

ITU starts today, September 10, 2018, operations in Honduras of the "Alternate Emergency Telecommunication Network" in the Americas

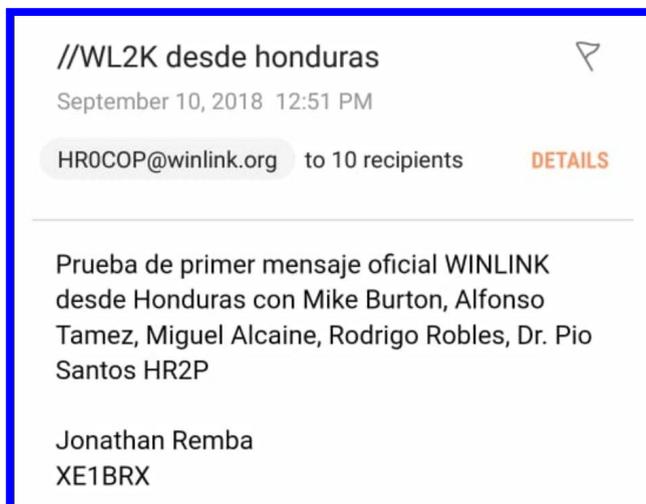

ITU along with CONATEL, COPECO and Radio Club de Honduras - national partners - and IARU, COMTELCA, CITEL and CEPREDENAC – international partners - is starting today, September 10, 2018, operations of the node HR0-COP in Honduras, which will be part of the "Alternate Emergency Telecommunication Network" in the

Americas using the solution Winlink.

This node will already cover most of Central America, and the following nodes will give to the network strong resilience.

With the implementation of the solution, the greatest achievement is not the equipment but the strengthened cooperation among all

actors involved, which will enable the growth of capabilities of Honduras in preparation to emergencies and catastrophes, and at the end, save lives.

ITU wants to recognize the disinterested collaboration of FMRE Mexico and the Winlink team in the success of this project.
