Volumetric Video: The “MPEG *Metadata for Immersive Video*” Distribution Format

INTERDIGITAL®

Volumetric Video: Key Use Cases

Volumetric Video Creates an Immersive Experience

- Volumetric content is the next generation of video
- Users can experience the sensations of depth and parallax
- Volumetric video enables increased immersion into a content

Experience of Parallax in VR

Volumetric Video is mandatory in VR

Users use volumetric video for:

- Up to 360° video with parallax
- Content that is not flat
- To enhance the overall video experience
 - More immersive
 - More natural
 - Less discomfort

Experience of Parallax on TV

On television, users can experience the sensation of depth and parallax using volumetric video

A key example:

- Dynamic Window Experience

Experience of Parallax on Smartphones

On smartphones, volumetric video can create new experiences on any 2D screen

Creating Volumetric Video from Multi-Views Content

Adapt Capture Setup to the Degree of Freedom of the Experience

To create a volumetric experience, there is a strong correlation between the degree of freedom of the experience and video rig design

Capture Real Video

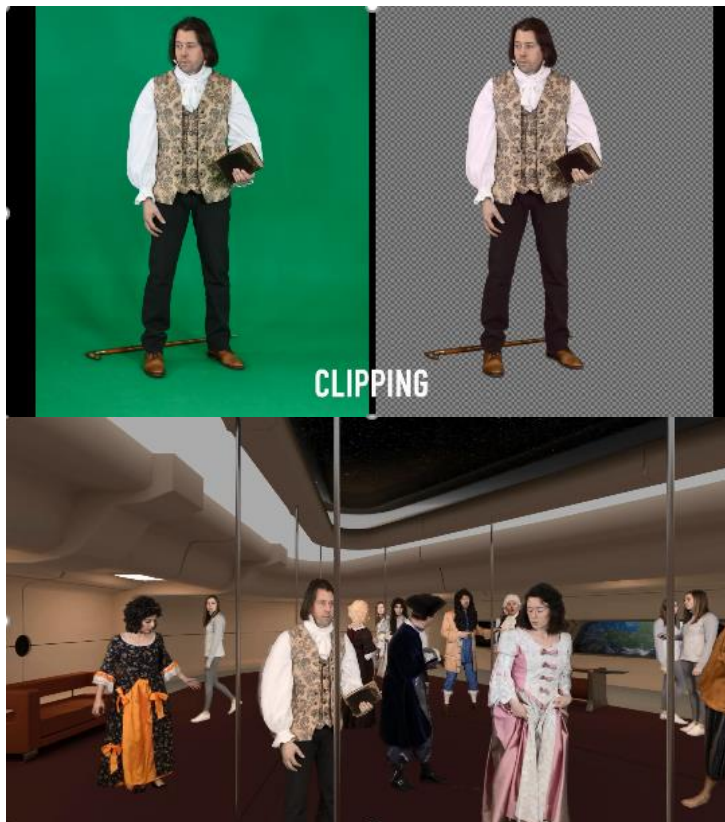

- Utilize light field camera arrays
- Leverage the relationship between degree of freedom and rig design
- Consider the challenge of capturing a large environment

Develop Computer-Generated Content

- Creating an up to 360 ° video with a virtual rig on a computer-generated (CG) scene

Create a Composite

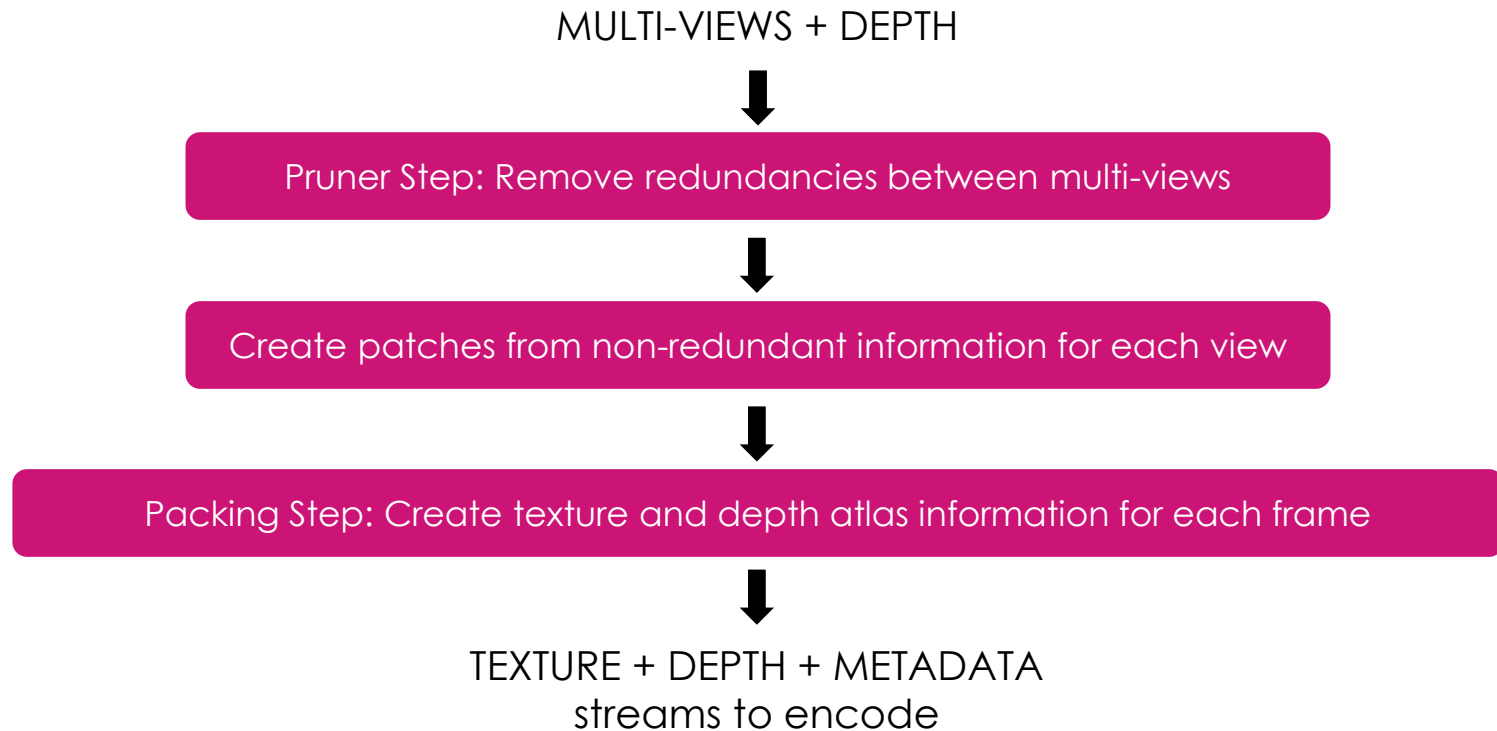

- Develop a scene composition for non full light field capture
- Provides large field of view content
- Use VFX compositing tools

How to Create Specific Volumetric Streams

The Encoder Pre-Processing Steps

Transforming Multi-Views and Depth Information into Video Streams

Finding Redundancies Between Multi-Views

- The Pruner Step
- The Packing Step

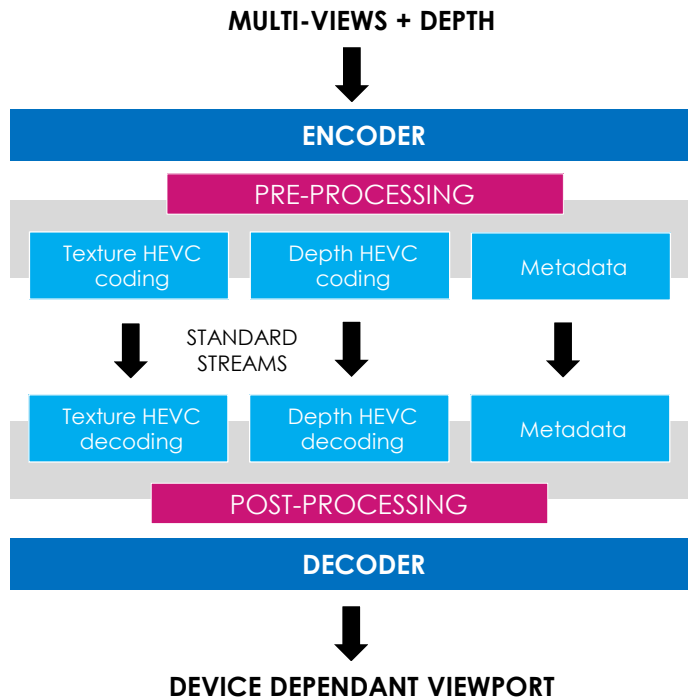

Understanding the MPEG Metadata for Immersive Video (MIV) Distribution Format

MPEG Metadata for Immersive Video Format

- The MPEG MIV format has three streams:
 - ✓ Texture
 - ✓ Depth
 - ✓ Metadata
- Content is encoded using standard compression codec (HEVC)
- Metadata includes camera parameters and patch list

ROADMAP

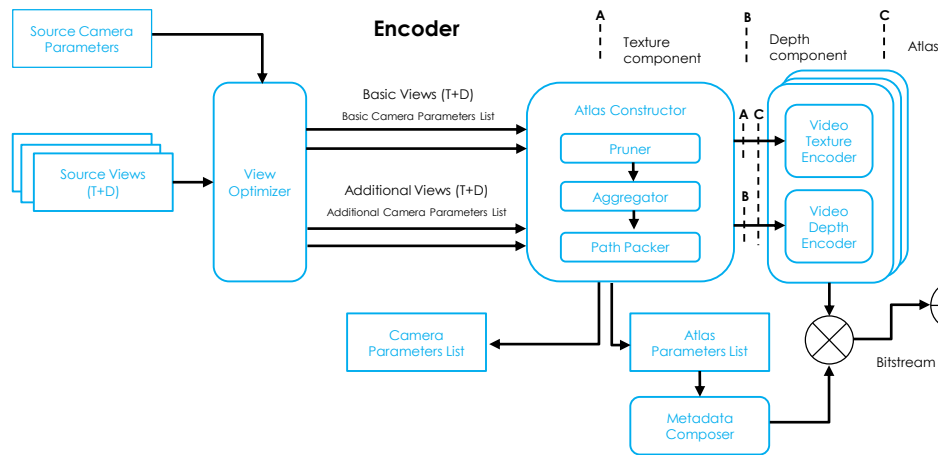

- Reference Software V1 available
- MPEG Committee draft begins in 2020 (MPEG-I Part 12)

MPEG Metadata for Immersive Video Format: Full Workflow

Encoder

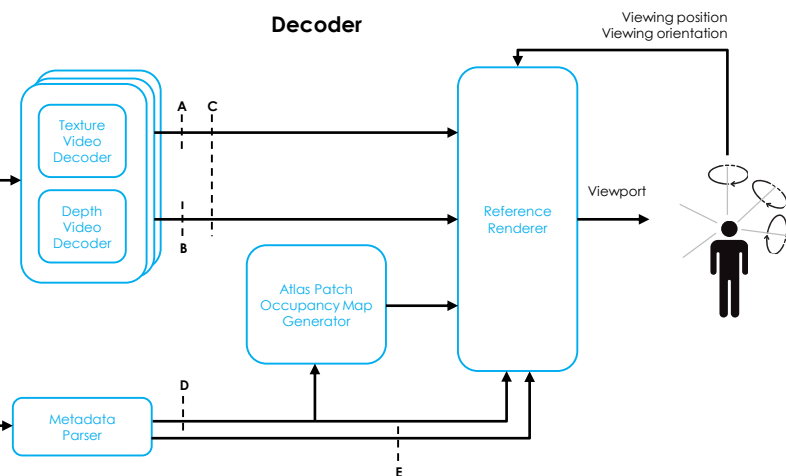

- From Multi-views + depth
- To input streams for compression

MPEG MIV encoder block diagram

Decoder

- From decoded streams
- To device specific viewport

MPEG MIV decoder block diagram

How to Render Volumetric Video

View Interpolation

- View interpolation takes sparse information to create a smooth rendering of immersive content
- View interpolation is an important quality assessment point for the user

MIV Distribution Format: The Results

Anchor 9.9Mb/s PSNR=33.1dB

InterDigital 7.4Mb/s PSNR=34dB

Adam Content,
Unity

What's Next for MPEG MIV Format and Volumetric Video?

Unlocking the Potential of Volumetric Video

To achieve the benefits and opportunities of volumetric video we must:

- **Identify new content types** where volumetric essence is core
- **Develop editing tools** to ingest true volumetric content
- **Create deep-learning** solutions to scale content creation & unlock rendering technologies
- **Implement encoding and rendering tools** for the next generation of capture and display devices
- **Develop video formats & distribution solutions** that are adapted to diverse use cases and market timelines and show a path to extended immersive experiences
