CAUTION !

PREPUBLISHED RECOMMENDATION

This prepublication is an unedited version of a recently approved Recommendation. It will be replaced by the published version after editing. Therefore, there will be differences between this prepublication and the published version.

FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU [had/had not] received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at <http://www.itu.int/ITU-T/ipr/>.

New Corrigendum 1 to ITU-T Recommendation T.24

Standardized digitized image set: Clarifications in Table 1

Summary

The images in this Recommendation include the original eight "ITU-T images" (referred to for years as the "CCITT images"), two bi-level test charts, a gray-scale test chart, various screened half-tone images, electronically dithered images, computer-generated images, gray-scale images and color images. The purpose of this image set is to provide a consistent baseline for future work; for example, results of compression algorithm experiments and image quality tests can be compared by a broad range of users, knowing that the input image data is identical.

The specimens reproduced inside the Recommendation in the figures are given for illustration purposes and are not suitable for measurements.

[Corrigendum 1 to Rec. T.24 \(1998\) "Standardized digitized image set" clarifies text in Table 1 with respect to the file sizes of reference test images on a companion CD-ROM.](#)

Introduction

Test images have played an important role throughout the development of Group 3 and Group 4 facsimile. This Recommendation has been prepared with the goal of providing a standard set of images¹ to facsimile experimenters. The set includes images that have been used over the years plus new images that are applicable for gray scale and colour. The standard set of images will provide a consistent baseline for further work; for example, results of compression algorithm experiments and image quality tests can be compared by a broad range of users, knowing that the input image data is identical. The set of images, stored on a Compact Disk Read Only Memory (CD-ROM), is available from the ITU.

¹ The test images reproduced in this Recommendation are not suitable for the tests.

Recommendation T.24

STANDARDIZED DIGITIZED IMAGE SET

(revised in ~~2015~~1998)

Description of the standardized digitized image set²

1 Eight ITU-T reference images

This image set is derived from the eight ITU-T reference pages (commonly known as the "CCITT images"). The eight pages were originally digitized by the French Administration as 200 pels per 25.4 mm and were used in the Group 3 Facsimile algorithm selection process, completed in 1980. The digitized images herein were produced from original-quality copies of the eight ITU-T reference pages, made at the time that the Group 3 compression algorithm studies were being conducted. All of the pages are A4 size, that is 210 mm wide by 297 mm long. The resolutions selected for the scanning process (200, 300, 400 and 600 pels per 25.4 mm) were based on those specified in the Group 3 and Group 4 Recommendations (200, 300 and 400 pels per 25.4 mm) plus 600 pels per 25.4 mm.

The number of pels per line is determined from the resolution and the width of the page. For the A4 page width of 210 mm, a 200 pels per 25.4 mm scan gives 1654 pels per line. The 1654 pel width is not a convenient number for computer-based processing (not divisible by 8). To correct this condition, the charts were scanned to produce the nominal pels per line and lines per image shown in the Group 3 and Group 4 Recommendations. This means that the pages were centered and overscanned. (The chart itself is 210 mm wide, but the scan line is 219.46 mm wide.) The total number of bytes required to store each of the images, as a function of resolution (or sampling density), is shown in Table 1. The eight ITU Reference Documents are illustrated in Figures 1 through 8.

² The specimens reproduced inside the Recommendation in the figures are given for illustration purposes and are not suitable for measurements.

Dr. P.N. Cundall,
Mining Surveys Ltd.,
Holroyd Road,
Reading,
Berks.

Dear Pete,

Permit me to introduce you to the facility of facsimile transmission.

In facsimile a photocell is caused to perform a raster scan over the subject copy. The variations of print density on the document cause the photocell to generate an analogous electrical video signal. This signal is used to modulate a carrier, which is transmitted to a remote destination over a radio or cable communications link.

At the remote terminal, demodulation reconstructs the video signal, which is used to modulate the density of print produced by a printing device. This device is scanning in a raster scan synchronised with that at the transmitting terminal. As a result, a facsimile copy of the subject document is produced.

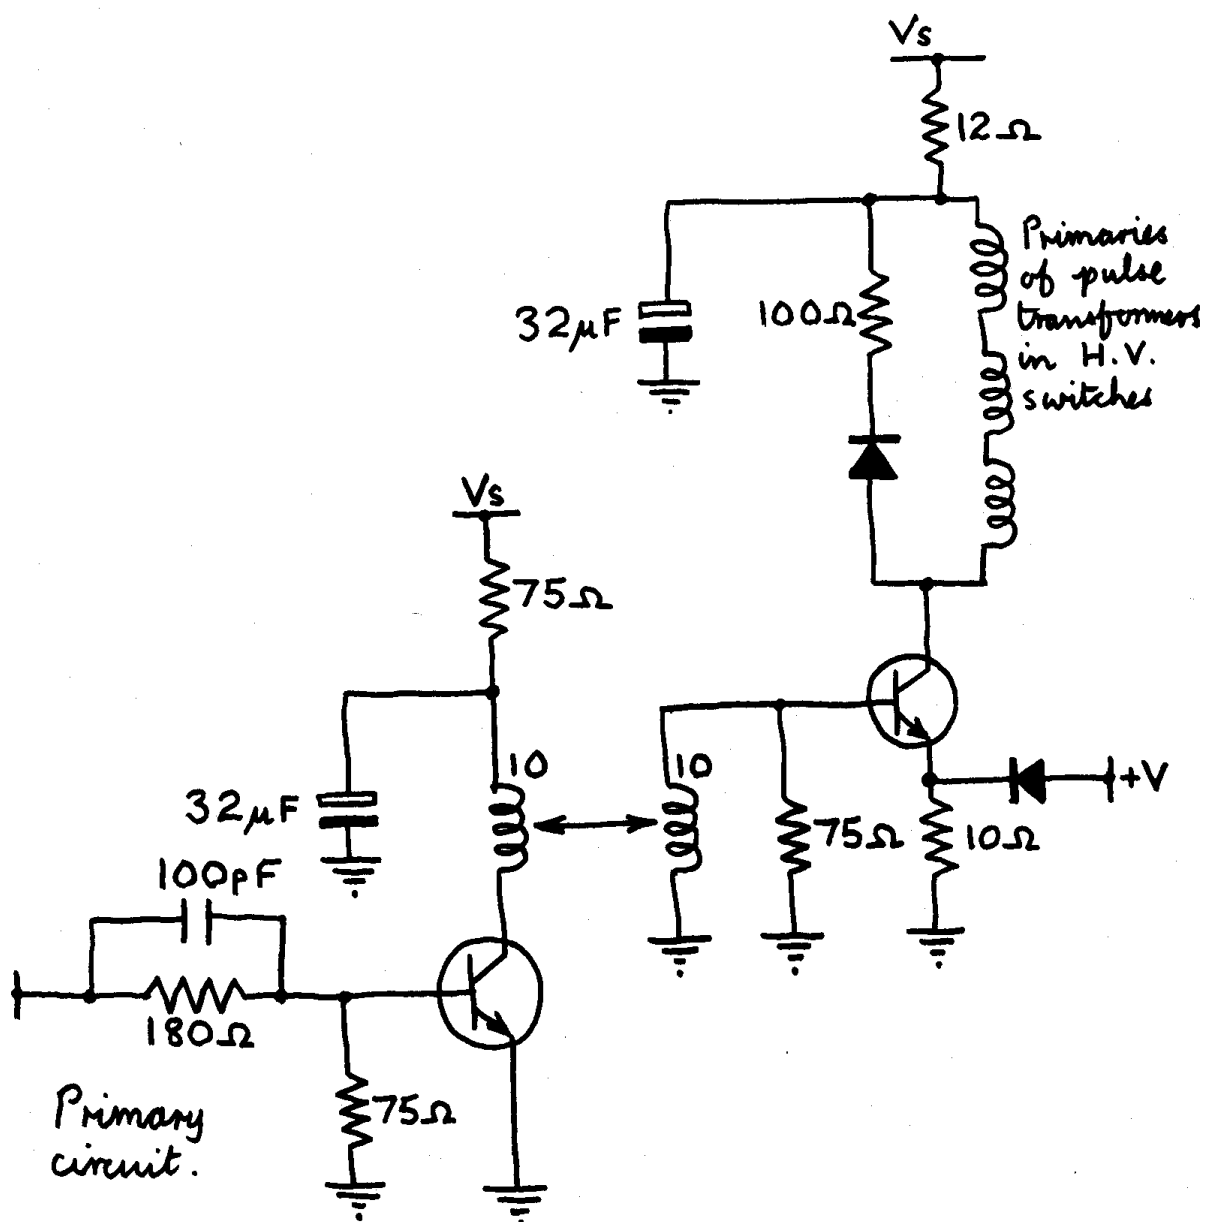

Probably you have uses for this facility in your organisation.

Yours sincerely,

P.J. CROSS

L'ordre de lancement et de réalisation des applications fait l'objet de décisions au plus haut niveau de la Direction Générale des Télécommunications. Il n'est certes pas question de construire ce système intégré "en bloc" mais bien au contraire de procéder par étapes, par paliers successifs. Certaines applications, dont la rentabilité ne pourra être assurée, ne seront pas entreprises. Actuellement, sur trente applications qui ont pu être globalement définies, six en sont au stade de l'exploitation, six autres se sont vu donner la priorité pour leur réalisation.

Chaque application est confiée à un "chef de projet", responsable successivement de sa conception, de son analyse-programmation et de sa mise en oeuvre dans une région-pilote. La généralisation ultérieure de l'application réalisée dans cette région-pilote dépend des résultats obtenus et fait l'objet d'une décision de la Direction Générale. Néanmoins, le chef de projet doit dès le départ considérer que son activité a une vocation nationale donc refuser tout particularisme régional. Il est aidé d'une équipe d'analystes-programmeurs et entouré d'un "groupe de conception" chargé de rédiger le document de "définition des objectifs globaux" puis le "cahier des charges" de l'application, qui sont adressés pour avis à tous les services utilisateurs potentiels et aux chefs de projet des autres applications. Le groupe de conception comprend 6 à 10 personnes représentant les services les plus divers concernés par le projet, et comporte obligatoirement un bon analyste attaché à l'application.

II - L'IMPLANTATION GEOGRAPHIQUE D'UN RESEAU INFORMATIQUE PERFORMANT

L'organisation de l'entreprise française des télécommunications repose sur l'existence de 20 régions. Des calculateurs ont été implantés dans le passé au moins dans toutes les plus importantes. On trouve ainsi des machines Bull Gamma 30 à Lyon et Marseille, des GE 425 à Lille, Bordeaux, Toulouse et Montpellier, un GE 437 à Massy, enfin quelques machines Bull 300 TI à programmes câblés étaient récemment ou sont encore en service dans les régions de Nancy, Nantes, Limoges, Poitiers et Rouen ; ce parc est essentiellement utilisé pour la comptabilité téléphonique.

A l'avenir, si la plupart des fichiers nécessaires aux applications décrites plus haut peuvent être gérés en temps différé, un certain nombre d'entre eux devront nécessairement être accessibles, voire mis à jour en temps réel : parmi ces derniers le fichier commercial des abonnés, le fichier des renseignements, le fichier des circuits, le fichier technique des abonnés contiendront des quantités considérables d'informations.

Le volume total de caractères à gérer en phase finale sur un ordinateur ayant en charge quelques 500 000 abonnés a été estimé à un milliard de caractères au moins. Au moins le tiers des données seront concernées par des traitements en temps réel.

Aucun des calculateurs énumérés plus haut ne permettait d'envisager de tels traitements.

L'intégration progressive de toutes les applications suppose la création d'un support commun pour toutes les informations, une véritable "Banque de données", répartie sur des moyens de traitement nationaux et régionaux, et qui devra rester alimentée, mise à jour en permanence, à partir de la base de l'entreprise, c'est-à-dire les chantiers, les magasins, les guichets des services d'abonnement, les services de personnel etc.

L'étude des différents fichiers a constitué et a donc permis de définir les principales caractéristiques du réseau d'ordinateurs nouveaux à mettre en place pour aborder la réalisation du système informatif. L'obligation de faire appel à des ordinateurs de troisième génération, très puissants et dotés de volumineuses mémoires de masse, a conduit à en réduire substantiellement le nombre.

L'implantation de sept centres de calcul interrégionaux constituera un compromis entre : d'une part le désir de réduire le coût économique de l'ensemble, de faciliter la coordination des équipes d'informaticiens ; et d'autre part le refus de créer des centres trop importants difficiles à gérer et à diriger, et posant des problèmes délicats de sécurité. Le regroupement des traitements relatifs à plusieurs régions sur chacun de ces sept centres permettra de leur donner une taille relativement homogène. Chaque centre "gèrera" environ un million d'abonnés à la fin du VIème Plan.

La mise en place de ces centres a débuté au début de l'année 1971 : un ordinateur IRIS 50 de la Compagnie Internationale pour l'Informatique a été installé à Toulouse en février ; la même machine vient d'être mise en service au centre de calcul interrégional de Bordeaux.

Figure 4/T.24 – Document No. 4 – French Text

Cela est d'autant plus valable que $T\Delta f$ est plus grand. A cet égard la figure 2 représente la vraie courbe donnant $|\phi(f)|$ en fonction de f pour les valeurs numériques indiquées page précédente.

FIG. 2

Dans ce cas, le filtre adapté pourra être constitué, conformément à la figure 3, par la cascade :

— d'un filtre passe-bande de transfert unité pour $f_0 \leq f \leq f_0 + \Delta f$ et de transfert quasi nul pour $f < f_0$ et $f > f_0 + \Delta f$, filtre ne modifiant pas la phase des composants le traversant ;

FIG. 3

— filtre suivi d'une ligne à retard (LAR) dispersive ayant un temps de propagation de groupe T_R décroissant linéairement avec la fréquence f suivant l'expression :

$$T_R = T_0 + (f_0 - f) \frac{T}{\Delta f} \quad (\text{avec } T_0 > T)$$

(voir fig. 4).

FIG. 4

telle ligne à retard est donnée par :

$$\varphi = -2\pi \int_0^f T_R df$$

$$\varphi = -2\pi \left[T_0 + \frac{f_0 T}{\Delta f} \right] f + \pi \frac{T}{\Delta f} f^2$$

Et cette phase est bien l'opposé de $\phi(f)$,

à un déphasage constant près (sans importance) et à un retard T_0 près (inévitables).

Un signal utile $S(t)$ traversant un tel filtre adapté donne à la sortie (à un retard T_0 près et à un déphasage près de la porteuse) un signal dont la transformée de Fourier est réelle, constante entre f_0 et $f_0 + \Delta f$, et nulle de part et d'autre de f_0 et de $f_0 + \Delta f$, c'est-à-dire un signal de fréquence porteuse $f_0 + \Delta f/2$ et dont l'enveloppe a la forme indiquée à la figure 5, où l'on a représenté simultanément le signal $S(t)$ et le signal $S_1(t)$ correspondant obtenu à la sortie du filtre adapté. On comprend le nom de récepteur à compression d'impulsion donné à ce genre de filtre adapté : la « largeur » (à 3 dB) du signal comprimé étant égale à $1/\Delta f$, le rapport de compression

$$\text{est de } \frac{T}{1/\Delta f} = T\Delta f$$

FIG. 5

On saisit physiquement le phénomène de compression en réalisant que lorsque le signal $S(t)$ entre dans la ligne à retard (LAR) la fréquence qui entre la première à l'instant 0 est la fréquence basse f_0 , qui met un temps T_0 pour traverser. La fréquence f entre à l'instant $t = (f - f_0) \frac{T}{\Delta f}$ et elle met un temps

$T_0 - (f - f_0) \frac{T}{\Delta f}$ pour traverser, ce qui la fait ressortir à l'instant T_0 également. Ainsi donc, le signal $S(t)$

CCITTの概要

沿革

CCITTは、国際電気通信連合（ITU）の四つの常設機関（事務総局、国際周波数登録委員会、CCIR、CCITT）の一つとして、ITUの中でも、世界の国際通信上の諸問題を真先に取上げ、その解決方法を見出して行く重要な機関である。日本名は、国際電信電話諮問委員会と称する。

CCITTの前身は、CCIF（国際電話諮問委員会）とCCIT（国際電信諮問委員会）である。CCIFは、1924年にヨーロッパに「国際長距離電話通信諮問委員会」が設置され、これが1925年のパリ電信電話会議のとき、正式に、「国際電話諮問委員会」として万国電信連合の公式機関となったものである。CCITは、同じく1925年の会議のとき、CCIFと併立するものとして設置された。

そして、CCIFは、1956年の12月に第18回総会が開催されたのち、CCITは、同年同月に第8回総会が開催されたのち、併合されて現在のCCITTとなった。このCCITTは、CCIFとCCITが解散した直後、第1回総会を開催し、第2回総会は、1960年にニューデリーで、第3回総会は、1964年、ジュネーブで、第4回総会は、1968年、アルゼンチンで開催された。

CCIFとCCITが合併したのは、有線電気通信の分野、とくに伝送路について電信回線と電話回線とを技術的に分ける意味がなくなってきたこと、各国とも大體において、電信部門と電話部門は同一組織内にあること、CCIFの事務局とCCITの事務局の合併による効率増進等がおもな理由であった。

CCITTは、上述のように、ヨーロッパ内の国々によって、ヨーロッパ内の電信・電話の技術・運用・料金の基準を定め、あるいは統一をはかっていたので、現在でも、その影響を受け、会合参加国は、ヨーロッパの国が多く、ヨーロッパで生起する問題の研究が多い。たとえば、1960年のCCITT勧告の中で、技術上配慮する距離は約2,500 kmであったが、これはヨーロッパ内領域を想定したものである。

しかしながら、1956年9月に敷設された大西洋横断電話ケーブルは、大陸間電話通信の自動化および半自動化への技術的可能性を与え、CCITTがこの問題を取り上げるに及び、CCITTの性格は漸次、汎世界的色彩を実質的に帯びるに至った。この汎世界的性格は第2次世界大戦後目まじしくなったアジア・アフリカ植民地の独立に伴ってITUの構成員の中にこれらの国が加わり、ITUの中に新しい意見が導入されたことにも起因して、技術面、政治面の双方から導入されてき

た。CCITTの汎世界化は、1960年の第2回総会がニューデリーで開催されたことにもあらわれている。この総会までは、CCIT、CCIFのいずれにしろ、アメリカやアジアで総会が開催されることがなく、CCITT委員長も、ニューデリー総会の準備文書で、この点には注目すべきであるとのべている。

任務

ITUは、全権委員会、主管庁会議を始めとして、七つの機関をもち、それぞれの機関の権限と任務は国際電気通信条約に明記されている。そこで条約を参照してみるならば、CCITTの任務は、つぎのとおりとなっている。

「国際電信電話諮問委員会（CCITT）は、電信および電話に関する技術、運用および料金の問題について研究し、および意見を表明することを任務とする。」（1965年モントルー条約第187号）

「各国国際諮問委員会は、その任務の遂行に当たって、新しい国または発展の途上にある国における地域および国際的分野にわたる電気通信の創設、発達および改善に直接関連のある問題について研究し、および意見を作成するように妥当な注意を払わなければならない。」（同第188号）

「各国国際諮問委員会は、また、関係国の要請に基づき、その国内電気通信の問題について研究し、かつ、勧告を行なうことができる。」（同第189号）

上記第187号と第188号にいわゆる「意見」とは、フランス語の *avis* から訳したもので、英語では、「勧告（Recommendation）」となっている。CCITTの表明する意見は、国際法的には強制力をもたないものであって、この点が、条約、電信規則、電話規則等各国を拘束する力をもっているものと異なる。もつとも意見とは称しても、技術的分野では、電信規則のごとき、各国政府が承認してその内容を実施する強制規則をもたないもので、実際にある機器の仕様を定める場合には、多くの国の意見が統一されたこの「意見」に従わなければ、円滑な国際通信を行なうことができない場合が多い。この意見（または勧告）は、国際通信を行なう場合各国が直面する問題について、具体的意見を表明するもので、たとえば、大陸間ケーブルで大陸間通話を半自動化しようとする場合、その信号方式や取り扱う通話の種類および料金は、どのようにするかを研究して意見を表明する。したがって、CCITTの活動は、つねに時代の最先端を行くもので、CCITTの活動方向は、そのまま世界の国際通信の活動方向であるともいえる。

この意見は、また、電信規則以下その他の規則のごとき、数年以上の間隔をもつて開催される主管庁会議というような大会議の決定をまたなくとも表明することができ、また、その改正も容易であるので、現在のように進歩の早い国際通信界では、関係国の意見を統一した国際的見解としては非常に便利である。

Figure 7/T.24 – Document No. 7 – Kanji

memorandum

FROM: A.P. Spriggs Research	TO: G.V. Smith Project Planning
TEL: EXTN: 2041	DATE: 1-9-71

We know that, where possible, data is reduced to alphanumeric form for transmission by communication systems. However, this can be expensive, and also some data must remain in graphic form. For example, we cannot key-punch an engineering drawing or weather map. I think we should realise that high speed facsimile transmissions are needed to overcome our problems in official graphic data communication. We need research into graphics data compression.

Any comments?

Albert

WELL, WE ASKED FOR IT!

Figure 8/T.24 – Document No. 8 – Handwritten Memorandum

2 T.22 Test Chart No. 4 – Black-White Facsimile Test Chart BW01

This bi-level image is the digitization (at 400 pels per inch) of the high-contrast black/white chart that is one of two charts that make up T.22 (see Figure 9 and Table 2). Figure 9 contains text in a variety of languages, fonts and pitches, and various test patterns.

Figure 10/T.24 – Half-tone Facsimile Test Chart

4 Bi-level Half-tones

Figure 11 through Figure 17 display bi-level half-tone images (see Table 4). Figures 11, 12, 13 and 14 show dithered sailboat images. The four sailboat images were made by processing a gray-scale sailboat image with four different algorithms: The processing included 8×8 dithering for Figure 11, error diffusion for Figure 12, 4×4 dithering for Figure 13 and 3×3 dithering for Figure 14.

Figure 15 is a composite of the house with sky image. Starting in clockwise order from the upper left, the dither patterns are ordered 4×4 , random dithering, ordered 8×8 and clump dithering.

Figure 16 combines a screened half-tone image and an electronically scanned text that has been inverted. Both the text and the image portion of the document were extracted from a magazine.

Figure 17 is a composite of electronically scanned segments of magazine pages. It includes a half-tone, text and inverted text.

Figure 20/T.24 – House with Sky

7 T.23 Test Chart No. 6 – 4-Color Printing Facsimile Test Chart 4CP01

This set of images comes from the facsimile color test chart (see Figure 21 and Table 6).

The toys photo shows higher sharpness for fine detail in the stuffed animals and the faces, and provides a range of textures and patterns. The presence of both bright and pastel colors provide widespread variations in luminance, hue and saturation. In addition, the image is rich in slowly varying color textures mixed with sharp color boundaries.

The computer-generated simulation of spheres image exhibits shadings for a 3-dimensional effect. It shows various-sized differently-colored spheres on a black background. It provides a wide range of color shadings with distinct edges. In general, each sphere is one color, shaded to give a 3-dimensional appearance. The gradual transition in color of each sphere's shading provides an excellent medium for discerning possible contouring effects. If contouring is present, it will usually manifest itself as a series of concentric circles with slightly different colors. The spheres' edges also provide sharp boundaries against both the background and other spheres.

The graphics image is from a magazine cover and exhibits a 3-dimensional effect. It uses pastel colors to denote surfaces and fine black lines to enhance details. It contains a number of repetitive patterns coupled with sharp boundaries between various colors.

9 Color Images (CMYK color space)

This set is made up of four color images in the CMYK color space (see Figures 24, 25, 26 and 27 and Table 8).

Table 8/T.24 – CMYK Images

Filename	Source	Image description	Color space	Bits per component	Image dimensions Pixels (W × H)	File size (Bytes)
BIKE	SCID	N5 "Bike"	CMYK	8	2048 × 2560	20 972 544
WOMAN	SCID	N1 "Portrait"	CMYK	8	2048 × 2560	20 972 544
CAFE	SCID	N2 "Cafe"	CMYK	8	2048 × 2560	20 972 544
TOOLS	Crosfield drum scan	Tools	CMYK	8	1524 × 1200	7 315 854

Figure 27/T.24 – CMYK Image: Tools

10 Color Images (RGB color space)

This set includes three images created with digital camera and two compound images, all in the RGB color space (see Figures 28, 29, 30, 31 and 32 and Table 9). The compound images consist of text with an embedded photograph.

Table 9/T.24 – RGB Images

Filename	Source	Image description	Color space	Bits per component	Image dimensions pixels (W × H)	File size (Bytes)
BIKE3	Crosfield digital camera	Motorcycle	RGB	8	781 × 919	2 153 821
WATER	PhotoCD	Water	RGB	8	2048 × 3072	18 899 574
CATS	PhotoCD	Cats	RGB	8	2048 × 3072	18 899 568
CMPND1	Computer generated	Text on photo	RGB	8	512 × 768	1 179 892

Figure 30/T.24 – RGB Image: Cats

Dear Pam,

I was delighted to hear from you last week. Patti and I had a wonderful time during our week-long summer vacation. The weather was excellent, and the food was absolutely exquisite. I hope that we can repeat this next year and that you will join us too.

We came back with a lot of fantastic memories, which we would like to share with you through some snapshots that we took.

Our favorite is this picture of us aboard the "Top Hat", which I have pasted into this letter using some really neat advanced digital imaging technology on my home computer. We will ship the rest to you on a CD-ROM soon. Wishing you the best.

Love,

Susan

Figure 31/T.24 – RGB Image: Text on photo

January 31, 2001

Dear Mom and Dad,

How are both of you doing? I thought I would drop a line to say hi. Fanny, little Danny, and I are doing well. As you can see by the picture, little Danny isn't quite so little! Isn't this letter really great! I took a picture of Danny that was on a Kodak PhotoCD, and I merged it onto this letter using my computer. I then printed the letter using a color inkjet printer I just bought...

Danny's wearing the gorgeous BLUE sweater you gave him last time you were visiting. It just brings out the RED in his lips and cheeks. He definitely gets his good looks from his mother!

Take care of yourselves and write soon.

Love,

Michael

11 Fingerprint and Medical Images (Gray scale)

This set includes a scanned fingerprint at eight bits per component, and five medical images at various pixel depths from eight to twelve bits per components (see Figures 33, 34, 35, 36, 37 and 38 and Table 10).

Table 10/T.24 – Gray-scale Medical Images

Filename	Source	Image description	Color space	Bits per component	Image dimensions pixels (W × H)	File size (Bytes)

APPENDIX I

Black/White Pixel Counts

The black/white pixel counts for all of the bi-level images in Recommendation T.24 are summarized in Table I.1. For each bi-level image and its corresponding resolution(s), information is included on the image dimensions (in pixel units), the size of the raw image data (in bytes), the black and white pixel counts, and the percentage of the image which is colored black and white

Table I.1/T.24 – Black/White Pixel Counts

APPENDIX II

Sun Raster Image Format

The Sun Raster image file format is the native bitmap format of the Sun Microsystems UNIX platforms that use the SunOs operation system. This format can store black/white, gray-scale and color bitmapped images of any pixel depth. Optionally the use of color maps and simple run-length compression are also supported. Most UNIX imaging applications support this format.

The Sun Raster file is organized as a header, followed by an optional color map, and then by the bitmapped image data. The header is 32 bytes long and has the following format:

```
typedef struct SunRaster
{
    DWORD MagicNumber           /*Magic number */
    DWORD Width;                /*Width of the image in pixels*/
    DWORD Height;               /*Height of the image in pixels*/
    DWORD Depth;                /*Number of bits per pixel*/
    DWORD Length;               /* Size of image in bytes */
    DWORD Type                  /* Type of raster file */
    DWORD ColorMapType;         /*Type of color map*/
    DWORD ColorMapLength        /*Size of the color map in bytes*/
};
```

Magic number identifies the file as a Sun Raster image, and always contains the value 59A66A95h (hexadecimal). Besides identifying the format, the magic number provides a check that the bytes in the file are being read in the proper order.

Width and height specify the size of the image in pixels. The width of a scan line is always a multiple of 16 bits, padded when necessary.

Depth is the number of bits per pixel of the image data.

Length is the size of the bitmapped image data in the bitmap file in bytes, (not including the color map and header).

Type is the version of the bitmapped file.

ColorMapType indicates the type of color map included in the file if any, and ColorMapLength contains the number of bytes stored in the color map

For further information contact:

Sun Microsystems Inc.
2550 Garcia Avenue
Mountain View, CA 94043

There are also a number of publicly available UNIX-based image file viewers that support the Sun Raster format.
