

BR IFIC 2815 – NEWS

The Bureau reported to WRC-15 the existing practice of limiting grid-points to above 3° elevation when identifying affected administrations and networks under Nos. 9.36 and 9.36.2 as well as No. 9.41 requests from administration (Doc 4(Add.2)(Rev.1) of WRC-15). When identifying worst-test point, GIBC/Appendix 8 and /PFD(space serv) software rejected all grid-points with elevation angle below 3° measured from the horizontal plane to the direction of a space station.

WRC-15 considered this issue and decided to request the BR to remove the 3 degree limitation. As a result, this limitation was removed from GIBC/Appendix 8 and /PFD(space serv) software as of BR IFIC 2815.
