SUMMARY

Implementors' Guide for Recommendation G.722.2

The changes that appear in this document are necessary to correct defects identified with the standard as well as to keep alignment of the text with the related 3GPP Recommendation, as reported and approved at SG 16’s meeting on 15-25 October 2002.

This revision of the document contains a few editorial changes (contacts, misspellings) but added a missing correction to section 3.3 (list of acronyms).

1 Introduction

This document is a compilation of reported defects identified with the 2002 decided edition of ITU-T G.722.2 Recommendation. It must be read in conjunction with the Recommendation to serve as an additional authoritative source of information for implementers. The changes, clarifications and corrections defined herein are expected to be included in future versions of affected G.722.2-series Recommendations.

2 Scope

This guide resolves defects in the following categories:

- editorial errors
- technical errors, such as omissions and inconsistencies
- ambiguities

In addition, the Implementers Guide may include explanatory text found necessary as a result of interpretation difficulties apparent from the defect reports.

This Guide will not address proposed additions, deletions, or modifications to the Recommendations that are not strictly related to implementation difficulties in the above categories. Proposals for new features should be made through contributions to the ITU-T.

3 Defect Resolution Procedure

Upon discovering technical defects with any components of the G.722.2 Recommendation, please provide a written description directly to the editors of the affected Recommendation with a copy to the Q7/16 Rapporteur. Return contact information should also be supplied so a dialogue can be established to resolve the matter and an appropriate reply to the defect report can be conveyed. This defect resolution process is open to anyone interested in Recommendation G.722.2. Formal membership in the ITU is not required to participate in this process.

4 References

This document refers to the following G.722.2 series Recommendations:

- ITU-T Recommendation G.722.2 – Appendix I (2002), Error concealment of erroneous or lost frames

5 Nomenclature

In addition to traditional revision marks, the following marks and symbols are used to indicate to the reader how changes to the text of a Recommendation should be applied:

**Description:** Editorial correction (Add section I.5.2.5)

---

I.5.2.5 High-band gain (for 23.85 kbit/s mode)

When RX_FRAMETYPE = SPEECH_BAD or RX_FRAMETYPE = SPEECH_LOST the received high-band energy parameter of the frame is not used and the estimation for the high-band gain is used instead. This means that in case of bad/lost speech frames, the high-band reconstruction operates in the same way for all the modes.

---
6.1.12 G.722.2 Section 1 and 10

| Description: | 3GPP has reduced the number of mandatory AMR-WB codec modes for the speech telephony service in 3GPP (see COM 16 – D 287). Three active codec sets (Configuration A, B and C) have been defined. This should be observed when interoperability with 3GPP standards-based wireless networks is required. Add sentence to Section 1 with reference to Section 10 and insert new Section 10 (old Section 10 renumbered to Section 11). |

Section 1 (add following sentence after last sentence in section 1):

Section 10 provides information on minimum requirements for support of AMR-WB modes in 3GPP speech telephony service.

Section 3.3 (add the following acronyms):

GERAN        GSM EDGE Radio Access Network
GMSK         Gaussian Modified Shift Keying
O-TCH/F      Octal TCH/Full rate, a 68.4 kbit/s gross bit-rate radio channel of GERAN-8PSK
O-TCH/H      Octal-TCH/Half rate a 32.4 kbit/s gross bit-rate radio channel of GERAN-8PSK
8PSK         8 Phase Shift Keying
TCH          Traffic CHannel (dedicated radio channel for speech or data.)
TCH/F        TCH/Full rate, a 22.8 kbit/s gross bit-rate radio channel of GERAN-GMSK
TCH/H        TCH/Half rate, an 11.4 kbit/s gross bit-rate radio channel of GERAN-GMSK
TFO          Tandem Free Operation (Tandem Free is achieved using in-band signalling after call set-up)
TrFO         Transcoder Free Operation (Tandem Free is achieved using out-of-band signalling before call set-up, the transcoders are in principle not in the communication path)
UTRAN        UMTS Terrestrial Radio Access Network

Section 10 (renumber old section 10 to section 11).

New Section 10 text:
10 Mandatory AMR-WB codec modes for the speech telephony service in 3GPP

This section should be observed when interoperability with 3GPP standards-based wireless networks is required.

To facilitate the implementation of AMR-WB for the circuit switched speech telephony service in 3GPP systems, the number of mandatory AMR-WB codec modes have been reduced to five. This allows for less complexity for the channel coding in terminals and networks. Following modes are used: 23.85, 15.85, 12.65, 8.85 and 6.60 kbit/s. Based on listening test results for the speech telephony service channels, these five modes are considered sufficient for high quality speech telephony service. For other services and applications in 3GPP all the 9 modes remain in use. All 9 source codecs are kept in the 3GPP AMR-WB codec, but the number of modes used for the speech telephony service is just limited to five.

In order to improve interoperability, the allowed AMR-WB codec mode configurations within active codec sets (ACS), i.e., which modes can be configured to be used within the mode adaptation at the same time, were further limited. The following three configurations are allowed: Configuration A (6.60, 8.85, 12.65), Configuration B (6.60, 8.85, 12.65, 15.85) and Configuration C (6.60, 8.85, 12.65, 23.85). This improves Tandem Free Operation / Transcoder Free Operation (TFO/TrFO) interoperability in 3GPP in the various speech service transmission channels because all these configurations are compatible. They contain the same three lower modes. This enables immediate establishment of TFO/TrFO (where double transcoding for calls between mobile terminals is avoided). This restriction for allowed mode configurations also simplifies signalling (e.g. in call set-up and handovers) and also drastically simplifies testing.

Table 14 summarises the requirements for support of AMR-WB mode configurations in 3GPP speech telephony service.

6.1.13 G.722.2 Annex C C-code changes

Description: Following changes to the G.722.2 C-code (v. 5.3.0) have been approved by Q7/16 to produce version 5.5.0. These changes will synchronize the G.722.2 C-code with v. 5.5.0 of the 3GPP AMR-WB C-code. The implementation of the C-code changes contained in this section of the Implementers’ Guide on the current C-code available from the TSB can be found at the following URL (available after the 3GPP TSG-SA approval end of December, 2002):

[End Correction]
6.1.14 Other changes to G.722.2 Annex C C-code

In addition to the above reported, mainly algorithmic changes, the ITU output format for v. 5.5.0 has been implemented as a command line option instead of being under a compilation flag. The ITU output format now also supports the DTX mode.
