Title: Proposal for new topic group: AI for Human
Reproduction and Fertility – Att.1: Presentation

Purpose: Discussion

Contact: Susanna Brandi E-mail: susanna.brandi@merckgroup.com
Eleonora Lippolis E-mail: eleonora.lippolis@merckgroup.com

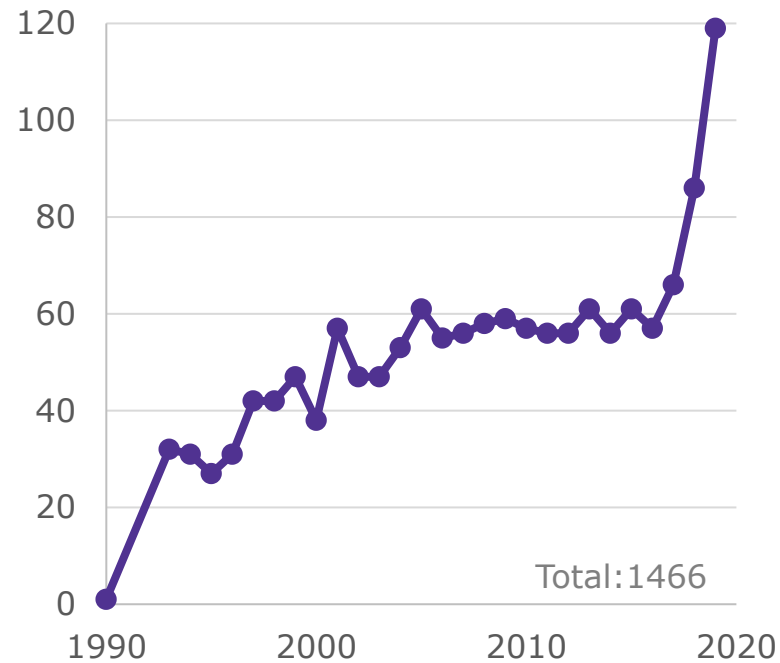

Abstract: This PPT summarizes the content of L-034 with a proposal for a new topic group on AI for fertility for presentation and discussion during the meeting. The topic group on AI for fertility will address challenges and considerations that should be assessed when developing AI solutions for clinical applications.

Infertility is a disease that impacts one in six couples and its treatment is unique, complex and divided in different phases

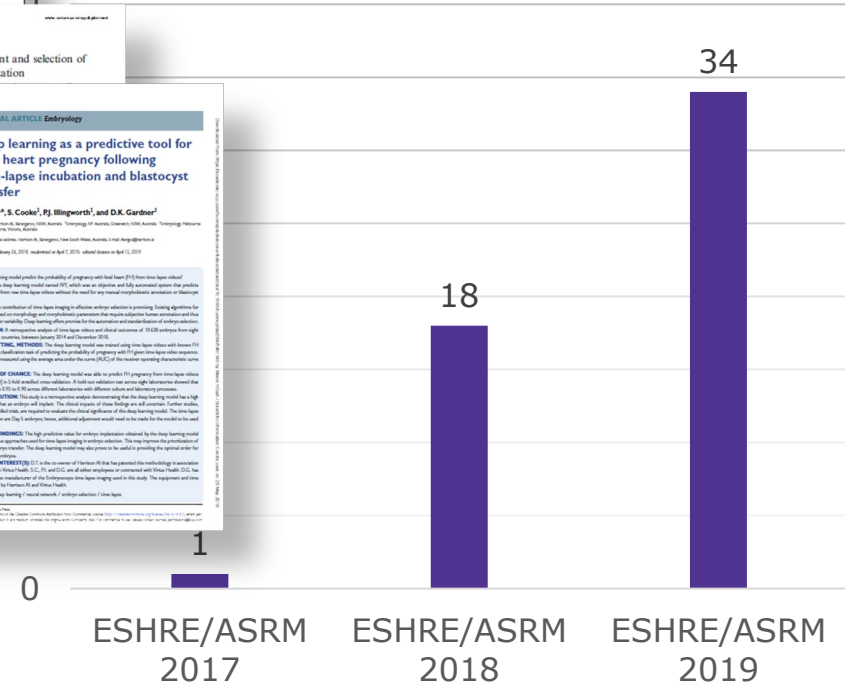

AI publications in medicine are growing very fast since a few years – Fertility is catching up as well

PAPERS ON AI IN MEDICINE IN PUBMED

PAPERS ON AI AT ESHRE/ASRM

Artificial intelligence and machine learning for human reproduction and embryology presented at ASRM and ESHRE 2018

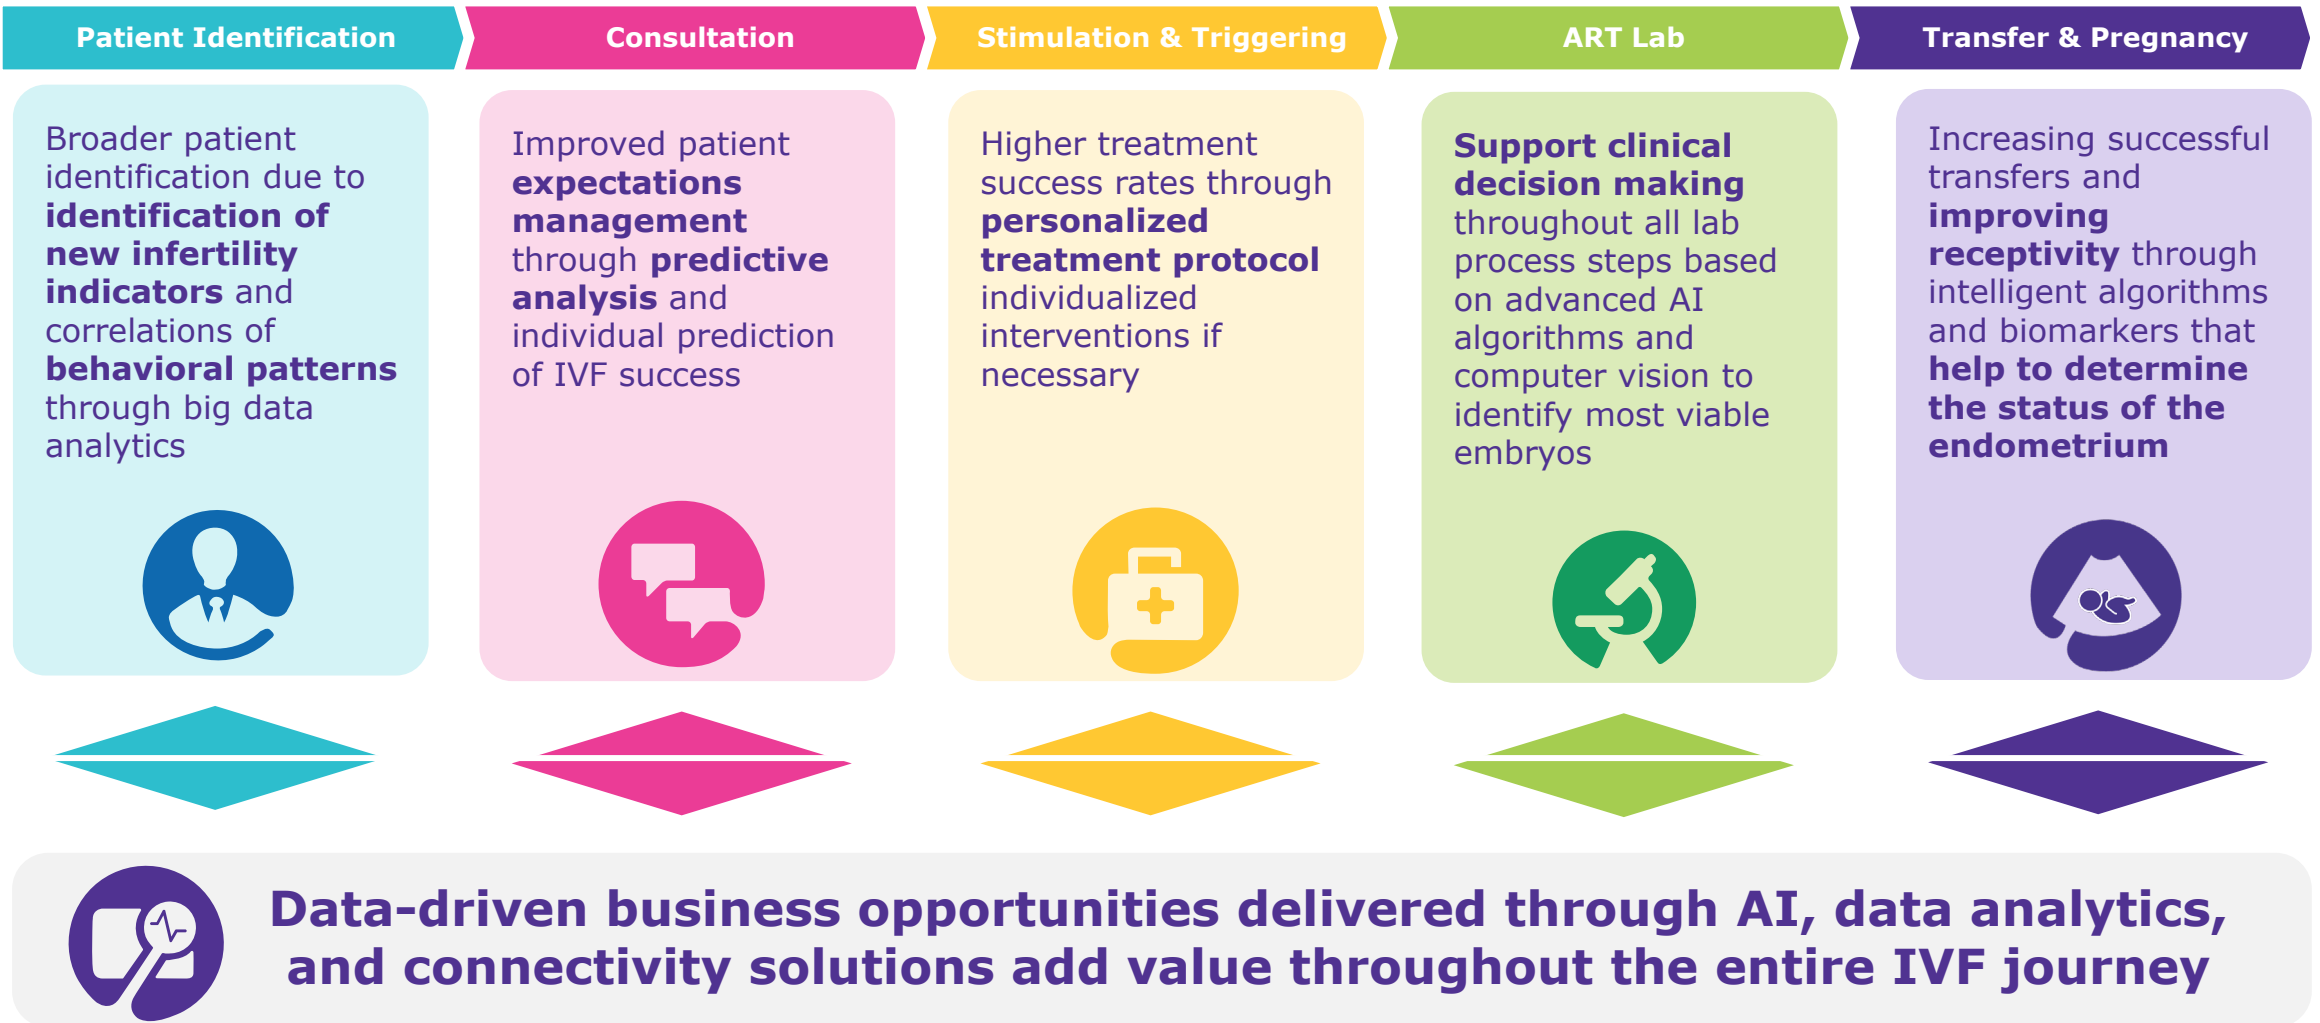

Feasibility of deep learning for predicting live birth from a blastocyst image in patients classified by age

Deep learning enables robust assessment and selection of human blastocysts after in vitro fertilization

Deep learning as a predictive tool for fetal heart pregnancy following time-lapse incubation and blastocyst transfer

These abstracts highlight the application of AI in reproductive medicine, specifically in predicting live birth from blastocyst images and assessing human blastocysts after IVF. They also discuss the use of deep learning to predict fetal heart pregnancy following time-lapse incubation and blastocyst transfer.

Advanced analytics and AI enables the creation of new products and services that improve treatment outcomes and efficiency

Most AI solutions are currently performed without any standardized process, regulatory or harmonized quality standards

Given the maturity and the recent developments of AI in Fertility, there are several challenges that need to be addressed to ensure safety, reliability and transparency

Challenges

Data

- Heterogeneity of data sources
- Data quality and data size
- Bias in the data, noise or partial evidence

Validation

- Proper validation on hold-out data and lack of benchmark
- Lack of clinical prospective validation

Proposal

Data

- Definition of quality standard and guidelines to harmonize data
- Facilitate integration and collection of data from different sources

Validation

- Definition of guidelines for proper development and validation
- Creation of benchmarks

Timeline

Enroll key opinion leaders

Assess and define areas of focus

Scope existing and emerging applications

Create guidelines, facilitate harmonization of data and creation of benchmarks
