

The Importance of the Internet in Disaster Relief

Piyawut Srichaikul

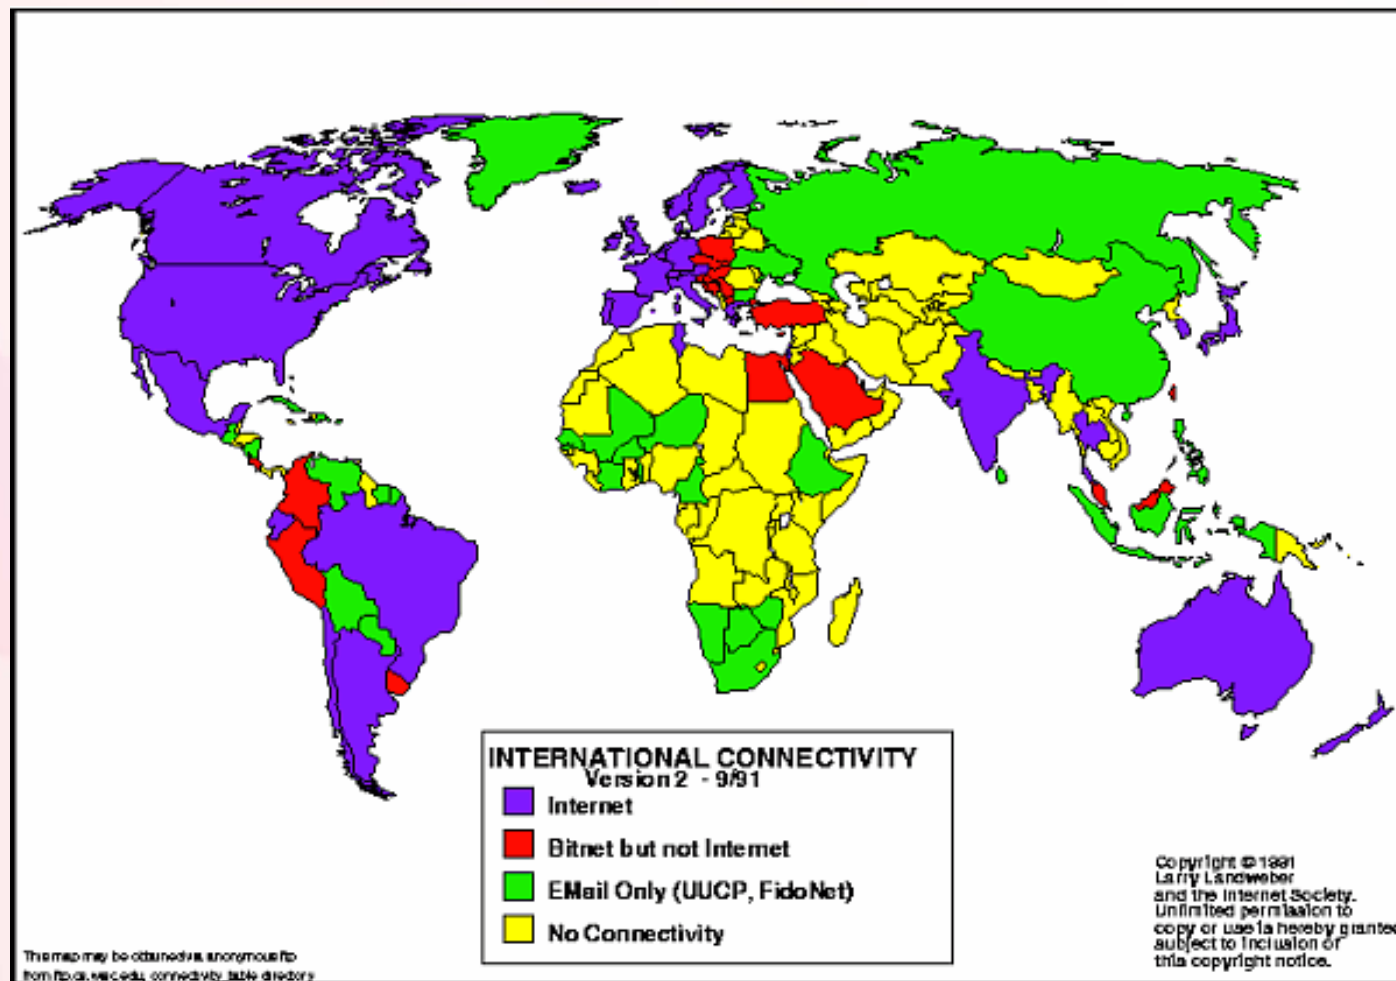

Piyawut.srichaikul@nectec.or.th

**National Electronics and Computer Technology Center
Thailand**

**ITU/ESCAP Disaster Communications Workshop
12 – 15 December 2006
Bangkok, Thailand**

Outline

- Growth of the Internet and global access allows reach-ability for the disaster information system
- Examples of applications on Information Management for Emergency
- Some lesson learned
- Towards Internet-based Disaster Information Management System: Open Standards

Missing Persons Tracking System

The system is developed to be a data center of disaster's missing persons. Relatives and friends can insert the detail of the missing love one. People in the disaster's area and governmental staffs may able to help identifying the status of the missing person. At the present, two databases of missing persons registration system are opened.

- ❑ Missing Persons Registration System for the Tsunami in Thailand at <http://www.missingpersons.or.th/>
- ❑ Missing Persons Registration System for the Flooding in Northern of Thailand at <http://www.missingpersons.or.th/flood/>

Open Source Developing Tools:

- ❑ Operating System:
 - FedoraCore 3 Linux
- ❑ Web Server:
 - Apache 2.0.52
- ❑ Programming Language:
 - PHP 4.3.10
- ❑ DBMS: MySQL

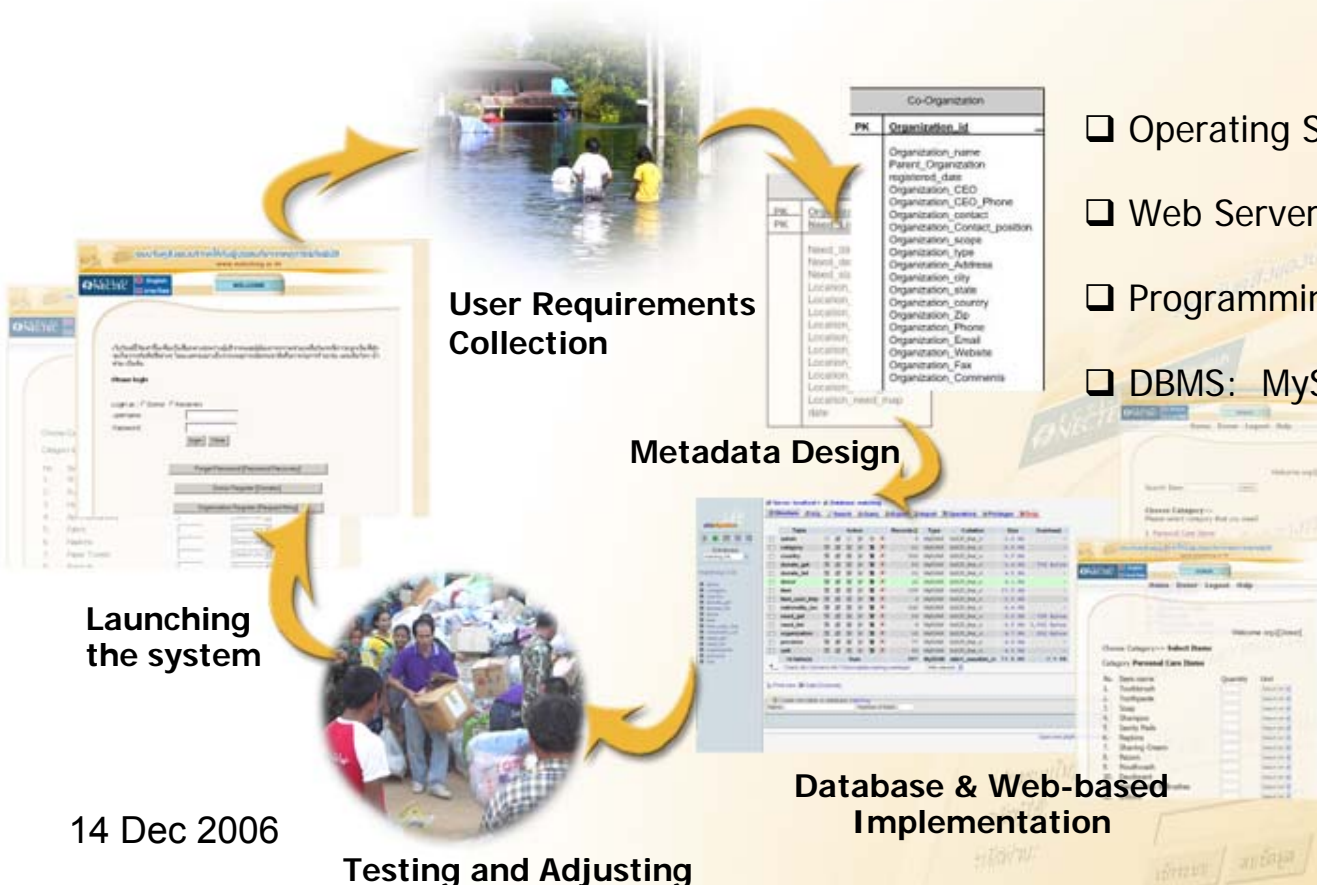

14 Dec 2006

Donation Matching System

The system is developed to receive the registration of the donations from the donors and the registration of requirements from the victims in the disaster's area. This system is intended to be a data center of the donation including the matching algorithm to meet the victims requirements. The system is under construction.

Open Source Developing Tools:

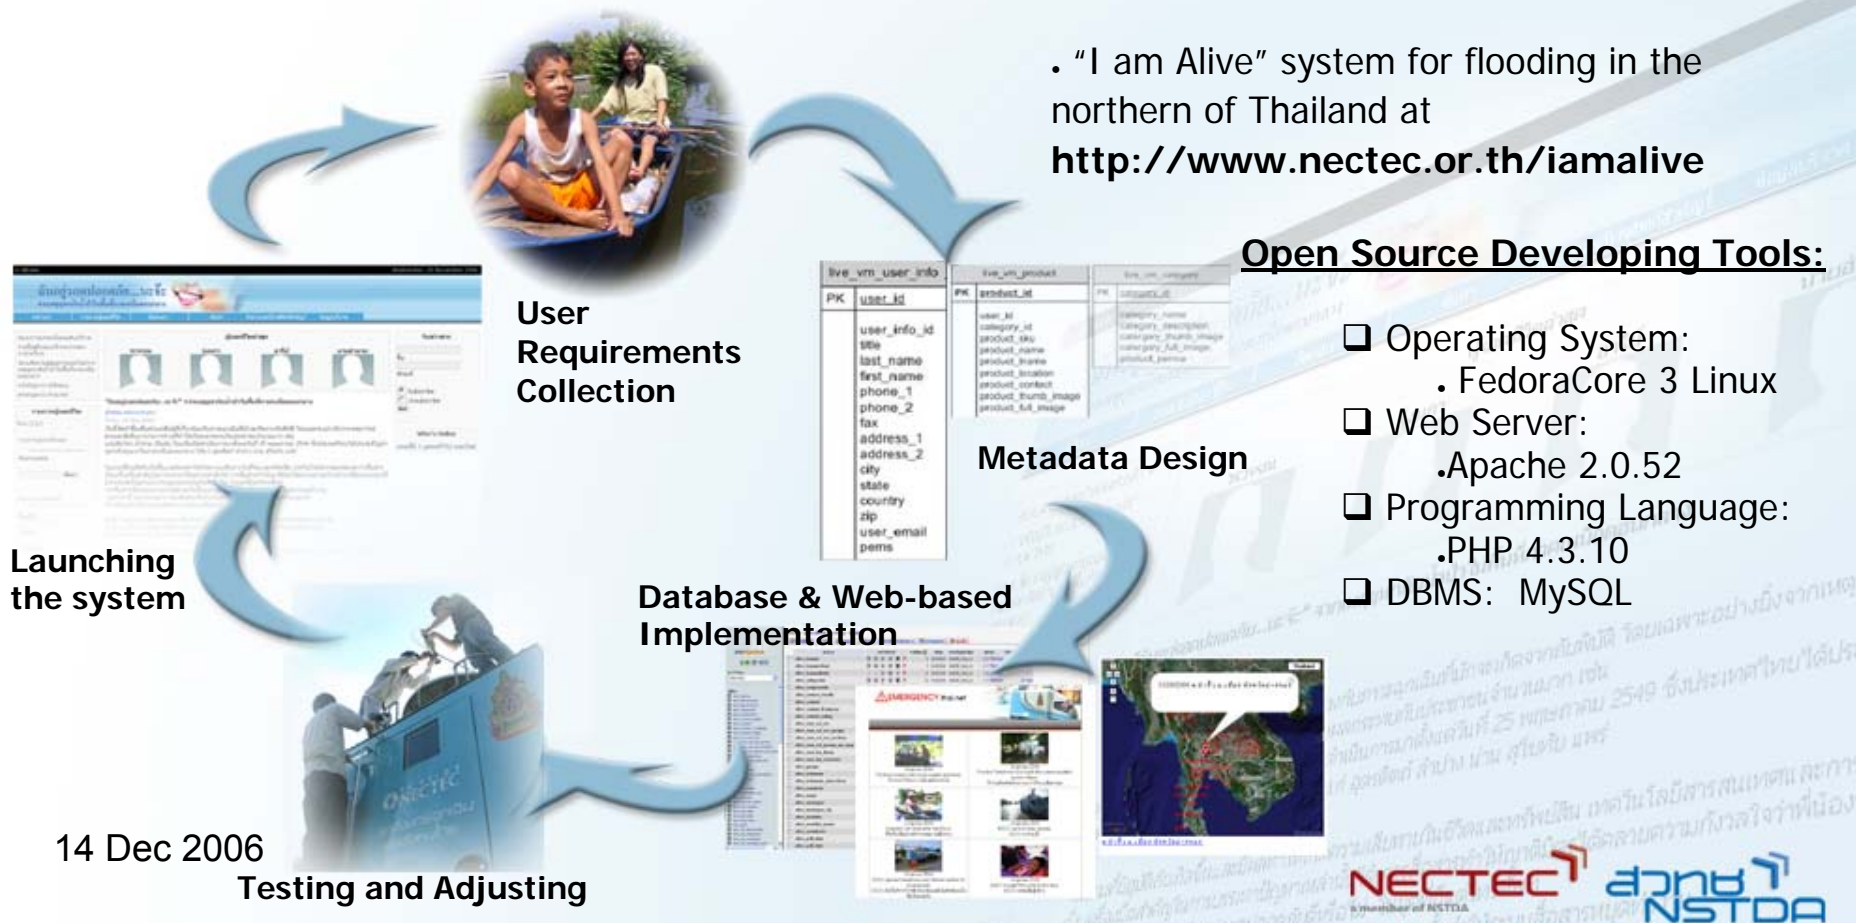

- ❑ Operating System: FedoraCore 3 Linux
- ❑ Web Server: Apache 2.0.52
- ❑ Programming Language: PHP 4.3.10
- ❑ DBMS: MySQL

14 Dec 2006

"I am Alive" System

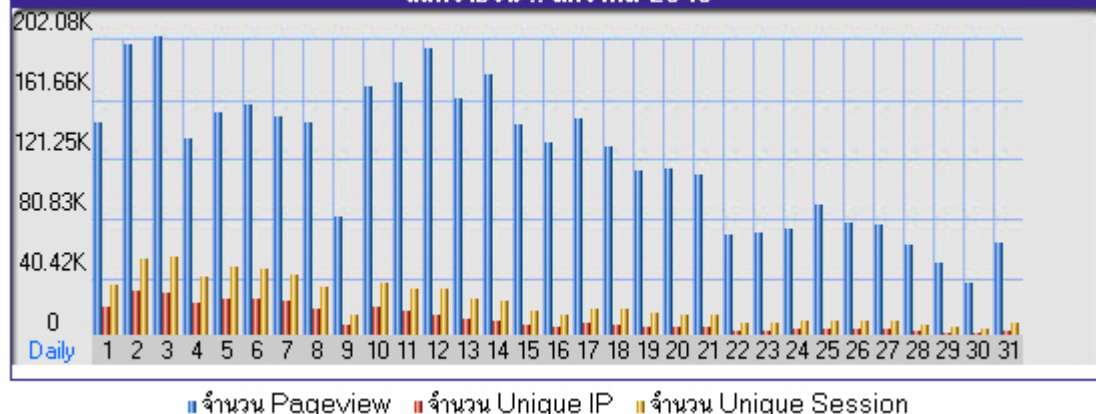

The system is developed for survivors from the disaster. Survivors can register by themselves their information into the system via Internet to be another channel of sending message to relatives and friends. In addition, people outside the disaster's area may access the system to query and search for their missing persons. At the present, one database is opened.

Experience from Tsunami missingpersons.or.th

- Weeks of sleepless nights
- Sharing to www.thaitsunami.com thru DB table dump
- Closed down registration Feb 14, 2005
- A lot of data cleansing before further use
- Total number of registered records: 4636
- From 62 countries
- Only 340+ cases has been resolved

Lesson Learned

- Due to **urgent nature of the situation** → information provided on an **ad-hoc basis**
- **Language Barrier** → **Difficult for non-local to locate** anything quickly
- **Information scattered/** multiple web sites → **difficult to find, duplicates records, lost track**
- **format incompatible** (fax scan, database table dump, spreadsheet, pdf, and free-form text) → data **consolidation impossible**

- Insufficient internet bandwidth in crisis → difficult to get thru
- primarily voice-based coordination → highly congested, misinterpretation
- lack of coordination → Demand and supply mismatched and untimely
- Each relief group came from a different place at different time. Findings were **NOT** shared → Lack of continuity. Waste of time and resources
- information sharing is and has always been a lower priority

Quoting From “**Open Standards – The Way Forward**, A Personal Remarks by **Thaweesak Koanantakool**” May 4, 2006, at Regional Conference on Open Standards, The key to an open ICT Ecosystem

“

1. *Form a ‘group’ modelled after the Berkman Roadmap for Open ICT Ecosystems exercise to explore specific areas of interest in open standards in the Asia-Pacific context.*
2. *Foster regional cooperation towards developing government interoperability frameworks – at the national and regional levels. This would include the development of local definitions of open standards and guidelines for policy.*
3. *Undertake capacity building activities on open standards targeting government CIOs, developers, and the general public.*
4. *Hold a region-wide competition to promote the development of open standards and to recognize the interoperability of government projects based on open standards.*
5. *Undertake a study to analyze existing government interoperability frameworks, and understand how they impact competition in the market place.*
6. *Establish centres of excellence, involving all stakeholders, to develop proof of concepts and case studies. For example, these centres may monitor the use*

OpenCARE!

- **OpenCARE** = the Open exchange for Collaborative Activities in Response to Emergencies
- a scalable information exchange infrastructure which primarily aims at providing better co-ordination in disaster handling
 - **Information sharing** (thru agreement and format)
 - **Infrastructure to enable such sharing needs** (implementation)
- A set of computer program that gathers information and disseminates them through the Internet network. It can be embedded and work with existing computer systems
- *First presented as “e-CARES” By Trin Tantsetthi, at Regional Conference on Open Standards, The key to an open ICT Ecosystem, May 2-4 2006, Thailand*
- <http://opencare.inet.co.th>

OpenCARE!

Central disaster and emergency coordination system enable incompatible systems to share information in their native formats
No change of original system in operation is required

Reporting agent

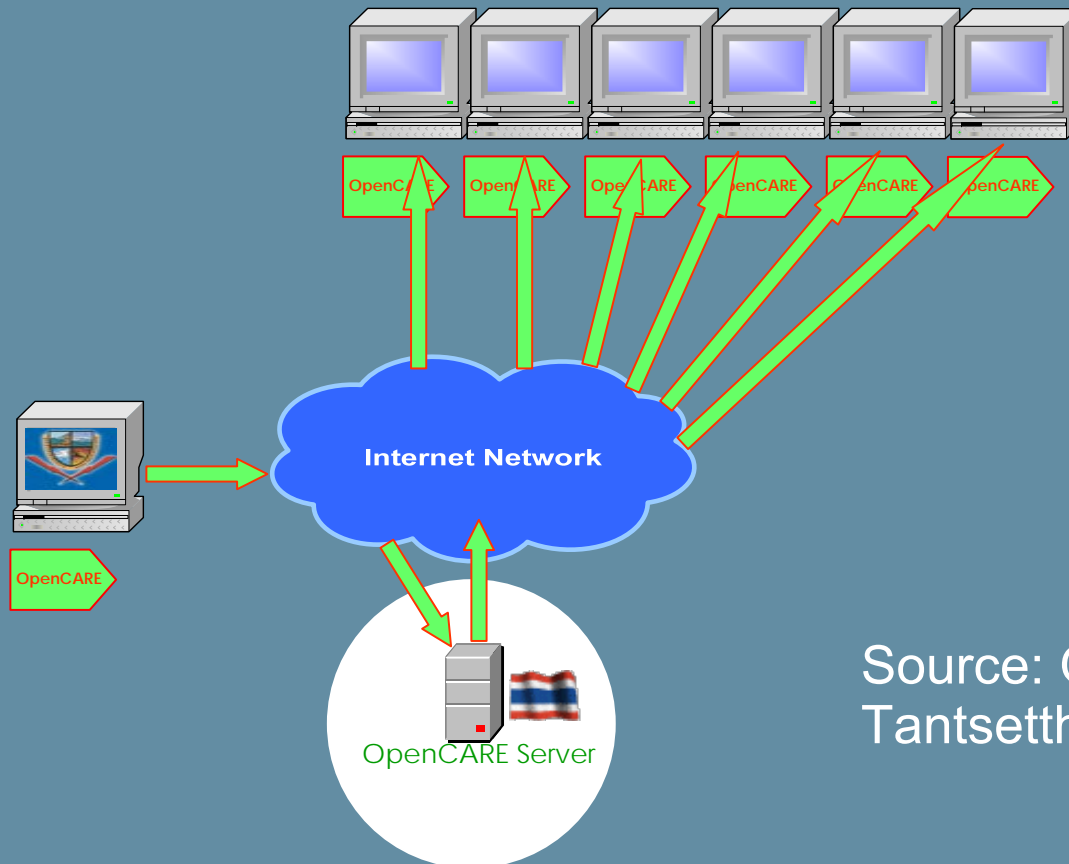

Source: OpenCARE Concept :Trin
Tantsetthi & Phat Kulphaichitra

OpenCARE!

Translate different formats so that each incompatible systems do not have to change

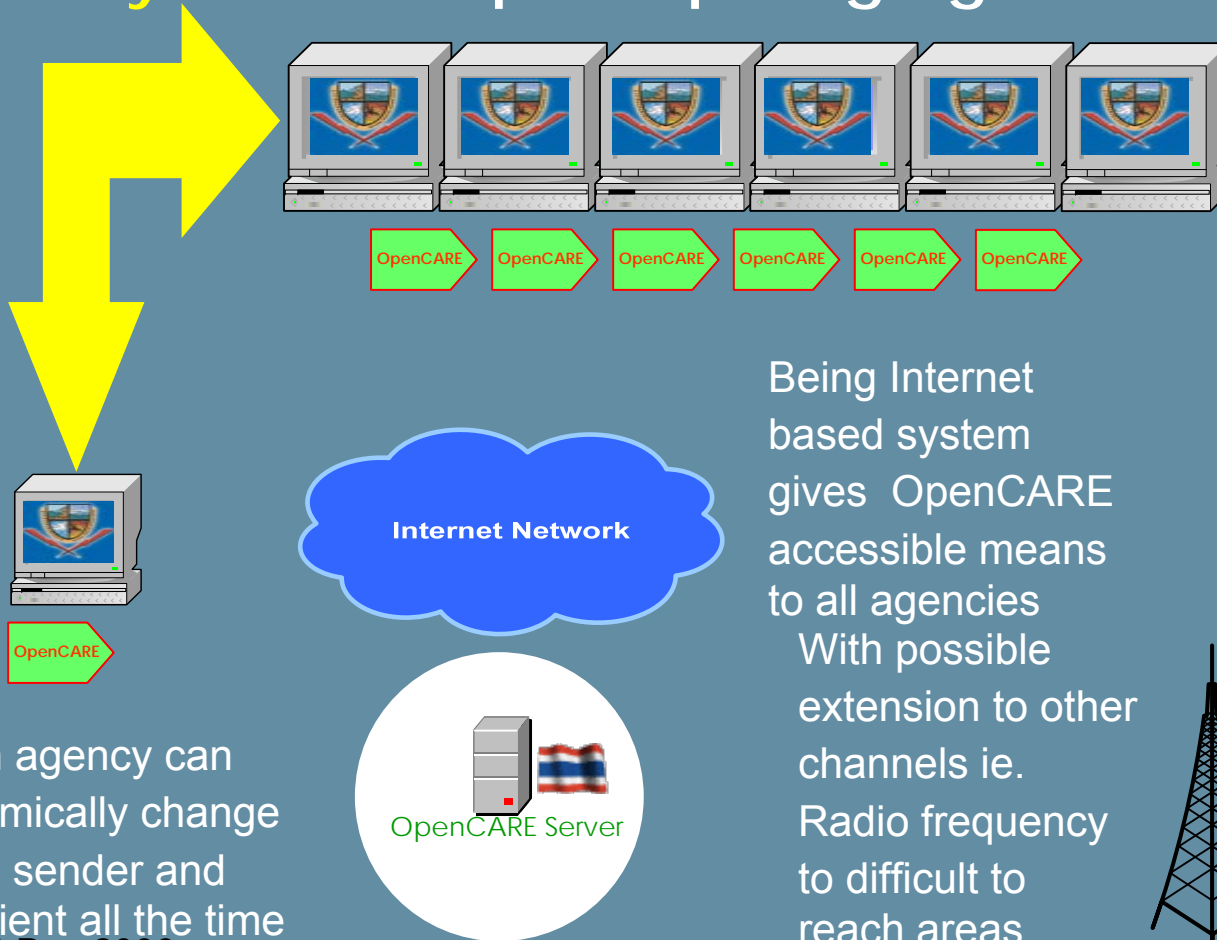

Source: OpenCARE Concept :Trin Tantsetthi & Phat Kulphaichitra

OpenCARE!

Accurate and usable information will be timely shared to participating agencies

Each agency can dynamically change to be sender and recipient all the time

Being Internet based system gives OpenCARE accessible means to all agencies With possible extension to other channels ie. Radio frequency to difficult to reach areas
