**Cape Town, South Africa  
12–14 December 2011**

# Presentation outline

- ❑ Wireless Sensor Networks (WSNs)
- ❑ Mobile Ad-hoc NETWORKS (MANETs)
- ❑ Integration of WSN and MANET
- ❑ WSN Hybrid rOuting prOtocol (WHOO)
  - ❑ Goal and design guidelines
  - ❑ Scenario overview
  - ❑ Software architecture
  - ❑ MANET formation
- ❑ Experimental evaluation
- ❑ State of standardization
- ❑ Conclusion and ongoing research efforts

# Wireless Sensor Networks (WSNs)

**WSN:** network of autonomous devices that cooperate to monitor environment conditions

## Features:

- ❑ self-organizing network
- ❑ data processing/aggregation
- ❑ low cost
- ❑ fast deployment

# Mobile Ad-hoc NETWORKS (MANETs)

**MANET:** impromptu wireless network among heterogeneous mobile devices

Features:

- ❑ no infrastructure
- ❑ decentralized
- ❑ fast formation

# Integration of WSN and MANET

**Mobile phones** can opportunistically exploit impromptu formed **MANETs**, to boost WSN performance:

- ❑ more computation power
- ❑ less energy constraints
- ❑ higher-speed and lower-latency network access

Mobile phones and devices have started to host onboard also novel low-power communications technologies, such as IEEE 802.15.4, so to enable technology for Internet of Things (IoT), Machine-to-Machine communication (M2M)

# WSN Hybrid rOuting prOtocol (WHOO)

The motivating goal is to **monitor quality of life** indicators in Smart Cities:

- ❑ structural integrity of buildings
- ❑ pollution
- ❑ traffic

Goal:

- ❑ Opportunistically exploit MANET-WSN links to provide a backbone to route **urgent data** packets generated by the WSN

Advantages:

- ❑ **faster delivery** for urgent data
- ❑ **longer battery life** for sensor nodes

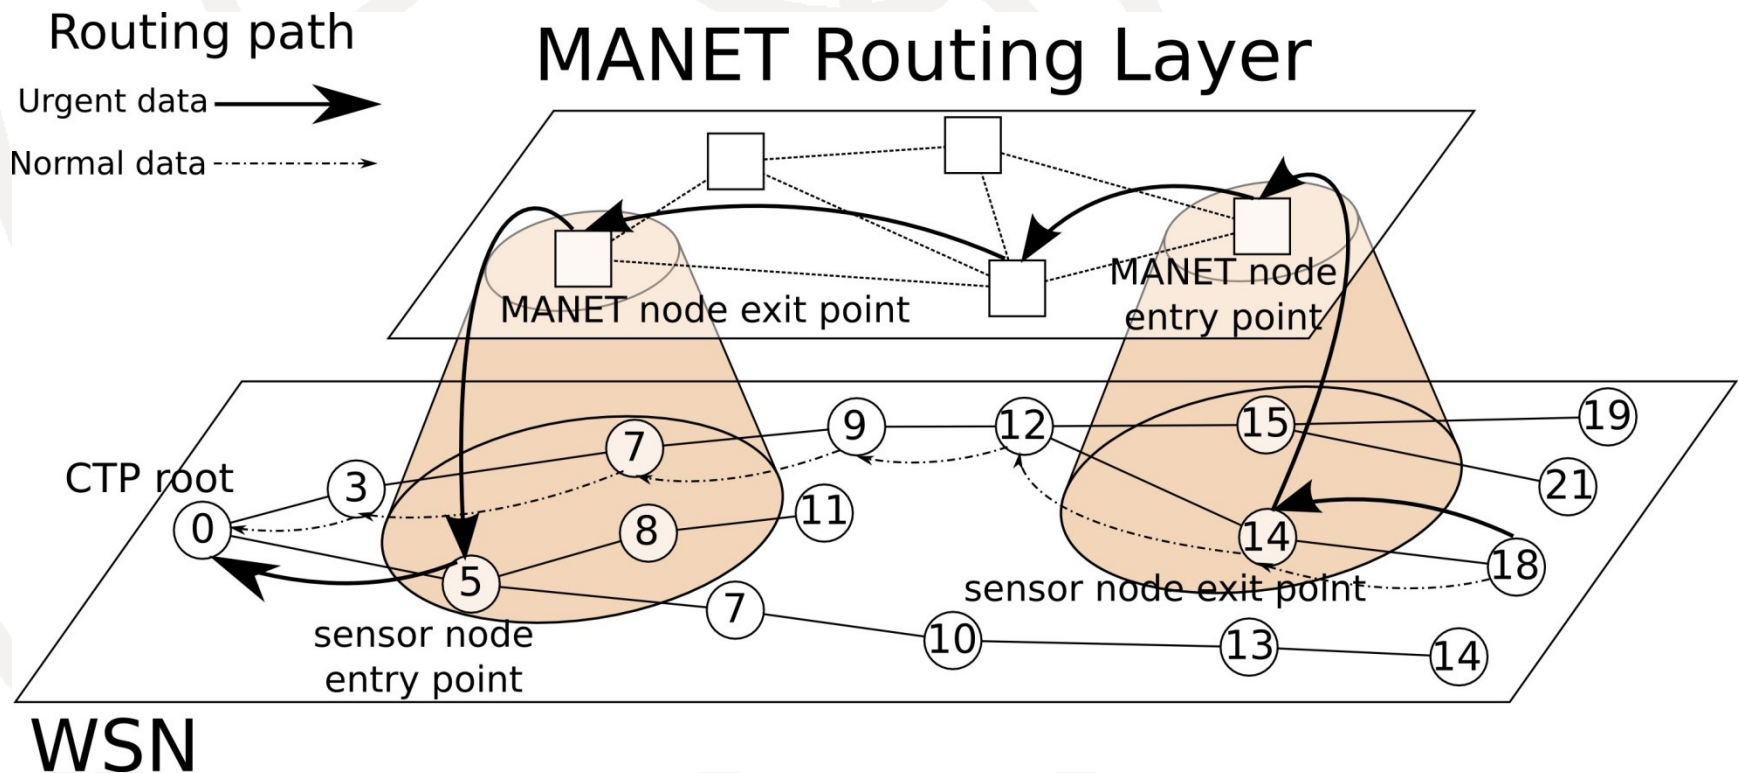

# WHOO goal and design guidelines

- ❑ Design **guidelines**:
  - ❑ Energy-conservative
  - ❑ Opportunistic
  - ❑ Adaptive
  - ❑ Localized
  - ❑ Compatible with off-the-shelf technologies
  
- ❑ Desirable **requirements**:
  - ❑ Robust
  - ❑ Tolerant to disrupted low-power links
  - ❑ Completely distributed
  - ❑ Zero overhead when not used
  - ❑ Guaranteed and predictable overhead

# WHOO scenario overview

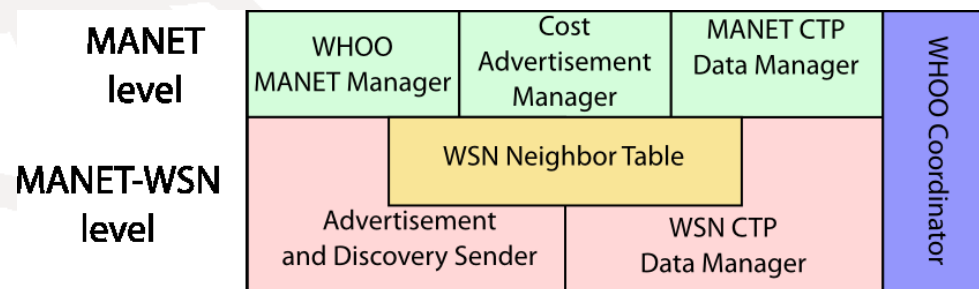

- Data collection on tree topologies
- Urgent and non-urgent packet pushed following a descending gradient to a root
- Mobile devices opportunistically self-organize in MANETs as backbone for urgent packets

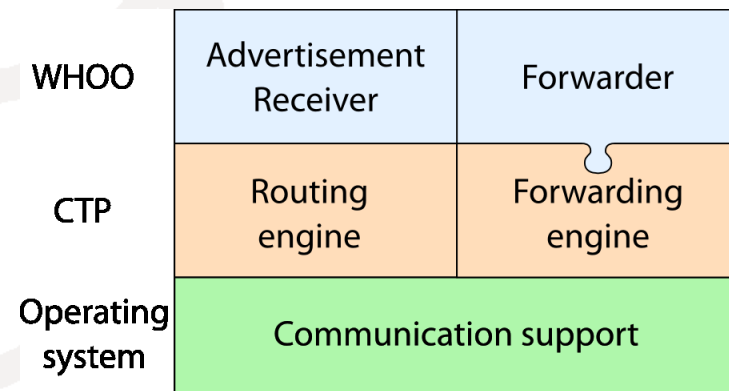

# WHOO Software Architecture

MANET node software stack

Sensor node software stack

# MANET formation

MANET node excluded with motivation

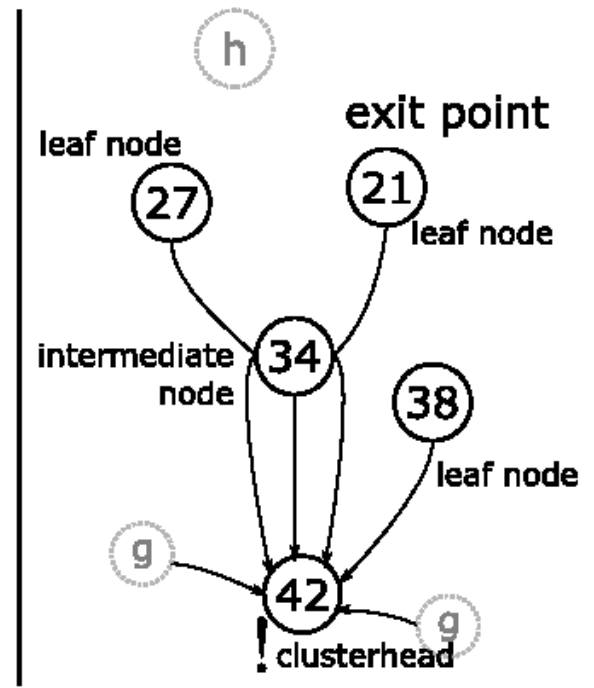

- h Broadcast hop limited reached
- g Gradient cost not better than MANET entry point cost

Step 1

Step 2

Step 3

# MANET Formation

No urgent packets

# MANET Formation

A urgent packet is routed on the WSN

# MANET Formation

Multiple MANET cluster form on the urgent packet path

# MANET Formation

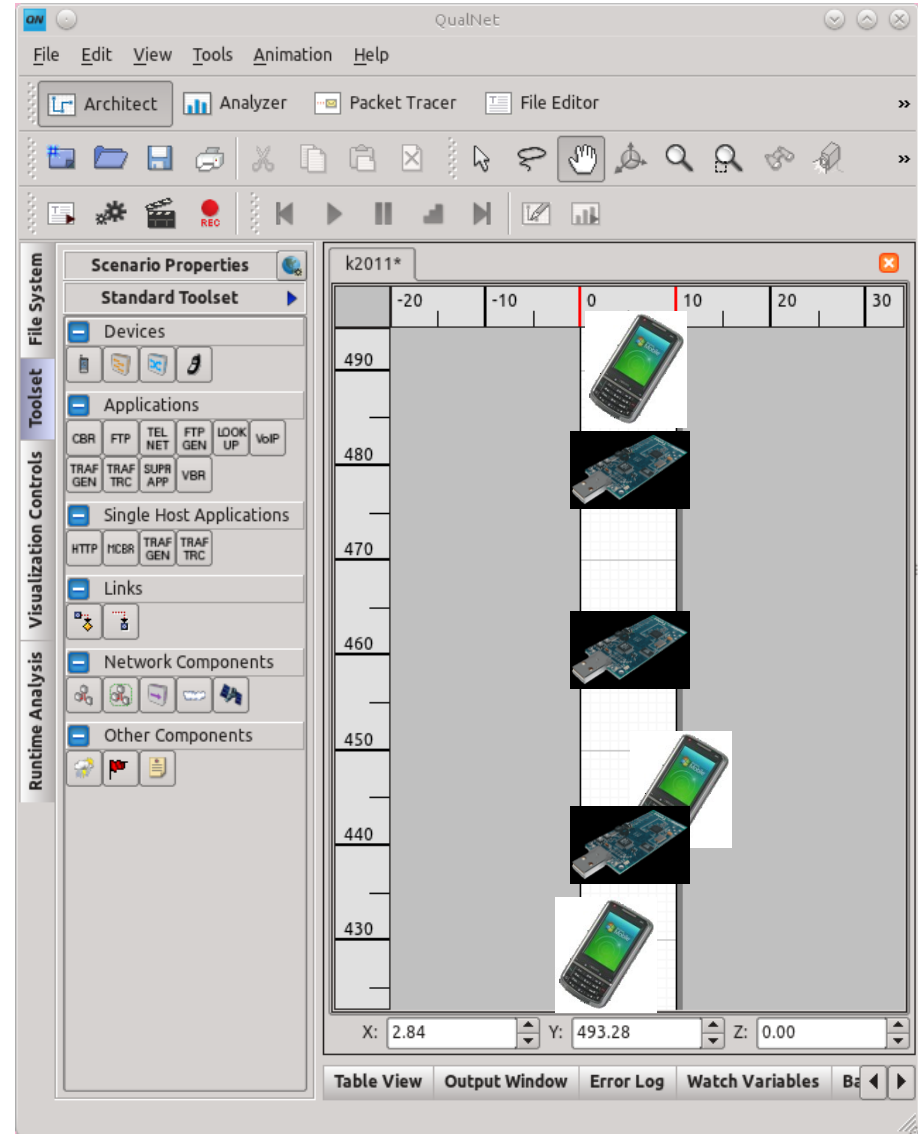

Overlapping clusters that do not route  
urgent packet shut down

# Experimental evaluation

## QualNet simulator

- ❑ **Street:** 1km long, 10m wide
- ❑ **50** equally spaced **sensor nodes** (20m apart)
- ❑ From **10** up to **50 MANET nodes** to simulate a mildly busy road

# Experimental evaluation

## Technical details:

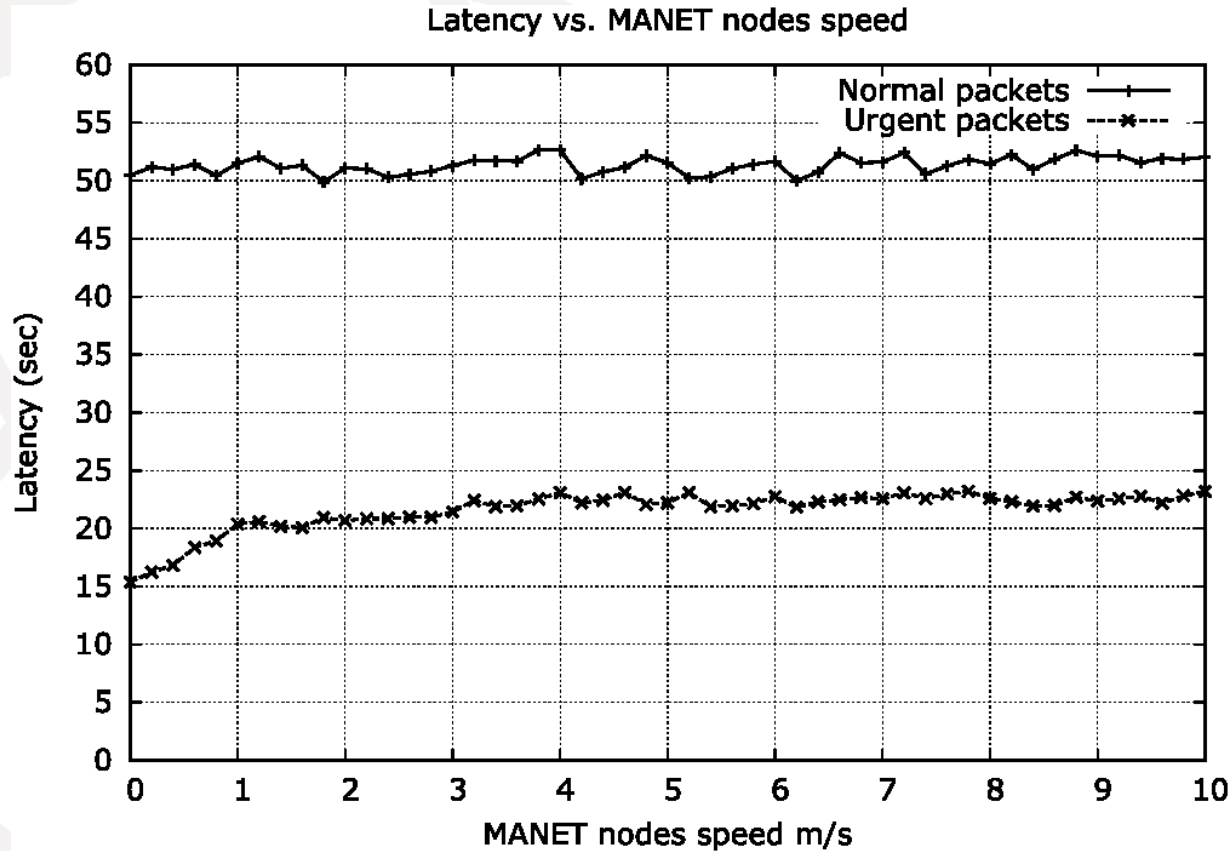

- ❑ Sensor nodes
  - ❑ Simulate TelosB/MicaZ nodes
  - ❑ PHY: 802.15.4
  - ❑ MAC: TinyOS CSMA/CA
  - ❑ Radio duty cycling: 2.5%
  - ❑ Application: TinyOS 2.1 CTP + WHOO
- ❑ MANET nodes
  - ❑ MANET PHY and MAC: IEEE 802.11b
  - ❑ Low-power PHY: 802.15.4
  - ❑ Low-power MAC: CSMA/CA
  - ❑ Application: WHOO
  - ❑ Mobility model: random waypoint

# Latency vs. MANET density

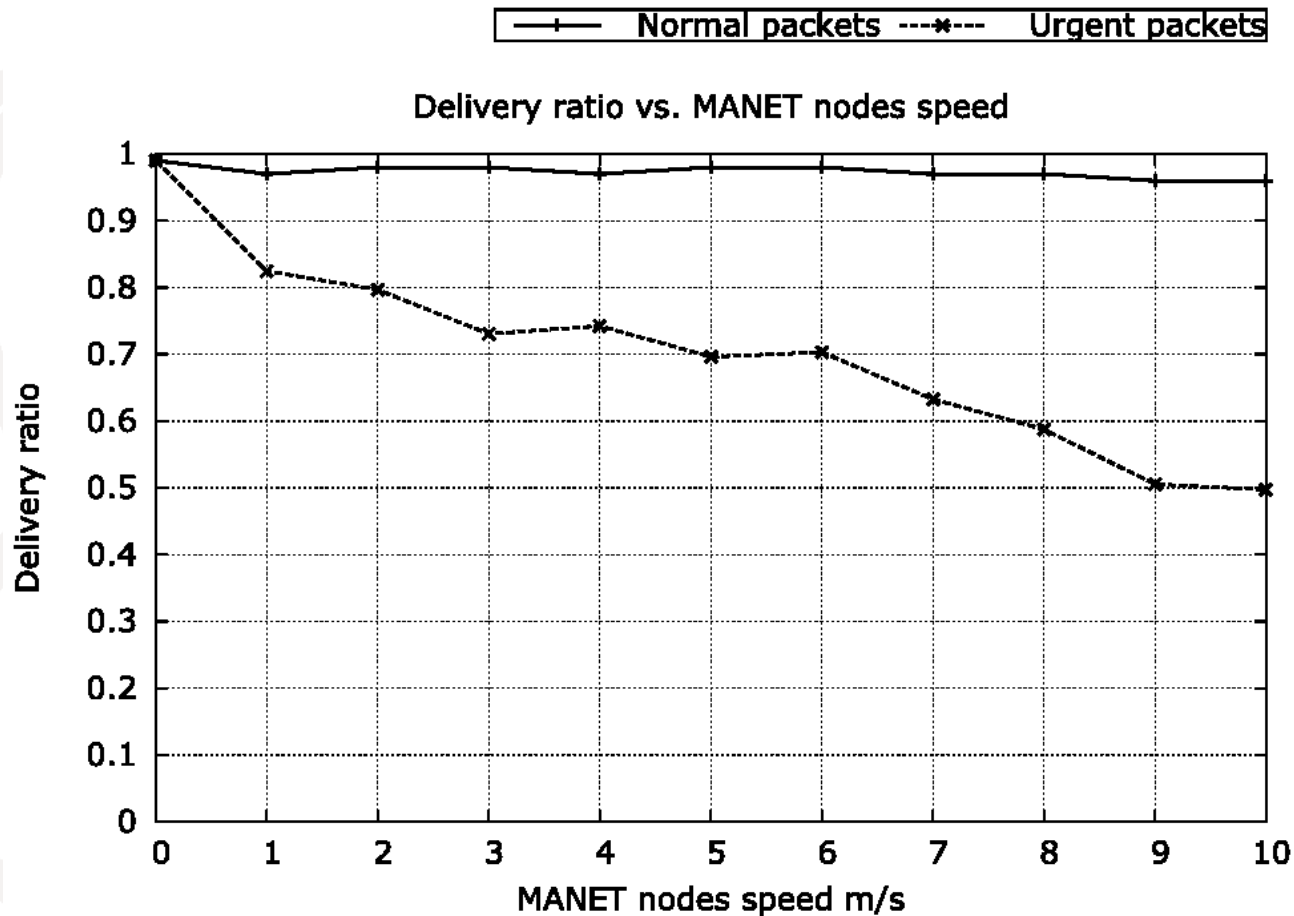

**Latency reduced up to 75%**

# Latency vs. MANET nodes speed

**Urgent packet routing independent from MANET nodes speed (for speed > 1 m/s)**

# Delivery ratio vs. MANET nodes speed

Delivery ratio decreases increasing MANET nodes speed because of broken clusters: **repeated sends** as a remedy

# State of standardization

WHOO demonstrates that WSN-MANET integration can be a basic enabler to realize internet of Things (**IoT**), Machine to Machine communication (**M2M**) and **Smart Cities** scenarios

Need for **widely accepted standards**

- ❑ There are many competing standards and proposal for different application niches, working at **different layers of the ISO/OSI stack**: ZigBee, Near Field Communication (NFC), Bluetooth Low Energy, DASH7, Wavenis, Z-Wave, ...
- ❑ Low power protocols are often **cross-layer**: a joint IETF/IEEE effort would help widespread diffusion of low-power wireless interfaces

# Conclusion and ongoing research efforts

WHOO: a **hybrid routing protocol** for **WSN** that enables leverage of **mobile devices** to provide high **quality of service**

- Ongoing work:
  - A more proactive approach: cache urgent data, while waiting for a backbone to be available
  - Fine tuning of novel power policies
  - Fine tuning of additional cluster parameters
  - Larger scale tests
