

**The Child Growth Monitor is a mobile app to digitally measure children's height and weight to detect malnutrition**

**Jochen Moninger**

# The starting point: the CGM, a mobile app to measure height and weight

## Digitized data

- Replace error prone process of plotting points on a paper graph
- Digital data generated instantly – difficult to manipulate

## Better height measurements

- Remove need for heavy, expensive wooden measuring board
- Avoid stretching the child - lower stress for child, mother & health worker

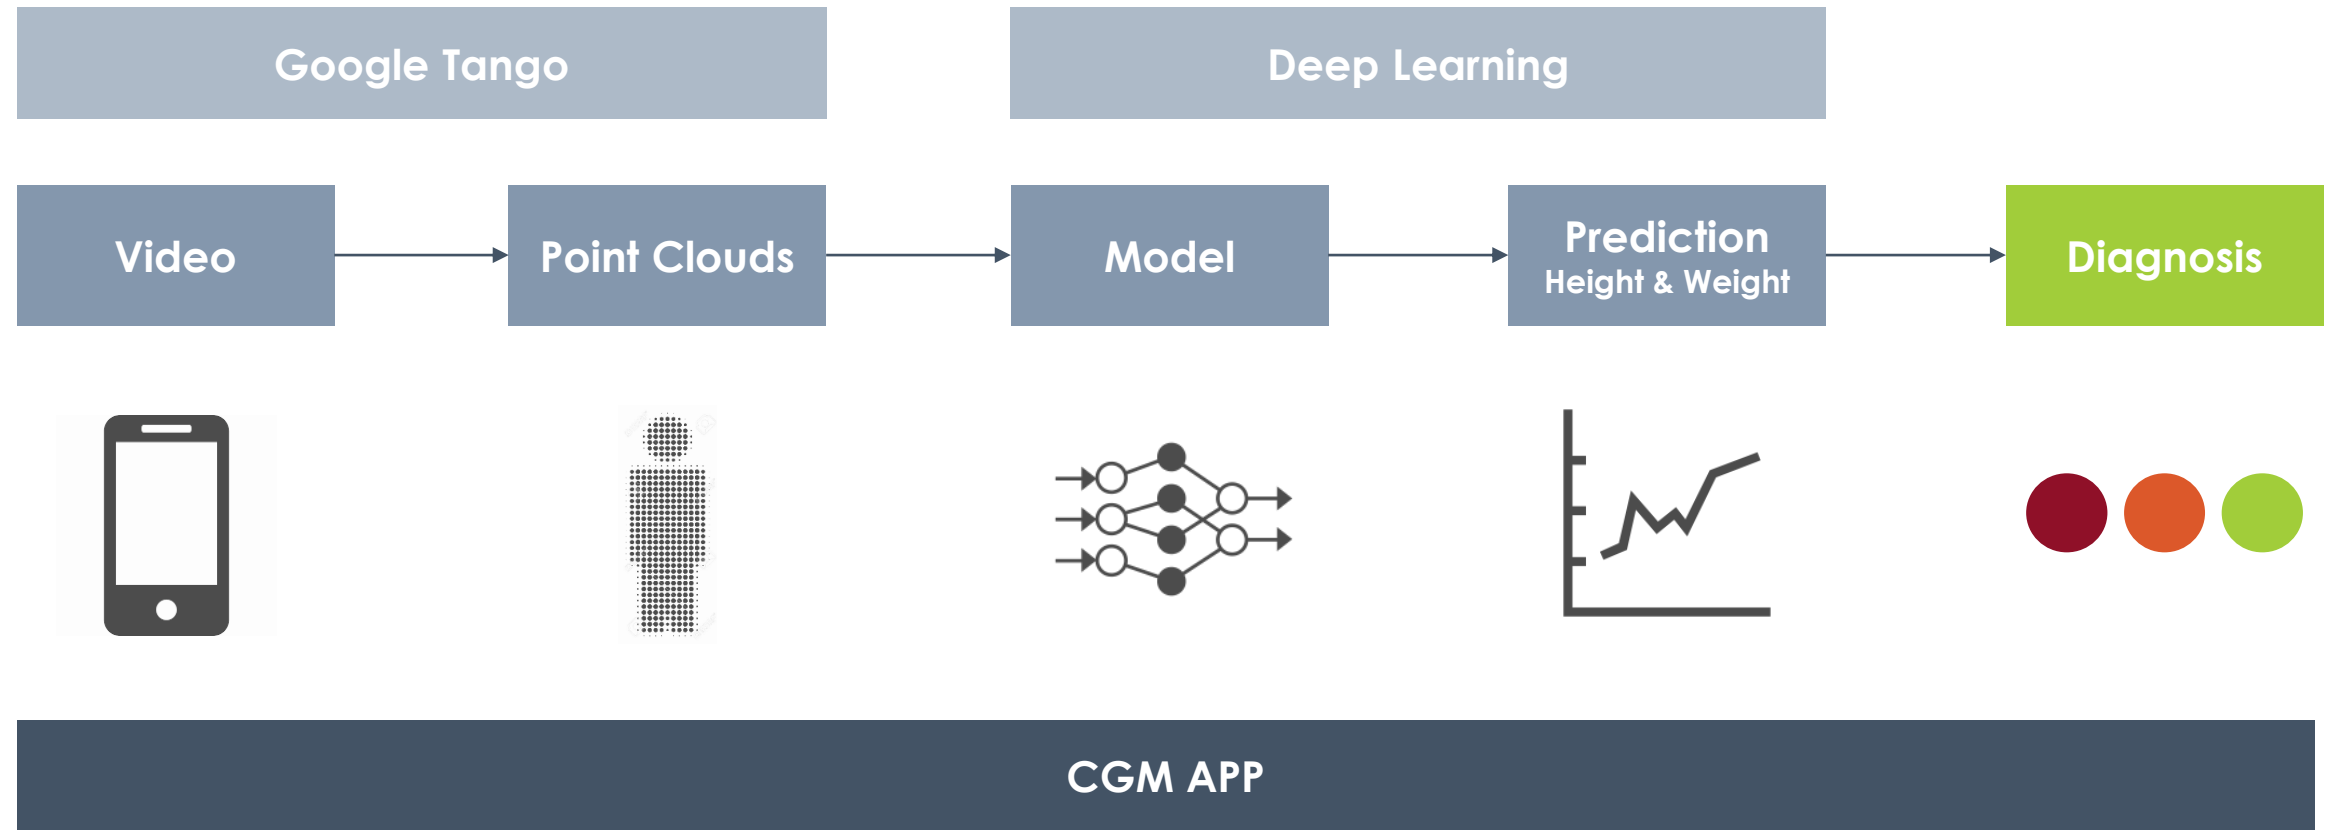

## Better weight measurements

- Remove need for heavy, expensive scales
- Avoid regular calibration of equipment to maintain accuracy

# The CGM today is using AR in combination with AI to diagnose malnutrition

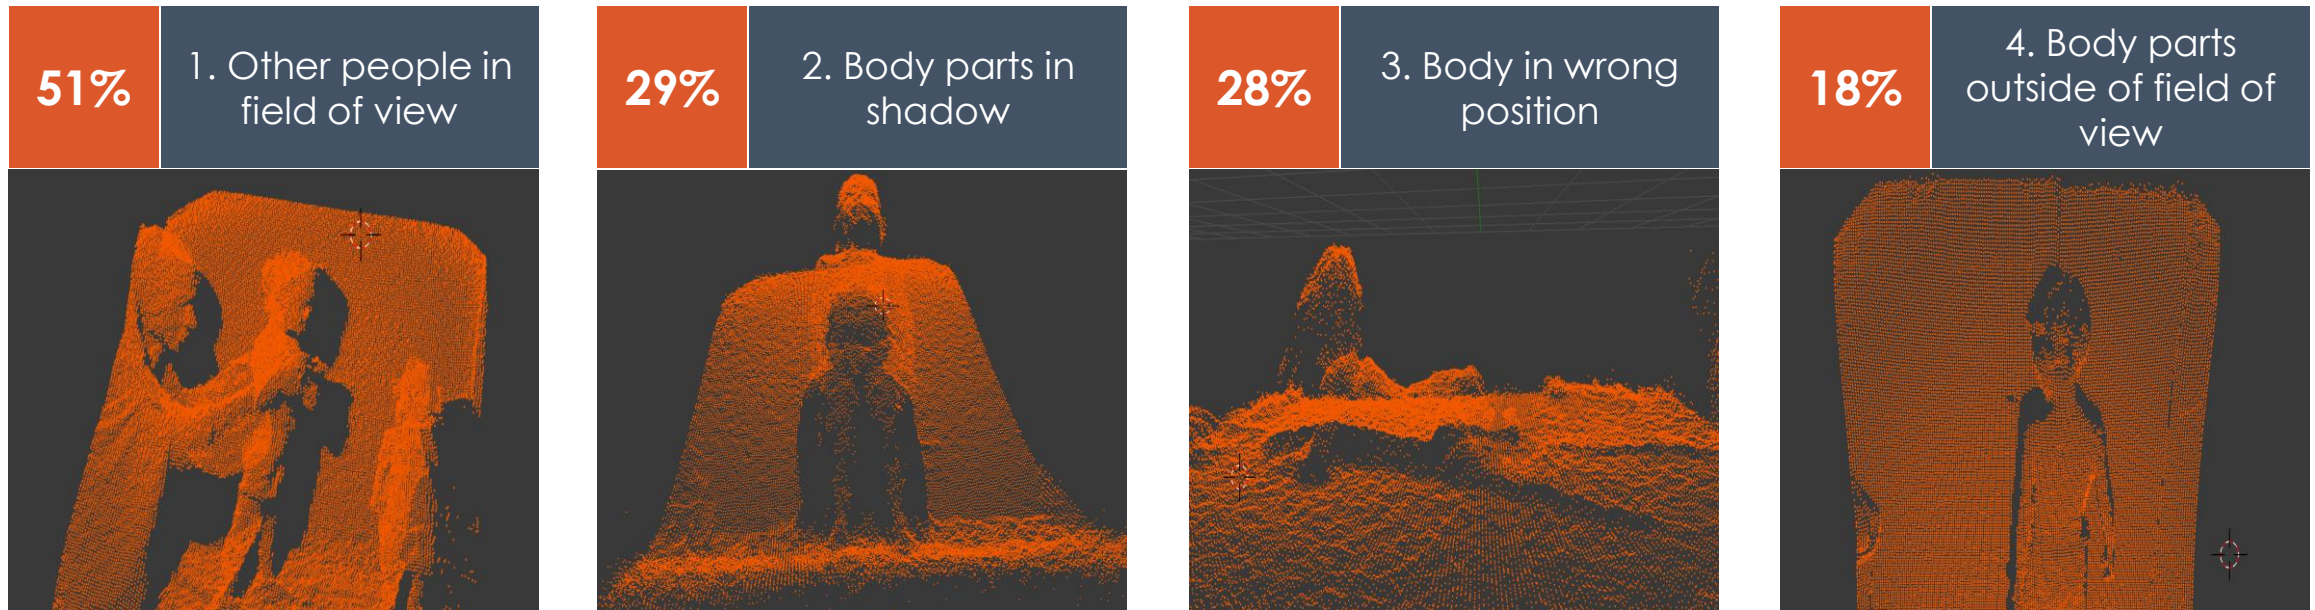

## User experience

### Current CGM user experience is inferior to manual measurement

1. Scan takes longer than manual measurement
2. Scan is more exhausting for child and support worker
3. No feedback of scan quality when it's being taken

# Current user experience leads to poor data quality and affects the accuracy of the CGM prediction model

Of **72** CGM scans analyzed, **~80%** belong to at least one of **4** error classes

## Measurement prediction

# Uncertain if height and weight can be predicted

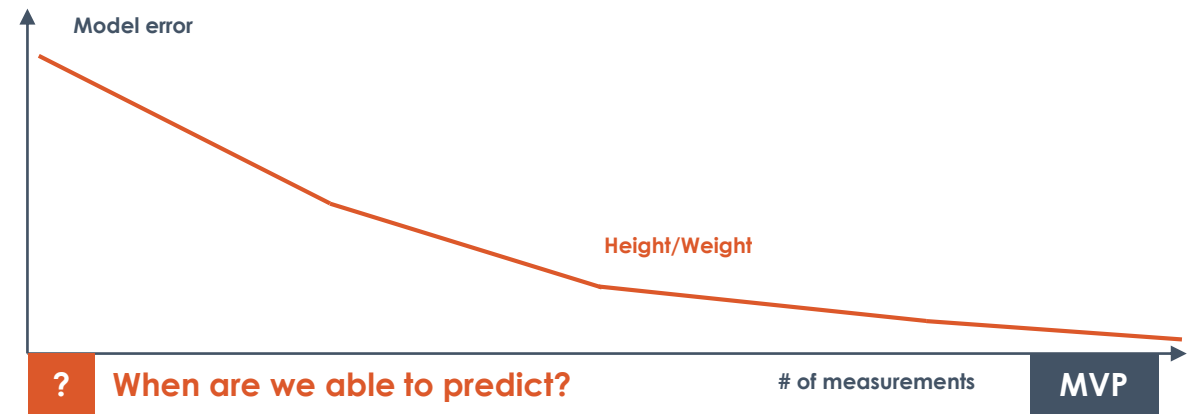

1. Unclear how much sample data is required to reach desired accuracy
2. Unclear if current algorithm is the right approach
3. Research on weight estimation is far from required accuracy

Deep Learning Models must be trained on ground truth data

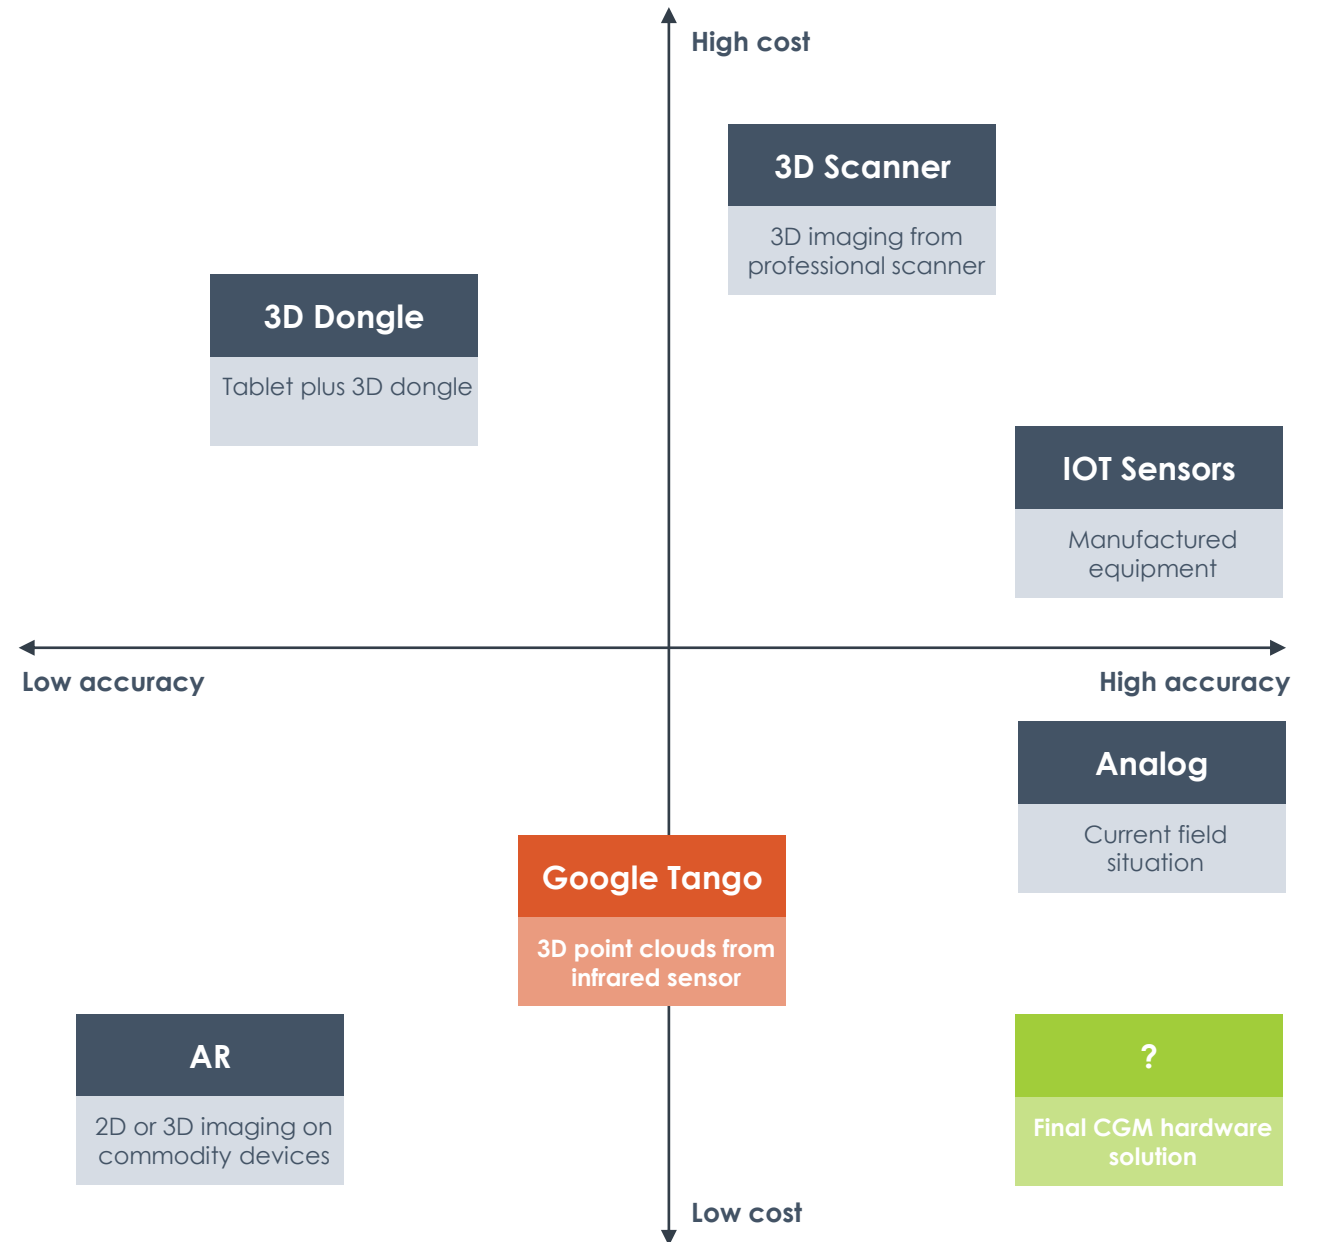

Model error should decrease as a function of the amount of input

## Hardware

# Selected hardware is not future proof

1. Current hardware has been discontinued
2. Data collected today has to be compatible with alternative future solutions
3. Thus far no alternative technology identified

# Today, the CGM is not fulfilling any of the required key dimensions

<b>Accuracy/precision</b>	✗	Height and weight measurement is not possible with current version	✓	• As accurate and precise as gold standard
<b>Data reliability</b>	✗	Accuracy and precision must be met first to move forward	✓	• Robust (human error) and reliable (data manipulation)
<b>Speed of diagnosis</b>	✗		✓	• As fast or faster than the manual measurement process
<b>Cost efficiency</b>	✗		✓	• As cheap or cheaper than the current equipment
<b>Maintainability</b>	✗		✓	• As easy or easier to maintain than the current equipment

# ...the realization of massive leaps

## Dimensions

	Manual process	POC (3 months)	Alpha (12 months)	Beta (6 months)	MVP (6 months)
<b>Accuracy/ Precision*</b>	Height: +/- 0.6 cm Weight: +/- 0.1 kg	Height: +/- 5 cm Weight: N/A	Height: +/- 2 cm Weight: +/- 5 kg	Height: +/- 1 cm <b>Weight: +/- 2 kg</b>	Height: +/- 0.6 cm <b>Weight: +/- 0.1 kg</b>
<b>Data reliability</b>	40-50%	Not used under real conditions	Not used under real conditions	Not used under real conditions	Approx. 90%
<b>Speed of diagnosis</b>	6 min	N/A	<b>&lt; 6 min</b>	<b>&lt; 3 min</b>	< 2 min
<b>Cost efficiency</b>	€~ 1,30 per scan	N/A	~€ 1,40 per scan	~€ 1,20 per scan	~€ 1,10 per scan
<b>Maintainability</b>	Specific measuring instruments	Specific device	<b>Specific device</b>	<b>Commodity device</b>	Commodity device

Annotations:

- Outperform research**: An orange box with an upward arrow pointing from the Beta stage to the MVP stage.
- Shift in scanning process**: An orange box with upward arrows pointing from the Alpha stage to the Beta stage.
- Change of tech stack**: An orange box with upward arrows pointing from the Alpha stage to the Beta stage.

## Conclusion

**CGM is at a junction: there are great challenges that need to be overcome, but the potential for creating impact is huge.**
