# Recommendation ITU-T Q.4164

## Protocols for Ck interfaces for quantum key distribution networks

### Summary

Recommendation ITU-T Q.4164 specifies protocols for Ck interfaces in quantum key distribution networks.

### History\*

| Edition | Recommendation | Approval   | Study Group | Unique ID          |
|---------|----------------|------------|-------------|--------------------|
| 1.0     | ITU-T Q.4164   | 2023-12-14 | 11          | 11.1002/1000/15728 |

### Keywords

Message parameters, protocol, QKD (quantum key distribution), QKDN (QKD network), signalling procedure.

## FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

## NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

## INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had not received notice of intellectual property, protected by patents/software copyrights, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the appropriate ITU-T databases available via the ITU-T website at <http://www.itu.int/ITU-T/ipr/>.

# Recommendation ITU-T Q.4164

## Protocols for Ck interfaces for quantum key distribution networks

### 1 Scope

This Recommendation specifies protocols for Ck interfaces for quantum key distribution networks (QKDNs) especially in the following areas.

- signalling procedures;
- signalling messages and parameters;
- security considerations.

### 2 References

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. At the time of publication, the editions indicated were valid. All Recommendations and other references are subject to revision; users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations and other references listed below. A list of the currently valid ITU-T Recommendations is regularly published. The reference to a document within this Recommendation does not give it, as a stand-alone document, the status of a Recommendation.

[ITU-T Q.4160] Recommendation ITU-T Q.4160 (2023), *Quantum key distribution networks – Protocol framework*.

[ITU-T X.1712] Recommendation ITU-T X.1712 (2021), *Security requirements and measures for QKD networks – Key management*.

### 3 Definitions

#### 3.1 Terms defined elsewhere

This Recommendation uses the following terms defined elsewhere:

**3.1.1 key management** [b-ITU-T Y.3800]: All activities performed on keys during their life cycle starting from their reception from the quantum layer, storage, formatting, relay, synchronization, authentication, to supply to cryptographic application and deletion or preservation depending on the key management policy.

**3.1.2 key management agent (KMA)** [b-ITU-T Y.3802]: A functional element to manage keys generated by one or multiple quantum key distribution (QKD) modules in a QKD node (trusted node).  
NOTE – KMA acquires keys from a QKD module/QKD modules, synchronizes, resize, formats, and stores them. It also relays keys through key management agent (KMA) links.

**3.1.3 key management agent link** [b-ITU-T Y.3802]: A communication link connecting key management agents (KMAs) to perform key relay and communications for key management.

**3.1.4 key manager (KM)** [b-ITU-T Y.3800]: A functional module located in a quantum key distribution (QKD) node to perform key management in the key management layer.

**3.1.5 key relay** [b-ITU-T Y.3800]: A method to share keys between arbitrary quantum key distribution (QKD) nodes via intermediate QKD node(s).

**3.1.6 key supply agent (KSA)** [b-ITU-T Y.3802]: A functional element to supply keys to a cryptographic application, being located between a key management agent (KMA) and the cryptographic application.

NOTE – Application interfaces for cryptographic applications are installed into the key supply agent (KSA). The KSA synchronizes keys, and verifies their integrity via a KSA link before supplying them to the cryptographic application.

**3.1.7 key supply agent link** [b-ITU-T Y.3802]: A communication link connecting key supply agents (KSAs) to perform key synchronization and integrity verification.

**3.1.8 quantum key distribution (QKD)** [b-ETSI GR QKD 007]: Procedure or method for generating and distributing symmetrical cryptographic keys with information theoretical security based on quantum information theory.

**3.1.9 quantum key distribution link** [b-ITU-T Y.3800]: A communication link between two quantum key distribution (QKD) modules to operate the QKD.

NOTE – A QKD link consists of a quantum channel for the transmission of quantum signals, and a classical channel used to exchange information for synchronization and key distillation.

**3.1.10 quantum key distribution module** [b-ITU-T Y.3800]: A set of hardware and software components that implements cryptographic functions and quantum optical processes, including quantum key distribution (QKD) protocols, synchronization, distillation for key generation, and is contained within a defined cryptographic boundary.

NOTE – A QKD module is connected to a QKD link, acting as an endpoint module in which a key is generated. These are two types of QKD modules, namely, the transmitters (QKD-Tx) and the receivers (QKD-Rx).

**3.1.11 quantum key distribution network (QKDN)** [b-ITU-T Y.3800]: A network comprised of two or more quantum key distribution (QKD) nodes connected through QKD links.

NOTE – A QKDN allows sharing keys between the QKD nodes by key relay when they are not directly connected by a QKD link.

**3.1.12 quantum key distribution network controller** [b-ITU-T Y.3800]: A functional module, which is located in a quantum key distribution (QKD) network control layer to control a QKD network.

**3.1.13 quantum key distribution node** [b-ITU-T Y.3800]: A node that contains one or more quantum key distribution (QKD) modules protected against intrusion and attacks by unauthorized parties.

NOTE – A QKD node can contain a key manager (KM).

## **3.2 Terms defined in this Recommendation**

None.

## **4 Abbreviations and acronyms**

This Recommendation uses the following abbreviations and acronyms:

|      |                                  |
|------|----------------------------------|
| ID   | Identifier                       |
| KM   | Key Manager                      |
| KMA  | Key Management Agent             |
| KSA  | Key Supply Agent                 |
| QKD  | Quantum Key Distribution         |
| QKDN | Quantum Key Distribution Network |
| RPC  | Remote Procedure Call            |
| Rx   | Receiver                         |
| TCP  | Transmission Control Protocol    |

TLS      Transport Layer Security  
Tx        Transmitter

## 5 Conventions

None.

## 6 Ck interface

A Ck interface is a reference point connecting a control and management functions in both a QKDN controller and a key manager (KM). A Ck interface provides a means for a QKDN controller to communicate control information with a key management agent (KMA) and a key supply agent (KSA).

## 7 Signalling procedure

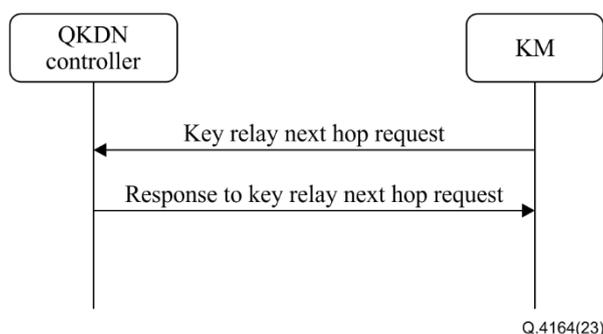

Examples of signalling procedures for key request, key relay and key supply in QKDN are described in Appendix I of [ITU-T Q.4160]. The protocol suites applied for signalling are specified in clause 7 of [ITU-T Q.4160]. Two kinds of signalling procedures can be distinguished according to whether the QKDN network architecture is distributed or centralized.

### 7.1 Signalling procedures for key relay request in a distributed QKDN

A distributed QKDN performs key relay with a series of hops between KMs to the destination KM. At the Ck interface of a distributed QKDN, a KM requests a QKDN controller for information about the KMs of neighbours for the next hop for key relay. The KM then relays the key to the next KM based on the controller's response. The next KM in turn requests the next hop from the controller. This request and hop procedure repeats until the key relay is completed at the destination.

Figure 1 shows signalling procedures for a key relay request in a distributed QKDN.

The KM sends a key relay next hop request to the QKDN controller for the KM identifier (ID) of the next hop. The QKDN controller responds with possible KM IDs to hop to the next KM.

**Figure 1 – Signalling procedures for key relay request in a distributed QKDN**

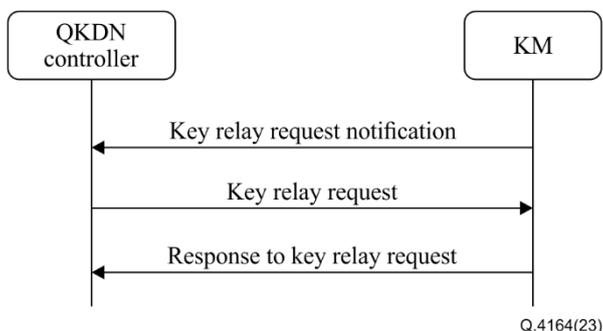

### 7.2 Signalling procedures for key relay request in a centralized QKDN

In a centralized QKDN, if a key relay is needed after receiving a key request from the cryptographic application, the KM can request a key relay route from the QKDN controller, and the QKDN controller returns the whole route to the destination KM (list of KMs to be passed). When all key relays are completed, the source KM returns notification of that fact.

Figure 2 shows signalling procedures for a key relay request in a centralized QKDN.

After the cryptographic application sends a key request to the KM, if a key relay is needed and there is none available, the KM requests one from the QKDN controller with a notification. The QKDN

controller specifies the whole route for the key relay to the destination KM and notifies the requesting KM of the list of transit KMs by a key relay request. The source KM starts the key relay according to the list of transit KMs. When the key relay completes at the KM to which the destination cryptographic application is connected, the source KM notifies the QKDN controller of the completion by a response to key relay request.

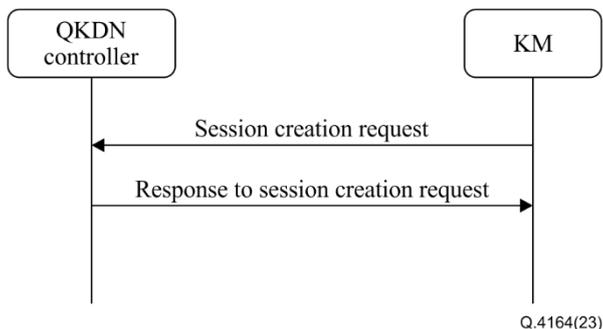

**Figure 2 – Signalling procedures for key relay request in a centralized QKDN**

### 7.3 Signalling procedures for session creation request

To facilitate key supply between cryptographic applications and the KMs on both sides, the source KM can send a session creation request to the corresponding QKDN controller, which then generates a session ID and notifies the destination KM with the session ID to create a session. After receiving the session creation result, the QKDN controller responds to the source KM with the session ID.

Figure 3 shows signalling procedures for a session creation request.

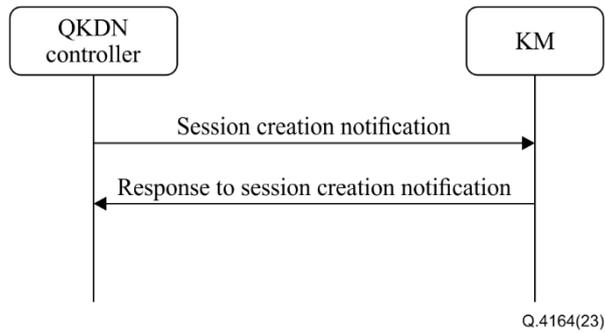

**Figure 3 – Signalling procedures for session creation request**

### 7.4 Signalling procedures for session creation notification

The corresponding QKDN controller can send a session creation notification with the session ID to the destination KM, which then notifies the destination cryptographic application. After receiving the session creation result from the destination cryptographic application, the destination KM responds to the corresponding QKDN controller with the session ID.

Figure 4 shows signalling procedures for a session creation notification.

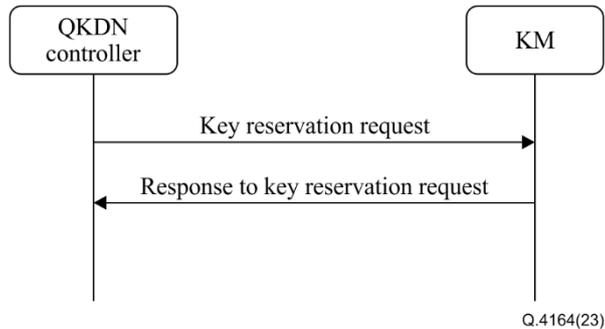

**Figure 4 – Signalling procedures for session creation notification**

### 7.5 Signalling procedures for key reservation request

The QKDN controller can send a key reservation request to the KM with KMA ID to reserve the key that will be relayed to destination KM. After receiving the key reservation request, the KM responds to the corresponding QKDN controller with a response to the key reservation request with KMA-key ID reserved and result code.

Figure 5 shows signalling procedures for a key reservation request.

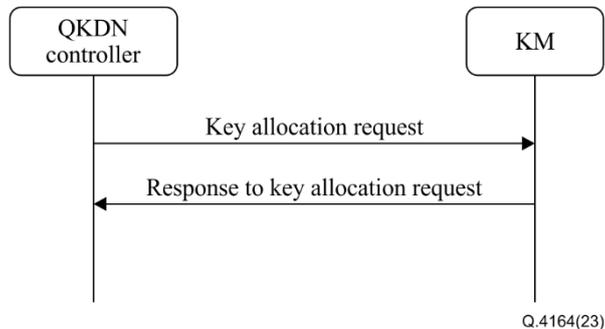

**Figure 5 – Signalling procedures for key reservation request**

### 7.6 Signalling procedures for key allocation request

The corresponding QKDN controller can send a key allocation request with KMA ID, KMA-key IDs to allocate the key resource that has been reserved. After receiving the key allocation request, the KM responds to the corresponding QKDN controller with a result code.

Figure 6 shows signalling procedures for a key allocation request.

**Figure 6 – Signalling procedures for key allocation request**

## 8 Signalling messages and parameters

This clause specifies messages and their parameters for the Ck interface.

The M/O columns of Tables 1 to 13 relate to signalling of the parameters in columns 1; M indicates mandatory and O indicates optional.

The messages and parameters specified in this clause are independent of a specific protocol and can have different implementations. The recommended protocol implementations are described in Appendices I and II.

NOTE – A message parameter described in Tables 1 to 13 is not necessarily mapped to a field in the message payload and might be a part of the control parameters of a specific protocol. The data type listed in columns 3 of Tables 1 to 13 may vary with specific protocols.

### 8.1 Key relay next hop request message

Table 1 lists parameters of a key relay next hop request message. Either a destination KMA ID or application destination ID is mandatory to specify the destination.

**Table 1 – Parameters of key relay next hop request message**

| Parameter                  | Description  | Data type        | M/O  | Remarks |
|----------------------------|--|------------------|--|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route   | String           | O  |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route  | String           | Either a destination KMA ID or application destination ID is mandatory |         |
| Application destination ID | ID of the cryptographic application with which the source cryptographic application (i.e., source application) requests to communicate | String           | Either a destination KMA ID or application destination ID is mandatory |         |
| Extension                  | Array of extension parameters  | Array of objects | O  |         |

### 8.2 Response to key relay next hop request message

Table 2 lists parameters of a response to key relay next hop request message. For a distributed QKDN, the QKDN controller returns the IDs of the possible KMs to reach the destination KMA, with or without the destination KMA ID.

**Table 2 – Parameters of response to key relay next hop request message**

| Parameter          | Description  | Data type        | M/O  | Remarks |
|--------------------|--|------------------|--|---------|
| Source KMA ID      | ID of KMA that is the source in the entire key relay route                         | String           | O  |         |
| Destination KMA ID | ID of KMA that is the destination in the entire key relay route                    | String           | Mandatory if an application destination ID is contained in the key relay next hop request message. |         |
| Next KMA IDs       | IDs of KMAs available as a next relay hop to relay the keys to the destination KMA | Array of string  | M  |         |
| Extension          | Array of extension parameters  | Array of objects | O  |         |

### 8.3 Key relay request notification message

Table 3 lists parameters of a key relay request notification message. In a centralized QKDN, after receiving a key request sent by a cryptographic application, if a key relay is needed, the KM can request the whole route of the key relay from the QKDN controller. At this time, as in the case of a distributed QKDN, information is required for either the destination KMA ID or the application destination ID in order to specify the destination of the key relay.

**Table 3 – Parameters of key relay request notification message**

| Parameter                  | Description  | Data type        | M/O  | Remarks |
|----------------------------|--|------------------|--|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route   | String           | O  |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route  | String           | Either a destination KMA ID or application destination ID is mandatory |         |
| Application destination ID | ID of the cryptographic application with which the source cryptographic application (i.e., source application) requests to communicate | String           | Either a destination KMA ID or application destination ID is mandatory |         |
| Extension                  | Array of extension parameters  | Array of objects | O  |         |

### 8.4 Key relay request message

Table 4 lists parameters of a key relay request message. The QKDN controller returns all KMs in the route (transit KMA IDs) to reach the destination KMA, with or without the destination KMA ID.

**Table 4 – Parameters of key relay request message**

| Parameter            | Description  | Data type        | M/O  | Remarks |
|----------------------|--|------------------|--|---------|
| Source KMA ID        | ID of KMA that is the source in the entire key relay route           | String           | O  |         |
| Destination KMA ID   | ID of KMA that is the destination in the entire key relay route      | String           | Mandatory if an application destination ID is contained in the key relay request notification message. |         |
| Transit KMA IDs      | List of IDs of KMAs that are the transition nodes of key relay route | String           | M  |         |
| Key relay request ID | ID of key relay request  | String           | O  |         |
| Extension            | Array of extension parameters  | Array of objects | O  |         |

### 8.5 Response to key relay request message

Table 5 lists parameters of a response to key relay request message.

**Table 5 – Parameters of response to key relay request message**

| Parameter            | Description                   | Data type        | M/O | Remarks                       |
|----------------------|-------------------------------|------------------|-----|-------------------------------|
| Response             | Result of key relay           | String           | M   | Reason for success or failure |
| Key relay request ID | ID of key relay request       | String           | O   |                               |
| Extension            | Array of extension parameters | Array of objects | O   |                               |

### 8.6 Session creation request message

A session creation request message is sent from the source KM to the corresponding QKDN controller. A session can be created to facilitate key supply between cryptographic applications and KMs on both sides.

Table 6 lists parameters of a session creation request message.

**Table 6 – Parameters of session creation request message**

| Parameter                  | Description   | Data type        | M/O | Remarks   |
|----------------------------|---|------------------|-----|---|
| Application source ID      | ID of the source cryptographic application (i.e., the application that connects to the source KM to receive KSA-keys)                           | String           | M   |   |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | M   |   |
| Number of keys             | Number of KSA-keys requested  | Integer          | O   | A default value is applied if omitted.<br>This parameter can be used as the maximum number of KSA-keys requested during one session |
| Extension                  | Array of extension parameters   | Array of objects | O   |   |

### 8.7 Response to session creation request message

A response to a session creation request message is sent from the corresponding QKDN controller to the source KM. After receiving a session creation request, the QKDN controller generates a session ID and notifies the destination KM of the session ID to create a session. After receiving the session creation result, the QKDN controller responds to the source KM with the session ID.

Table 7 lists parameters of a response to a session creation request message.

**Table 7 – Parameters of response to session creation request message**

| Parameter         | Description                              | Data type        | M/O | Remarks                       |
|-------------------|--|------------------|-----|-------------------------------|
| Session ID        | ID of the session created for key supply | String           | M   |                               |
| Response          | Result of the creation of the session    | String           | M   | Reason for success or failure |
| Destination KM ID | ID of the destination KM                 | String           | M   |                               |
| Extension         | Array of extension parameters            | Array of objects | O   |                               |

### 8.8 Session creation notification message

A session creation notification message is sent from the corresponding QKDN controller to the destination KM. The destination KM can notify the destination cryptographic application of the received session ID for a session creation.

Table 8 lists parameters of a session creation notification message.

**Table 8 – Parameters of session creation notification message**

| Parameter                  | Description   | Data type        | M/O | Remarks   |
|----------------------------|---|------------------|-----|---|
| Application source ID      | ID of the source cryptographic application (i.e., the application that connects to the source KM to receive KSA-keys)                           | String           | M   |   |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | M   |   |
| Session ID                 | ID of the session created for key supply  | String           | M   |   |
| Source KM ID               | ID of the source KM   | String           | M   |   |
| Number of keys             | Number of KSA-keys requested  | Integer          | O   | A default value is applied if omitted.<br>This parameter can be used as the maximum number of KSA-keys requested during one session |
| Extension                  | Array of extension parameters   | Array of objects | O   |   |

### 8.9 Response to session creation notification message

A response to a session creation notification message is sent from the destination KM to the corresponding QKDN controller. The destination KM responds to the corresponding QKDN controller with the session creation result.

Table 9 lists parameters of a response to a session creation notification message.

**Table 9 – Parameters of response to session creation notification message**

| Parameter  | Description                              | Data type        | M/O | Remarks                       |
|------------|--|------------------|-----|-------------------------------|
| Session ID | ID of the session created for key supply | String           | M   |                               |
| Response   | Result of the creation of the session    | String           | M   | Reason for success or failure |
| Extension  | Array of extension parameters            | Array of objects | O   |                               |

**8.10 Key reservation request**

Table 10 lists parameters of a key reservation request.

**Table 10 – Parameters of key reservation request message**

| Parameter                  | Description   | Data type        | M/O | Remarks |
|----------------------------|---|------------------|-----|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route  | String           | M   |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route   | String           | M   |         |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | O   |         |
| Extension                  | Array of extension parameters   | Array of objects | O   |         |

**8.11 Response to key reservation request**

Table 11 lists parameters of a response to a key reservation request message.

**Table 11 – Parameters of response to key reservation request message**

| Parameter                  | Description   | Data type        | M/O | Remarks |
|----------------------------|---|------------------|-----|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route  | String           | O   |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route   | String           | O   |         |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | O   |         |
| Key IDs                    | IDs of KMA-keys reserved  | String           | M   |         |
| Response                   | Result of key reservation request   | Integer          | M   |         |
| Extension                  | Array of extension parameters   | Array of objects | O   |         |

**8.12 Key allocation request**

Table 12 lists parameters of a key allocation request.

**Table 12 – Parameters of key allocation request message**

| Parameter                  | Description   | Data type        | M/O | Remarks |
|----------------------------|---|------------------|-----|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route  | String           | M   |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route   | String           | M   |         |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | O   |         |
| Key IDs                    | IDs of KMA-keys reserved  | Array of objects | M   |         |
| Extension                  | Array of extension parameters   | Array of objects | O   |         |

### 8.13 Response to key allocation request

Table 13 lists parameters of a response to a key allocation request message.

**Table 13 – Parameters of response to key allocation request message**

| Parameter                  | Description   | Data type        | M/O | Remarks |
|----------------------------|---|------------------|-----|---------|
| Source KMA ID              | ID of KMA that is the source in the entire key relay route  | String           | O   |         |
| Destination KMA ID         | ID of KMA that is the destination in the entire key relay route   | String           | O   |         |
| Application destination ID | ID of the destination cryptographic application (i.e., the application with which the source cryptographic application requests to communicate) | String           | O   |         |
| Key IDs                    | IDs of KMA-keys reserved  | Array of objects | O   |         |
| Response                   | Result of key allocation request  | Integer          | M   |         |
| Extension                  | Array of extension parameters   | Array of objects | O   |         |

## 9 Security considerations

Control and management information is transferred through a Ck reference point. Security requirements and measures to protect it are specified in [ITU-T X.1712].

## Appendix I

### Protocol implementation using the transmission control protocol

(This appendix does not form an integral part of this Recommendation.)

This appendix describes an implementation using the transmission control protocol (TCP) for messages and parameters that are described in clause 8 using the transmission control protocol (TCP).

NOTE 1 – Some parameters are mapped to a part of the control information of the protocol instead of being mapped to a field in the data payload.

The KM can connect to the QKDN controller using the TCP [b-IETF RFC 9293]. The corresponding message format over the TCP is shown in Figure I.1.

|         |           |             |        |         |
|---------|-----------|-------------|--------|---------|
| Version | MessageID | CommandCode | Length | Payload |
|---------|-----------|-------------|--------|---------|

Q.4164(23)

**Figure I.1 – Message format over the transmission control protocol**

In Figure I.1:

Version: the current version of the protocol format adopted, 2 bytes;

MessageID: the unique ID of each message, 4 bytes;

CommandCode: a unique code that denotes different command/response messages transferred at the Ck interface, 2 bytes;

Length: the length of the message payload, 2 bytes;

Payload: the message parameters of a specific command/response message, JavaScript object notation data format [b-IETF RFC 8259].

NOTE 2 – The transport layer security (TLS) protocol [b-IETF RFC 5246] can be implemented with the TCP or enhanced security.

On establishment of the connection, mutual authentication between the KM and the QKDN controller is performed. After mutual authentication, a command/response message can be transferred at the Ck interface for key relay request.

NOTE 3 – When applying the TLS protocol, the KM can verify the validity of a certificate the QKDN controller possesses and based in that confirm the ID of the QKDN controller it is connecting to. Similarly, the QKDN controller can verify the validity of a certificate the KM possesses and based in that confirm the ID of the connecting KM.

Table I.1 lists CommandCode vs. command/response message name.

**Table I.1 – CommandCode vs. command/response message name**

| CommandCode | Command/response message name          |
|-------------|--|
| 0x1401      | Key relay next hop request             |
| 0x4102      | Response to key relay next hop request |
| 0x1403      | Key relay request notification         |
| 0x4104      | Key relay request                      |
| 0x1405      | Response to key relay request          |
| 0x1406      | Session creation request               |
| 0x4107      | Response to session creation request   |

**Table I.1 – CommandCode vs. command/response message name**

| <b>CommandCode</b> | <b>Command/response message name</b>      |
|--------------------|---|
| 0x4108             | Session creation notification             |
| 0x1409             | Response to session creation notification |
| 0x410A             | Key reservation request                   |
| 0x140B             | Response to key reservation request       |
| 0x410C             | Key allocation request                    |
| 0x140D             | Response to key allocation request        |

The first two digits "14" in a CommandCode indicate that the corresponding message is sent from the KM to the QKDN controller; "41" indicate that the corresponding message is sent from the QKDN controller to the KM.

## Appendix II

### Protocol implementation using gRPC

(This appendix does not form an integral part of this Recommendation.)

This appendix describes a protocol implementation for messages and parameters that are described in clause 8 using gRPC.

#### II.1 Mapping of signalling messages to gRPC messages

gRPC is a cross-platform open source high-performance remote procedure call (RPC) framework. It is currently being developed under the Cloud Native Computing Foundation (CNCF) under the Linux Foundation. It uses HTTP 2.0 and supports multiple programming languages [b-CNCF gRPC].

**Table II.1-1 – Example mapping of signalling messages to gRPC messages**

| Signalling messages                 | gRPC message name           |
|-------------------------------------|-----------------------------|
| Key relay request notification      | KeyRelayRequestNotification |
| Key relay request                   | KeyRelayRequest             |
| Response to key relay request       | KeyRelayResponse            |
| Key reservation request             | KeyReservationRequest       |
| Response to key reservation request | KeyReservationResponse      |
| Key allocation request              | KeyAllocationRequest        |
| Response to key allocation request  | KeyAllocationResponse       |

#### II.2 Key relay request notification

Table II.2-1 shows gRPC profiles for a key relay request notification message mapping example.

**Table II.2-1 – gRPC profiles for key relay request notification message mapping example**

| Parameter                  | Mapped to       | Data type |
|----------------------------|-----------------|-----------|
| Source KMA ID              | gRPC 'start_km' | String    |
| Destination KMA ID         | gRPC 'end_km'   | String    |
| Application destination ID | not mapped      |           |
| Extension                  | not mapped      |           |

#### II.3 Key relay request and response message

Table II.3-1 lists gRPC profiles for a key relay request message mapping example. Table II.3-2 lists an example of response message mapping.

**Table II.3-1 – gRPC profiles for key relay request message mapping example**

| Parameter            | Mapped to                 | Data type |
|----------------------|---------------------------|-----------|
| Source KMA ID        | gRPC 'start_km'           | String    |
| Destination KMA ID   | gRPC 'end_km'             | String    |
| Transit KMA IDs      | gRPC 'kma_id'             | String    |
| Key relay request ID | gRPC 'keyrelayrequest_id' | String    |

**Table II.3-1 – gRPC profiles for key relay request message mapping example**

| Parameter | Mapped to  | Data type |
|-----------|------------|-----------|
| Extension | not mapped |           |

**Table II.3-2 – gRPC profiles for response to key relay request message mapping example**

| Parameter            | Mapped to                              | Data type |
|----------------------|--|-----------|
| Response             | gRPC 'result_code'<br>ex) 0: OK, 1: NG | Integer   |
| Key relay request ID | gRPC 'keyrelayrequest_id'              | String    |
| Extension            | gRPC 'error_message'                   | String    |

#### **II.4 Key reservation request and response message**

Table II.4-1 lists gRPC profiles for a key reservation request message mapping example. Table II.4-2 lists an example of response message mapping.

**Table II.4-1 – gRPC profiles for key reservation request message mapping example**

| Parameter                  | Mapped to       | Data type |
|----------------------------|-----------------|-----------|
| Source KMA ID              | gRPC 'start_km' | String    |
| Destination KMA ID         | gRPC 'end_km'   | String    |
| Application destination ID | not mapped      |           |
| Extension                  | not mapped      |           |

**Table II.4-2 – gRPC profiles for response to key reservation request message mapping example**

| Parameter                  | Mapped to                              | Data type |
|----------------------------|--|-----------|
| Source KMA ID              | gRPC 'start_km'                        | String    |
| Destination KMA ID         | gRPC 'end_km'                          | String    |
| Application destination ID | not mapped                             |           |
| Key IDs                    | gRPC 'key_id'                          | String    |
| Response                   | gRPC 'result_code'<br>ex) 0: OK, 1: NG | Integer   |
| Extension                  | gRPC 'error_message'                   | String    |

#### **II.5 Key allocation request and response message**

Table II.5-1 lists gRPC profiles for a key allocation request message mapping example. Table II.5-2 lists an example of response message mapping.

**Table II.5-1 – gRPC profiles for key allocation request message mapping example**

| <b>Parameter</b>           | <b>Mapped to</b> | <b>Data type</b> |
|----------------------------|------------------|------------------|
| Source KMA ID              | gRPC 'start_km'  | String           |
| Destination KMA ID         | gRPC 'end_km'    | String           |
| Application destination ID | not mapped       |                  |
| Key IDs                    | gRPC 'key_id'    | String           |
| Extension                  | not mapped       |                  |

**Table II.5-2 – gRPC profiles for response to key allocation request message mapping example**

| <b>Parameter</b>           | <b>Mapped to</b>                       | <b>Data type</b> |
|----------------------------|--|------------------|
| Source KMA ID              | gRPC 'start_km'                        | String           |
| Destination KMA ID         | gRPC 'end_km'                          | String           |
| Application destination ID | not mapped                             |                  |
| Key IDs                    | gRPC 'key_id'                          | String           |
| Response                   | gRPC 'result_code'<br>ex) 0: OK, 1: NG | Integer          |
| Extension                  | gRPC 'error_message'                   | String           |
