

Recommendation ITU-R BS.2094-2 (02/2025)

BS Series: Broadcasting service (sound)

Common definitions for the audio definition model

Foreword

The role of the Radiocommunication Sector is to ensure the rational, equitable, efficient and economical use of the radio-frequency spectrum by all radiocommunication services, including satellite services, and carry out studies without limit of frequency range on the basis of which Recommendations are adopted.

The regulatory and policy functions of the Radiocommunication Sector are performed by World and Regional Radiocommunication Conferences and Radiocommunication Assemblies supported by Study Groups.

Policy on Intellectual Property Right (IPR)

ITU-R policy on IPR is described in the Common Patent Policy for ITU-T/ITU-R/ISO/IEC referenced in Resolution ITU-R 1. Forms to be used for the submission of patent statements and licensing declarations by patent holders are available from <https://www.itu.int/ITU-R/go/patents/en> where the Guidelines for Implementation of the Common Patent Policy for ITU-T/ITU-R/ISO/IEC and the ITU-R patent information database can also be found.

Series of ITU-R Recommendations

(Also available online at <https://www.itu.int/publ/R-REC/en>)

Series	Title
BO	Satellite delivery
BR	Recording for production, archival and play-out; film for television
BS	Broadcasting service (sound)
BT	Broadcasting service (television)
F	Fixed service
M	Mobile, radiodetermination, amateur and related satellite services
P	Radiowave propagation
RA	Radio astronomy
RS	Remote sensing systems
S	Fixed-satellite service
SA	Space applications and meteorology
SF	Frequency sharing and coordination between fixed-satellite and fixed service systems
SM	Spectrum management
SNG	Satellite news gathering
TF	Time signals and frequency standards emissions
V	Vocabulary and related subjects

Note: This ITU-R Recommendation was approved in English under the procedure detailed in Resolution ITU-R 1.

RECOMMENDATION ITU-R BS.2094-2

Common definitions for the audio definition model

(2016-2017-2025)

Scope

This Recommendation contains a set of common definitions for multichannel audio configurations that use the audio definition model (Recommendation ITU-R BS.2076) to describe them.

Keywords

ADM, audio, multichannel, channel-based, tracks, metadata, bw64, exchange, audio programme, BWF, immersive, HOA, Higher Order Ambisonics

The ITU Radiocommunication Assembly,

considering

- a) that storage media based on information technology, including data disks and tapes, have penetrated all areas of audio production for radio broadcasting, namely non-linear editing, on-air play-out and archives;
- b) that the adoption of a single file format for signal interchange would greatly simplify the interoperation of individual pieces of equipment, and remote studios, and it would facilitate the desirable integration of editing, on-air play-out, and archiving;
- c) that compatibility with currently-available commercial file formats would minimize the industry efforts required to implement a new format in the equipment;
- d) that future audio systems will require metadata associated with the audio to be carried in the file;
- e) that future audio systems will use a variety of multichannel configurations including channel-, object-, and scene-based audio such as specified in Recommendation ITU-R BS.2051;
- f) that future audio systems will use the audio definition model (Recommendation ITU-R BS.2076) to describe the technical format of the audio being delivered and exchanged;
- g) that the majority of audio in existence and produced in the short-term future is and will be channel-based using a commonly used set of configurations;
- h) that using different metadata descriptions for identical audio configurations will cause compatibility problems and unnecessary overheads,

recommends

that, for exchanging any audio that uses the audio definition model (Recommendation ITU-R BS.2076) as the metadata model, a set of common definitions be used to describe any audio configurations as defined in Annex 1.

Annex 1 (normative)

Common definitions for the audio definition model

1 Introduction

Recommendation ITU-R BS.2076 – Audio Definition Model, is a metadata model used to describe the technical content and format of audio. It can be used to describe any type of audio signal to allow it to be rendered correctly, whether it be object-, scene-, or channel-based. While the audio definition model (ADM) is extremely flexible and allows any type of audio format to be defined, the vast majority of audio in existence is based on a few commonly used channel-based configurations. Therefore, it is not efficient for these commonly used formats to need to be explicitly defined every time they are used. It would also be problematic for identical formats to be defined in different ways by different organisations or applications.

To provide consistency and efficiency in the use of the ADM, a set of common definitions has been drawn up. These are based on what is commonly used in the audio industry, including those specified in Recommendations ITU-R BS.2051 and ITU-R BS.775 to produce definitions that should be used when these configurations are used in files and streams. This set of common definitions is intended to be a living resource, with new definitions added in the future should they be required.

2 Contents of the common definitions

As the vast majority of existing audio (and in the short-term future) is channel-based, most of the common definitions will be for channel-based audio. The initial set will concentrate on commonly used channel-based configurations. The other assumption used is that the track formats are pulse code modulation (PCM), so it does not include coded audio.

The ADM consists of several different elements used for defining audio. They either describe the content or the format. The set of common definitions is only concerned about the format elements as these can be defined without knowledge of the content of the audio. These elements are:

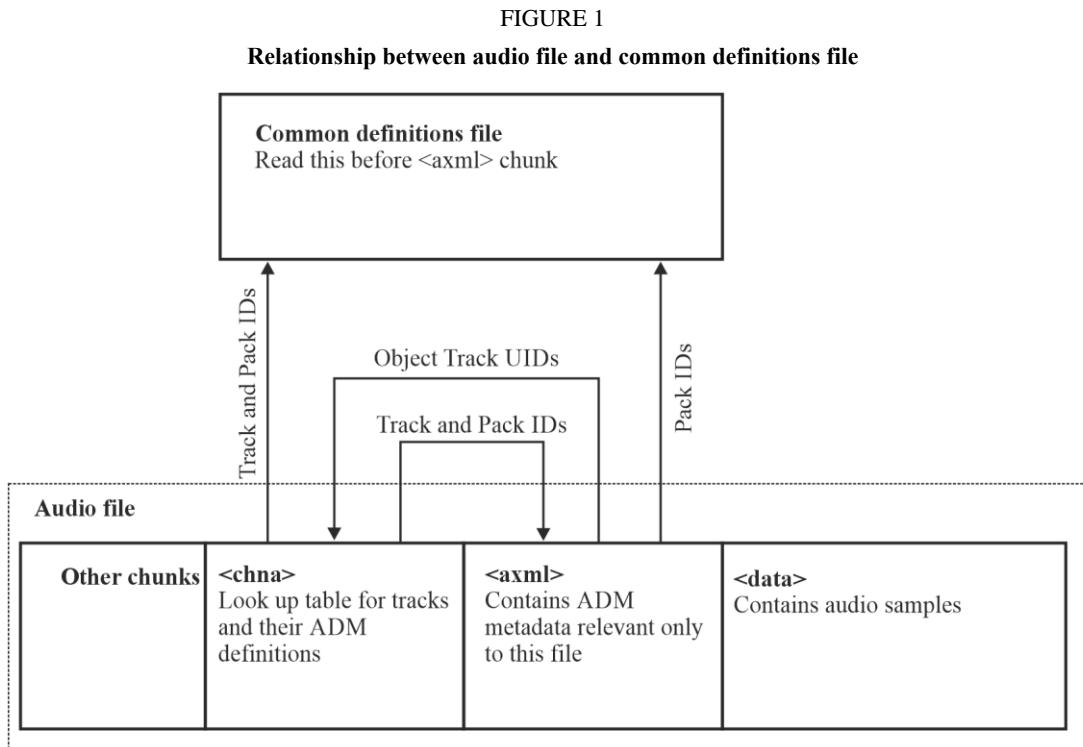

- audioTrackFormat
- audioStreamFormat
- audioChannelFormat
- audioBlockFormat
- audioPackFormat

Apart from audioPackFormat the elements are very closely tied together with one of each used for each channel definition. However, it does not mean that all four of these elements are required to be used at all times. It is perfectly acceptable to use a common audioChannelFormat/ audioBlockFormat definition with custom-made audioTrackFormat and audioStreamFormat definitions.

3 Common definitions usage

The common definitions exist as an extensible markup language (XML) file which can be either stored locally with the application that is handling the audio files, or referred to remotely. It is not intended to be carried in the audio file itself, as one of the intentions of it is to reduce the amount of metadata required to be carried in audio files.

Any code that reads audio files that contain ADM-defined audio (so BWF, BW64, RF64 typically) should always aim to read the common definitions first before reading the ADM metadata stored within the audio file itself. The relationship between the audio file and the common definitions file is shown in Fig. 1.

BS.2094-01

The `<chna>` chunk contains an ID reference to both an `audioTrackFormat` and an `audioPackFormat` definition for each track in the file. These references should be looked up in the common definitions file first to see whether that contains the IDs, and if not then the audio file's `<axml>` chunk should be referred to. When inspecting the content-related ADM metadata in the `<axml>` chunk, in particular the `audioObject` elements, it may have references to IDs that exist in the common definitions file, most probably `audioPackFormat` IDs. This ordering of the chunks is not strict, and it may be preferable to place the `<axml>` chunk after the `<data>` chunk.

4 Set of common definitions

The set of common definitions consists of commonly used channel-based configurations, some of which are recognised standards and some are common proprietary configurations. The definitions consist of a set of `audioChannelFormat` definitions for channels associated with many different speaker locations, including all those in Recommendation ITU-R BS.2051. Each of these channel definitions has an associated `audioStreamFormat` and `audioTrackFormat` definition for PCM audio signals to cover the most typical use case. The set of `audioPackFormat` definitions for the various speaker combinations use only channels from this common set.

The `audioChannelFormat` and the `audioPackFormat` IDs follow this format:

- `audioChannelFormatID: AC_yyyy0xxx`
- `audioPackFormatID: AP_yyyy0xxx`

where the first four hexadecimal digits (yyyy) indicate what the type of audio is. If this value is set to 0001 then the type is ‘DirectSpeakers’, if it is 0002 then it is ‘Matrix’, 0003 for ‘Objects’, 0004 for ‘HOA’ and 0005 for ‘Binaural’. The final four digits (xxxx) have values below 1000, so belong to the set of common definitions as listed here.

4.1 Common definitions for the ‘DirectSpeakers’ audio type

4.1.1 Common audioChannelFormats for ‘DirectSpeakers’

TABLE 1A

AC_0001002c	BottomFrontRight	-30	-30	B-030

⁽¹⁾ These channels also feature a low pass frequency cut-off of 120 Hz. For further characteristics of LFE signal, refer to Annex 7 of Recommendation ITU-R BS.775.

NOTE – Earlier versions (Recommendation ITU-R BS.2094-0 and ITU-R BS.2094-1) of this Recommendation contained the common definitions for these audioChannelFormatIDs and audioChannelFormatNames but have now been deprecated. These audioChannelFormatIDs shall not be used for other audioChannelFormats to avoid compatibility issues.

AC_0001082a	BackRightCentreMid_Cart	0.5	-1	0	M_BR50

⁽¹⁾ These channels also feature a low pass frequency cut-off of 120 Hz. For further characteristics of LFE signal, refer to Annex 7 of Recommendation ITU-R BS.775.

⁽²⁾ The speakerLabel of an audioChannelFormat in the Cartesian coordinate system uniquely identifies a channel in the “virtual cube”. The loudspeaker, as defined in Recommendation ITU-R BS.2051, that this channel will be played back on is undetermined until the target system layout is known. Table 2B in this document provides speakerLabel mappings for the common definition audioPackFormats when the target system layout matches the audioPackFormat.

Each channel definition is listed in Table 1A, where the audioChannelFormatID, audioChannelFormatName and speakerLabel elements are listed. The azimuth and elevation columns represent the position that would be specified within the position sub-element (the distance is 1.0 for all these channel definitions).

The XML below shows how the first entry in Table 1A is represented in XML.

```
<audioChannelFormat      audioChannelFormatID="AC_00010001"      audioChannelFormatName="FrontLeft"
typeLabel="0001" typeDefinition="DirectSpeakers">
  <audioBlockFormat audioBlockFormatID="AC_00010001_00000001">
    <speakerLabel>urn:itu:bs:2051:0:speaker:M+030</speakerLabel>
    <position coordinate="azimuth">30.0</position>
```

```

<position coordinate="elevation">0.0</position>
<position coordinate="distance">1.0</position>
</audioBlockFormat>
</audioChannelFormat>

```

4.1.2 Common audioStreamFormats and audioTrackFormats for ‘DirectSpeakers’

The common format type for audioStreamFormat and audioTrackFormat is ‘PCM’.

As previously mentioned, the audioStreamFormat and audioTrackFormat, which relate to each audioChannelFormat definition use the same ID prefixes and the same names with ‘PCM_’ appended, such as ‘PCM_FrontLeft’. The XML code below shows both the audioStreamFormat and audioTrackFormat definition for the first entry in the Table.

```

<audioStreamFormat      audioStreamFormatID="AS_00010001"      audioStreamFormatName="PCM_FrontLeft"
formatLabel="0001" formatDefinition="PCM">
  <audioChannelFormatIDRef>AC_00010001</audioChannelFormatIDRef>
  <audioTrackFormatIDRef>AT_00010001_01</audioTrackFormatIDRef>
</audioStreamFormat>

<audioTrackFormat      audioTrackFormatID="AT_00010001_01"      audioTrackFormatName="PCM_FrontLeft"
formatLabel="0001" formatDefinition="PCM">
  <audioStreamFormatIDRef>AS_00010001</audioStreamFormatIDRef>
</audioTrackFormat>

```

4.1.3 Common audioPackFormats for ‘DirectSpeakers’

The audioPackFormat definitions cover a range of speaker configurations. Tables 2A and 2B show the set of configurations that have been defined. The ones that are in Recommendation ITU-R BS.2051 are indicated. The last column gives the references to each channel the pack consists of. Instead of giving the whole ID (e.g. AP_00010001), only the last two digits are listed for clarity; so they would be AP_000100xx where xx is the digits listed to give the full audioPackFormatIDRef.

The audioPackFormat names have been given both a traditional name and the name formatted in the style of Recommendation ITU-R BS.2051 (U+M+L) separated by an underscore. Spaces are not used in the names as they can cause problems.

To simplify mapping, each audioPackFormat definition in Table 2A has a corresponding entry in Table 2B.

The audioPackFormat elements defined in Tables 2A and 2B for each of the coordinate systems have been designed so that the last 2-digits of the audioPackFormatIDs from one coordinate system corresponds to the other coordinate system. The 3 last digits in the range of 0x001 to 0x7ff indicates a polar based pack, 0x800 to 0xffff indicates a Cartesian based pack.

⁽¹⁾ The playback system speaker specified in this column is only relevant when the loudspeaker configuration of the playback system matches the audioPackFormat specified.

To show how an audioPackDefinition is represented in XML the following code shows the stereo pack definition.

```
<audioPackFormat audioPackFormatID="AP_00010002"
audioPackFormatName="urn:itu:bs:2051:0:pack:stereo_(0+2+0)" typeLabel="0001"
typeDefinition="DirectSpeakers">
  <audioChannelFormatIDRef>AC_00010001</audioChannelFormatIDRef>
  <audioChannelFormatIDRef>AC_00010002</audioChannelFormatIDRef>
</audioPackFormat>
```

4.2 Common definitions for the ‘Matrix’ audio type

Currently, there are no common definitions for the ‘Matrix’ audio type. However, in future revisions relevant information may be added to this section for common matrix configurations used.

4.3 Common definitions for the ‘Objects’ audio type

Currently, there are no common definitions for the ‘Objects’ audio type. However, in future revisions relevant information may be added to this section.

4.4 Common definitions for the 'HOA' audio type

4.4.1 Common audioChannelFormats for 'HOA'

TABLE 3
AudioChannelFormat definitions for 'HOA'

audioChannelFormatID	audioChannelFormatName	Order	Degree	Normalization

Each channel definition is listed in Table 3, where the audioChannelFormatID, and audioChannelFormatName elements are listed. The order, degree, and normalization columns represent the settings that would be specified within the audioBlockFormat sub-elements. The XML below shows how the first entry in this table is represented in XML.

```
<audioChannelFormat      audioChannelFormatID="AC_00040001"      audioChannelFormatName="SN3D_ACN_0"
typeLabel="0004" typeDefinition="HOA">
  <audioBlockFormat audioBlockFormatID="AB_00040001_00000001">
    <normalization>SN3D</normalization>
    <order>0</order>
    <degree>0</degree>
  </audioBlockFormat>
</audioChannelFormat>
```

4.4.2 Common audioPackFormats for ‘HOA’

The audioPackFormat definitions cover HOA configurations where all channels have the same normalization scheme and a complete series of channels up to a given order. Table 4 shows the set of configurations that have been defined.

As audioPackFormats can be nested, this allows the higher order packs to contain the lower order pack it contains plus the higher order channels. This reduces the size of each pack, and allows for flexibility in systems where different orders may require different processing.

The audioPackFormat names consist of the order, normalization and type. Spaces are not used in the names as they can cause problems.

audioPackFormatID scheme:

for type 0-1: AP_00040<type><normalization><order>

for type 2-3: AP_00040<type><normalization><order combination>

TABLE 4
HOA type values

<type>	Value
0	3D / periphonic
1	2D / pantophonic / horizontal-only
2	pantophonic and periphonic superimposed (#H#P)
3	Complete mixed-order sets (#H#V)

TABLE 5

	AC_00040109	N3D_ACN_8	2	2	N3D

To show how an audioPackDefinition is represented in XML the following code shows the first-order SN3D ACN (AmbiX) pack definition.

```
<audioPackFormat audioPackFormatID="AP_00040001" audioPackFormatName="3D_order1_SN3D_ACN"
typeLabel="0004" typeDefinition="HOA">
  <audioChannelFormatIDRef>AC_00040001</audioChannelFormatIDRef>
  <audioChannelFormatIDRef>AC_00040002</audioChannelFormatIDRef>
  <audioChannelFormatIDRef>AC_00040003</audioChannelFormatIDRef>
  <audioChannelFormatIDRef>AC_00040004</audioChannelFormatIDRef>
</audioPackFormat>
```

4.5 Common definitions for the ‘Binaural’ audio type

Currently, there are no common definitions for the ‘Binaural’ audio type. However, in future revisions relevant information may be added to this section.

4.5.1 Common audioChannelFormats for ‘Binaural’

TABLE 8
AudioChannelFormat definitions for ‘Binaural’

audioChannelFormatID	audioChannelFormatName
AC_00050001	LeftEar
AC_00050002	RightEar

Each channel definition is listed in Table 8, where the audioChannelFormatID, and audioChannelFormatName elements are listed. The XML below shows how the first entry in this table is represented in XML.

```
<audioChannelFormat audioChannelFormatID="AC_00050001" audioChannelFormatName="LeftEar"
typeLabel="0005" typeDefinition="DirectSpeakers">
  <audioBlockFormat audioBlockFormatID="AC_00050001_00000001">
    </audioBlockFormat>
</audioChannelFormat>
```

4.5.2 Common audioStreamFormats and audioTrackFormats for ‘Binaural’

The common format type for audioStreamFormat and audioTrackFormat is ‘PCM’.

As previously mentioned, the audioStreamFormat and audioTrackFormat, which relate to each audioChannelFormat definition use the same ID prefixes and the same names with ‘PCM_’ appended, such as ‘PCM_LeftEar’. The XML code below shows both the audioStreamFormat and audioTrackFormat definition for the first entry in the table.

```
<audioStreamFormat audioStreamFormatID="AS_00050001" audioStreamFormatName="PCM_LeftEar"
formatLabel="0001" formatDefinition="PCM">
  <audioChannelFormatIDRef>AC_00050001</audioChannelFormatIDRef>
  <audioTrackFormatIDRef>AT_00050001_01</audioTrackFormatIDRef>
</audioStreamFormat>

<audioTrackFormat audioTrackFormatID="AT_00050001_01" audioTrackFormatName="PCM_LeftEar"
formatLabel="0001" formatDefinition="PCM">
  <audioStreamFormatIDRef>AS_00050001</audioStreamFormatIDRef>
</audioTrackFormat>
```

4.5.3 Common audioPackFormats for ‘Binaural’

The audioPackFormat definition covers a single configuration. Table 9 shows the configuration that has been defined. The last column gives the references to each channel the pack consists of. Instead of giving the whole ID (e.g. AP_00010001), only the last two digits are listed for clarity; so they would be AP_000100xx where xx is the digits listed to give the full audioPackFormatIDRef.

TABLE 9
AudioPackFormat definitions

audioPackFormatID audioPackFormatName	audioChannelIDRef	audioChannelName
AP_00050001 Binaural	AC_00050001 AC_00050002	LeftEar RightEar

To show how an audioPackDefinition is represented in XML the following code shows the binaural pack definition.

```
<audioPackFormat audioPackFormatID="AP_00050001" audioPackFormatName="Binaural" typeLabel="0001"
typeDefinition="DirectSpeakers">
  <audioChannelFormatIDRef>AC_00050001</audioChannelFormatIDRef>
  <audioChannelFormatIDRef>AC_00050002</audioChannelFormatIDRef>
</audioPackFormat>
```

4.6 Using URIs

As the set of common definitions may increase in the future, it helps to have a method of provenance for particular elements. In the channel definitions for polar coordinates the speakerLabel elements correspond to those used in Recommendation ITU-R BS.2051, which use the L+aaa style of naming.

The two places that use URIs are the speakerLabel element (within audioBlockFormat) and the audioPackFormatName attribute (part of audioPackFormat). For example, for Recommendation ITU-R BS.2051-0 the URI prefix is given as: *urn:itu:bs:2051:0*. It should be noted that this is not necessarily the most recent edition of Recommendation ITU-R BS.2051. An example of code using the URIs specifying M+030 and stereo is shown below.

```
<speakerLabel>urn:itu:bs:2051:0:speaker:M+030</speakerLabel>
<audioPackFormat audioPackFormatID="AP_00010002"
audioPackFormatName="urn:itu:bs:2051:0:pack:stereo_(0+2+0)" typeLabel="0001"
typeDefinition="DirectSpeakers">
```

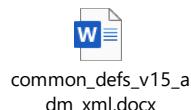

After each *urn* prefix follows a string to classify what is being named (either *speaker* or *pack* in this case), and then this is followed by the actual name.

5 Attachments

This file is a Microsoft Excel spreadsheet containing both the channel definitions and pack definitions:

The following file contains the Common Definitions using the Recommendation ITU-R BS.2076 model in XML. It has been automatically generated from the spreadsheet. Due to the limitations of Word, an XML file cannot be embedded. So this is a Word document containing just the XML as text. To use, open the file, select all, then copy into a plain ASCII text file (using a text editor) and save it as "common_adm_def_v15.xml".

If there is a difference between the text in this Recommendation and the attached files (XLSX, XML), the text of this Recommendation shall have priority.

Annex 2 (informative)

Overview of changes in this edition (Recommendation ITU-R BS.2094-2)

Modifications are as follows:

- The audio channel labels of Low Frequency Effects -Left and -Right are changed to Low Frequency Effects -1 and -2 respectively in modified Tables 1 and 2.
 - New common definitions of audioChannelFormat for M+/-150 and B+/-030 with polar coordinate system are added in Table 1A.
 - New common definitions of audioPackFormat for the following sound systems with polar coordinate system are added in Table 2A.
 - Six sound systems without LFE used in production (7.0back, 7.0top, 7.0topside, 9.0, 11.0, 22.0).
 - Eight sound systems used in streaming / package media (13.1_9.1.4, 15.1_9.1.6, Auro-3D_8.0 (4+4+0), Auro-3D_10.1 (5+5+0), Auro-3D_11.1 (6+5+0), Auro-3D_11.1 (4+7+0), Auro-3D_13.1 (6+7+0), 360RealityAudio).
 - The common definitions of audioPackFormat for Auro-3D_(9+9+0) and audioChannelFormat for M+/-135_Difff with polar coordinate system are deprecated from modified Tables 2A and 1A.
 - New common definitions of audioChannelFormat and audioPackFormat for Cartesian coordinate system are added in Tables 1B and 2B.
 - Addition of text in § 5 regarding the priority of Recommendation text versus attached XML:
 - "If there is a difference between the text in this Recommendation and the attached files (XLSX, XML), the text of this Recommendation shall have priority."
-
