

# NaLamKI

Nachhaltige Landwirtschaft mit Künstlicher Intelligenz

Sustainable Agriculture with Artificial Intelligence

Dr. Raghu Chaiganti  
Interactive and Cognitive Systems (ICS)  
Fraunhofer HHI – Heinrich Hertz Institute

Federal Ministry  
for Economic Affairs  
and Climate Action

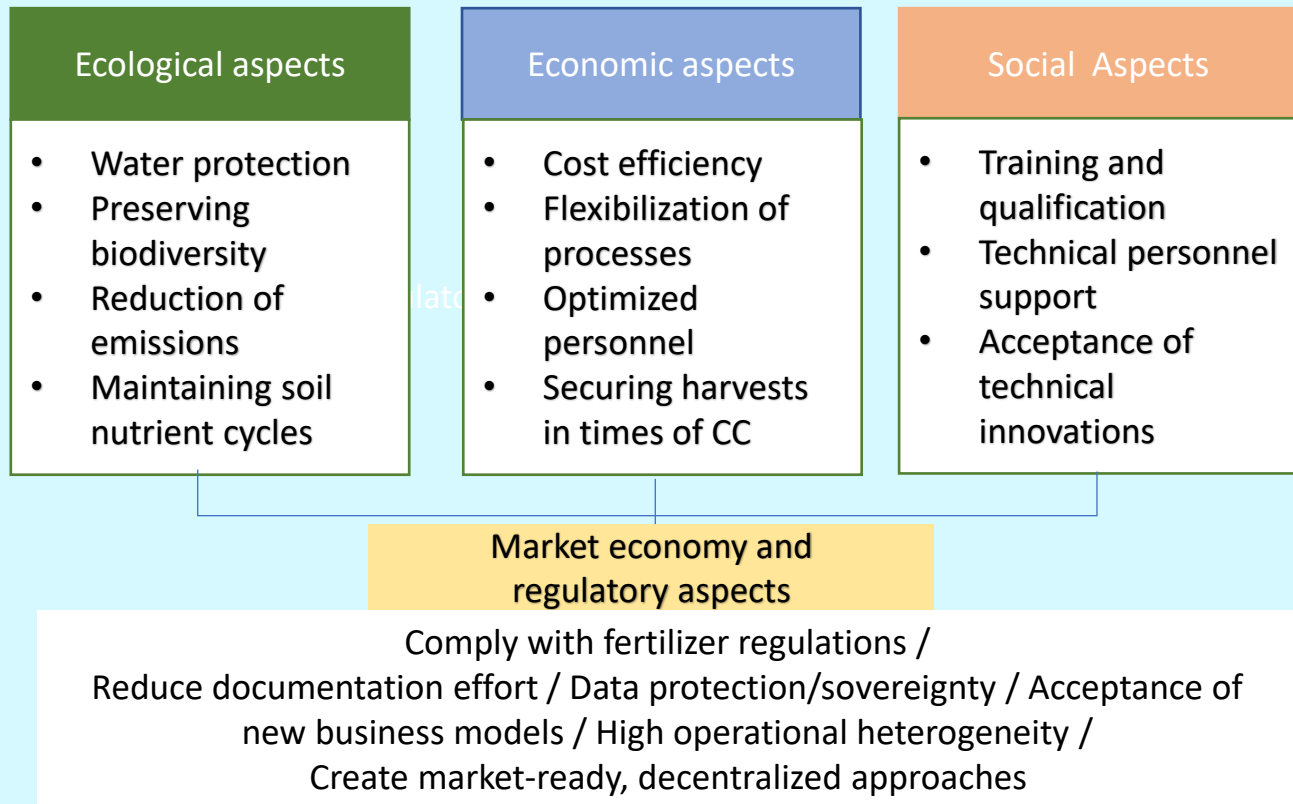

on the basis of a decision  
by the German Bundestag

## Background

# Why NaLamKI

- Cloud-based
- heterogeneity and data sovereignty aware
- GAIA-X compliant
- model-based AI approach to increase agricultural sustainability and competitiveness

# About NaLamKI

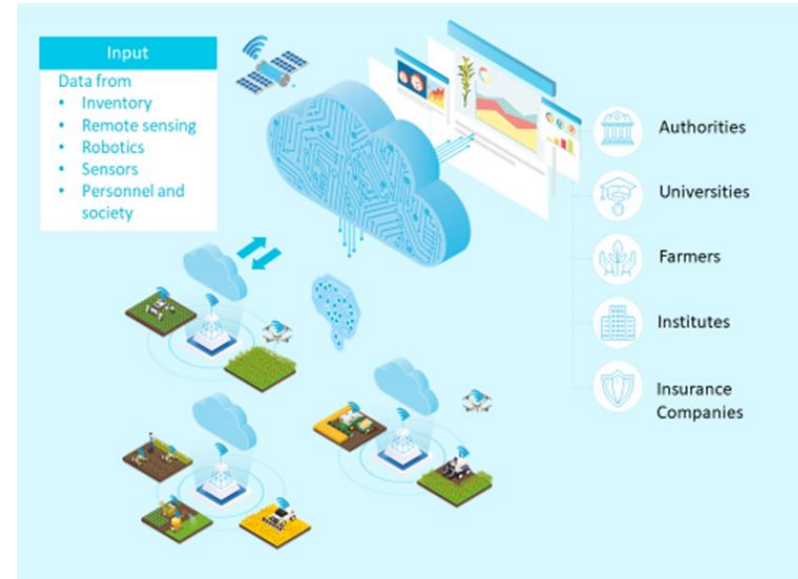

- AI services are being developed for use in agriculture, which evaluate data from conventional and autonomous agricultural machinery, satellites, and drones, combine them in a software service platform and make results accessible via open interfaces.
- AI methods have to be adapted to agricultural use cases
- Domain-specific data must be processed and made accessible for training the models

# About NaLamKI

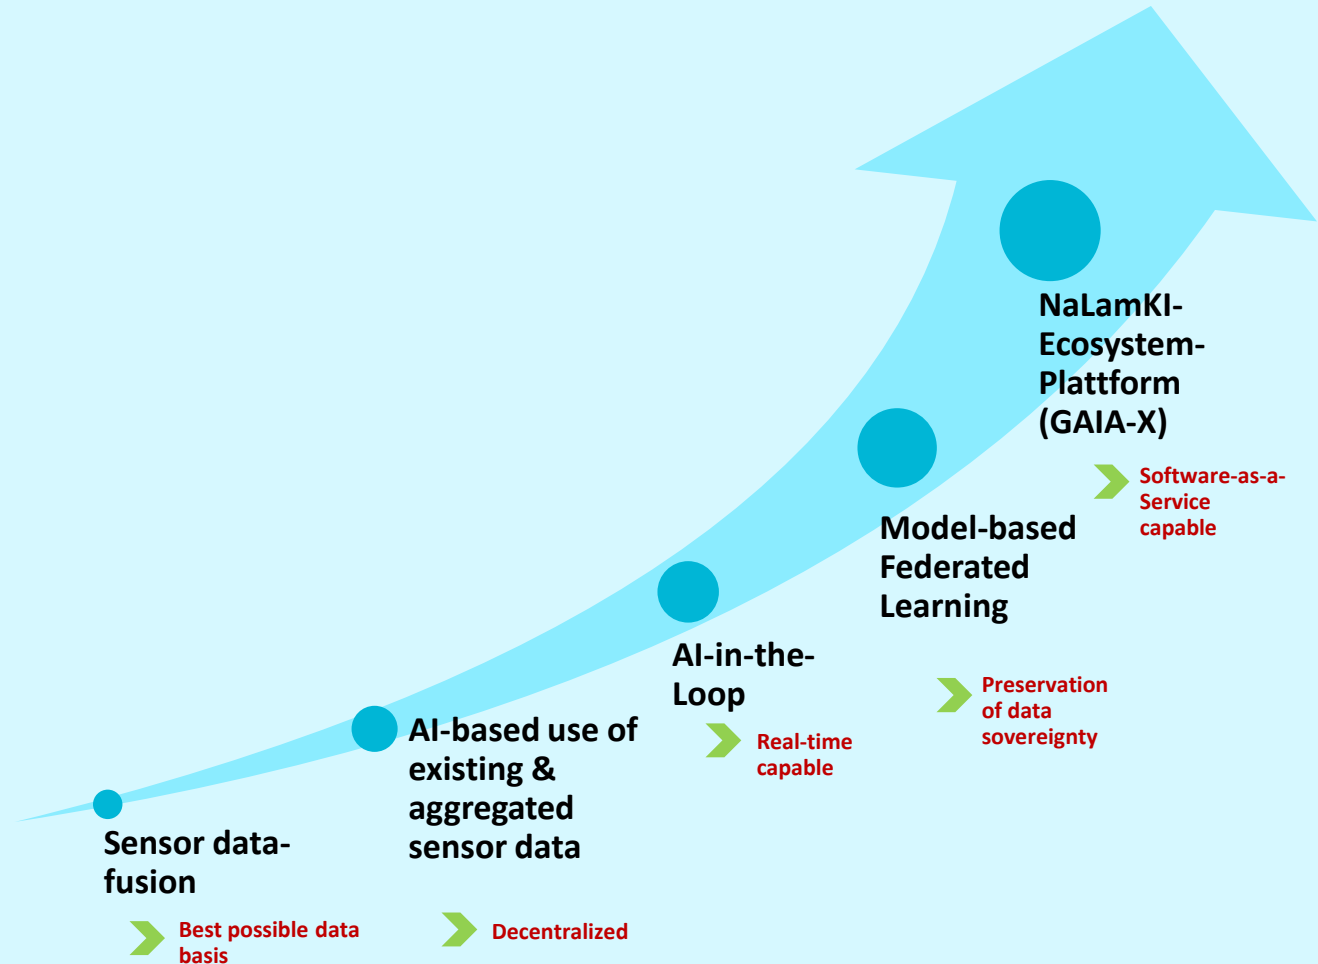

- ❑ Aggregating data (sensor and machine data obtained through remote sensing, soil sensing, robotics, manual data collection, and inventory data)
- ❑ Agricultural practices can be optimized in a more sustainable, efficient, and transparent manner
- ❑ By building an International Data Space for Agriculture (IDSA) and GAIA-X compliant services, the platform will act as interoperability between different centralized and decentralized cloud providers and users.

NaLamKI- platform

# NaLamKI Innovation - potential

- Technical feasibility
- High-quality data basis for the learning phase of the algorithms
- Results can be individually transferred and used in the competence domains of the individual partners
- Both individual and overall solutions can be implemented

# NaLamKi Application Potential

## Cloud Level

- SaaS/AaaS platform
- GAIA-X compliant architecture
- Openness to third-party providers while maintaining data sovereignty

## Operational Level

- AI-based collection
- Documentation (output quantities, transparency)
- AI-based resource-optimized and cost-efficient process and application control
- Modeling of the overall "field" system

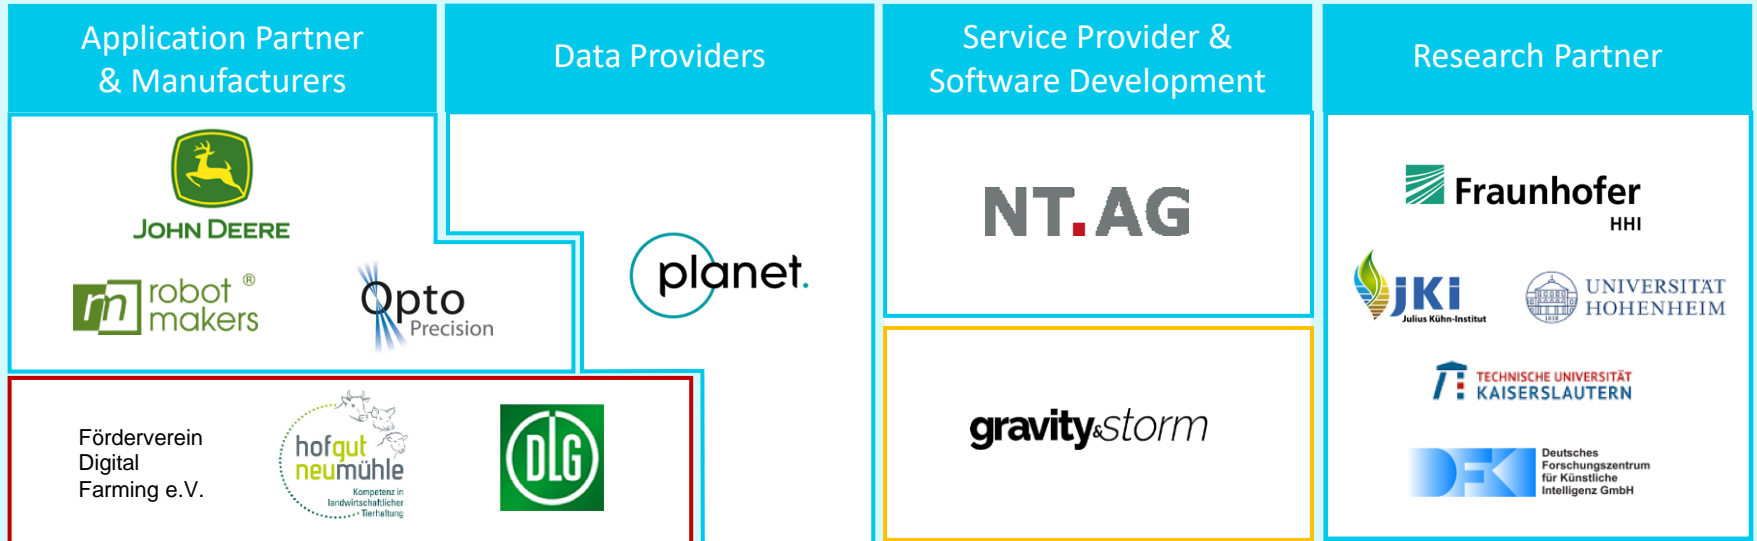

## Maschine Level

- Driving strategy, autonomy, service and maintenance applications
- Remote control
- Sensor calibration

## Demonstrators

1. Area-specific crop protection measures
2. Remote sensing detection of plant infections
3. Orchard inspection
4. Environment inspection by means of a (partially) autonomously driving tractor
5. GAIA-X-compliant cloud infrastructure for AI-based Software as a Service solution
6. Multi-scale information retrieval with remote sensing
7. Farmer dashboard for visualization of project data
8. 5G sideline communication between drones and ground vehicles.

# NaLamKI - Partners

 Project Partner

 Associate Partner

 Subcontracted Partner

# NaLamKi Use Cases

Demonstrator 1: Precise application of crop protection measures and area-specific plausibility of soil moisture with the aid of AI on arable land and grassland

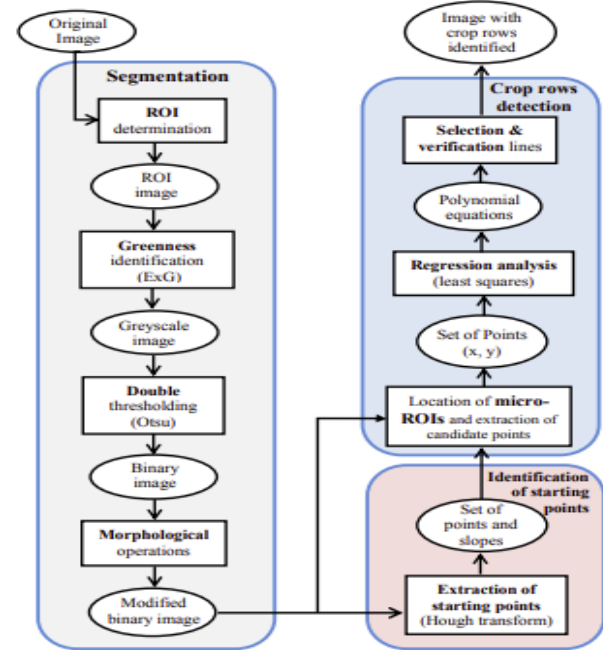

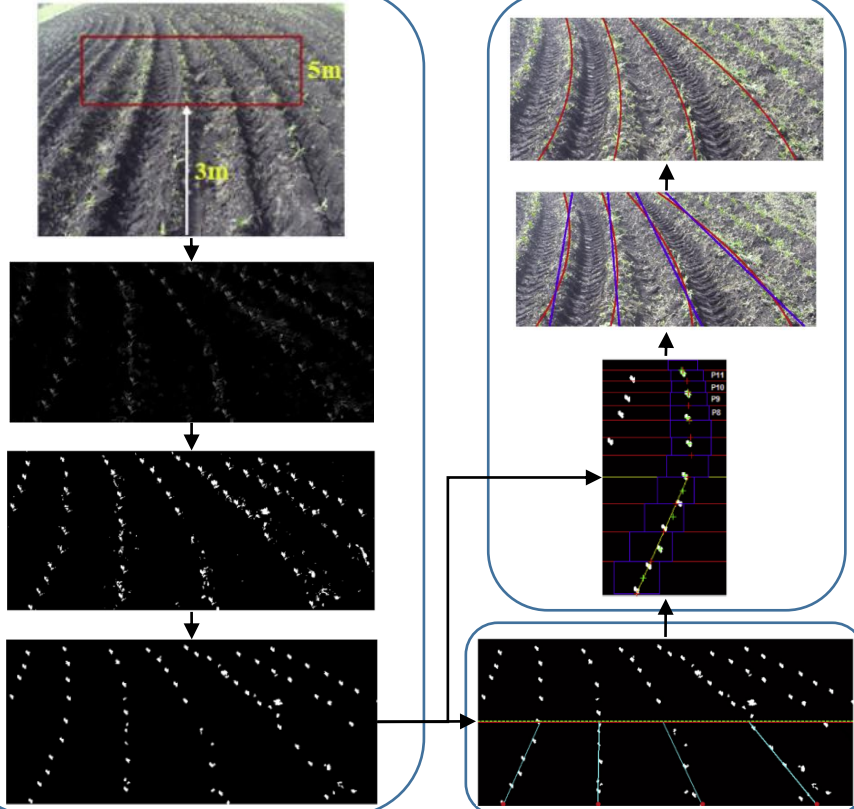

# Physical setup

- Ground penetrating radar in planning
- Expandable with further sensors

## Methods for computer-visual row recognition - DBMR

# NaLamKi Use Cases

Demonstrator 2:

Remote sensing detection of plant infections

# Drones

# Flight Planning

3200 Bilder und  
10GB Daten pro Flug  
Alle 0,2s ein Foto

Ground Resolution: 0,06cm  
Footprint: 1,1m x 1,1m  
Flight Time 12min  
Area 1800m<sup>2</sup> bei 2,5km

# Temporal images of wheat multispectral camera - 5m and 40m

# NaLamKi Use Cases

Demonstrator 3: Inspection of orchards

# Inspection of Apple plantations

- The autonomous vehicle from Robot Makers was developed by TU Kaiserslautern with sensors for data acquisition (currently two stereo camera systems and a 360° LIDAR).

## Detection of fruits (MinneApple dataset): Comparison of Models

- Models:
    - Faster RCNN (Baseline Network for MinnieApple dataset)
    - YOLO v5
  - Speed/Computational Cost
    - YOLO v5 model runs about 2.5 times faster
  - Mean Average Precision:
    - Faster RCNN: maP .82
    - YOLO v5: maP .79
- Beide Modelle haben eine vergleichbare mAP und funktionieren gut (see left side).  
 → Generell ist YOLO schneller und erkennt auch sehr kleine Objekte gut  
 → YOLO v5 is advantageous over Faster RCNN.

Faster RCNN relies on VGG

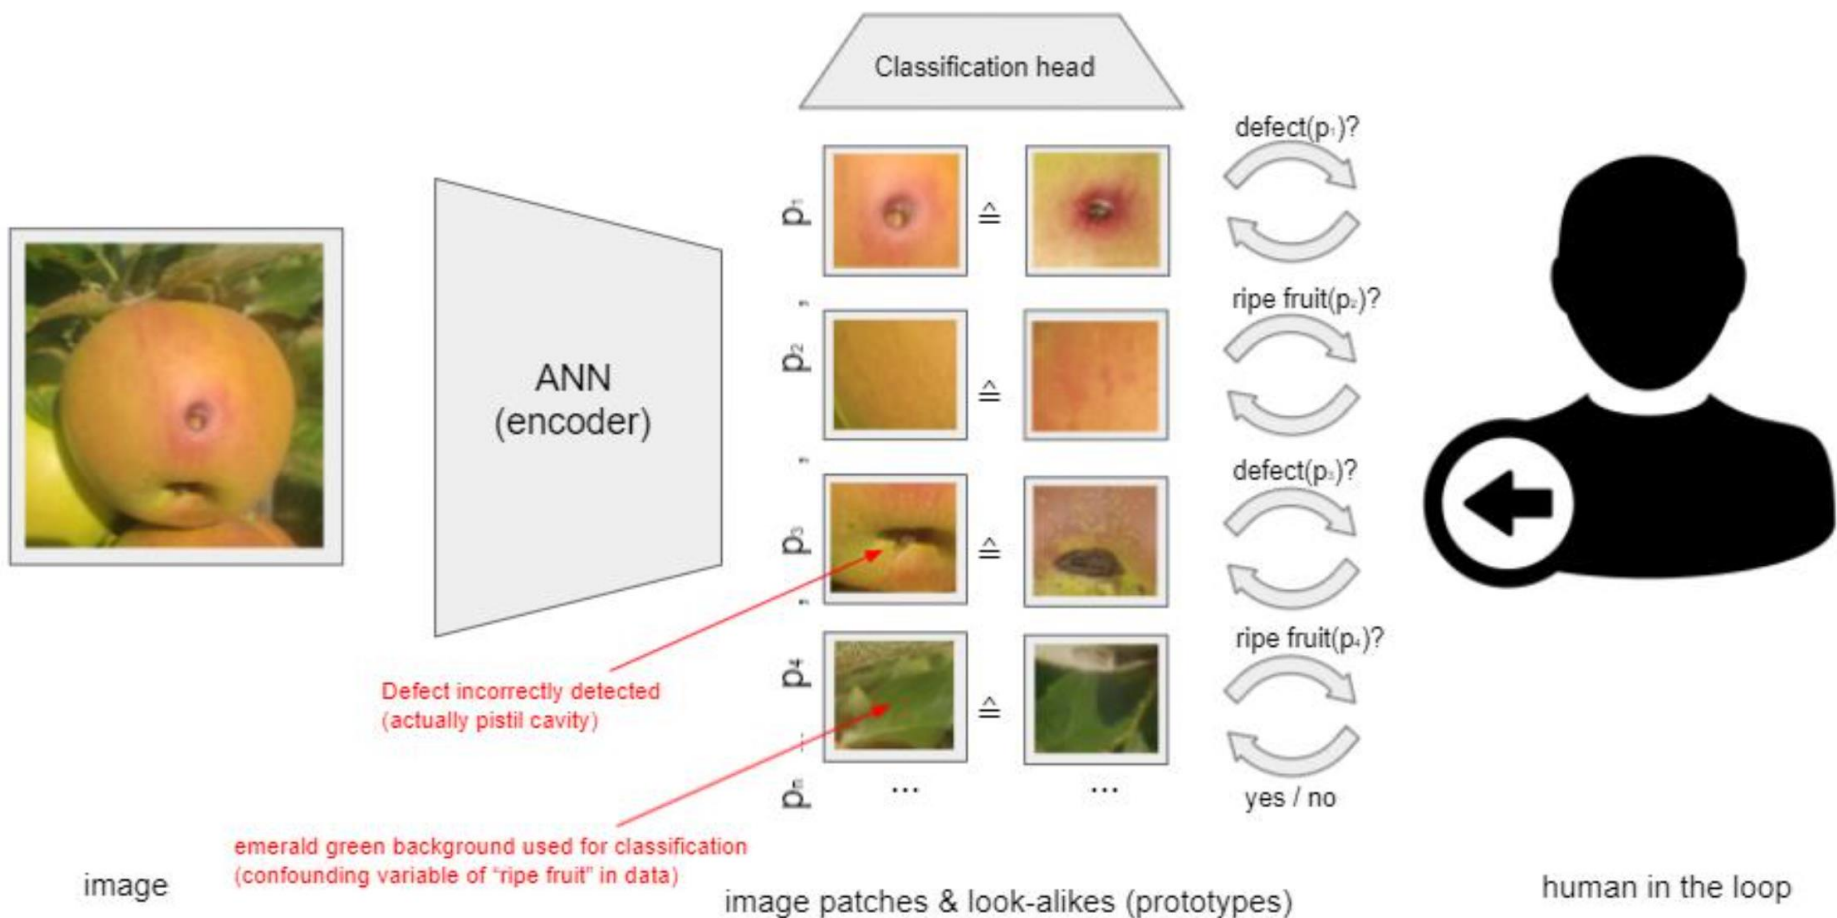

Yolo v5 has an EfficientNet as backbone

Open question: How well do models that are trained on MinneApple perform on our future data?

Prediction: Ripe Apple with Defect
