Recommendation F.40

Geneva, 1991

FOREWORD

The CCITT (the International Telegraph and Telephone Consultative Committee) is a permanent organ of the International Telecommunication Union (ITU). CCITT is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The Plenary Assembly of CCITT which meets every four years, establishes the topics for study and approves Recommendations prepared by its Study Groups. The approval of Recommendations by the members of CCITT between Plenary Assemblies is covered by the procedure laid down in CCITT Resolution No. 2 (Melbourne, 1988).

Recommendation F.40 was prepared by Study Group I and was approved under the Resolution No. 2 procedure on the 11 of March 1991.

CCITT NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication Administration and a recognized private operating agency.

Recommendation F.40

INTERNATIONAL PUBLIC TELEMESAGE SERVICE

1 Introduction

1.1 Scope

1.1.1 Administrations providing the international public telemesage service as a form of telecommunication in accordance with Article 4.3 c) of the International Telecommunication Regulations (Melbourne, 1988) should explicitly agree to this on the basis of this Recommendation, which contains the relevant operational provisions.

1.1.2 The international public telemesage service may operate in parallel with, or as an alternative to, the international public telegram service. The international public telemesage service shall provide the capability of operating in conjunction with the international public telegram service in those cases where it is used as an alternative to the international public telegram service.

1.1.3 The tariff principles for the international public telemesage service are laid down in Recommendation D.45.

1.1.4 While this Recommendation implies an implementation related to the long established message retransmission system defined in Recommendation F.31 the telemesage service is not restricted to the F.31 based techniques.

1.2 Service definitions

1.2.1 telemesage service

An international public service provided to enable the transmission of character-coded messages input electronically on national public telecommunication networks or by other means for physical delivery by a postal service (or equivalent) in the destination country, normally on the next working/business day.

1.2.2 telemesage

Document printed in letter style preferably including the printing of capital and small letters and delivered in a distinctive envelope designed for use with the service. A telemesage includes the address of the recipient and, where possible of the sender.

1.2.3 telemesage switching centre

A unit used to automatically switch international and/or national telemesage traffic.

1.2.4 national telemesage input centre

An office used for accepting telemessages.

1.2.5 national telemesage distribution office

An office used for the printing and enveloping of telemessages for subsequent entry into the mail network (or equivalent).

1.2.6 printing station

Equipment used to print messages in the national telemessages distribution office. The printing station shall be capable of accepting a minimum of 69 printing characters (including spaces) per line.

1.3 *General operating principles*

The telemessage service is made up of the following elements.

1.3.1 *Processing/switching*

1.3.1.1 Once the telemessage has entered the telemessage switching centre, it may be processed to ensure speed and code compatibility, then queued for switching to another point in the network or for onward transmission internationally.

1.3.2 *Transmission*

1.3.2.1 The telemessage switching centres are connected internationally as outlined in § 4.

1.3.3 *National distribution and delivery*

1.3.3.1 Telemessages are printed locally in national telemessage distribution offices, which are located to meet the quality of service criteria (see § 6). Final delivery is achieved by the ordinary mail service or other means of physical delivery.

2 **Acceptance of telemessages**

2.1 Individual Administrations will decide what methods national customers may use to lodge telemessages. However, in principle it is expected that telemessages would normally be accepted via a wide range of national subscriber service, such as telephone (including public payphones), telex, teletex, telefax, videotex and by computer inputs.

2.2 In the basic service, the characters used in composing telemessages may initially be restricted to those available in the telegram service (Recommendations F.1, A.16 to A.18) i.e. International Telegraph Alphabet No. 2 (ITA2). Nevertheless, noting the ability to preserve the distinction between capital and small letters in ITA2 where the method of lodgement permits, customers should be encouraged to use capital and small letters, so that in the preferred case where the method of international transmission also allows it, this distinction will be preserved for delivery at destination (national matter).

2.3 In relations where appropriate bilateral agreements exist, the following more extensive character sets should be used in lodging telemessages:

- a) the international reference version of International Alphabet No. 5 (IA5) defined in Recommendation T.50;
- b) the Teletex basic repertoire of graphic characters defined in Recommendation T.61.

2.4 The text and the signature of a telemessage may be written in any language.

3 **Telemessage switching centres**

3.1 A telemessage switching centre shall, in the basic service, conform to the requirements of a telegram retransmission centre as defined in Recommendation F.31 except where otherwise specified by this Recommendation.

3.2 A telemessage switching centre must be capable of switching ITA2 as described in § 2.2 above.

4 **International network requirements**

4.1 The telemessage service may utilize by bilateral agreement:

- i) dedicated circuits between telemessage switching centres; and/or
- ii) a public data transmission network; and/or
- iii) the public switched telephone network (or circuits allocated for DATEL services); and/or
- iv) any other network e.g. telex or Gentex.

4.2 Coding of the character sets permitted in §§ 2.2 and 2.3 above shall be in accordance with Recommendations S.1, S.2 (ITA2), T.50 (IA5 IRV), T.61 (Teletex), or others as appropriate.

In these cases the teletext centres can be interconnected in accordance with the Message Handling service, Recommendation X.400-Series, or other protocols by bilateral agreement.

4.3 In the case of transmission in ITA2, distinction between capital and small letters should be retained wherever possible using the coding convention defined for this purpose in Recommendation S.2. This implies that teletext switching centres (including transit centres) should not delete possible superfluous shift characters, although this is permissible if three or more of them appear in succession.

4.4 The international connection between switching centres may, by bilateral agreement, operate at any modulation rate.

5 Format

5.1 General

5.1.1 In the basic service, teletexts shall be transmitted in a format in conformance with Recommendation F.31 (Telegram retransmission system), except that the specific provisions below shall apply. Format examples in ITA2 and IA5 are given at Annex A.

5.2 Message header

5.2.1 The pilot line shall include, apart from the destination and origin indicators as specified in Recommendation F.1 and the number of actual words, the priority indicator C and the tariff indicator T.

5.2.2 The actual word count shall include all the words in the text, the signature (if any) and the sender's address (if any). Consequently, the delivery address and the service indication line (if any) are excluded.

5.2.3 The preamble line shall include the office of origin (as specified in Recommendation F.1), the actual word count, date and legal time of acceptance.

5.3 Address part

5.3.1 Service indications

In relations where the telegram and teletext services share common facilities, the first line of the address part shall begin with the service indication TELEMESSAGE¹⁾. The only optional service indication is LXx which designates de luxe cards (see § 9.1). This indication has to be separated by a space character from the indication TELEMESSAGE.

5.3.2 Postal address

5.3.2.1 The postal address must include all reasonable requirements for delivery without any enquiries in the destination country. Wherever possible the postal code should be included. In some cases a country code may be added to the postal code. Even where this is not the case, the destination country should not be shown in the address.

5.3.2.2 The postal address will be composed preferably of six lines of up to 30 printing/spacing characters each. In some cases (e.g. in relations where the telegram and teletext services share common facilities) a postal address of five lines of up to 43 characters each shall be accepted.

5.3.2.3 The last line, or at most the last two lines, of the address will be used in many cases to switch the teletext to the appropriate national distribution office. Accordingly, it (or they) shall consist of the following elements:

¹⁾ The word "TELEMESSAGE" may not be printed (national matter).

- wherever possible the postal code (which may contain letters and/or figures in any order);
- the name of the town or city in a form acceptable to the destination country, which may accept more than one version (e.g. LONDON, LONDRES);
- the name (*or an accepted abbreviation*) of the state, province or county (if applicable).

5.3.2.4 The position of the postal code should be in accordance with the requirements of the destination country.

5.3.2.5 Where practicable and convenient, the town or city name should also appear in the last line of the address, preceding the state/province/county name. Otherwise it should be given on its own in the second last line of the address.

5.3.2.6 The relevant list of telegraph offices may be consulted when composing the address.

5.4 *The text and signature*

5.4.1 The text and signature (if any) of any one teletext shall not exceed 35 lines, including blank lines for paragraphing and separating the signature from the text. The number of text and signature (if any) lines can exceed 35 by bilateral agreement. Each line may consist of a maximum of 69 printing/spacing characters with an option, by bilateral agreement, for 80 characters maximum providing service is not via a transit centre.

5.4.2 The text may be freely formatted, e.g. it may include columns, separate paragraphs, etc., as might be expected in a conventional letter. In principle the text shall be transmitted in the precise format accepted from the customer.

5.5 *The sender's address*

5.5.1 The sender's address, while not obligatory, should normally follow the signature and should consist of a maximum of six lines of up to 30 printing/spacing characters each (the inclusion of the sender's address may facilitate possible service action).

5.5.2 The last line of the sender's address should be the internationally recognized name (or abbreviation) of the country of origin.

5.5.3 There may be an option for the date and legal time of acceptance in the country of origin to be added by the accepting Administrations on a separate line.

6 **Transmission and delivery**

6.1 International teletexts should be transmitted to the teletext switching centre in the destination country within two hours of acceptance.

6.2 The location of national teletext distribution offices should be arranged to ensure that at least 95% of sufficiently addressed messages received in the destination country by 1600 hours legal time (at the destination town or locality) will be delivered on the next working/business day.

6.3 In view of § 6.2, customers may be advised that, as a general rule, teletexts received by 1600 hours at the destination will be delivered on the next working/business day. Customers will need to take due account of any time zone differences and public holidays in the destination country. It should also be noted that, while every effort will be taken to achieve "next working day" delivery, this is not always possible for remote or sparsely populated regions, nor can any guarantee of delivery time be given in the international teletext service.

7 **Servicing procedures**

7.1 *Non-delivery*

7.1.1 If a teletext cannot be delivered by the postal service in the destination country, due to an incorrect address, insufficient address, addressee moved, etc., the teletext should be forwarded to the international teletext switching centre in the destination country.

7.1.2 When one or more telemessages are returned to that centre by the postal service, the centre shall advise the outgoing centre of the origin country. This advice should consist of a report generated each working day listing all undelivered returned telemessages and, where possible, a brief reason for nondelivery²⁾. The recommended format is to quote in one line per message, the date of acceptance, channel sequence number and the reason for non-delivery in plain language (e.g. addressee moved).

7.2 *Check of word count*

7.2.1 No systematic check of actual word count need be performed on reception. Nevertheless, when a gross error is detected, normal service procedures in accordance with Recommendation F.1 may be used.

8 **Archives**

8.1 It should be possible for a telemessage to be retransmitted at the request of a destination or transit centre for a minimum period of seven days after the initial transmission.

8.2 All outgoing messages should be stored in telemessaging switching centres for a minimum period of three months to meet the requirement in Recommendation D.45, § 4.2 on justifying a refund for non-delivery. Nevertheless, to minimize operator involvement, investigations into non-delivery should be avoided as a general principle.

8.3 Essential accounting information shall be held in archives for a minimum period of six months counted from the month after that in which the telemessaging was handed in. This information shall include:

- a) the numbering line;
- b) the office of origin;
- c) date and time of acceptance;
- d) brief identification of the address (e.g. addressee's name and country);
- e) outgoing route if necessary;
- f) time of transmission.

9 **Facilities**

9.1 *Greetings/deluxe messages*

9.1.1 As an optional service, telemessages may be delivered with a greetings/deluxe card, preferably in a range of designs to suit a number of different occasions. The first line of the address part shall contain the service indication LXX. Values of x are listed below.

When a choice is offered the following range of card types and indications is suggested, although it may be extended or modified. Specific designs chosen are the responsibility of the destination Administration.

- 11 General Greetings
- 22 Weddings
- 33 Adult Greetings
- 44 Child Greetings
- 55 Birth
- 66 Condolences

9.1.2 Any translation of the card indication necessary in the country of destination to effect delivery shall be performed by the terminal telemessaging switching centre.

²⁾ When no undelivered telemessages are returned no report shall be generated.

9.1.3 If the requested deluxe card is not available in the country of destination, it should normally be substituted by the general greetings card, with the possible exception when 66 (Condolences) has been requested.

9.1.4 Administrations that do not admit GREETINGS/DELUXE messages listed in § 9.1.1 must let them pass in transit except in the case of suspension of service provided for in Article 20 of the Convention (Nairobi, 1982).

9.2 *Cancellation*

The facility to cancel a telemessage after it has been accepted is not offered.
