dval_BCBT_Dig**" is sub-divided into three main modules as follows:

- Validation of the file structure (as defined in the CR/215):
 - Each notification file must contain a <HEAD> section followed by ONE or MANY <NOTICE> section(s) and end with a <TAIL> section.
 - Each section must start with a beginning tag (i.e.: <NOTICE>) and end with an end tag (i.e.: </NOTICE>).
 - Sub-sections are only allowed within the <NOTICE> section.
 - Sub-sections are treated the same way as sections, which means that it must start with a beginning tag and end with an end-tag.
- Basic data validation: Validation of the **keys**, the length of the data **value** and the data **type**.
 - Lines starting with character strings other than <, t_ or rrc_ are not processed.
 - Lines containing data should start with a valid key string followed by an equal sign and subsequently the value assigned to the notified key.
- Exhaustive data Validation. Checks for:
 - Duplicate keys;
 - Values within the defined range (ref. FM/TV validation rules plus RRC-04 decisions);
 - Presence of mandatory keys (as defined in the CR 215 Annex 2-6);
 - Validity of administrations and geographical areas codes.
 - Validity of geographical coordinates vis-à-vis the IDWM.

Implementation details

The three validation modules are coded in module "RRC04Validation.bas".

The module contains the following functions:

- **CheckNoticeFormat:** with the validation of the file structure
- **ValidateNtc:** with basic validation
- **BEndValidateNtc:** with exhaustive data validation

Each of these modules call specific functions as detailed in the following tables.

1- Validation of the file structure - *CheckNoticeFormat*

VB Module	Function	Reference Document	Remarks
RRC04Validation	checkSectionFormat	CR 215	

2- Basic data validation - *validateNtc*

VB Module	Function	Key	Validation rule	Reference Document	Remarks
ValReadSectionFromFile	valReadHeadSection	t_adm	Char(3) and No Integers	CR 215	
		t_email_addr	Char(50)		
		t_char_set	(Accepted key no validation)		
	valReadNoticeSection	t_notice_type	[DS1,DT1,DS2,DT2,DA1]		
		t_d_adm_ntc	[yyyy-mm-dd]		
		t_fragment	[RC06]		
		t_action	[ADD, MODIFY, SUPPRESS]		
		t_adm_ref_id	Char(20) and No double space		
		t_trg_adm_ref_id	Char(20) and No double space		
		t_ctry	Char(3) and No integers		
		t_site_name	Char(30) and No double space		
		t_long	DDDMSS or DDDMM 0 < DDD <180; 0 < MM <60 0 < SS <60		
		t_lat	DDDMSS or DDMM 0 < DD <90; 0 < MM <60 0 < SS <60		
		t_polar	[H, V, M, U]		
		t_erp_h_dbw	Numeric value		
		t_erp_v_dbw	Numeric value		
		t_hgt_agl	Numeric value		

		t_site_alt	Integer value		
		t_eff_hgtmax	Integer value		
		rrc_ant_dir	[N, ND]		
		rrc_sys_var	Char(2) where [A,B,C,D,E,F] ∈ Char(1) [1,2,3,5,7] ∈ Char(2)	CR 215 + Corrigendum1	
		rrc_nb_carr	[2K, 8K]	CR 215	
		rrc_guard_interval	[4, 8, 16, 32]		
		rrc_rx_mode	[F, B, A, M]		
		rrc_ref_plan_cfg	Char(4)		
		rrc_typ_ref_netwk	Char(3)		
		rrc_sfn_id	Char(30)		
		rrc_sfn_tx_tim	Integer max 4 digits		
		rrc_adm_allot_id	Char(20)		
		rrc_spect_mask	Char(1)		
		rrc_conv_freq_assgn	Numeric value		
		rrc_conv_long	DDDMMSS or DDDMM 0 < DDD <180; 0 < MM <60 0 < SS <60		
		rrc_conv_lat	DDMMSS or DDMM 0 < DD <90; 0 < MM <60 0 < SS <60		
		rrc_freq_block	Char(30)		
		rrc_channel	Char(30)		
		rrc_allot_name	Char(30) and No double space		
		rrc_geo_area	Char(3) and No integer		
		rrc_nb_sub_areas	Numeric value		
		rrc_contour_id	Integer and maximum 4 digits		
		rrc_nb_test_pts	Integer and maximum 2 digits		
	valReadPointSection	rrc_long	DDDMMSS or DDDMM 0 < DDD <180 ; 0 < MM <60 0 < SS <60		
		rrc_lat	DDMMSS or DDMM 0 < DD <90;		

			0 < MM <60 0 < SS <60		
	valReadCoordSection	t_adm	Char(3) and No integer		
	valReadAntHgtSection	t_eff_hgt@azm0 to t_eff_hgt@azm350	Numeric value		
	valReadAntDiag_HSection	t_attn@azm0 to t_attn@azm350	Numeric value		
	valReadAntDiag_VSection	t_attn@azm0 to t_attn@azm350	Numeric value		
	valReadTailSection	t_num_notices	Integer value		Number of notices notified in this field should be the same as the number of notice read

3- Exhaustive data Validation – bEndValidateNtc

VB Module	Function	Key	Validation rule	Reference Document	Remarks
