Recommendation ITU-T P.1204

Video quality assessment of streaming services over reliable transport for resolutions up to 4K

Summary

Recommendation ITU-T P.1204 is the introductory document for a set of documents that describe model algorithms for monitoring the video quality for streaming using reliable transport (e.g., adaptive streaming based on the hypertext transfer protocol (HTTP) over the transmission control protocol (TCP), quick user datagram protocol internet connections (QUIC)).

The ITU-T P.1204 series of Recommendations comprises different variants of models for sequence-related (between 5 and 10 s) and per-1-second video-quality estimation. The variants differ in the type of input information they use: bitstream based, pixel based, and hybrid (using both bitstream and pixel information).

In principle, the per-1-second outputs of these video-quality models can be used together with an audio-quality model for integration into audiovisual quality and, together with information about initial loading delay and media playout stalling events, further into a final per-session model output, an estimate of integral per-session quality (see e.g., ITU-T P.1203, ITU-T P.1203.2, ITU-T P.1203.3).

Recommendation ITU-T P.1204 was developed in collaboration with the Video Quality Experts Group (VQEG).

The structure of the set of Recommendations reflects the different functionality of modules described in each document:

- ITU-T P.1204 (2020), Video quality assessment of streaming services over reliable transport for resolutions up to 4K.
- ITU-T P.1204.1, Video quality assessment of streaming services over reliable transport for resolutions up to 4K with access to transport information (in development)
- ITU-T P.1204.2, Video quality assessment of streaming services over reliable transport for resolutions up to 4K with access to video frame information (in development)
- ITU-T P.1204.3 (2020), Video quality assessment of streaming services over reliable transport for resolutions up to 4K with access to full bitstream information.
- ITU-T P.1204.4 (2020), Video quality assessment of streaming services over reliable transport for resolutions up to 4K with access to full and reduced reference pixel information.
- ITU-T P.1204.5 (2020), Video quality assessment of streaming services over reliable transport for resolutions up to 4K with access to transport and received pixel information.

The ITU-T P.1204-series of Recommendations addresses three application areas, which are respectively indicated in the module-related ITU-T P.1204.1, ITU-T P.1204.2, ITU-T P.1204.3, ITU-T P.1204.4 and ITU-T P.1204.5:

- large-screen presentation as with fixed-network video streaming;
- mobile streaming on handheld devices such as smartphones;
- presentation on tablet-type devices.

FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g.,, interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at http://www.itu.int/ITU-T/ipr/.

Recommendation ITU-T P.1204

Video quality assessment of streaming services over reliable transport for resolutions up to 4K

1 Scope

This Recommendation describes a set of objective video quality assessment modules that together with audio and integration modules can be used to form a complete model to predict the impact of audio and video media encodings and observed Internet protocol (IP) network impairments on quality experienced by the end-user in multimedia streaming applications. The streaming techniques addressed comprise progressive download as well as adaptive streaming, for both mobile and fixed network streaming applications. The video quality modules can also be used stand-alone as a video quality prediction model.

Five model types are defined to cover a range of use-cases, from monitoring bitstreams where the video payload is fully encrypted, unencrypted bitstreams, and where deep packet inspection is possible, or where the bitstream is available at the encoding premises, up to measurement using pixel information available e.g., from the client side. The models thus have a wide range of application, from encoding optimization over client-side quality of experience (QoE) assessment to network or service optimization, or benchmarking purposes. The models in the ITU-T P.1204 series of Recommendations are bitstream based, pixel based and hybrid based.

The models described here are applicable to progressive download and adaptive streaming or other streaming applications with reliable transport, where the quality experienced by the end user is affected by video degradations due to coding, spatial re-scaling or variations in video frame rates. Quality assessment of adaptive streaming includes aspects of media adaptation, which may be handled in integration modules such as [ITU-T P.1203.3], and not in the video modules. This Recommendation is able to handle various video codecs (i.e., H.264, H.265 high-efficiency video coding (HEVC), video payload type 9 (VP9), resolutions up to 4K or ultra-high definition-1 (UHD-1) and frame rates of up to 60 frames/s. The video-quality module Pv of [b-ITU-T P.1203], i.e., [ITU-T P.1203.1], only addresses ITU-T H.264 and full high definition (HD) with up to 30 frames/s.

The models predict a mean opinion score (MOS) on a five-point absolute category rating (ACR) scale (see [ITU-T P.910]) as an overall video quality MOS (5 to 10 s). In addition to the overall quality score, the video quality models produce a per-one-second quality score, suitable for diagnostics or integration into an integral quality score for longer sessions (cf. e.g., [ITU-T P.1203.3] for 1 to 5 min duration sessions).

The models associated with this Recommendation cannot provide a comprehensive evaluation of the video quality as perceived by an *individual end-user* because the scores reflect the perceived impairments due to coded video media data being transmitted over an IP connection with a certain performance and do not include a specific terminal device or user-specific information. The scores predicted by such a general quality model necessarily reflect *average perceptual quality*.

Effects due to source generations, such as signal noise, video shake, certain colour properties (and other similar video factors), as well as other impairments related to the payload, are not reflected in the scores computed by this model.

As a consequence, this Recommendation can be used for applications such as the following.

- In-service quality monitoring for specific IP-based audiovisual services, as specified in more detail in clause 6.1.
- Performance and quality assessment of live networks (including video encoding) considering the effect due to encoding bitrate, encoding resolution, and encoding frame rate.

- Laboratory testing of video systems.
- Benchmarking of different service implementations.
- Benchmarking of different encoder implementations. Note that only the full/reduced reference pixel-based model type can be used for direct benchmarking of this type.
- Evaluation of transcoding solutions.

In particular, targeted applications are progressive download streaming and adaptive streaming (using reliable transport), which includes the following.

- Over-the-top (OTT) services, as well as operator-managed video services (over the TCP).
- Video over both mobile and fixed connections.
- The streaming protocols HTTP live streaming (HLS) or dynamic adaptive streaming over HTTP (DASH) used with the hypertext transfer protocol (HTTP) or HTTP2 over TCP/IP or quick user datagram protocol internet connections (QUIC), or real-time messaging protocol (RTMP) over TCP/IP). Note that the model is agnostic to the specific application or transport layer protocol, with the exception that it assumes reliable delivery of video packets.
- Video services typically using container formats based on the ISO/IEC base media file format such as Moving Picture Experts Group-4 (MPEG-4) Part 14 (MP4), or other container formats such as audio video interleave (AVI), Matroska video (MKV), WebM, Third Generation Partnership (3GP), and MPEG-2 transport stream (MPEG-2-TS). Note that the model is agnostic to the type of container format.

2 References

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. At the time of publication, the editions indicated were valid. All Recommendations and other references are subject to revision; users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations and other references listed below. A list of the currently valid ITU-T Recommendations is regularly published. The reference to a document within this Recommendation does not give it, as a stand-alone document, the status of a Recommendation.

3 Definitions

3.1 Terms defined elsewhere

This Recommendation uses the following terms defined elsewhere:

3.1.1 bitstream [ITUT H.264]: A sequence of bits that forms the representation of coded pictures and associated data forming one or more coded video sequences. Bitstream is a collective term used to refer either to a NAL unit stream or a byte stream.

3.1.2 integral quality [b-ITU-T P.1203]: The quality as perceived by a subject in a subjective test, which corresponds to the scope of this Recommendation. Artefacts presented in the subjective tests typically include a combination of audio compression, video compression, and stalling effects.

3.1.3 media adaptation [b-ITU-T P.1203]: Events where the player switches video playback between a known set of media quality levels while adapting to network conditions, by downloading and decoding individual segments in sequence.

3.1.4 media quality level [b-ITU-T P.1203]: A particular encoding setting applied to a video or audio stream.

3.1.5 model, model algorithm [b-ITU-T P.1203]: An algorithm with the purpose of estimating the subjective (perceived) quality of a media sequence.

3.1.6 sequence [b-ITU-T P.1203]: An audiovisual stream composed of multiple non-overlapping segments.

3.1.7 video chunk [b-ITU-T G.1022]: A contiguous set of samples for one track of a video.

3.2 Terms defined in this Recommendation

This Recommendation defines the following term:

3.2.1 mean opinion score (**MOS**): The mean of opinion scores, which are values on a predefined scale that subjects assign to their opinion of the performance of the telephone transmission system used either for conversation or for listening to spoken material.

NOTE – Paraphrased from clause 7 of [ITU-T P.800.1].

4 Abbreviations and acronyms

This Recommendation uses the following abbreviations and acronyms:

ACR	Absolute Category Rating
AV1	AOMedia Video 1
AVI	Audio Video Interleave
DASH	Dynamic Adaptive Streaming over HTTP
GoP	Group of Pictures
HD	High Definition

HEVC	High-Efficiency Video Coding
HLS	HTTP Live Streaming
HTTP	Hypertext Transfer Protocol
IP	Internet Protocol
MKV	Matroska Video
MO	Mobile
MOS	Mean Opinion Score
MP4	MPEG-4 Part 14
MPEG	Moving Pictures Expert Group
MPEG-2-TS	MPEG-2 Transport Stream
OTT	Over The Top
PC	Personal Computer
PVS	Processed Video Sequence
QoE	Quality of Experience
QUIC	Quick UDP Internet Connections
RExt	Range Extension
RMSE	Root Mean Square Error
RTP	Real-time Transport Protocol
RTMP	Real-Time Messaging Protocol
TA	Tablet
TCP	Transmission Control Protocol
TV	Television
UDP	User Datagram Protocol
UHD	Ultra-High Definition
VP9	Video Payload type 9
VVC	Versatile Video Coding

5 Conventions

This Recommendation uses the following conventions:

- 4K: Video resolution of $4\ 096 \times 2\ 160$ or $3\ 840 \times 2\ 160$
- Pa designates the audio quality estimation module, see [ITU-T P.1203.2].
- Pv designates the video quality estimation module (as specified in this Recommendation).
- Pq designates the quality integration module, see [ITU-T P.1203.3].
- Reliable transport: Reliable delivery with protocols guaranteeing no loss of information.

6 Areas of application

6.1 Application range for the models

Table 1 shows the application range of the model in this Recommendation on what the model has actually been developed for and Table 2 lists areas where it is not applicable. Table 3 lists test factors and coding technologies for which this Recommendation has been validated

Table 1 – Areas for which this Recommendation is applicable

Areas for which the model is applicable

In-service monitoring of video sent over reliable transport. Both OTT services and operator-managed video services, using reliable delivery with protocols such as HTTP or HTTP2 over TCP/IP or QUIC, or RTMP over TCP/IP. Note that this model is agnostic to the type of container format

Performance and quality assessment of live networks (including video encoding) considering impairments due to encoding bitrate, encoding resolution, and encoding frame rate

Laboratory testing of video systems

Benchmarking of different service implementations

Benchmarking of different encoder implementations. Note that only the full or reduced reference pixelbased model type can be used for direct benchmarking of this type

Evaluation of transcoding solutions

Table 2 – Areas for which this Recommendation is not applicable

Areas for which the model is not applicable

In-service monitoring of video streaming using unreliable transport (e.g., real-time transport protocol/ user datagram protocol RTP/UDP)), where packet loss introduces visible quality degradations

Evaluation of visual quality of display/device properties

Evaluation of audio/video sync distortions

Evaluation of video codecs for which the model is not validated (AOMedia Video 1(AV1), MPEG-I Part 3 [versatile video coding (VVC)], etc.)

Evaluation of the effects of noise, delay, colour correctness or other content-production-related aspects

Table 3 – Test factors and coding technologies for which this Recommendation has been validated

Video test factors for which the model has been validated				
Video content	Movies and movie trailers, sports videos, documentaries, computer-generated graphics/games, etc.			
Input video length	The video modules were trained and validated to produce one overall video- quality score for a chunk of 7–9 s and also provide the per-second scores. Optimal performance for ~8 s. Models are assumed to provide valid overall video-quality estimations for $5-10$ s long sequences			
Bitstream container	AVI, MP4, MKV, WebM			
Encoder types (and implementation, see Note 1)	H.264/AVC (libx264), H.265/HEVC (libx265), VP9 (libvpx-vp9)			

Table 3 – Test factors and coding technologies for which this Recommendation has been validated

Video test factors for which the model has been validated					
H.264 (MPEG-4 Part 10): Constrained baseline, Main, Hi, Hi10, Hi422.					
Encoder profiles	H.265: Main, Main	n10, range extens	sion (RExt).		
	VP9: 0, 1, 2, 3.				
	Resolution definition	Video height range	Personal computer/ television (PC/TV)	Mobile/tablet (MO/TA)	
Video resolution and	Below SD	180-270		90 Kbps-1 Mbps	
bitrate	SD	360-540	150 Kbps-4 Mbps	150 Kbps-4 Mbps	
	HD	720-1 080	500 Kbps-15	500 Kbps-15 Mbps	
		1 440 2 1 60	Mbps	15 MI 20 MI	
	Above HD	1 440-2 160	1.5 Mbps-45 Mbps	1.5 Mbps-20 Mbps	
Video aspect ratio		16:	9, see Note 2		
Group of pictures (GoP)	Variable. Average GOP length can be between 0.5 s and chunk duration				
Bit-depth	8 bit or 10 bit				
Chroma subsampling	YUV 4:2:0 and YUV 4:2:2				
OTTs	Online providers that offer video on demand and video encoding as a service. It				
0113	should be noted that the models are applicable for similar OTTs				
Display resolution and	PC/TV; 2160p, up to 60 frames/s.				
frame rate	MO/TA: 1440p, up to 60 frames/s.				
Viewing distances	PC/TV: 1.5H to 3H (H: Screen height), see Note 3				
	MO/TA: 4 <i>H</i> to 6 <i>H</i>				
NOTE 1 – During training and validation, FFmpeg 3.2.2 was used with x264 snapshot 20170202-2245, x265 v2.2, libvpx 1.6.1.					

NOTE 2 – For original content with a larger aspect ratio, letterboxing of up to 30% was allowed, that is 1 512 pixels height for video coded at 2 160 pixels height. Video content with 1.89:1 aspect ratio (e.g., cinema 4K) may also be used.

NOTE 3 - It is noted that for PC or MO, the model output is conservative and should be interpreted to correspond to a viewing distance of 1.5H to 1.6H.

6.2 Model types

The model types are specified in Tables 4, 5 and 6, which also provide more information on input. Meta-data is defined here as being header information and information on the I.GEN interface as defined in clause 7.1.

Model type and Recommendation	Model type and RecommendationInput (see clause 7.1 for complete list of inputs)			
Transport, see Note 1 For further study	Meta-data	Low		
Video frame-level, see Note 2 For further study	Meta-data and frame header information	Low		
Bitstream, see Note 3 [ITU-T P.1204.3]	Meta-data and any information from the video bitstream	High		
NOTE 1 – Corresponding to mode 0 in [b-ITU-T P.1203]. NOTE 2 – Corresponding to mode 1 in [b-ITU-T P.1203]. NOTE 3 – Corresponding to mode 3 in [b-ITU-T P.1203].				

Table 4 – ITU-T P.1204 types of bitstream-based model

Table 5 – ITU-T P.1204 types of pixel-based model

Model type and Recommendation	Type related inputs (see clause 7.1 for complete list of inputs)	Complexity
Reduced reference (RR). Can be used as a full reference (FR) model [ITU-T P.1204.4]	Side information derived from reference video Degraded video	High

Table 6 – ITU-T P.1204 types of hybrid models

Model type and Recommendation	Type-related inputs (see clause 7.1 for complete list of inputs)	Complexity
Hybrid no reference (NR) with transport information [ITU-T P.1204.5]	Degraded video Meta-data information	Low to high

7 Building blocks

The module layout of the ITU-T P.1204 model is depicted in Figure 1 and Figure 2.

Figure 1 – Building blocks of the video quality models in this Recommendation; the input information used by the different types of model is indicated

The model will be revised to include ITU-T P.1204.1 and ITU-T P.1204.2 once these have been approved by ITU-T.

Figure 2 – Building blocks of the ITU-T P.1204 video quality module in the context of longerterm integration. Here, all greyed-out components reflect an implementation in line with the audiovisual-quality and long-term integration according to [b-ITU-T P.1203]

The model will be revised to include ITU-T P.1204.1 and ITU-T P.1204.2 once these have been approved by ITU-T.

7.1 Model input interfaces

The ITU-T P.1204 model will receive media information and prior knowledge about the media stream or streams. For the different types of model, the following inputs may be extracted or estimated in

different ways, which lie outside the scope of this Recommendation although they may be added in future annexes. The model receives the following input information, depending on its type (for details see Table 7):

I.GEN: Display resolution and device type. The device type is defined as follows:

- PC/TV: screen size 24 inches or larger and less than or equal to 100 inch.
- MO/TA: screen size 13 inch or smaller.
- **I.11**: Audio coding information. Not used in this Recommendation, kept to maintain consistency with [b-ITU-T P.1203], for example.
- **I.13**: Video coding information.
- **I.14**: Initial loading delay and stalling event information. Not used in this Recommendation, kept to maintain consistency with [b-ITU-T P.1203], for example.
- **I.15**: Degraded video pixel information.
- **I.16**: Reference video pixel information.

7.2 Specification of inputs I.GEN, I.13, I.15 and I.16

See Table 7.

ID	Description	Values	Frequency	Available to models (ITU-T P.1204.X)
I.GEN	I			
0	The resolution of the image displayed to the user	Number of pixels $(W \times H)$ in displayed video	Per media chunk	All
1	The device type on which the media is played	"PC", "TV", "MO", "TA"	Per media chunk	All
2	Device display size	Display size (diagonal in inches)	Per media chunk	All
3	Relative viewing distance in multiple of display height	Relative viewing distance	Per media chunk	All
I.13				
4	Video bitrate	Bitrate in kilobits per second	Per media chunk	3, 5
5	Video frame rate	Frame rate in frames per second.	Per media chunk	3, 5
6	Segment duration	Duration in seconds	Per media chunk	3, 5
7	Video encoding resolution	Number of pixels $(W \times H)$ in transmitted video	Per media chunk	3, 5

Table 7 – I.13 and I.14 input description (see Note 1)

ID	Description	Values	Frequency	Available to models (ITU-T P.1204.X)
8	Video codec and profile	H.264 (MPEG-4 Part 10): Constrained Baseline, Main, Hi, Hi10, Hi422. H.265: Main, Main10, RExt. VP9: 0, 1, 2, 3		3, 5
9	Video frame number	Integer, starting at 1, denoting the frame sequence number in encoding order	1, denoting the mber in encoding Per video frame	
10	Video frame duration	Duration of the frame in seconds	Per video frame	3
11	Frame presentation timestamp	The frame presentation timestamp	Per video frame	3
12	Frame decoding timestamp	The frame decoding timestamp	Per video frame	3
13	Video frame size	The size of the encoded video frame in bytes	Per video frame	3
14	Type of each picture	See Note 2. "I"/"P"/"B" for ITU-T P.1204.3	Per video frame	3
15	Video bitstream	Encoded video bytes for the frame	Per video frame	3
16	Video pixel format	8-bit or 10-bit, together with 4:2:2 or 4:2:0 chroma subsampling	Per media chunk	3
I.15				
26	Degraded video	The raw pixels (YUV file including metadata required for parsing; width, height, frame rate, and pixel format) of the processed video, i.e., the video decoded and upscaled to display resolution without buffering or stalling. The frame information in I.16 and I.15 is synchronized, i.e., no frame misalignments are present		4,5
	1	<i>I.16</i>	1	I

Table 7 – I.13 and I.14 input description (see Note 1)

ID	Description	Values	Frequency	Available to models (ITU-T P.1204.X)
27	Reference video information	The reference-side information extraction module takes as input the reference video and outputs the side information file. The reference model side channel bandwidth limit is 256 kbit/s. Thus, the side information of the reference model for a video sequence v is stored in a file with size at most $256/8 * t_v$ kB, where t_v is the duration of video v in seconds.	Per media chunk	4
NOTE ITU-T. NOTE	$1 - $ This table will also address $\frac{1}{2}$.	ITU-T P.1204.1 and ITU-T P.1204.2 once	these have been a	pproved by

 Table 7 – I.13 and I.14 input description (see Note 1)

7.3 Model output information

The Pv modules provide one score per second and one overall video quality score for the chunk under consideration.

There should not be any output score for frames at the end of a sequence, when those frames do not add up to a complete second. The quality score is calculated at the closest frame boundary at or after each integer second from the start of the stream.

For all outputs, a quality scale of 1 to 5 is used, where "1" means "bad" quality and "5" means "excellent" quality, as specified in [ITU-T P.910].

The ITU-T P.1204 Pv-model outputs are as follows:

- O.22: Video coding quality per second
 - per-1-second scores provided per chunk and on a quality scale of 1 to 5
- O.27: Final video session quality score
 - single score for the chunk, on a quality scale of 1 to 5.

8 Overview of databases used for model development

For model development and validation, 26 databases were created in total. Each database consists of a set of processed video sequences (PVSs). The source videos of each database were of a duration of 6 s to 9 s. Each source video was repeated at most six times within a database. The number of PVSs in each database was chosen to be around 200. In total, 5 002 PVSs were used.

The videos were encoded with H.264, H.265 or VP9, using the libx264, libx265, or libvpx VP9 codec implementations, respectively. In addition, some videos were encoded via frequently used online streaming services. The videos were encoded using one of the profiles given in item 8 under I.13 in Table 7.

For each database, an ACR [ITU-T P.910] subjective test was performed to collect ratings on the 5-point scale. Out of the 26 subjective tests, 12 were performed using a UHD PC monitor for

playback, six using a UHD TV set, seven using an MO with a 5 inch to 6 inch display. One test was performed on a 10 inch tablet.

Out of the 26 databases, 13 were initially shared for model development and training. The remaining 13 databases were used for model selection and validation.

Overall performance p is determined by a weighted average of the per-database mean squared error (MSE). In more detail, the mean squared error MSE_k of database k is weighted by a weight w_k , summed over all databases and normalized,

$$p = \frac{1}{N} \sum_{k=1}^{M} w_k \times \text{MSE}_k \tag{1}$$

where the weight $w_k = 0.1$ if the database k is part of the initially shared databases, and $w_k = 0.9$ otherwise. The total number of databases M is 26, and the normalization constant N is given by $N = \sum_{k=1}^{M} w_k$.

9 Description of ITU-T P.1204 model algorithms

Detailed descriptions of the individual modules can be found in the respective Recommendations, and their annexes: [ITU-T P.1204.3] for the bitstream-based video quality model; [ITU-T P.1204.4] for the pixel-based video quality model; and [ITU-T P.1204.5] for the hybrid no-reference video quality model.

Appendix I

Performance figures

(This appendix does not form an integral part of this Recommendation.)

In this appendix, the root mean square errors (RMSEs) of Pv models are reported. Note that the numbers are reported after a final per-database mapping between the model output and the subjective scores of a database. This linear mapping is used to account for scale and bias variations between different databases.

 Table I.1 – Validation performance of Pv model: The submitted model is the model trained on the exchanged training databases and frozen before creation of validation data. Models were retrained using a five-fold cross-validation approach, with their validation performance listed to show stability of the performance indicating no over-fitting

Full bitstream	Submitted model	0.421				
	Five-fold cross- validation	0.394	0.407	0.402	0.413	0.401
Pixel-based Reference	Submitted model	0.444				
	Five-fold cross- validation	0.418	0.418	0.425	0.442	0.429
Hybrid Transport- level	Submitted model	0.452				
	Five-fold cross- validation	0.451	0.440	0.441	0.443	0.457

The re-training of the submitted model was performed on five different splits. The splits were defined on the database level. The following is the procedure that was followed to determine the splits.

- All training and validation databases were merged to obtain in total 26 different short databases (18 PC/TV and eight MO/TA).
- A level of difficulty of prediction for each database was determined based on average prediction error over all models.
- A 50:50 training:validation split was determined randomly, but respecting the level of difficulty. In total, five different splits were defined. Each split had a balanced distribution of databases based on difficulty in both the training and validation.
- The 50:50 split was separately performed for PC/TV and MO/TA cases.
- The final model coefficients correspond to the best performing split.
