

The Failure of Security to Protect & the need for Security Inclusion Now!

Abstract

Large data breaches in the financial sector still continue to occur with minimal consequences. How is it that Security has failed to protect us? How can we expect security to protect our global financial systems of tomorrow? How can trust be established and maintained in perhaps the most important societal digital use case - money.

The ultimate question is how and to what level of assurance will we protect all forms of Digital Currency in general and more importantly the digital currency that would underpin the viability of a nation in the digital age - its Digital Fiat Currency?

Protection from Digital Harm is a human right!
