ITU-T

H.323 System Implementors' Guide

TELECOMMUNICATION STANDARDIZATION SECTOR OF ITU

(26 November 2004)

SERIES H: AUDIOVISUAL AND MULTIMEDIA SYSTEMS Infrastructure of audiovisual services – Communication procedures

Implementors' Guide for Recommendations of the H.323 System ("Packet-based multimedia communications systems"):

H.323, H.225.0, H.245, H.246, H.283, H.235, H.341, H.450 Series, H.460 Series, and H.500 Series

Summary

This document is a compilation of reported defects identified in the versions of ITU-T Recommendation H.323 and its related Recommendations currently in force. It must be read in conjunction with the Recommendations to serve as an additional authoritative source of information for implementers. The changes, clarifications and corrections defined herein are expected to be included in future versions of affected H.323-series Recommendations.

This revision contains all updates submitted upto and including those at Study Group 16 meeting, November 2004, in Geneva (TD 52R1/PLEN). This Implementors' Guide provides corrections and clarifications for implementations of the H.323-series Recommendations approved in May 2003, and supersedes the earlier Implementors' Guide version approved 2004-01.

IMPLEMENTORS' GUIDE FOR ITU-T H.323, H.225.0, H.245, H.246, H.283, H.235, H.341, H.450 SERIES, H.460 SERIES, AND H.500 SERIES RECOMMENDATIONS

1 Introduction

This document is a compilation of reported defects identified in the versions of ITU-T Recommendation H.323 and its related Recommendations currently in force. It must be read in conjunction with the Recommendations to serve as an additional authoritative source of information for implementors. The changes, clarifications and corrections defined herein are expected to be included in future versions of affected H.323-series Recommendations.

Upon discovering technical defects with any components of the H.323 Recommendations series, please provide a written description directly to the editors of the affected Recommendations with a copy to the Q2/16 or Q3/16 Rapporteur. The template for a defect report is located at the end of the Guide. Contact information for these parties is included at the front of the document. Return contact information should also be supplied so a dialogue can be established to resolve the matter and an appropriate reply to the defect report can be conveyed. This defect resolution process is open to any interested party. Formal membership in the ITU is not required to participate in this process.

2 Scope

This guide resolves defects in the following categories:

- editorial errors
- technical errors, such as omissions and inconsistencies
- ambiguities

In addition, the Implementors' Guide may include explanatory text found necessary as a result of interpretation difficulties apparent from the defect reports.

This Guide will not address proposed additions, deletions, or modifications to the Recommendations that are not strictly related to implementation difficulties in the above categories. Proposals for new features should be made in through contributions to the ITU-T.

3 References

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. At the time of publication, the editions indicated were valid. All Recommendations and other references are subject to revision; users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations and other references listed below. A list of the currently valid ITU-T Recommendations is regularly published. The reference to a document within this Recommendation does not give it, as a stand-alone document, the status of a Recommendation

- ITU-T Recommendation H.460.7 (2002), Digit Maps Within H.323 Systems
- ITU-T Recommendation H.460.8 (2002), Querying for alternate routes within H.323 systems
- ITU-T Recommendation H.460.9 (2002), Support for online QoS-Monitoring report
- ISO/IEC 11571 (1998), Information technology Telecommunications and information exchange between systems – Private Integrated Services Networks – Addressing

- ITU-T Recommendation Q.931 (1998), ISDN user-network interface layer 3 specification for basic call control
- ITU-T Recommendation H.283, Remote device control logical channel transport

4 Nomenclature

In addition to traditional revision marks, the following marks and symbols are used to indicate to the rmereader how changes to the text of a Recommendation should be applied:

Symbol	Description
[Begin Correction]	Identifies the start of revision marked text based on extractions from the published Recommendations affected by the correction being described.
[End Correction]	Identifies the end of revision marked text based on extractions from the published Recommendations affected by the correction being described.
•••	Indicates that the portion of the Recommendation between the text appearing before and after this symbol has remained unaffected by the correction
SPECIAL INSTRUCTIONS {instructions}	being described and has been omitted for brevity. Indicates a set of special editing instructions to be followed.

5 Technical and Editorial Corrections to H.323 Series Recommendations

5.1 Technical and Editorial Corrections to ITU-T Recommendation H.323 (2003)

5.1.1 H.245 Request Mode Initiation

Description:	Figures D.8 through D.11/H.323 show the H.245 procedures necessary to
_	establish a fax call. The endpoints shown are labeled as Originating and
	Terminating. However, this distinction is not important and any endpoint that
	detects the fax tone may initiate the procedures, regardless of whether it originated
	or terminated the call. The following text should be added to Annex D/H.323 to
	further clarify this.

[Begin Correction]

D.5 Replacing an existing audio stream with a T.38 fax stream

. . .

Figure D.8 illustrates a successful switchover from voice to fax when a separate H.245 channel is already open for two unidirectional media channels. <u>Note that in this diagram and in ones that follow,</u> originating and terminating endpoints do not necessarily refer to sending and receiving or calling and

called endpoints. Any	endpoint that	detects the fax	tone initiate	s H.245	procedures to	switch to fax
mode.						

5.2 Technical and Editorial Corrections to ITU-T Recommendation H.225.0 (2003)

5.2.1 Error Codes Mapping is Unspecified

Description:	Mapping from LocationRejectReason and AccessRejectionReason codes to
	AdmissionRejectReason codes is not specified within H.225.0. The following new
	section provides this mapping.

[Begin Correction]

7.22 Error Code Mapping

A Gatekeeper that needs to return an **AdmissionReject** message in response to an **AdmissionRequest** from an endpoint, as a result of having received a **LocationReject** or an H.501 **AccessRejection** in response to its sending an **LocationRequest** or **AccessRequest** message, should use the following tables to map the error code that it returns in the **AdmissionReject** message.

<u>Table 24/H.225.0 – LocationRejectReason to AdmissionRejectReason</u>

LocationRejectReason	Corresponding AdmissionRejectReason
notRegistered	<u>calledPartyNotRegistered</u>
invalidPermission	<u>invalidPermission</u>
requestDenied	requestDenied
undefinedReason	undefinedReason
<u>securityDenial</u>	<u>securityDenial</u>
aliasInconsistent	aliasesInconsistent
<u>routeCallToSCN</u>	<u>routeCallToSCN</u>
<u>resourceUnavailable</u>	<u>resourceUnavailable</u>
<u>genericDataReason</u>	<u>genericDataReason</u>
<u>neededFeatureNotSupported</u>	<u>neededFeatureNotSupported</u>
hopCountExceeded	<u>noRouteToDestination</u>
incompleteAddress	incompleteAddress
<u>securityWrongSyncTime</u>	<u>securityWrongSyncTime</u>
securityReplay	securityReplay
<u>securityWrongGeneralID</u>	<u>securityWrongGeneralID</u>
<u>securityWrongSendersID</u>	<u>securityWrongSendersID</u>
<u>securityMessageIntegrityFailed</u>	securityMessageIntegrityFailed

<u>securityWrongOID</u>	securityWrongOID
<u>securityDHmismatch</u>	<u>securityDHmismatch</u>
<u>noRouteToDestination</u>	<u>noRouteToDestination</u>
unallocatedNumber	unallocatedNumber

<u>Table 25/H.225.0 – AccessRejectionReason to AdmissionRejectReason</u>

AccessRejectionReason	Corresponding AdmissionRejectReason
noMatch	<u>noRouteToDestination</u>
packetSizeExceeded	undefinedReason
security	securityDenial
<u>hopCountExceeded</u>	noRouteToDestination
needCallInformation	undefinedReason
<u>noServiceRelationship</u>	noRouteToDestination
undefined	undefinedReason
neededFeature	<u>neededFeatureNotSupported</u>
<u>genericDataReason</u>	<u>genericDataReason</u>
destinationUnavailable	<u>resourceUnavailable</u>
aliasesInconsistent	aliasesInconsistent
<u>resourceUnavailable</u>	<u>resourceUnavailable</u>
incompleteAddress	incompleteAddress
unknownServiceID	noRouteToDestination
usageUnavailable	undefinedReason
cannotSupportUsageSpec	<u>undefiedReason</u>
<u>unknownUsageSendTo</u>	undefinedReason

[End Correction]

5.2.2 Clarification on Usage of additionalSourceAddresses

Description:	The interworking function between ISUP and H.323 uses Calling Party IE and
	additionSourceAddresses in H.225.0 Call Signalling Setup message to carry
	more than one calling party address. The usage by a call signaling routed GK is
	noted as below.

[Begin Correction]

7.2.2.6 Calling party number

. . .

H.323 endpoints shall not send multiple Calling Party Number IEs in the same message. Gateways may provide support for interworking with Q.931 SETUP messages that contain multiple Calling Party Number IEs. Gateways that provide such support shall map the first Q.931 Calling Party Number IE to the Calling Party Number IE of the H.225.0 Setup message, and map subsequent Q.931 Calling Party Number IEs to the **additionalSourceAddresses** field of the H.225.0 Setup message. Gatekeepers that route H.225.0 Setup messages initiated by an H.323 endpoint may insert a number in the **additionalSourceAddresses** field before forwarding it to its next recipient.

[End Correction]

5.2.3 Gatekeeper Assignment of Aliases

Description:	The text in H.225.0v4 removed the capability of a Gatekeeper to assign an E.164
	address to an endpoint that does not register any itself. The following corrections
	restore this capability.

[Begin Correction]

7.9.1 RegistrationRequest (RRQ)

. . .

terminalAlias – This optional value is a list of alias addresses, by which other terminals may identify this terminal. This field may be used in addition to or as an alternative to the terminalAliasPattern and supportedPrefixes fields. If the terminalAlias is null, a terminalAlias address may be assigned by the gatekeeper; and included in the RCF. If the terminalAlias does not contain any dialedDigits or partyNumber address, a dialedDigits or partyNumber address may be assigned by the gatekeeper and included in the RCF. If an email-ID is available for the endpoint, it should be registered. Note that multiple alias addresses may refer to the same transport addresses. All of the endpoint's aliases that it desires to register shall be included in this list unless the additiveRegistration option is specified, in which case the endpoint aliases in an RRQ shall be added to the list of aliases currently registered for the endpoint.

[End Correction]

5.2.4 Use of Facility to initiate H.245

Description:	The usage of Facility message to carry h245Address to initiate H.245 procedures
	is not correctly reflected in the text. The following sections in H.225.0 should be
	amended as shown below

[Begin Correction]

7.3.1 Alerting

. . .

h245Address – This is a specific transport address on which the called endpoint or gatekeeper handling the call would like to establish H.245 signalling. This address may also be sent in Call Proceeding, Progress, or Connect, or Facility.

. . .

7.3.3 Connect

. . .

h245Address – This is a specific transport address on which the called endpoint or gatekeeper handling the call would like to establish H.245 signalling. This address shall be sent if sent earlier in Alerting, Progress, or Call Proceeding, or Facility.

. . .

7.3.7 Progress

. . .

h245Address – This is a specific transport address on which the called endpoint or gatekeeper handling the call would like to establish H.245 signalling. This address shall be sent if sent earlier in Call Proceeding, Alerting, or Connect, or Facility.

. . .

[End Correction]

5.2.5 Length Field of UUIE

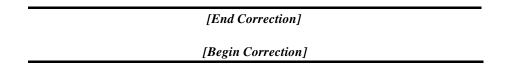

Description:	The current text describing the length of the UUIE field and the value supplied in
	Table 7/H.225.0 through Table 18/H.225.0 can be misleading. The text below
	supplies the correction.

[Begin Correction]

7.3 Q.931 based H.225.0 call signalling message details

Note that the lengths of the information elements specified in the tables below refer to messages that are generated by H.323 terminals only. The size of the User-user information element, not explicitly shown, is understood as the size of the user-data structure in PER encoded H323-

UserInformation <u>sequence and does not include the **h323-UU-PDU**</u>. The total size of **H323-UserInformation** is limited to 65 536 octets. Regardless of the specified sizes, messages forwarded from the SCN side may have different (larger) sizes.

[Editorial Note] The correction below to the User-User Information Element should be applied to all tables from Table 7/H.225.0 through to Table 18/H.225.0.

Table 7/H.225.0 – Alerting

Information element	H.225.0 status (M/F/O)	Length in H.225.0
Protocol discriminator	M	1
Call reference	M	3
Message type	M	1
Bearer capability	0	5-6
Extended facility	0	8-*
Channel identification	FFS	NA
Facility	0	8-*
Progress indicator	0	2-4
Notification indicator	0	2-*
Display	0	2-82
Signal	0	2-3
High layer compatibility	FFS	NA
User-user	M	2-131 *

5.3 Technical and Editorial Corrections to ITU-T Recommendation H.245 (7/2003)

5.3.1 Annex A corrections

Description:	It is not currently possible to indicate the OID of the encryption algorithm used for encryptedSignalType in H.245 signal UserInputIndication. This can cause interoperability problems, so a new field will be added to the H.245 ASN.1 definition to indicate the algorithm OID.

5.4 Technical and Editorial Corrections to ITU-T Recommendation H.246 (1998)

5.4.1 Annex A Corrections for MCV and Cancel-MCV commands

Description:	The H.245 equivalents defined for H.230 commands MCV and Cancel-MCV
	were incorrectly defined in H.246. The following text corrects those table entries.

[Begin Correction]

A.5.2.4.1 Multipoint Control C&I

H.230 command/indication	H.245 equivelent
MCV	Send brondenstMe
	Send either
	$\underline{conference Request.broadcast My Logical Chann}$
	<u>el or</u>
	conferenceCommand.broadcastMyLogicalChan
	nel with the LCN of the video channel in the
	direction from the gateway to the H.323 endpoint.
	If the gateway has previously both sent and received
	the MVC capability to/from the H.230 side
	(indicating that both ends of the terminal-MCU or
	inter-MCU link have declared the MVC capability
	or the H.245 equivalent), then the H.245 side shall
	use the conferenceRequest form of the message.
	Otherwise, it shall use the conferenceCommand
	form of the message.
Cancel-MCV	Send cancelBroadcastMe
	Send
	conferenceCommand.cancelBroadcastMyLogic
	alChannel

[End Correction]

Description:	New H.243 codepoints MVC, MVA, and MVR were approved in February
	2000. To support those new codepoints, the following additions shall be added to
	the table in A.5.2.4.1 as shown below

[Begin Correction]

A.5.2.4.1 Multipoint Control C&I

H.230 command/indication	H.245 equivelent
MVC	Send

	conferenceCapability.multipointVisualizationCapability
MVA	Send conferenceResponse.broadcastMyLogicalChan nel.grantedBroadcastMyLogicalChannel
MVR	Send conferenceResponse.broadcastMyLogicalChan nel.deniedBroadcastMyLogicalChannel

Description:	A minor inconsistency has been discovered in section A.5.2.4.4 of H.246 Annex A.
	The H.245 equivalent continuous presence BAS codes were not included in
	H.245v3 so continuous presence processing cannot be translated through a
	H.320-H.323 gateway. To correct this, commands are added to H.245 and the
	following corrected translations amend H.246.

[Begin Correction]

A.5.2.4.4 Multipoint Control C&I

H.230 command/indication	H.245 equivelent
VIN	Send terminalYouAreSeeing
VCB/Cancel-VCB	Send makeTerminalBroadcaster / CancelMakeTerminalBroadcaster
VCS/Cancel-VCS	Send sendThisSource / CancelSendThisSource
VCR	Send videoCommandReject
VIN2	FFSSend terminalYouAreSeeingInSubPictureNumber
VIC	FFSSend videoIndicateCompose
VIM	FFSSend videoIndicateMixingCapability

[End Correction]

5.4.2 Reference to ATM Forum Document

Description:	To help clarify the usage of H.246 with respect to ATM, a reference to an ATM
	Forum document has been proposed. This reference shall appear in next H.246
	publication from the ITU.

1 Scope

•••

Voice/Voiceband terminals on GSTN use the appropriate national standards for call control and G.711 or analogue signals for voice. Voice/Voiceband terminals on ISDN use the appropriate national variant of Q.931 for call control and G.711 for voice.

Interworking of H.323 over ATM with H.323 over non-ATM IP networks is possible through the use of an H.323-H.323 gateway. Transport of H.323 media streams over ATM is described in AF-SAA-0124.000.

[End Correction]

5.5 Technical and Editorial Corrections to ITU-T Recommendation H.235 (2003)

5.6 Technical and Editorial Corrections to ITU-T Recommendation H.450 Series

5.6.1 Technical and Editorial Corrections to H.450.1 (1998)

5.6.1.1 Actions at a Destination Entity

_	Typographical errors have been discovered in section 6.6 of H.450.1 (1998). The text below outlines the necessary changes.
	The text below outlines the necessary changes.

[Begin Correction]

1) Section 6.6, line 6

Change:

"rejectUnrecognizedInvokePdu"

to

"rejectAnyUnrecognizedInvokePdu"

2) Section 6.6, line 12

Change:

"discardAnyUnrecognizedInvokePDU"

to

"discardAnyUnrecognizedInvokePdu"

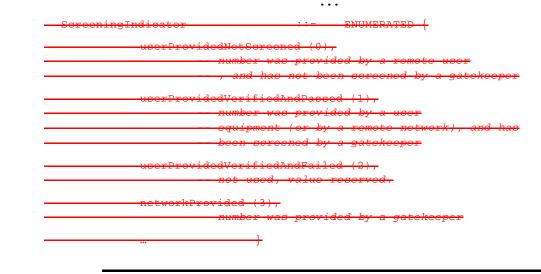

[End Correction]

5.6.1.2 Corrections to the ASN.1

Description:	H.225.0 (1999) introduces redundancy with H.450.1 in that both H.225.0 (1999)
	and H.450.1 have screening and presentation information. To remove the
	redundancy, it was decided that H.225.0 was the proper place for this information
	and the redundant elements shall be removed from H.450.1. Below shows the
	revision to the ASN.1 found in Table 6/H.450.1.

                -- conflicting presentation information.
```

5.6.1.3 Clarifications to ROS APDUs

Description:	The ASN.1 specification of ROS APDUs has caused some uncertainty over the
	correct encoding of invoke identifiers. A correct encoding is essential for
	interoperability between different implementations. The text below attempts to
	clarify the uncertainty.

Add the following note below Table 4/H.450.1:

[Begin Correction]

Note:

In the *Invoke* APDU, the *invokeID* is an INTEGER constrained by a PER-visible constraint (InvokeIdSet = 0..65535) and is therefore encoded as a **constrained** INTEGER (16 bits, no length field). In the *ReturnResult* and *ReturnError* APDUs, however, the *invokeID* is encoded as an **unconstrained** INTEGER (with explicit length field) because the applicable constraint ("must be that for an outstanding operation...") is not PER-visible. In the *Reject* APDU the *invokeID* is also encoded as an **unconstrained** INTEGER (with explicit length field) since no constraint applies.

[End Correction]

5.6.1.4 Error Definitions

Description:	Error description as defined in Table 8 need to be clarified. The text below
	provides the needed clarifications.

[Begin Correction]

10.3 General error list

Table 8 contains the definitions of <u>general</u> <u>Herrors</u> <u>that may be</u> used within H.450.x Recommendations.

Note — Every operation defined in any H.450.x Recommendation lists all permitted error values explicitly. This means that the errors defined here are not automatically part of another H.450.x Recommendation. An H.450.x Recommendation that uses one of the error values below must import it from the module defined below before it can be used for an operation of H.450.x.

Table 8/H.450.1 - H.450.1 General Error List

```

5.6.2 Technical and Editorial Corrections to H.450.2 (1998)

5.6.2.1 Editorial Corrections

Description:	Typographical errors have been discovered in sections 11.4.2, 11.5.2, 11.6.2,		
	and 13.4 of H.450.2. The text below outlines the necessary changes.		

1) Editorial - Clause 11.4.2, line 4 c)

Change:

"The CTSetup.request primitive is used to request call establishment from TRTSE."

to

"The CTSetup.request primitive is used to request call establishment to TRTSE"

2) Editorial - Clause 11.4.2, line 5 d)

Change:

"The CTSetup.confirm primitive is used to indicate success of call establishment to TRTSE."

to

"The CTSetup.confirm primitive is used to indicate success of call establishment from TRTSE."

3) Editorial - Clause 11.5.2, line 6 e)

Change:

"The CTIdentify.indication primitive is used to request a call identification."

to

"The CTIdentify.indication primitive is used to indicate a call identification."

4) Editorial - Clause 11.5.2, line 11,12 j)

Change:

"The CTComplete.request primitive may be used by GKs to request sending of call transfer information to the transferred-to user."

to

"The CTComplete.request primitive may be used by GKs to request sending of call transfer information to the transferred-to endpoint."

5) Editorial - Clause 11.5.2, line 13,14 k)

Change:

"The CTComplete.indication primitive is used to indicate call transfer information to the transferred-to endpoint."

to

"The CTComplete.indication primitive is used to indicate call transfer information to the transferred-to user."

6) Editorial - Clause 11.6.2, line 2

Change:

"CT-T1 - Timer CT-T1 shall operate at the TRGSE during state CT-Await-Identify-Response. Its purpose is to protect against the absence of response to the CTIdentify.request."

to

"CT-T1 - Timer CT-T1 shall operate at the TRGSE during state CT-Await-Identify-Response. Its purpose is to protect against the absence of response to the CTIdentify.invoke."

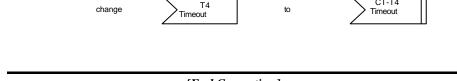

7) Editorial – Clause 13.4, FIGURE 25 (sheet 2 of 3, 4th branch) of H.450.2 (i.e. FIGURE 22/H.450.2 (sheet 2 of 3, 4th branch) of H.450.2 (2/98) publication) Change:

"T4 Timeout"

to

"CT-T4 Timeout"

In addition, the type of symbol was mistake. Time-Out event is an internal event.

[End Correction]

5.6.2.2 Clarification of CallIdentifier and ConferenceIdentifier

Description: A clarification of the setting of H.225.0 elements CallIdentifier and ConferenceIdentifier values in conjunction with H.450.2 transferred calls has been added within a new clause 10.7 "Interactions with H.225.0 parameters". Special Note: This section appeared in the May 1999 Implementors' Guide, but stated that the CallIdentifier should be the same for transferred calls. That definition contradicted H.323v2's definition of the CallIdentifier, so this section has been changed to align with H.323v2 and higher.

[Begin Correction]

10.7 Interactions with H.225.0 parameters

The H.225.0 CallIdentifier value of the transferred call shall use a new value, rather than the value that was used in the primary call.

The H.225.0 ConferenceIdentifier of a transferred call may use a new value. However, the ConferenceIdentifier of an existing conference (multipoint conference) shall not be altered.

[End Correction]	_

5.6.2.3 Transfer without Consultation

Description: An exceptional procedure for a transferred endpoint B actions has been add			
	clause 8.2.1 to allow call transfer without consultation to take place successfully		
	even if the transferred-to endpoint C does either not support H.450.2 or not		
	support H.450 at all. Furthermore, clause 6 was enhanced to allow a different		
	Interpretation APDU setting.		

[Begin Correction]

6 Messages and Information elements

•••

When conveying the invoke APDU of operation callTransferSetup, the Interpretation APDU shall contain value clearCallIfAnyInvokePduNotRecognized<u>in case of Transfer with Consultation</u>. In case of Call Transfer without Consultation, the Interpretation APDU shall be set to value discardAnyUnrecognizedInvokePdu.

[End Correction]

[Begin Correction]

8.2.1 Transfer without Consultation with transferred-to endpoint C not supporting H.450.2

a) When receiving a CONNECT message from endpoint C (that does not include a response to the call Transfer Setup Invoke APDU) while being in state CT-Await-Setup-Response, the transferred endpoint B should continue as if a call Transfer Setup Return Result APDU would have been received. This allows endpoint B to successfully continue with the Call Transfer procedures (including appropriate internal call transfer state handling and clearing of the primary call to the transferring endpoint A). This exceptional procedure enables successful Call Transfer even if the transferred-to endpoint C does not support H.450 at all.

b) When a RELEASE COMPLETE message as a response to a SETUP message containing callTransferSetup Invoke APDU is received in endpoint B on the transferred call attempt, possibly containing callTransferSetup Return Error or Reject APDU, then endpoint B may retry call establishment to endpoint C using a normal basic call. Upon receiving the CONNECT message from endpoint C, endpoint B may continue with the procedures as described in a) above.

Note that this procedure may apply if endpoint C supports H.450.1 but no H.450.2 and if endpoint B has not selected the recommended Interpretation APDU value discardAnyUnrecognizedInvokePdu but has set the value to clearCallIfAnyInvokePduNotRecognized.

[End Correction]

5.6.3 Technical and Editorial Corrections to H.450.3 (1998)

5.6.3.1 Editorial Correction in H.450.3

Description:	Typographica	l errors have b	een disc	overed ii	n H.450.3 clause 12 SDLs.

Note: The tex	Note: The text within the referred symbols remains unchanged.				
	change			to	

5.6.3.2 Clarification of the CallIdentifier and ConferenceIdentifier

Description:	A clarification of the setting of H.225.0 elements CallIdentifier and ConferenceIdentifier values in conjunction with H.450.3 forwarded calls has been added within a new clause 9.9.3 "Interactions with H.225.0 parameters".
	Special Note: This section appeared in the May 1999 Implementors' Guide, but stated that the CallIdentifier should be the same for diverted calls. That definition contradicted H.323v2's definition of the CallIdentifier, so this section has been changed to align with H.323v2 and higher.

[End Correction]

[Begin Correction]

9.9.3 Interactions with H.225.0 parameters

The H.225.0 CallIdentifier of a forwarded call shall use a new value, rather than the value that was used in the forwarding call.

The H.225.0 ConferenceIdentifier of a forwarded call may use a new value. However, the ConferenceIdentifier of an existing conference (multipoint conference) shall not be altered.

[End Correction]

5.6.3.3 Correction to the ASN.1

Description: A typographical error has been discovered in the ASN.1 definitions presented in

H.450.3, Chapter 11.

[Begin Correction]

H225InformationElement FROM H225-Generic parameters - definition

[End Correction]

5.6.4 Technical and Editorial Corrections to H.450.4 (1999)

5.6.4.1 Change Relating to Interpretation APDU

Description:	In order to align H.450.4 with other H.450-series A modified description of the Call Hold Interpretation APDU (i-apdu) setting has been added in clause 6 of Recommendation H.450.4.
	This information will be contained in the revision 2 of H.450.4 Recommendation to be published by the ITU-T. The modified text is shown below.

[Begin Correction]

6 Messages and Information elements

••

When conveying the Invoke APDU of operations **remoteHold** and **remoteRetrieve**, the Interpretation APDU shall <u>be omitted or shall</u> contain the value **rejectAnyUnrecognizedInvokePdu**.

[End Correction]

5.6.4.2 Feature Interaction between H.450.4 and H.450.2

Description:	A modified description of the Call Hold interaction with Call Transfer has been added in clause 9.2.1 of Recommendation H.450.4.
	This information will be contained in the revision 2 of H.450.4 Recommendation to be published by the ITU-T. The modified text is shown below.

[Begin Correction]

9.2.1 Call Transfer (H.450.2)

If prior to Consultation, the first call has been put on hold, the served User <u>endpoint</u> shall <u>decide</u> <u>whether or not to automatically</u> retrieve the held User before Call Transfer is invoked.

If the served User endpoint decides for the automatic retrieve option, a retrieveNotific Invoke APDU (in case of near end call hold) or a remoteRetrieve Invoke APDU (in case of remote-end call hold) may either be sent by the served user prior to the message containing the callTransferInitiate Invoke APDU or may be sent within the same message containing the callTransferInitiate Invoke APDU.

If call transfer fails after retrieval from hold was successful (i.e. if callTransferInitiate Return Error or Reject APDU is received or if timer CT-T3 expires), the served user endpoint may automatically re-invoke SS-Hold.

If remote-end call hold retrieval is unsuccessful, in order to proceed with call transfer the remoteRetrieve Return Error or remoteRetrieve Reject APDU should be disregarded.

If the served User endpoint decides to not choose the automatic retrieve option, call hold applies to the primary call until call transfer has been completed successfully (i.e. until the primary call is cleared). If transfer fails, the primary call remains being held by User A.

[End Correction]

5.6.5 Technical and Editorial Corrections to H.450.5 (1999)

5.6.5.1 Clarification of the CallIdentifier

Ι	Description:	A clarification of the setting of H.225.0 element CallIdentifier in conjunction with H.450.5 parked calls has been added within clause 8.3 "Interactions with H.225.0 parameters".
		This information will be contained in the revision 2 of H.450.5 Recommendation to be published by the ITU-T. The modified text is shown below.

[Begin Correction]

8.3 Interaction with H.225.0 parameters

The H.225.0 **CallIdentifier** value within a parked call shall <u>use a new value, rather</u> be set to the CallIdentifier value that was used in the primary call. For all other SETUP messages carrying SS-PARK or SS-PICKUP related APDUs as defined within this recommendation, new CallIdentifier values shall be used. Note that the CallIdentifier value of the parked/alerting call is preserved during the SS-PARK / SS-PICKUP procedure within the H.450 APDUs.

[End Correction]

5.6.6 Technical and Editorial Corrections to H.450.7 (1999)

5.6.6.1 Change Relating to Interpretation APDU

Description:	In order to align H.450.7 with other H.450-series, a modified description of the
	Message Waiting Indication Interpretation APDU (i-apdu) setting has been added
	in clause 7.1.1 of Recommendation H.450.7.
	This information will be contained in the revision 2 of H.450.7 Recommendation to
	be published by the ITU-T. The modified text is shown below.

[Begin Correction]

7.1.1 H.450.1 Supplementary Service APDU

•••

When conveying the Invoke APDU of operations **mwiActivate**, **mwiDeactivate**, and **mwiInterrogate**, the interpretation APDU shall be omitted <u>or shall contain the value</u> <u>rejectAnyUnrecognizedInvokePdu</u>. This is implicitly equivalent to specifying an interpretation <u>APDU of rejectAnyUnrecognizedInvokePDU</u>.

[End Correction]

5.6.7 Technical and Editorial Corrections to H.450.8 (2000)

5.6.7.1 Usage of CalledName and AlertingName

Description:	An editorial error has been found in the H.450.8 (2000) Recommendation in the
	usage of calledName and alteringName. The following text corrects the errors.

[Begin Correction]

7.2 Terminals or MCU as Originating Endpoint

. . .

A terminal or MCU in receipt of an H.225.0 Connect, Alerting, or Release Complete message containing a connectedName, <u>calledalerting</u>Name, or busyName APDU should not present name information if the Name element indicates namePresentationRestricted.

8.2 Terminals or MCU as Terminating Endpoint

A terminal or MCU in receipt of the H.225.0 Setup message may include name information in the Connect, Alerting or Release Complete as described above in 6.2, 6.3 or 6.4. If presentation of the name to the calling party is desirable, the Name element in the alertingName, connectedName, or busyName operation should indicate namePresentationAllowed. If presentation of the name to the called party is to be restricted, the Name element in the <u>calledalerting</u>Name, connectedName, or busyName operation should indicate namePresentationRestricted.

[End Correction]

5.6.8 Technical and Editorial Corrections to H.450.12 (2001)

5.6.8.1 Technical Correction

Description:	The receipt of a CmnInform APDU at User A's Endpoint is not described.
	Therefore add the text below at the end of section 7.1.1.1 ANF-CMN invocation.

[Begin Correction]

7.1.1.1 ANF-CMN invocation

•••

<u>Upon receipt of a CmnInform invoke APDU in any message, the Originating endpoint shall remain</u> in the current state.

[End Correction]

5.6.8.2 Add definition of the states CMN-Wait-Response and CMN-Wait-Answer-Response

Description:	The states CMN-Wait-Response and CMN-Wait-Answer-Response are used
	only in the SDL diagrams but are not defined anywhere. To avoid confusion, a
	definition of their meaning is added in section 13.

[Begin Correction]

13. Specification and Description Language (SDL) Diagrams for ANF-CMN

•••

In the following SDLs the states CMN-Wait-Response and CMN-Wait-Answer-Response are used to describe the behavior of the Endpoints using explicit primitive exchange.

The state CMN-Wait-Response is entered at the Endpoint after a primitive CMNRequest indication is received and the previous state was CMN-Idle.

The state CMN-Wait-Answer-Response is entered at the Endpoint after a primitive CMNRequest indication is received and the previous state was CMN-Wait-Answer.

[End Correction]

5.6.8.3 Redesign the SDL Diagrams, add two missing collision branches and delete an erroneous message symbol

Description:	Two collision branches are missing: add in section 13.1 Figure 8/H.450.12 the possible receipt of a CMNInform request from the application in state CMN-Wait-Answer and in Figure 9/H.450.12 the possible receipt of a CMNRequest request in state CMN-Wait-Response.
	In Figure 9/H.450.12 the receipt of a CMNInform Request in state CMN-Wait-Response shall be ignored and the message with CMNInform invoke APDU shall not be forwarded to endpoint B.

[Begin Correction]

Editorial - Replace the indicated diagrams by the following:

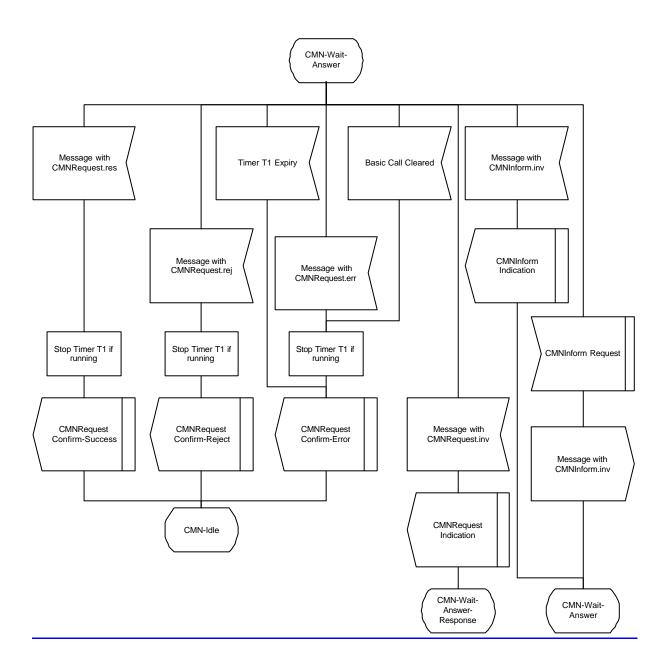

Figure 8/H.450.12 – SDL Representation of ANF-CMN at Endpoint A (Part 3)

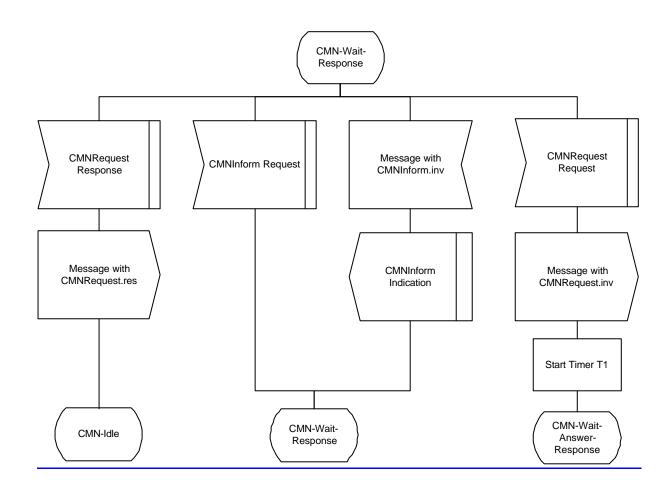

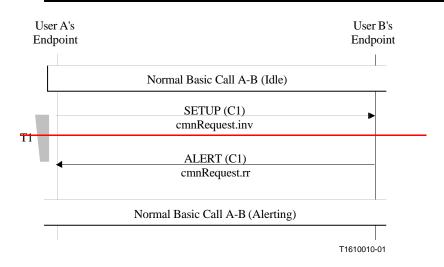

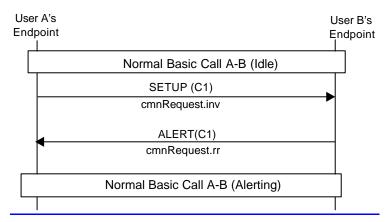

Figure 9/H.450.12 – SDL Representation of ANF-CMN at Endpoint A (Part 3)

5.6.8.4 Message Flow of ANF-CMN

Description:	Timer T1 is started if cmnRequest invoke is sent in FACILITY message, but not
	if it is sent in a SETUP message. However, the message flow diagram in Figure
	2/H.450.12 erroneously contains timer T1. The erroneous diagram should be
	replaced by the corrected diagram as below.

[End Correction]

5.7 Technical and Editorial Corrections to ITU-T Recommendation H.341 (1999)

5.7.1 Corrections to H.341 Annex B-1 H225-MIB

Description:	Each field in CallSignalStatsEntry SEQUENCE referred to the number of
	messages received ("In") and the number of messages transmitted ("Out"). These
	counters shall be combined.

5.7.3 Support for Expanded Country Code Values in T.35 in H.341 Annex B-3

Description:	T.35 (1999) expanded the available country codes from one octet to two octets.
	In order to support the expanded country codes going forward, it is recommended
	that implementers make the following changes to these definitions in H.341 Annex
	B-3 H323TERMINAL-MIB.

[Begin Correction]

```
h323TermSystemt35CountryCode OBJECT-TYPE
             SYNTAX INTEGER (0..255)
            MAX-ACCESS read-only
             STATUS current

is 255, in which case this value shall contain
the country code found in T.35 Annex B."
::= { h323TermSystemEntry 6 }
```

[End Correction]

5.8 Technical and Editorial Corrections to Annex C/H.246 (2003)

5.8.1 Interworking for Conveying Two Calling Party Numbers

Description:	ISUP networks can convey 2 calling party numbers: One in the calling party			
	number, and another one in the generic number (which has the qualification			
	"additional calling party number"). H.323 describes H.460.5 to convey multiple			

IEs. However this does not allow Gatekeepers to add a "network provided number" and is un-necessarily complex for this simple function.
The interworking function to use the existing H.225.0 field
additionalSourceAddresses to support this functionality is described using the
following set of corrections and additions.

[Begin Correction]

C.6.2.1.1 Special arrangement applies

. . .

Setup Received from Gatekeeper

A) If only the **additionalSourceAddresses** is present, or

If only the Calling Party Number is present, or

If only the **sourceAddress** is present, then Table C.20.1 applies:

Table C.20.1/H.246 – Calling Party Number

<u>SETUP®</u>	IAM®	
additionalSourceAddresses or Calling Party Number or	Calling Party Number	
sourceAddress		

B) If the Calling Party Number (or the **sourceAddress** in case the Calling Party Number IE is absent) and the **additionalSourceAddresses** are present, then Table C.20.2 applies:

Table C.20.2/H.246 - Calling Party Number

<u>SETUP®</u>	<u>IAM®</u>	
Calling Party Number or	Generic Number	
sourceAddress	(- additional Calling Party Number)	
additionalSourceAddresses	Calling Party Number	

Table C.20 applies:

Table C.20/H.246 Calling Party Number

SETUP®.	IAM®	
Calling Party Number	Calling Party Number	
	or	
	Generic Number	
	— (additional Calling Party number)	
SourceAddress	Calling Party Number	

NOTE—If a Calling Party number is included in the sourceAddress, then the Calling party number should be sent in the Generic Number.

The address presentation restricted indicator of the calling party number and generic number parameters shall be set according to the CLIR supplementary service. The H.225.0 Setup IE presentationIndicator—indicates whether presentation of the sourceAddress should be allowed or restricted. If both presentationIndicator and the presentation indicator of the Calling Party Number IE are present and are in conflict, the presentation indicator of the Calling Party Number IE shall be used.

[End Correction]	
[Begin Correction]	

C.6.2.1.2 Special arrangement does not apply

. . .

Table C.20.1 and Table C.20.2 apply.

Table C.22/H.246 Connected Party Number

SETUP®	IAM®
Calling Party Number	Calling Party Number or (Note)
	Generic Number — (- additional Calling Party number)
sourceAddress	Calling Party Number

NOTE—If a Calling Party number is included in the sourceAddress, then the Calling party number should be sent in the Generic Number.

The address presentation restricted indicator of the calling party number parameter shall be set according to the CLIR supplementary service. The H.225.0 Setup IE presentationIndicator indicates whether presentation of the sourceAddress should be allowed or restricted. If both presentationIndicator and the

presentation indicator of the Calling Party Number IE are present and are in conflict, the presentation indicator of the Calling Party Number IE shall be used.

[End Correction]	
[Begin Correction]	

C.6.2.2 Calling Party Name Restriction (H.450.8)/Calling Line Identification Restriction (CLIR)

<u>If additionalSourceAddresses</u> field is not present then <u>T</u>the address presentation restricted indicator of the calling party number and of the generic number parameters is coded as described in Table C.23.

NOTE – If the calling user does not have the Calling Party Name Restriction, the address presentation restricted indicator of the calling party number parameter is set to *presentation allowed* (see 4.10/Q.951.x [19]).

Table C.23/H.246 – Coding of the address presentation restricted indicator of the calling party number and generic number parameters

Internal data (User profile data)		SETUP®	IAM®
Permanent mode		Calling party number information element/	Calling party number/ generic number
	Temporary mode	User-user information element	parameter
	default setting	Presentation indicator	Address presentation restricted indicator
Yes	Value non-significant	Value non-significant	Presentation restricted
		Presentation restricted	Presentation restricted
	Restricted	Absent	Presentation restricted
No		Presentation allowed	Presentation allowed
		Presentation allowed	Presentation allowed
	Allowed	Absent	Presentation allowed
		Presentation restricted	Presentation restricted

NOTE – The presentationIndicator field in Setup-UUIE carries information identical to the presentation indicator found in the Calling Party Number IE. If both **presentationIndicator** and the presentation indicator of the Calling Party Number IE are present and are in conflict, the presentation indicator of the Calling Party Number IE shall be used. The meaning and use of the presentation indicator is defined in Q.951.x.

<u>If additionalSourceAddresses</u> field is present then the address presentation restricted indicator of the calling party number and of the generic number parameters is coded as described in Table C.23bis.

<u>Table C.23bis/H.246 – Coding of the address presentation restricted indicator</u> <u>of the calling party number and generic number parameters</u>

Internal data (User profile data)		<u>SETUP®</u>	IAM®

		Presentation ind.	Presentation restricted
		Screening ind.	As received
		Number digits	No digit
		Option 2:	
		Type of number	Unknown
		Numbering plan	Unknown
		Presentation ind.	Presentation restricted
		Screening ind.	Network provided
		Number digits	No digit

Table C.56/H.246 – CLIP information sent to the called user (concluded)

IAM®		SETUP®	
		source	Address
Address not available			or
Or	Value non-significant	Calling par	ty number IE
No calling party number		Type of number	Unknown
parameter		Numbering plan	Unknown
•		Presentation ind.	Not available due to interworking
		Screening ind.	Network provided
		Number digits	No digit

NOTE 1 – If the "two calling party number delivery option" does not apply:

 only one calling party number information element is sent on H.225.0 side. The generic number is used (see Table C.58).

If the "two calling party number delivery option" applies:

- By performing the conversion specified in H.460.5[20], two calling party number information elements are sent on H.225.0 side: one coded according to the generic number parameter (see Table C.58), one according to the calling party number parameter (see Table C.57). The order in which the calling party number information elements appear in the SETUP message is a network option.
- The additionalSourceAddresses is sent and is coded according to the calling party number parameter received, and the Calling Party Number IE is coded according to the generic number parameter (see Table C.58)

NOTE 2 – As a national option, the presentation restriction indication received in the calling party number parameter can be overridden for specific calling access categories. In such a case, the same actions are taken as if *presentation allowed* was received, except for the presentation restriction indication, which is passed transparently into the calling party number information element.

Table C.57/H.246 – Coding of the calling party number information element according to the calling party number parameter

NOTE — If an additional Calling Party number is included in the Generic Number, then the additional Calling party number should be sent in the Calling Party Number.

-[End Correction]

5.8.2 ACM sending without cause when PI=8

Description:	The current text seems to indicate an SS7 ACM message should not be sent when
	the Progress Indicator had value 8 (in-band information or an appropriate pattern
	is now available) in a Call Proceeding or Progress message. This is incorrect since
	the SS7 backward talk path will not be set up without sending ACM and there will
	be no way for the in-band information to make it to the calling party without
	sending ACM.

C.7.1.3.2 ACM without cause parameter

The following cases are possible trigger conditions of sending the address complete message (ACM) without cause parameter:

- a) The destination has determined independently of access indications that the complete called party number has been received.
- b) Overlap receiving is used on the H.225.0 side and a CALL PROCEEDING is received.
- c) En bloc receiving is used on the H.225.0 side and a Progress indicator information element (except with value No. 8, in band information or an appropriate pattern is now available, No. 3, originating address is non ISDN, or No. 4, call has returned to the ISDN) is received in a CALL PROCEEDING message or in a PROGRESS message.
- d) The first ALERTING message is received.

On *speech* or 3.1 kHz calls, the awaiting answer indication (e.g. ring tone) is sent to the calling party upon receipt of the first ALERTING message.

NOTE 1 – In all cases, it is assumed that no Address Complete Message (ACM) has already been sent.

NOTE 2 – The case of the sending of the Address Complete Message (ACM) when the call is forwarded is not described hereafter: see C.7.2.

[End Correction]

5.9 Technical and Editorial Corrections to ITU-T Recommendation H.283 (1999)

5.9.1 Support for Expanded Country Code Values in T.35

Description: T.35 (1999) expanded the available country codes from one octet to two octets. In order to support the expanded country codes going forward, it is recommended that implementers take note of the following usage guidelines for fields in H.283.

[Begin Correction]

```
H221NonStandard ::= SEQUENCE
                                          -- country, as per T.35 Annex A
   t35CountryCode
                      INTEGER(0..255),
                                          -- assigned nationally, unless
   t35Extension
                      INTEGER(0..255),
   the

5.10 Technical and Editorial Corrections to ITU-T Recommendation H.460 Series

5.10.1 Technical and Editorial Corrections to H.460.1 (2002)

5.10.1.1 Encoding rules

Description:	Currently, H.460.1 requires each individual recommendation to specify the
	encoding that it will use for parameters in the raw format. It would be better to
	specify the default encoding in H.460.1 and let individual recommendations change
	it only if needed. The textual changes are shown below.

[Begin Correction]

7.2 Encoded in Raw Method

. . .

If the feature is defined using ASN.1, then it is recommended that the basic aligned variant of the PER encoding rules be used. However, irrespective of this, the encoding rules that are used, if different from the above, shall be explicitly stated in the specification of the feature.

[End Correction]

5.10.2 Technical and Editorial Corrections to H.460.2 (2001)

5.10.2.1 Typographical Error in Section 4.1

Description:	A typographical error has been discovered in that the parameter
	qorPortedNumber in the ASN.1 is referred to as qorPortedAddress in Section
	4.1 of H.460.2 (2001). The text below outlines the necessary change.

[Begin Correction]

4.1 Messages and Signaling

. . .

5) When a Gatekeeper receives an ARQ or LRQ and determines that the destination number is ported out of the network and it may wish to invoke number portability Query on Release (QoR) procedures (as specified in Annex C/Q.769.1). In such cases, the Gatekeeper must respond with ARJ or LRJ that contains a reject reason of **genericDataReason**. The Gatekeeper should include the **genericData** of the ARJ/LRJ that contains the **NumberPortabilityGenericData** with the **numberPortabilityRejectReason**. The

numberPortabilityRejectReason now will have a value of **qorPorted<u>NumberAddress</u>** (=1). This maps to the ISUP release cause value = #14 (QoR: ported number) as specified in Addendum 1/Q.850.

[End Correction]

5.10.2.2 Cardinality of Number

Description:	A typographical error has been discovered in that the parameter
	qorPortedNumber in the ASN.1 is referred to as qorPortedAddress in Section
	4.1 of H.460.2 (2001). The text below outlines the necessary change.

[Begin Correction]

5 H.225.0 Generic Data Usage

. . .

Generic Extensibility Type	Fields	Field name	Value
EnumeratedParameter			
GenericIdentifier	id	standard	1
Contents	content	raw	ASN.1 PER encoding of the NumberPortabilityInfo
Parameter Cardinality			Once and Only Once

[End Correction]

5.10.3 Technical and Editorial Corrections to H.460.6 (2002)

5.10.3.1 Close All Channels

Description:	The intent of the Close All Media Channels request described in section 4.1.2 is to
	close all open media channels and cancel all available sessions, as described in
	section 4.5. To this end, text in sections 4.1.2 and 4.5.2 should be changed as
	follows.

[Begin Correction]

4.1.2 Close All Channels

This parameter may be used by a party to request that the receiving endpoint close all open media channels <u>and cancel all available sessions</u>. Support for this parameter is optional, and shall be negotiated during EFC feature negotiation.

. . .

4.5.2 Requesting Close-All-Channels

An endpoint or a third party may request that the other endpoint close all open media channels <u>and cancel</u> <u>all available sessions</u> by sending a **genericData** element with the EFC featureID and parameter 2 present in any convenient call signalling message (e.g., FACILITY). The receiving endpoint is expected to silently close all open channels without any response (e.g., without issuing any **Null-OLCs**.)

[End Correction]

5.10.3.2 Signaling of EFC Support in supportedFeatures

Description:	It is held that signalling of EFC in supportedFeatures by the originating party is	
	unnecessary. The text in section 4.2 should be corrected as below.	

[Begin Correction]

4.2 Invocation of Extended Fast Start

An originating party shall indicate its desire to use EFC when it issues a SETUP message. The SETUP shall contain a request for EFC support in the **desiredFeatures** element, or a requirement for EFC support in the **neededFeatures** element. The supportedFeatures element shall indicate support for EFC as well. The EFC feature is symmetric, hence requestor support for the feature may be inferred from a request for EFC, and the supportedFeatures element need not be included to indicate support for EFC. In addition, the SETUP message shall include a **genericData** element specifying EFC Proposal (parameter 1) and a **fastStart** element containing one or more proposals. That is, EFC procedures shall include the standard Fast Connect procedures.

[End Correction]

5.10.3.3 Prevention of Race Condition in Master/Slave Determination

Description:	There is a possible race condition that may occur, depending on the order in which
	an endpoint processes fastStart elements versus tunnelled H.245 master/slave
	negotiation messages embedded in the same H.225.0 message. Thus, it is
	suggested that the following paragraph be added to the end of section 4.2.1.

[Begin Correction]

4.2.1 Master/Slave Determination

Parties supporting Extended Fast Connect should use the H.245 tunnel to carry out master/slave negotiation. For the initial Fast Connect exchange, the caller (sender of the SETUP with proposals) shall be considered the slave, and the called party (acceptor of proposals) shall act as the master. Although this convention will suffice for simple A-to-B calls, it can lead to complications in more complex call scenarios.

<u>Different implementations may process</u> **fastStart** elements and tunnelled H.245 messages in different orders. EFC proposals or acceptances shall not be included in any H.225.0 message that carries an

H.245 **MasterSlaveDeterminationAck** message that conveys a change in master/slave status. Doing so could lead to temporary confusion about which party is master and how to respond to the EFC elements.

[End Correction]

5.10.3.4 Remote Endpoint Type and Version after Re-routing

Description:	An endpoint may not be aware of the H.323 protocol version number supported
	by the remote endpoint, especially if the call gets re-routed one or more times. In
	some cases it might be helpful for the endpoint to have this information. The
	following additions should be made to H.460.6 document.

[Begin Correction]

5.5 EFC Third-party Pause and Rerouting

EFC supports third-party pause and rerouting, as described in H.323 Annex F for SETs, when used by a routing gatekeeper. The third party (the gatekeeper in the example in Figure 5) may idle the caller's transmit and/or receive channels via **Null-OLCs**, then supply the caller's proposal **fastStart** to a new party (e.g., in a SETUP). The acceptance **fastStart** will appear to the caller as a redirection or reconfiguration, asillustrated in Figure 5.

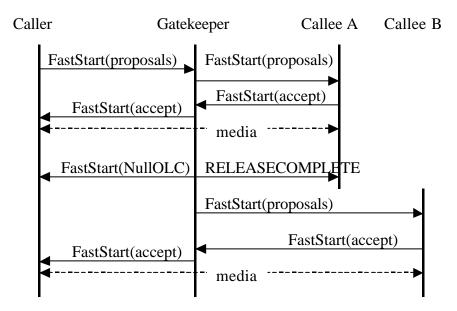

Figure 5/H.460.6 - Third-Party Redirection

In the above diagram, the Gatekeeper, or the entity that re-routes a call should send a Facility message containing the **destinationInfo** field upon completion of the re-routing to the entity that gets re-routed, i.e., Caller. An endpoint should examine this message for the H.225.0 version information at any point that a Facility message is received containing this field.

After coming out of the "paused" state an endpoint should examine the version-id fields in TCS messages to determine the H.245 version supported by the remote endpoint.

In addition, an endpoint interested in knowing the version of the remote endpoint should send a Status Inquiry message and wait for the receipt of the Status message to determine the version of the H.225.0 in use when it exits the paused state when the above Facility message is not received within a reasonable amount of time. The length of this time is left to the implementation.

[End Correction]

5.10.3.5 Termination of Extended Fast Connect

Description:	It is held that extended fast connect shall not be terminated when an H.245	
	address is present in a message returned by the called party. Instead, EFC shall be	
	terminated when a connection is established to the H.245 address. To this end,	
	text in section 4.2 should be changed as follows.	

[Begin Correction]

4.2 Invocation of Extended Fast Connect

. .

Extended Fast <u>Connect</u> <u>Start</u> requires that H.245, if used, shall be tunnelled in the H.225.0 signalling channel. If a calling party offers Extended Fast <u>Connect</u> <u>Start</u> support in SETUP, and the called party returns a message including **h245Address** <u>before returning an EFC response</u>, <u>(thereby requesting a separate H.245 connection)</u>, the calling party shall presume that EFC is not supported and may proceed with establishment of the requested connection. <u>Including **h245address** in messages does not by itself terminate EFC, but establishing a connection to an H.245 address will cause termination of EFC.</u>

[End Correction]

5.10.3.6 Clarification on simultaneous use of EFC acceptance and acceptance fastStart

Description:	EFC acceptance and acceptance fastStart can be simultaneously included in any
	message up to and including Connect. Having both the fields in the same message
	can cause undue processing on the recipient and must be avoided when it is
	possible. To this end, text in section 4.2 should be changed as follows.

[Begin Correction]

4.2 Invocation of Extended Fast Connect

. . .

Note that the EFC acceptance and acceptance **fastStart** can be returned in any message up to and including the CONNECT message, but the identical acceptance should not be repeated in any subsequent message.

[End Correction]

5.10.3.7 Clarification on orientation of logical channels

Description:	Orientation of logical channels proposed using EFC are not related to the direction
---------------------	---

of the call. The following paragraph should be added to Section 4.3 to clarify this.

[Begin Correction]

4.3 Opening New Sessions

Opening new media sessions proceeds just like standard Fast Connect, except that either party may invoke EFC at any time to propose new media sessions by sending a message (e.g., FACILITY) containing a proposal **fastStart** element with one or more **OLC**s for one or more **sessionID**s, along with a **genericData** element indicating "EFC Proposal". As for standard Fast Connect, multiple **OLC**s with the same **sessionID** are considered to be alternative proposals for a single media stream. The other party may reply with a **fastStart** element containing **OLC**s for the accepted channels and sessions. A slave party will supply a non-zero **sessionID** for any media channels it proposes. Parties may use EFC to propose and open any number of sessions. Session IDs may take any valid value and need not be limited to the "well-known" values of 1, 2, or 3.

For each logical channel, the EFC proposal establishes the orientation of the forward and reverse logical channels: the forward logical channel carries media from the proposer to the acceptor, and the reverse logical channel carries media from the acceptor to the proposer; the order is not determined from the direction of the call as a whole.

As in standard Fast Connect, once a proposed alternative is selected by another party, the issuing endpoint may suspend any reception of media on the other alternatives. Nevertheless, it shall be prepared for the other party to replace the initially-selected alternative with another (see section 4.7, below).

5.10.4 Technical and Editorial Corrections to H.460.7 (2002)

5.10.4.1 Compound Type Parameter Usage

Description:	The contents of the compound parameter in Section 6.4, Table 9 are not well	
	defined. The text below clarifies its usage.	

[Begin Correction]

6.4 Digit map string parameters

. . .

Table 1/H.460.7 – Type of Number Associated Digit Maps

Parameter name:	ToN Associated Digit Map	
Parameter description:	This compound type conveys Digit Map associated with a particular Type of Number	
Parameter identifier type:	Standard	
Parameter identifier value:	5	
Parameter type:	Compound	
Parameter cardinality:	Zero or more	

Within the **compound** type <u>defined in Table 9</u>, the parameters defined in Table 2 <u>and Table 11</u> shall be included to convey <u>one or more</u> Digit Map strings for a particular Type of Number:

Table 2/H.460.7 – Type of Number Parameter

Parameter name:	Type of Number (ToN)
Parameter description:	This parameter indicates the type of number
Parameter identifier type:	Standard
Parameter identifier value:	1
Parameter type:	Number8
Parameter valid values:	1 International number
	2 National number
	3 Network specific number
	4 Subscriber number
	6 Abbreviated number
Parameter cardinality:	Once

The Digit Map strings comprising the Digit Map associated with a Type of Number are conveyed as additional parameters within the **compound** type of the Type of Number <u>Associated Digit Maps</u> parameter shown in Table <u>119</u>. <u>This is shown in Table 11</u>.

Table 3/H.460.7 - Digit Map strings for ToN Parameter

Parameter name:	Digit Map Strings for ToN
Parameter description:	This parameter contains a single Digit Map string
Parameter identifier type:	Standard
Parameter identifier value:	2
Parameter type:	Text
Parameter cardinality:	One or more

The syntax of the **text** field, which holds a single Digit Map string, is described in section 10.

The order of the Digit Map strings in the **parameters** field has no significance.

[End Correction]

5.10.4.2 Duplicate Parameters

Description:	Section 6.3 (Table 3) and Section 6.5 (Table 12) both define a parameter with ID 2. They can be used in the same place (in an RCF), so it is not possible to
	1 \ // 1
	distinguish between them. The parameter identifier value should be changed to 2 as
	below.

[Begin Correction]

6.5 URL parameter

. . .

Table 4/H.460.7 - URL Parameter

Parameter name:	Digit Map URL
Parameter description:	This parameter contains a URL to Digit Map information accessible via HTTP
Parameter identifier type:	Standard
Parameter identifier value:	<u>26</u>
Parameter type:	Alias
Parameter cardinality:	Zero or one

[End Correction]

5.10.5 Technical and Editorial Corrections to H.460.8 (2002)

5.10.5.1 CallTerminationCause Parameter Usage

Description:	Table 3 defines a parameter for "Call Termination Cause" but does not explicitly
	define its format. The text below clarifies this.

[Begin Correction]

6 Querying For Alternate Routes

. . .

TABLE 5

Parameter to contain the Call Termination Cause

Parameter name:	Call Termination Cause
Parameter description:	The CallTerminationCause structure contains the reason for the previously failed call attempt
Parameter identifier type:	Standard
Parameter identifier value:	2
Parameter type:	Raw
Parameter cardinality:	Zero or one

The contents of the raw parameter shall be encoded the same as **CallTerminationCause** as defined in the ASN.1 in Annex H/H.225.0.

[End Correction]

5.11 Technical and Editorial Corrections to ITU-T Recommendation Annex P/H.323 (2003)

5.11.1 Allowance for multiple Audio and VBD Streams

Description:	Inconsistencies exist between the current Annex P text and the text found in	
	V.150.1 related to the same functionality for SDP-based systems. In particular,	
	the text for SDP-based systems allows for any number of audio streams and	
	multiple VBD streams. The text below provides the correction.	

While there are no strict limitations on the number of streams that may be contained within any MPS channel, the MPS channel used for MoIP shall contain no zero or more than one audio streams, no one or more than one VBD streams, no more than one SSE stream, and no more than one SPRT stream. If the SPRT stream is opened as a separate channel, the MPS channel shall not also include an SPRT stream. In addition, there may shall be one different payload types for normal audio, one for the VBD stream, one for the SSE stream, and one for the SPRT streams within the MPS. It is possible that more than four payload types may be utilized for those audio, VBD, SSE, and SPRT four streams. For example, if the VBD stream is protected with Forward Error Correction (FEC), and if those FEC packets are contained within a Redundancy Encoding packet, there may be not just one payload type value for the VBD stream, but three: one used in the RTP header to signify that the packet contains a redundantly encoded payload, one for the primary payload (the VBD data), and one for the FEC data carried as the secondary encoding.

To optionally protect the a_VBD stream, an endpoint may utilize forward error correction and/or redundancy encoding. A stream that utilizes forward error correction shall be signalled via the **fec** field of the **DataType** structure within the **MultiplePayloadStreamElement** structure. A stream that utilizes redundancy encoding shall be signalled via the **redundancyEncoding** field in the **DataType** structure within the **MultiplePayloadStreamElement** structure.

[End Correction]

6 Implementation Clarifications

6.1 Token Usage in H.323 Systems

There has been some confusion on the usage of individual **CryptoH323Tokens** as passed in RAS messages. There are two main categories of **CryptoH323Tokens**; those used for H.235 procedures and those used in an application specific manner. The use of these tokens should be according to the following rules:

- All H.235 defined (e.g. cryptoEPPwdHash, cryptoGKPwdHash, cryptoEPPwdEncr, cryptoGKPwdEncr, cryptoGKCert, and cryptoFastStart). shall be utilized with the procedures and algorithms as described in H.235.
- Application specific or proprietary use of tokens shall utilize the nestedcryptoToken for their exchanges.
- Any nestedcryptoToken used should have a tokenOID (object identifier) which unambiguously identifies it.

6.2 H.235 Random Value Usage in H.323 Systems

The random value that is passed in xRQ/xCF sequence between endpoints and Gatekeepers may be updated by the Gatekeeper. As described in section 4.2 of H.235 this random value may be refreshed in any xCF message to be utilized by a subsequent xRQ messages from the endpoint. Due to the fact that

RAS messages may be lost (including xCF/xRJ) the updated random value may also be lost. The recovery from this situation may be the reinitializing of the security context but is left to local implementation.

Implementations that require the use of multiple outstanding RAS requests will be limited by the updating of the random values used in any authentication. If the updating of this value occurs on every response to a request, parallel requests are not possible. One possible solution, is to have a logical "window" during which a random value remains constant. This issue is a local implementation matter.

6.3 Gateway Resource Availability Messages

The Resources Available Indication (RAI) is a notification from a gateway to a gatekeeper of its current call capacity for each H-series protocol and data rate for that protocol. The gatekeeper responds with a Resources Available Confirmation (RAC) upon receiving a RAI to acknowledge its reception. A Gatekeeper should ignore any RAI notifications (e.g. send no RAC) upon receiving a RAI which contains bogus information (i.e. a bad endpointIdentifier).

6.4 OpenLogicalChannel in fastStart

In the H.225.0 ASN.1, **fastStart** is defined as SEQUENCE OF OCTET STRING OPTIONAL. The text definition states "This uses the **OpenLogicalChannel** structure defined in H.245..." Each OCTET STRING in **fastStart** is to contain the **OpenLogicalChannel** structure, not an entire request message.

6.5 Clarification in Q.931 (1993)

Table 4-3/Q.931 (1993) (Information Element Identifier Coding) shows that the Progress Indicator IE identifier is 0x1e, but Figure 4-29/Q.931 (octet layout of Progress Indicator IE) shows the identifier as 0x1f. Note that the identifier should be 0x1e.

6.6 Graceful Closure of TCP Connections

When a TCP connection is closed, the graceful closure procedure documented in section 3.5 of RFC 793 should always be used.

6.7 Race Condition on Simultaneous Close of Channels

Section 8.5 of H.323 describes the procedures that an endpoint follows to terminate a call. It should be noted that as prescribed in Step 6, both endpoints shall issue a Release Complete simultaneously. Endpoints should be prepared for this potential race condition.

6.8 Acceptance of Fast Connect

When an endpoint accepts the Fast Connect procedure, it may select from the proposed channels as specified in section 8.1.7.1/H.323. The Recommendation clearly specifies what fields shall be modified by the endpoint to accept both the forward and the reverse channels. An endpoint shall not modify any fields other than those specified in 8.1.7.1/H.323 when returning the proposed channels.

Newer versions of H.245 may introduce new fields into the **OpenLogicalChannel** sequence or one of the structures contained therein, as well as new procedures. An older endpoint is obviously not required to decode such new fields or to return such new fields when accepting any proposal. Implementers should consider the consequences of transmitting a newer H.245 OLC to an older endpoint. For the purposes of Fast Connect, the calling endpoint shall assume that the called endpoint's version of H.245 is the minimum

version of H.245 necessary to be complaint with an H.323 device that advertises the version of H.225.0 transmitted in the messages from the called endpoint (refer to the "Summary" section of H.323).

6.9 Semantic Differences between Lightweight RRQs and IRQ/IRR Messages

The lightweight RRQ and the IRR message serve two different functions with an H.323 system. While both are a means of allowing the Gatekeeper to discover that an endpoint is alive, they also each serve separate, unique functions.

The lightweight RRQ is intended to prevent a registration with a Gatekeeper from expiring. The message is generated by the endpoint and does not require the Gatekeeper to poll each endpoint on a regular interval. This message is also a means of allowing the Gatekeeper to provide updated registration information, such as a new list of Alternate Gatekeepers, after the initial registration.

Version 1 of H.323 did not have the concept of a lightweight RRQ, so the IRQ/IRR exchange is the only mechanism available to determine endpoint status of Version 1 devices. However, the lightweight RRQ may be a better choice for determining endpoint status for Version 2 and higher devices.

The IRQ/IRR exchange allows the Gatekeeper to poll the endpoint periodically to discover if the endpoint is still alive. However, an IRR is also intended to convey details about current active calls. This can be used by the Gatekeeper to discover calls that have terminated, which may happen if the endpoint fails to properly send a DRQ message for a call. The IRR message also provides specific details about active calls.

6.10 Specifying the Payload Format for a Channel

Implementers should be conscientious of the fact that there are possibly multiple payload formats defined for media formats. For example, two payload formats are defined for H.263—one is defined for the Recommendation H.263 (1996) and one for Recommendation H.263 (1998). Other payload formats may be defined for existing codecs or revisions of those codecs. For interoperability, it is strongly advised that implementers provide the **mediaPacketization** element of the **h2250LogicalChannelParameters** sequence in the **OpenLogicalChannel** message so that there is no ambiguity at to which payload format is being used.

6.11 Version Dependencies in Annexes

It was noted that the Annexes to H.323 often fail to indicate the minimum version of H.323 and H.245 required for the Annex. This table is an attempt to clarify the version relationships:

H.323 Annex	Minimum H.323 Version	Minimum H.245 Version
Annex Dv1 (1998)	1998 (Version 2)	1998 (Version 4)
Annex Dv2 (2000)	2000 (Version 4)	2000 (Version 7)
Annex E	1998 (Version 2)	N/A
Annex F	1998 (Version 2)	N/A
Annex G	1998 (Version 2)	1998 (Version 4)
Annex J	1998 (Version 2)	N/A

Annex M.1	2000 (Version 4)	N/A
Annex M.2	2000 (Version 4)	N/A
Annex P	2000 (Version 4)	2003 (Version 9)
Annex R	2000 (Version 4)	N/A

6.12 Routing through Signaling Entities and Detecting Loops

In some call scenarios, a call may be routed though a signaling entity multiple times. For example, a call from Endpoint 1 (EP1) may be routed through Gatekeeper 1 (GK1) and Gatekeeper 2 (GK2) to Endpoint 2 (EP2) as shown in the Figure 1.

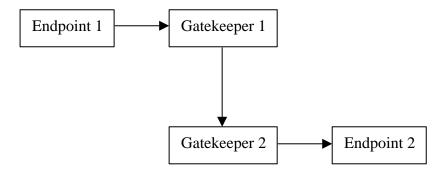

Figure 1 - Call placed through multiple gatekeepers

If EP2 redirects the call to a third endpoint, such as Endpoint 3 (EP3), signaling entities such as GK1 and GK2 should be prepared to handle such call rerouting. For this example, assume that EP2 returned a Facility message with a **reason** of **callForwarded** upon receiving a Setup message. Rather than propagate that response back to EP1, GK2 may choose to handle the call forward operation. GK2 would send a Release Complete to EP2 and begin rerouting the call. Suppose that GK2 sends an LRQ message to GK1 for EP3 and that GK1 replies with its address so that that calls routed to EP3 are routed through it. GK2 would then send a Setup message for this call to GK1 as shown in Figure 2.

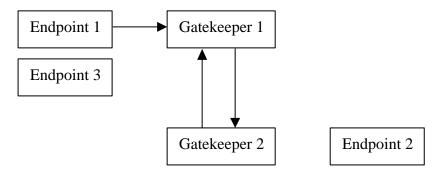

Figure 2 - Gatekeeper 2 re-routes call back to Gatekeeper 1

When GK1 receives the Setup message from GK2, it may inadvertently mistake the call as "bogus", since the Call Identifier will match an already existing call within the Gatekeeper. Implementers should consider this type of call scenario and be prepared to receive incoming calls that contain Call Identifiers for calls that are already being routed through the routing entity. The routing entity should examine not only the Call Identifier, but also the destination address of the call (the call signaling address, aliases, or Called Party Number of the destination). In this case, the call is routed through GK1 with a destination address of EP2

is rerouted by GK2 to GK1, but with a destination address of EP3. In this way, the GK1 will properly handle call routing and rerouting, as well as prevent loops in the call signaling path.

In this example, there was a dependency on the H.323v2 Call Identifier. Unfortunately, H.323 version 1 systems did not have Call Identifiers. For this reason, these loop detection and rerouting procedures are not possible. Nonetheless, it is advisable for routing entities to make an effort to prevent loops properly. For example, if the entities in Figure 2 were version 1 devices, the GK1 may examine the source address, destination address, and Conference Identifier (CID) of the call. The first time the call is presented to the Gatekeeper, the destination address is EP2, just as before. However, when GK re-routes the call back to GK1, the destination address is EP3. In this way, GK1 may allow proper rerouting of the call to EP3.

The logic for Version 1 devices seems similar to that for Version 2 and higher devices, but there are issues when EP2 and EP3 are MCUs, for example. Suppose that EP2 is an MCU that is directing all calls to EP3. The first time a call is redirected to GK1, GK1 may realize that this is, indeed, a call redirection as described above. However, when the second call is redirected, GK1 has no means of distinguishing between the first redirected call and the second: the source address *may* be the same, the destination address is the same as the previously rerouted call (EP3), and the Conference ID is the same. So in this case, GK1 may have no choice but to assume that a loop has occurred and release the offending call. Although this is unfortunate, H.323v2 and higher systems do not suffer from this problem. What is important, though, is that loop detection is possible—even with version 1 systems.

6.13 Packetization for G.729, G.729a, G.711, and G.723.1

The delay associated with codec processing and packetization should be kept as short as possible. To accomplish this objective when G.729 or G.729A is used, two frames per packet should be considered as the maximum packet size. Similarly, G.711 may be used with packet sizes of 10 ms (80 frames) or 20 ms (160 frames) to achieve this objective. Finally, when G.723.1 is used, only one frame should be included in each packet. The 30 ms frame size of G.723.1 results in speech collection and coding delay of at least 60 ms, contributing to difficulty of interactive communications.

6.14 Checking versions for T.38 and V.150.1

It is important that devices properly negotiate the version of the T.38 or V.150.1 to be used and agree to use the same version. At the present time there are few guidelines for version negotiation. Until the guidelines are developed the following note applies:

Devices supporting multiple versions of T.38 and V.150.1 may offer multiple proposals in Fast Connect, each with a different version specified. A device shall not accept a proposal for a version that it does not support.

7 Allocated Object Identifiers and Port Numbers

Information in this section is provided for informational purposes and convenience. This section does not supercede nor replace proper references in H.225.0, H.225, H.235, or other Recommendations.

7.1 Allocated Object Identifiers

The following object identifiers have been allocated for protocols associated with H.323. Any future object IDs that are allocated should be indexed here to prevent duplication.

Note that object IDs below that are allocated below the arc $\{ \text{ itu-t}(0) \text{ recommendation}(0) \}$ are show with an abbreviated prefix of "0 0" below.

{ 0 0 h(8) 2250 version(0) [v] }	H225.0 version numbers
Assigned values of v: 1-4	
{ 0 0 h(8) 2250 annex(1) g(7) version(0) [v] }	H225.0 Annex G version numbers
Assigned values of v : 1-2	
{ 0 0 h(8) 2250 annex(1) g(7) usage(1) [u] }	H225.0 Annex G usage tags
Assigned values of u : none	
{ 0 0 h(8) 245 version(0) [v] }	H245 version numbers
Assigned values of <i>v</i> : Please refer to Table D.1/H.245	
{ 0 0 h(8) 245 generic-capabilities(1) video(0) [c] }	Generic video capabilities
Assigned values of <i>c</i> : Please refer to Table D.1/H.245	
{ 0 0 h(8) 245 generic-capabilities(1) audio(1) [c] }	Generic audio capabilities
Assigned values of <i>c</i> : Please refer to Table D.1/H.245

Assigned values of <i>c</i> : Please refer to Table D.1/H.245	
{ 0 0 h(8) 245 generic-capabilities(1) control(3) [c] }	Generic control capabilities
Assigned values of <i>c</i> : Please refer to Table D.1/H.245	
{ 0 0 h(8) 245 generic-capabilities(1) multiplex(4) [c] }	Generic multiplex capabilities
Assigned values of <i>c</i> : Please refer to Table D.1/H.245	
{ 0 0 h(8) 283 generic-capabilities(1) 0 }	H.283 Capability
{iso (1) identified-organization (3) icd-ecma (0012) private-isdn-signalling-domain (9)}	Identifies QSIG as the tunneled protocol within an H.225.0 Call Signalling Channel

7.2 Allocated Port Numbers

The following IP port numbers have been allocated for various components of H.323:

1300 TLS secured call signalling

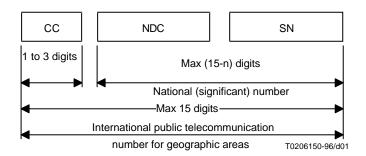

1718 Multicast RAS Signalling

- 1719 Unicast RAS Signalling
- 1720 TCP call signalling
- 2099 Annex G/H.225.0 Signalling
- 2517 Annex E/H.323 Signalling

8 Use of E.164 and ISO/IEC 11571 Numbering Plans

8.1 E.164 Numbering plan

ITU-T Recommendation defines E.164 numbers the following way for geographic areas:

CC Country Code for geographic areas NDC National Destination Code (optional) SN Subscriber Number n Number of digits in the country code

NOTE – National and international prefixes are not part of the international public telecommunication number for geographic areas.

Figure – International public telecommunication number structure for geographic areas

Similar descriptions are also defined for non-geographic areas. Recommendation E.164 further defines country codes (CC) for all the countries and regions of the world.

An international E.164 number always starts with a country code and its total length is always 15 digits or less. More importantly, it does not include any prefixes that are part of a dialing plan (for example, "011" for an international call placed in North America, or "1" for a long-distance call), nor does it include "#" or "*". The number "49 30 345 67 00" is an E.164 number with CC=49 for Germany. A national number is the international number stripped of the country code, "30 345 67 00" in this case. The subscriber number is the national number stripped of the national destination code, "345 67 00" in this case.

An E.164 number has global significance: any E.164 number can be reached from any location in the world. A "dialed digit sequence", however, only has significance within a specific domain. Within a typical private numbering plan in an enterprise, for example, a prefix, such as "9", may indicate that a call goes "outside", at which point the local telephone company's dialing plan takes over. Each telephone company or private network is free to choose its own dialing plan. It is also free to change it as it pleases—and frequently does so (adding new area codes, for example).

In a typical geographically determined network where users input telephone numbers manually and where users do not travel too much, having different dialing plans everywhere is usually a problem. However, when a user travels, the user must determine the other network's numbering plan in order to place calls.

When computer systems perform the dialing automatically, the user is usually required to customize the dialing software for every region or network.

Because of these issues with varying dialing plans and automated dialing, it is essential to be able to refer to an absolute "telephone number" instead of "what you have to dial to reach it from a specific location." Proper usage of E.164 numbers can resolve these issues. Many systems use E.164 numbers instead of dialed digits: for example, a PBX may gather the dialed digits from a user on a telephone and then initiate a call to the local phone company using an E.164 number in the Called Party Number information element in Q.931. When completing the Called Party Number IE, specifying the numbering plan as "ISDN/telephony numbering plan (Recommendation E.164)" indicates an E.164 number. Specifying the type of number as "unknown" and the specifying the numbering plan as "unknown" indicates dialed digits.

The following are a set of definitions from E.164:

number

A string of decimal digits that uniquely indicates the public network termination point. The number contains the information necessary to route the call to this termination point.

A number can be in a format determined nationally or in an international format. The international format is known as the International Public Telecommunication Number which includes the country code and subsequent digits, but not the international prefix.

numbering plan

A numbering plan specifies the format and structure of the numbers used within that plan. It typically consists of decimal digits segmented into groups in order to identify specific elements used for identification, routing and charging capabilities, e.g. within E.164 to identify countries, national destinations, and subscribers.

A numbering plan does not include prefixes, suffixes, and additional information required to complete a call.

The national numbering plan is the national implementation of the E.164 numbering plan.

dialing plan

A string or combination of decimal digits, symbols, and additional information that define the method by which the numbering plan is used. A dialing plan includes the use of prefixes, suffixes, and additional information, supplemental to the numbering plan, required to complete the call.

address

A string or combination of decimal digits, symbols, and additional information which identifies the specific termination point(s) of a connection in a public network(s) or, where applicable, in interconnected private network(s).

prefix

A prefix is an indicator consisting of one or more digits, that allows the selection of different types of number formats, networks and/or service.

international prefix

A digit or combination of digits used to indicate that the number following is an International Public Telecommunication Number.

country code (CC) for geographic areas

The combination of one, two or three digits identifying a specific country, countries in an integrated numbering plan, or a specific geographic area.

national (significant) number [N(S)N]

That portion of the number that follows the country code for geographic areas. The national (significant) number consists of the National Destination Code (NDC) followed by the Subscriber Number (SN). The function and format of the N(S)N is nationally determined.

national destination code (NDC)

A nationally optional code field, within the E.164 number plan, which combined with the Subscriber's Number (SN) will constitute the national (significant) number of the international public telecommunication number for geographic areas. The NDC will have a network and/or trunk code selection function.

The NDC can be a decimal digit or a combination of decimal digits (not including any prefix) identifying a numbering area within a country (or group of countries included in one integrated numbering plan or a specific geographic area) and/or network/services.

national (trunk) prefix

A digit or combination of digits used by a calling subscriber, making a call to a subscriber in his own country but outside his own numbering area. It provides access to the automatic outgoing trunk equipment.

subscriber number (SN)

The number identifying a subscriber in a network or numbering area.

8.2 Private Network Number

Private Network Numbers are used in private or virtual private telephony networks, e.g., a corporate network of PBXs and virtual private lines.

ISO/IEC 11571 defines Private Network Number (PNP) as having up to three regional levels.

A PNP Number shall comprise a sequence of x decimal digits (0,1,2,3,4,5,6,7,8,9) with the possibility that different PNP Numbers within the same PNP can have different values of x. The maximum value of x shall be the same as for the public ISDN numbering plan, see ITU-T Recommendation E.164.

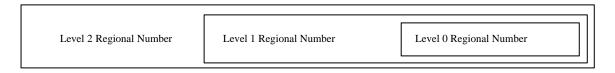

Figure – H.323 - Structure of a PNP Number with three levels of regions

A level n Regional Number (RN) shall have significance only within the level n region to which it applies. When that number is used outside that level n region, it shall be in the form of an RN of level greater than n. Only a Complete Number shall have significance throughout the entire PNP.

A typical example in North America would be a 4-digit "extension" as the Level 0 Regional Number: a 3-digit "location code" combined with the 4 digit "extension" would form the Level 1 Regional Number. The Level 2 Regional Number would be nil.

A prefix could also be used to signal which regional number is used, and would not be part of the regional number per se, but only part of the dialing plan. Again, a typical example would be the use of digit "6" to access a Level 1 Regional Number, and no digit for a Level 0 Regional Number.

The following are a set of definitions from ISO/IEC 11571:

Private Numbering Plan (PNP)

The numbering plan explicitly relating to a particular private numbering domain, defined by the PISN Administrator of that domain.

PNP Number

A number belonging to a PNP.

Region

The entire domain or a sub-domain of a PNP. A region does not necessarily correspond to a geographical area of a PISN.

Region Code (RC)

The leading digits of a PNP Number which identify a region. The RC may be omitted to yield a shortened form of a PNP Number for use internally to that region.

Regional Number (RN)

A particular form of a PNP Number which is unambiguous in the region concerned.

Complete Number

A number which is unambiguous in the entire PNP, i.e. which corresponds to the highest regional level employed in that PISN.

9 ASN.1 Usage, Guidelines, and Conventions

9.1 NULL, BOOLEAN, and NULL/BOOLEAN OPTIONAL

Throughout the ASN.1 used in H.323-series documents, the reader will see the types NULL and BOOLEAN used, along with the modifier OPTIONAL in some cases. People have questioned when NULL should be used or when BOOLEAN should be used and what the semantic differences are.

The BOOLEAN type allows a TRUE or FALSE value to be conveyed in the protocol. When used in conjunction with OPTIONAL, it actually allows three values to be conveyed through the protocol: TRUE, FALSE, and *absent*. The question is what does *absent* mean? In some instances, the absence of a BOOLEAN OPTIONAL means should be interpreted as FALSE, while in other cases, it should be interpreted as "I don't care" or "I don't know"—but not always. For example, the **additiveRegistration** field in the RRQ of H.225.0 Version 4 is defined as a BOOLEAN OPTIONAL. When present, it clearly indicates that the endpoint supports the feature or does not support the feature. However, absence of this field shall also be interpreted as FALSE. The reason is that an older endpoint would not know anything about the field and would obviously not be able to include it. Moreover, they certainly do not support the feature. Another example is the **originator** field in the **perCallInfo** sequence. When present, the meaning is quite clear: the caller is the originator or the terminator of the call. However, if the field is not present, it may mean that the endpoint does not know or cannot supply this information for some reason.

The NULL type is often used to select one of several CHOICE options. NULL carries no particular value, as it merely indicates presence. In selecting the conference goal in a Setup message, for example, the goal CHOICEes are simply NULL types to allow the endpoint to indicate a selection. Another common use of NULL is with the OPTIONAL modifier. A NULL OPTIONAL type allows an endpoint to indicate support for a feature, for example. It is similar in semantics to a BOOLEAN in that the

presence of a NULL field indicates TRUE and absence of the NULL field indicates a FALSE. As an example, the **fastConnectRefused** field in the Alerting message is a NULL OPTIONAL. Absence of the field is interpreted as FALSE—Fast Connect is not (yet) refused. Presence of the field, though, clearly indicates refusal of Fast Connect. So why was BOOLEAN not used as the type for this field? It would not have made the encoding any clearer, because the field is past the extension marker (ellipsis). A version 1 and 2 device, for example, would not know to send this field, so there would be three values to consider if BOOLEAN were used: TRUE, FALSE, and *absent*.

Ideally, a field will convey no more values than makes sense. In most cases, these types indicate only two possible values: TRUE/present or FALSE/absent. However, there may be cases where three values are intended and the reader should refer to the appropriate Recommendation to determine if, indeed, there is significance in tri-state fields.

9.2 ASN.1 Usage in H.450-Series Recommendations

This section summarizes the use of ASN.1 in the current H.450.x recommendations. This information is provided for implementers of the H.450.x protocols, as well as authors of new H.450.x Recommendations.

9.2.1 ASN.1 version and encoding rules

The ASN.1 code in H.450.x is based on the 1994 version of X.680-683, including the amendments on "Rules of extensibility".

The basic aligned variant of packed encoding rules (PER) is used as specified in X.691 (1995).

9.2.2 Tagging

All modules defined in Recommendations H.450.x use the tag default AUTOMATIC TAGS.

The ROS APDUs (see below) are defined in H.450.1 as *tagged types* within the CHOICE type ROS. No other type defined in H.450.x is a *tagged type*, i.e. all *sets*, *sequences* and *choices* (except ROS) are automatically tagged.

9.2.3 Basic ASN.1 Types

The following types occur in ASN.1 definitions of H.450.x:

BMPString, NumericString	NULL
BOOLEAN	OBJECT IDENTIFIER
CHOICE	OCTET STRING
CLASS (see below)	Open type (see below)
ENUMERATED	SEQUENCE
GeneralizedTime	SEQUENCE OF
INTEGER	SET OF

No use is currently foreseen for the following basic types (needs consideration on a case-by-case basis):

CHARACTER STRING	ObjectDescriptor	
EMBEDDED PDV	REAL	
EXTERNAL	UTCTime	
GeneralString, GraphicString, PrintableString, TeletexString (T61String), UniversalString, VideotexString, VisibleString (ISO646String)		

Use of the following basic types in future recommendations H.450.x should not be precluded (needs consideration on a case-by-case basis):

BIT STRING	Selection Type (out of a CHOICE)
IA5String	SET
INSTANCE OF	TYPE-IDENTIFIER (see X.681)

Note: Some of these types are already used by other recommendations in the H.323 universe, e.g. BIT STRING and TYPE-IDENTIFIER in H.235.

9.2.4 Value sets, subtyping and constraints used in H.450.x:

H.450.x recommendations use *size constraints* (strings, set-of and sequence-of) and *value range* constraints (integers). In H.450.1 *inner subtyping* ("WITH COMPONENTS") is used occasionally.

The use of *value sets*, *single values*, *contained subtypes* and *permitted alphabets* should be possible if needed by future services. The *type constraint* (for restricting an *open type*) may be useful, too.

Explicit set arithmetic (UNION, INTERSECTION, EXCEPT, ALL EXCEPT) is currently not used on subtype specifications.

9.2.5 Object classes, parameterization, general constraints, and ROS

H.450.1 defines a remote operations service (ROS) based on X.880. ROS uses object classes (X.681), parameterization (X.683) and constraints (X.682) for its generic part.

Two object classes OPERATION and ERROR are defined and then used to define four PDU types (*Invoke, ReturnResult, ReturnError* and *Reject*) as sequences containing individual parts of these classes. The first three PDU types contain an optional *open type* component which is tied by a *table constraint* ("at (@)" notation) to the code value identifying the particular operation or error.

For each supplementary service the actual operations and errors are then defined as *object instances* of the generic classes OPERATION and ERROR in the corresponding Rec. H.450.x. Each operation and error is identified uniquely (within the context of the H.450.x series) by a code value (type INTEGER). A list of currently assigned operation and error values is contained in section 10.8 below.

Each supplementary service defines an *object set* containing all operations defined for that service.

9.2.6 Extensibility and non-standard information

Wherever meaningful, an extension marker (ellipsis "...") is included in the definitions.

All operations, and some errors, include placeholders for non-standard (e.g. manufacturer-specific) information. This non-standard information can either be of type *NonStandardParameter* (imported from H.225.0) or of type *Extension*, which is defined in H.450.1 and consists of an *object identifier* followed by an *open type*. The definition of the Extension type uses an *object class* (EXTENSION) with *parameterization* and *constraints* similar to the ROS definition.

Usually there is space for more than one addition of non-standard information in an operation. Additions of both types (NonStandardParameter and Extension) can be mixed in any order.

9.2.7 List of Operation and Error Codes

Table 10.1: ASN.1 Operation values used in H.450 series

Value number	Value name	Defined in standard:
0	callingName	H.450.8
1	<u>called</u> <u>alerting</u> Name	H.450.8
2	connectedName	H.450.8
