AVANT-PROPOS

L'UIT-T (Secteur de la normalisation des télécommunications) est un organe permanent de l'Union internationale des télécommunications (UIT). Il est chargé de l'étude des questions techniques, d'exploitation et de tarification, et émet à ce sujet des Recommandations en vue de la normalisation des télécommunications à l'échelle mondiale.

La Conférence mondiale de normalisation des télécommunications (CMNT), qui se réunit tous les quatre ans, détermine les thèmes d'études à traiter par les Commissions d'études de l'UIT-T lesquelles élaborent en retour des Recommandations sur ces thèmes.

L'approbation des Recommandations par les Membres de l'UIT-T s'effectue selon la procédure définie dans la Résolution n° 1 de la CMNT (Helsinki, 1^{er}-12 mars 1993).

La Recommandation UIT-T X.283, que l'on doit à la Commission d'études 7 (1993-1996) de l'UIT-T, a été approuvée le 16 novembre 1993 selon la procédure définie dans la Résolution n° 1 de la CMNT.

NOTE

Dans la présente Recommandation, l'expression «Administration» est utilisée pour désigner de façon abrégée aussi bien une administration de télécommunications qu'une exploitation reconnue de télécommunications.

RÉSUMÉ

La présente Recommandation fournit les spécifications des informations de gestion relatives à la couche réseau de l'OSI, y compris la définition de la classe des objets de gestion de la couche réseau, la relation entre objets de gestion et attributs avec le fonctionnement de la couche et avec les autres objets et attributs de la couche les opérations de type action sur les attributs des objets de gestion de la couche réseau.

INTRODUCTION

La présente Recommandation fait partie d'un ensemble de Recommandations qui ont été établies pour faciliter l'interconnexion de systèmes ouverts. Cet ensemble de Recommandations traite des services, des protocoles et des informations de gestion qui sont nécessaires pour réaliser une telle interconnexion.

Les couches définies dans le Modèle de référence pour l'interconnexion de systèmes ouverts (voir la Recommandation X.200) situent la présente Recommandation, qui traite en particulier de la définition des informations de gestion dans la couche réseau, par rapport aux autres Recommandations du même ensemble.

Recommandation X.283

ÉLÉMENTS D'INFORMATION DE GESTION RELATIFS À LA COUCHE RÉSEAU DE L'INTERCONNEXION DE SYSTÈMES OUVERTS¹⁾

(Genève, 1993)

1 Champ d'application

La présente Recommandation spécifie les informations de gestion relatives aux opérations de la couche OSI réseau à l'intérieur d'un système ouvert. Les détails de mise en œuvre de la gestion de la couche réseau sont hors du champ d'application de la présente Recommandation. On définira les attributs d'information de gestion relatifs à la structure de la couche réseau en spécifiant ce qui suit:

- la définition d'une classe d'objets gérés conformément aux directives énoncées dans la «*Structure des informations de gestion*» (voir les Recommandations X.720-X.723) pour les objets gérés de la couche réseau;
- la relation des objets gérés et des attributs avec le fonctionnement de cette couche ainsi qu'avec d'autres objets et attributs de la couche; et
- les opérations de type «action» effectuées sur les attributs des objets gérés de la couche réseau qui sont soumis à la gestion des systèmes OSI.

2 Références normatives

Les Recommandations et les Normes internationales suivantes contiennent des dispositions qui, par suite de la référence qui y est faite, constituent des dispositions valables pour la présente Recommandation. Au moment de la publication, les éditions indiquées étaient en vigueur. Toute Recommandation ou Norme est sujette à révision et les parties prenantes aux accords fondés sur la présente Recommandation sont invitées à rechercher la possibilité d'appliquer les éditions les plus récentes des Recommandations et Normes indiquées ci-après. Les Membres de la CEI et de l'ISO possèdent le registre des Normes internationales en vigueur. Le Bureau de la normalisation des télécommunications tient à jour une liste des Recommandations du UIT-T en vigueur.

2.1 Recommandations | Normes internationales identiques

- Recommandation X.213 du CCITT (1992) | ISO/CEI 8348:1993, *Technologies de l'information – Interconnexion de systèmes ouverts – Définition du service de réseau*.
- Recommandation X.233 de l'UIT-T (1993) | ISO/CEI 8473:1993, *Technologies de l'information – Spécification du protocole pour le service OSI de réseau en mode sans connexion*.
- Recommandation X.701 du CCITT (1992) | ISO/CEI 10040:1992, *Technologies de l'information – Interconnexion de systèmes ouverts – Aperçu général de la gestion de systèmes*.
- Recommandation X.720 du CCITT (1992) | ISO/CEI 10165-1:1993, *Technologies de l'information – Interconnexion de systèmes ouverts – Services d'information de gestion – Structure des informations de gestion – Modèle d'information de gestion*.
- Recommandation X.721 du CCITT (1992) | ISO/CEI 10165-2:1992, *Technologies de l'information – Interconnexion de systèmes ouverts – Services d'information de gestion – Structure des informations de gestion – Définition des informations de gestion*.
- Recommandation X.722 du CCITT (1992) | ISO/CEI 10165-4:1992, *Technologies de l'information – Interconnexion de systèmes ouverts – Services d'information de gestion – Structure des informations de gestion – Directives pour la définition des objets gérés*.
- Recommandation X.723 de l'UIT-T (1993) | ISO/CEI 10165-5:1994, *Technologies de l'information – Interconnexion de systèmes ouverts – Services d'information de gestion – Structure des informations de gestion – Informations génériques de gestion*.

¹⁾ La présente Recommandation et l'ISO/CEI 10733, *Technologies de l'information – Télécommunications et échange d'informations entre systèmes – Éléments d'information de gestion relatifs à la structure de la couche OSI réseau*, sont des normes qui ont été élaborées en étroite collaboration et qui sont techniquement identiques.

Remplacée par une version plus récente

- Recommandation X.730 du CCITT (1992) | ISO/CEI 10164-1:1993, *Technologies de l'information – Interconnexion de systèmes ouverts – Gestion des systèmes – Fonction de gestion des objets*.
- Recommandation X.731 du CCITT (1992) | ISO/CEI 10164-2:1993, *Technologies de l'information – Interconnexion de systèmes ouverts – Gestion des systèmes – Fonction de gestion des états*.
- Recommandation X.732 du CCITT (1992) | ISO/CEI 10164-3:1993, *Technologies de l'information – Interconnexion de systèmes ouverts – Gestion des systèmes – Attributs pour représenter les relations*.

- ISO/CEI 10589:1992, *Technologies de l'information – Télécommunications et échange d'informations entre systèmes – Protocole intra-domaine de routage d'un système intermédiaire à un système intermédiaire, à utiliser conjointement avec le protocole fournissant le service de réseau en mode sans connexion (ISO 8473).*

3 Définitions

3.1 Modèle de référence

La présente Recommandation utilise les termes suivants, qui sont définis dans le Modèle de référence OSI (voir la Rec. X.200 du CCITT | ISO 7498):

- a) système ouvert;
- b) point d'accès au service réseau (NSAP);
- c) couche réseau;
- d) protocole de réseau;
- e) gestion de couche;
- f) gestion de systèmes.

3.2 Modèle d'information

La présente Recommandation utilise les termes suivants, qui sont définis dans la *Structure des informations de gestion – Modèle d'information de gestion* (voir la Rec. X.720 du CCITT | ISO/CEI 10165-1):

- a) attributs;
- b) type d'attribut;
- c) confinement;

Remplacée par une version plus récente

- d) nom distinctif;
- e) héritage;
- f) objet géré;
- g) opérations de gestion;
- h) notifications;
- i) classe d'objets;
- j) nom distinctif relatif;
- k) sous-classe;
- l) superclasse.

3.3 Directives pour la définition des objets gérés (GDMO) (*guidelines for the definition of managed objects*)

La présente Recommandation utilise les termes suivants, qui sont définis dans la *Structure des informations de gestion – Directives pour la définition des objets gérés* (voir la Rec. X.722 du CCITT | ISO/CEI 10165-4):

- a) définition d'une classe d'objets gérés;
- b) modèle (classe prédéfinie);
- c) paramètre.

3.4 Cadre général de gestion

La présente Recommandation utilise le terme suivant, qui est défini dans le *Cadre de gestion pour l'interconnexion de systèmes ouverts* (voir la Rec. X.700 du CCITT | ISO/CEI 7498-4):

- information de gestion

4 Symboles et abréviations

Dans le cadre des définitions d'objets gérés et des modèles de directives pour la définition des objets gérés (GDMO), les abréviations suivantes sont utilisées comme attribut de dénomination normal pour l'identification d'un document, lorsque l'on fait référence à d'autres documents:

DMI	Définition des informations de gestion (<i>definition of management information</i>) Rec. X.721 du CCITT ISO/CEI 10165-2
GMI	Informations génériques de gestion (<i>generic management information</i>) Rec. UIT-T X.723 ISO/CEI 10165-5

La présente Recommandation utilise les symboles et abréviations ci-après:..

BCUG	Groupe fermé d'usagers bilatéral (<i>bilateral closed user group</i>)
CLNP	Protocole de couche réseau en mode sans connexion (<i>connectionless-mode network protocol</i>)
CLNS	Service de couche réseau en mode sans connexion (<i>connectionless-mode network service</i>)
CMIP	Protocole de transfert d'informations communes de gestion (<i>common management information protocol</i>)
CMIS	Définition du service de transfert d'informations communes de gestion (<i>common management information service definition</i>)
CONS	Service de couche réseau en mode connexion (<i>connection-mode network service</i>)
CUG	Groupe fermé d'usager (<i>closed user group</i>)
ES	Système d'extrémité (<i>end system</i>)
ESH	Appel du système d'extrémité (<i>end system hello</i>)
ER PDU	Unités de données de protocole de signalisation d'erreur (<i>error report protocol data unit</i>)
IS	Système intermédiaire (<i>intermediate system</i>)
ISH	Appel du système intermédiaire (<i>intermediate system hello</i>)
IVMO	Objet géré valeurs initiales (<i>initial values managed object</i>)
LCN	Numéro de canal logique (<i>logical channel number</i>)

Remplacée par une version plus récente

MO	Objet géré (<i>managed object</i>)
NSAP	Point d'accès à des services de couche réseau (<i>network service access point</i>)
NSE	Attribut de service de couche réseau (<i>network service element</i>)
NUI	Identification de l'utilisateur de la couche réseau (<i>network user identification</i>)
PLE	Entité de couche paquet (<i>packet layer entity</i>)
PVC	Circuit virtuel permanent (<i>permanent virtual circuit</i>)
RD PDU	Unité de données de protocole de réacheminement (<i>redirect protocol data unit</i>)
RDN	Nom distinctif relatif (<i>relative distinguished name</i>)
SNDCF	Fonction de convergence des sous-réseaux (<i>subnetwork dependent convergence function</i>)
SNPA	Point de rattachement au sous-réseau (<i>subnetwork point of attachment</i>)
VC	Communication virtuelle (<i>virtual call</i>)

5 Eléments d'information de gestion relatifs à la structure de la couche réseau

5.1 Hiérarchie des objets gérés

5.1.1 Liste des objets gérés

L'ensemble suivant de classes d'objets gérés est défini pour la couche OSI réseau:

- a) l'objet géré sous-système de couche réseau (voir 5.3).
- b) l'objet géré entité de couche réseau (voir 5.4).
- c) l'objet géré point NSAP (voir 5.5).
- d) l'objet géré service de couche réseau en mode sans connexion (voir 5.6).
- e) l'objet géré lien (voir 5.7).
- f) l'objet géré service de couche réseau en mode connexion (voir 5.8).
- g) l'objet géré connexion de couche réseau (voir 5.9).
- h) l'objet géré ETTD d'entité PLE X.25 (voir 5.10.3).
- i) l'objet géré ETCD d'entité PLE X.25 (voir 5.10.4).
- j) l'objet géré valeurs initiales d'ETTD d'entité PLE X.25 (voir 5.10.5).
- k) l'objet géré valeurs initiales d'ETCD d'entité PLE X.25 (voir 5.10.6).
- l) l'objet géré ETTD de circuit virtuel permanent (voir 5.11.4).
- m) l'objet géré ETCD de circuit virtuel permanent (voir 5.11.5).
- n) l'objet géré valeurs initiales de communication virtuelle (voir 5.11.6).
- o) l'objet géré ETTD de communication virtuelle (voir 5.11.7).
- p) l'objet géré ETCD de communication virtuelle (voir 5.11.8).
- q) l'objet géré décomptes selon série de Recommandations D (voir 5.11.9).

Les classes d'objets gérés suivantes ne sont jamais instanciées mais n'existent que pour engendrer des sous-classes:

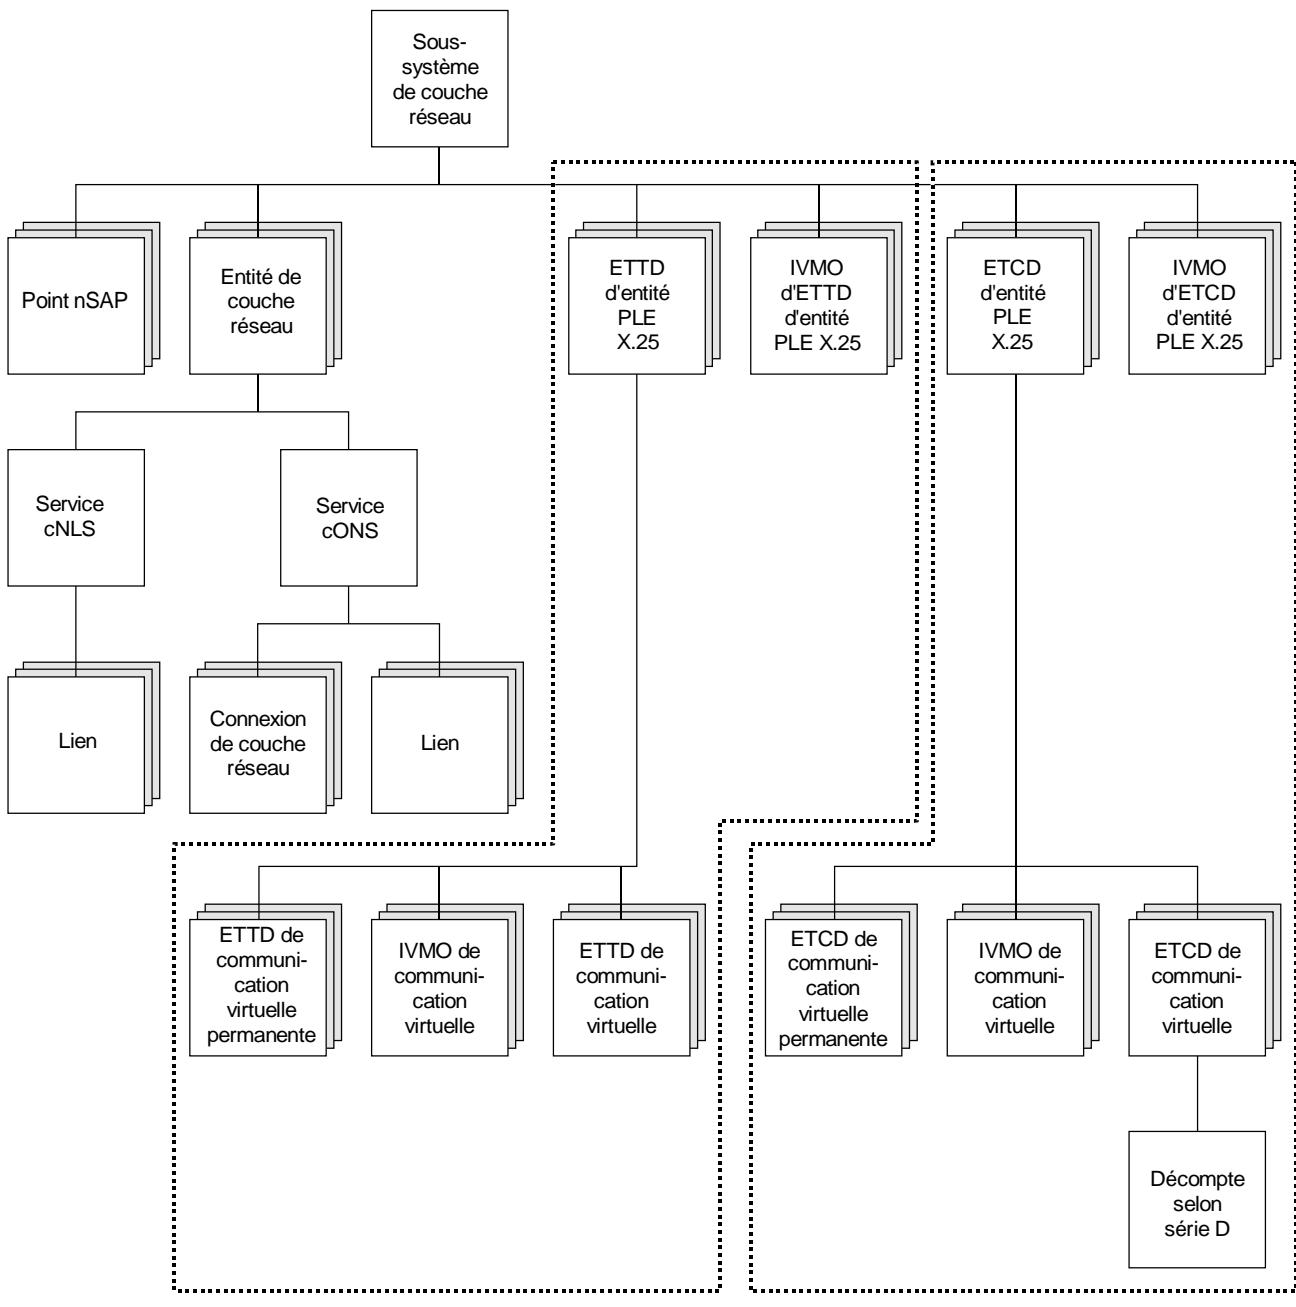

- a) l'objet géré entité PLE X.25 (voir 5.10.1).
- b) l'objet géré valeurs initiales d'entité PLE X.25 (voir 5.10.2).
- c) l'objet géré circuit virtuel (voir 5.11.1).
- d) l'objet géré ETTD de circuit virtuel (voir 5.11.2).
- e) l'objet géré ETCD de circuit virtuel (voir 5.11.3).

Ces objets gérés représentent la vue par la gestion OSI des attributs de système ouvert qui supportent le service de couche OSI réseau soumis aux opérations de gestion OSI.

5.1.2 Hiérarchie de confinement

La hiérarchie de confinement est décrite à la Figure 1. Les objets gérés qui peuvent avoir des instances multiples sont repérés par des cases (multiples) ombrées. Ces objets sont définis en détail dans les paragraphes suivants.

Remplacée par une version plus récente

T0714030-92/d01

FIGURE 1/X.283
Hiérarchie de confinement dans la couche réseau

Remplacée par une version plus récente

L'objet géré (MO) sous-système de couche réseau est subordonné à l'objet géré système de couche réseau. Les objets gérés entité PLE X.25 et IVMO d'entité PLE X.25 sont des exemples de ce qu'on appelle «objets gérés de point SNPA», qui sont des objets gérés spécifiques d'un sous-réseau. On prévoit l'apparition future d'un certain nombre d'objets gérés additionnels de type point SNPA, par exemple pour les RNIS.

L'objet géré point SNPA se rapporte au protocole utilisé pour accéder à un sous-réseau. Il existe par exemple un objet géré point SNPA pour chaque entité PLE X.25. L'objet géré service cLNS se rapporte aux fonctions des protocoles de service CLNS (selon la Rec. X.233 de l'UIT-T | ISO/CEI 8473-1, l'ISO 9542 et l'ISO/CEI 10589). Ces fonctions sont applicables au fonctionnement général du protocole dans son ensemble plutôt que dans ses relations avec des points de rattachement individuels. L'objet géré lien se rapporte, pour sa part, aux fonctions de convergence des sous-réseaux (SNDCF). L'objet géré service cONS et ses objets gérés lien associés sont de même applicables aux protocoles associés au service CONS (selon la Rec. X.223 de l'UIT-T | ISO/CEI 8878, la Rec. X.612 du CCITT | ISO/CEI 9574, l'ISO 10030, l'ISO/CEI 10177, etc.).

Pour les directives concernant les objets gérés contenus dans l'arbre de confinement qui doivent être instanciés pour une mise en œuvre conforme, voir les clauses applicables de la déclaration de conformité de cette instance.

5.1.3 Relations

5.1.3.1 Considération générale

Les paragraphes suivants décrivent chaque type de relation. L'utilisation d'attributs relationnels est illustrée par des exemples dans l'Appendice II.

5.1.3.2 Liens

Il existe une relation entre les objets gérés lien et point SNPA (les attributs sN-ServiceProvider et sN-SAP pointent tous les deux vers le même objet géré). Par exemple, un lien relatif à l'opération de la fonction SNDCF selon la Rec. X.233 de l'UIT-T | ISO/CEI 8473-1 pour le protocole X.25 possède une relation avec un objet géré ETTD d'entité PLE X.25. La relation d'un lien ne correspond qu'à un seul point SNPA. Dans le cas d'une entité de couche réseau contenant une seule machine protocole selon la Rec. X.233 de l'UIT-T | ISO/CEI 8473-1 opérant sur un certain nombre d'entités PLE X.25, il existera donc un certain nombre d'objets gérés lien, reliés chacun à un objet géré ETTD d'entité PLE X.25 différent. Bien qu'un seul lien ne corresponde qu'à un seul point SNPA, il est possible qu'un certain nombre d'autres liens soient en correspondance avec le même point SNPA. Il peut par exemple exister des liens de service cONS et des liens de service cLNS qui utilisent le même ETTD d'entité PLE X.25 et donc le même objet géré point SNPA.

Dans certains cas d'exploitation de la couche réseau, il peut n'y avoir aucun protocole d'accès spécifique. Par exemple, la Rec. X.233 de l'UIT-T | ISO/CEI 8473-1 contient une fonction SNDCF pour usage direct dans le service de liaison de données. Dans de tels cas, le lien possède des relations (attributs sN-ServiceProvider et sN-SAP pointant vers différents objets gérés) non pas avec un point SNPA mais avec des objets gérés appropriés dans la couche liaison de données.

5.1.3.3 Points NSAP

Il existe une relation (par l'attribut localSAPNames) entre un objet géré entité de couche réseau et un objet géré point nSAP. Chaque objet géré nSAP ne se rapporte qu'à une seule entité de couche réseau, bien qu'une même entité de couche réseau puisse être reliée à plusieurs objets gérés point nSAP.

5.1.3.4 Clients de couche n+1

L'objet géré point nSAP possède un ensemble de relations (par l'attribut userEntityName) avec les clients de couche n+1 (normalement l'entité de couche Transport, qui possède une relation (par l'attribut actualNSAP) avec l'objet géré point nSAP).

5.1.3.5 Services de couche n-1

Les objets gérés lien comme Entité PLE X.25 ont tous les deux des relations (par les attributs sN-ServiceProvider et sN-SAP) avec les objets gérés de couche liaison de données appropriés.

5.1.3.6 Connexions

Il existe une relation (par l'attribut underlyingConnectionNames) entre un objet géré connexion de transport et son objet géré sous-jacent connexion de couche réseau (s'il en existe un), ainsi qu'entre l'objet géré connexion de couche réseau et l'objet géré sous-jacent ETTD de communication virtuelle. La relation entre l'objet géré ETTD de communication

Remplacée par une version plus récente

virtuelle et un quelconque objet géré sous-jacent couche liaison de données est implicitement présente en tant que résultat des relations, avec la couche liaison de données, des objets gérés connexes ETTD d'entité PLE X.25 ou ETCD d'entité PLE X.25, comme décrit plus haut.

Il existe en outre une relation (par l'objet géré point NSAP local) entre l'objet géré connexion de couche réseau et l'objet géré correspondant point nSAP.

5.1.4 Capacités minimales de filtrage d'événements

Les définitions relatives à la gestion de la couche réseau, contenues dans la présente Recommandation, impliquent l'émission fréquente, sinon excessive, de notifications pendant les opérations normales de couche. Ces notifications sont particulièrement utiles pour une gestion efficace des dérangements car elles facilitent la recherche et la localisation des situations d'erreur. Pour éviter une dissémination excessive de ces rapports d'événement dans les conditions normales d'exploitation, il est souhaitable qu'un système géré possède, au moins, la capacité d'effectuer une sélection sur la base:

- a) de la classe d'objets gérés d'origine;
- b) des valeurs d'identification d'objets contenues dans les champs cause probable et problèmes spécifiques des messages d'alarme relatifs à la communication et sur la base des informations de communication contenues dans le champ type de communication.

5.1.5 Utilisation des champs facultatifs

Lorsque la présente Recommandation fait référence à la syntaxe ASN.1 définie dans la Rec. X.723 | ISO/CEI 10165-5 ou dans la Rec. X.721 | ISO/CEI 10165-2, seuls les champs suivants doivent être employés:

- a) ceux qui ne sont pas dénotés comme étant «OPTIONAL» dans la syntaxe ASN.1;
- b) ceux qui sont «OPTIONAL» mais dont l'usage est explicitement prescrit par la présente Recommandation;
- c) ceux qui sont «OPTIONAL» mais du type ASN.1 «SET OF ManagementExtension».

L'utilisation de quelques autres champs est interdite.

Remplacée par une version plus récente

5.2 Classes prédefinies de comportements communs

commonCreationDeletion-B BEHAVIOUR

DEFINED AS

!Managed object class imports the ISO/IEC 10165-2 objectCreation and objectDeletion notifications. Used as follows:
objectCreation - Generated whenever an instance of the managed object class is created. Implementations may optionally include the sourceIndicator parameter in the notification.
If creation occurred as a result of internal operation of the resource, the value 'resourceOperation' is used. If creation occurred in response to a management operation, the value 'managementOperation' is used. A value of 'unknown' may be returned if it is not possible to determine the source of the operation. None of the other optional parameters are used.
objectDeletion - Generated whenever an instance of the managed object class is deleted. Implementations may optionally include the sourceIndicator parameter in the notification.
If deletion occurred as a result of internal operation of the resource, the value 'resourceOperation' is used. If deletion occurred in response to a management operation, the value 'managementOperation' is used. A value of 'unknown' may be returned if it is not possible to determine the source of the operation. None of the other optional parameters are used.!;

commonStateChange-B BEHAVIOUR

DEFINED AS

!Managed object class imports the ISO/IEC 10165-2 stateChange notification.
Used to report the changes to the operationalState attribute, and where present, the administrativeState attribute. A single parameter set is included in the State change definition field.
Only the (mandatory) attributeId and (optional) newValue parameters are used.!;

octetsSentReceivedCounter-B BEHAVIOUR

DEFINED AS

The octetsSentCounter and octetsReceivedCounter shall count only user data octets in valid data packets. They shall not count user data octets in data packets which are rejected for any reason, nor user data octets in non data packets;

successfulConnectionEstablishment-B BEHAVIOUR

DEFINED AS

This Package imports the communicationsInformation notification from "GMI".
It is used to report the following events.
successfulConnectionEstablishment: Generated when a connection is successfully established. However, the precise synchronization between the notification and the corresponding protocol and service interface interactions is not defined by this Specification.
The value NLM.successfulConnectionEstablishment shall be reported in the informationType field.;

Remplacée par une version plus récente

deactivateConnection-B BEHAVIOUR

DEFINED AS

The Deactivate action causes the connection to be terminated. The termination should occur as rapidly as practical, but no particular time constraints are implied. Typically, this action simulates a disconnect request received across the service interface. If a more rapid means for terminating the connection exists, then this should be used. The termination shall occur in conformance to the protocol standard. The Managed Object remains in existence after completion of the Deactivate action. It is subsequently deleted when the connection is terminated, in the same way as if the connection has been terminated by other means. A deactivate action may fail (with the ProcessingError response) if it is temporarily not possible to terminate the connection.;

resettingTimer-B BEHAVIOUR

DEFINED AS

This attribute specifies the interval between certain events in the operation of the protocol state machine. If the value of this attribute is changed to a new value while the protocol state machine is in operation, the implementation shall take the necessary steps to ensure that for any time interval which was in progress when the corresponding attribute was changed, the next expiration of that interval takes place no later than the expiration of the interval in progress or the specified interval whichever is the sooner. The precision with which this time shall be implemented shall be the same as that associated with the basic operation of the timer attribute;

cLNS8473PImportedCounters-B BEHAVIOUR
DEFINED AS The cLNS8473-P package imports octetsSentCounter and octetsReceivedCounter from ISO/IEC 10165-2. They are used to count the number of octets of data transmitted or received by the local network entity in ITU-T Rec. X.233 | ISO/IEC 8473-1 Data PDUs. (i.e. those which have a source or destination N-Address, respectively, which corresponds to that one of those of the local network entity.)

cLNS8473PImportedNotifications-B BEHAVIOUR
DEFINED AS The cLNS8473-P package imports the communicationsAlarm notification from Rec. 721 | ISO/IEC 10165-2.
It is used to report the following cLNS managed object events.

pDUDiscard:
Generated when a data NPDU is discarded due to any of the reasons specified in ITU-T Rec. X.233 | ISO/IEC 8473-1 Table 7, with the exception of 'PDU Discarded due to Congestion'. The header of the PDU in error shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationPDUHeader parameters.
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.pDUDiscard and that corresponding to the Reason For Discard shall both be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field.
A PDU which does not contain one of the protocol identifiers defined in ITU-T Rec. X.233 | ISO/IEC 8473-1 shall not cause this event.
A PDU with a protocol ID 1000 0001 shall not cause this event if it does not also contain the Version/Protocol Identifier extension in 7.2.4 of ITU-T Rec. X.233 | ISO/IEC 8473-1.
If an error report PDU is generated, the PDU header and Discard Reason in the error report shall be the same as those in the corresponding notification.

;

linkage-ISO9542ISReachabilityChange-B BEHAVIOUR
 DEFINED AS
 This package imports the communicationsInformation notification
 from Rec. X.723 | ISO/IEC 10165-5.
 It is used to report the following events.

iSReachabilityChange:

 Generated when an ES or IS detects a change
 in the reachability of a neighbouring IS.
 The value NLM.iSReachabilityChange shall be reported in the
 informationType field.
 The new State, NET of the IS concerned, snpaAddress (where
 available) and the reason for the change shall be reported
 in the informationData field using the reachabilityChange
 PARAMETER.

linkage-ISO9542ESReachabilityChange-B BEHAVIOUR
 DEFINED AS
 This package imports the communicationsInformation notification
 from Rec. X.723 | ISO/IEC 10165-5.
 It is used to report the following events.

Remplacée par une version plus récente

eSReachabilityChange:

Generated when an ES or IS detects a change in the reachability of a neighboring ES.
The value NLM.eSReachabilityChange shall be reported in the informationType field.
The new State, set of NSAPAddresses of the IS concerned, the snpaAddress (where available) and the reason for the change shall be reported in the informationData field using the reachabilityChange PARAMETER.

;

linkage-ISO9542ImportedAlarmNotifications-B BEHAVIOUR

DEFINED AS This package imports the communicationsAlarm notification from Rec. X.721 (1992) | ISO/IEC 10165-2.
It is used to report the following events.

invalid9542PDU:

Generated when an ISO 9542 PDU is received which is discarded as result of the PDU Header Error Detection or Protocol Error Processing Functions specified in ISO 9542.
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.iSO9542PDUDiscard shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the AdditionalInformation field.

operationalProtocolIV-B BEHAVIOUR

DEFINED AS If the linkage MO is created by management operation (using the linkage-cLNS-Management name binding), the initial value of the operationalProtocols attribute shall be specified in the CMIP create.
Otherwise, the value shall be determined in an implementation specific manner;

sN-ServiceProviderIV-B BEHAVIOUR

DEFINED AS If the linkage MO is created by management operation (using the linkage-cONS-Management or linkage-cONS-Management name bindings), the initial value of the sN-ServiceProvider attribute shall be specified in the CMIP create.
Otherwise, the value shall be determined in an implementation specific manner;

-- *Attributs*

activeESConfigTimer ATTRIBUTE
DERIVED FROM "GMI":timer;
BEHAVIOUR activeESConfigTimer-B BEHAVIOUR
DEFINED AS Currently active value for the ISO 9542 ES configuration timer
in seconds.;;
REGISTERED AS { NLM.aoi activeESConfigTimer (22) };

callsFailed ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR callsFailed-B BEHAVIOUR
DEFINED AS Counter of the number of X.25 call failures
while attempting establishment by the SNDCF;;
REGISTERED AS { NLM.aoi callsFailed (30) };

callsPlaced ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR callsPlaced-B BEHAVIOUR
DEFINED AS Counter of the number of X.25 VCs successfully established
by the SNDCF;;
REGISTERED AS { NLM.aoi callsPlaced (29) };

defaultESConfigTimer ATTRIBUTE
DERIVED FROM "GMI":timer;
BEHAVIOUR resettingTimer-B, defaultESConfigTimer-B BEHAVIOUR
DEFINED AS Default value for the ISO 9542 ES configuration timer
in seconds. This value is used when the ES has not received,
or has not chosen to accept, a suggested configuration timer
value from an Intermediate System;;
REGISTERED AS { NLM.aoi defaultESConfigTimer (21) };

eSReachabilityChanges ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR eSReachabilityChanges-B BEHAVIOUR
DEFINED AS Count of the number of changes in reachability of End Systems
from this system;;
REGISTERED AS { NLM.aoi eSReachabilityChanges (27) };

holdingTimerMultiplier ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
BEHAVIOUR holdingTimerMultiplier-B BEHAVIOUR
DEFINED AS The factor to derive holding timer from configuration timer.
This value, when multiplied by a configuration timer yields the value of
the holding timer parameter issued with configuration information. The semantics of
this parameter are such that it is permissible to also add a delta value to the result to
compensate for possible delays and imprecision of timers. The result of the calculation
is truncated, upon overflow, to the maximum value for the parameter permitted by the
protocol (65535);;
REGISTERED AS { NLM.aoi holdingTimerMultiplier (20) };

Remplacée par une version plus récente

idleTimer ATTRIBUTE

DERIVED FROM "GMI":timer;

BEHAVIOUR idleTimer-B BEHAVIOUR

DEFINED AS Time in seconds before release of an idle call.

This timer determines the interval (in seconds) for which a call is permitted to remain idle (i.e. no data traffic in either direction) before being released by the SNDCF;;

REGISTERED AS { NLM.aoi idleTimer (31) };

initialMinimumTimer ATTRIBUTE

DERIVED FROM "GMI":timer;

BEHAVIOUR initialMinimumTimer-B BEHAVIOUR

DEFINED AS Minimum time in seconds to retain call after establishment.

This timer determines the interval (in seconds) that a call shall remain connected after being established, irrespective of traffic. (NOTE – This should be set small enough so that the call is cleared before the start of the next charging interval.);

REGISTERED AS { NLM.aoi initialMinimumTimer (33) };

invalid9542PDUs ATTRIBUTE

DERIVED FROM "GMI":nonWrapping64BitCounter;

BEHAVIOUR invalid9542PDUs-B BEHAVIOUR

DEFINED AS Counter of invalid 9542 PDUs received.

This is the number of ISO 9542 PDUs received which are discarded as a result of the PDU Header Error Detection or Protocol Error Processing Functions specified in ISO 9542;;

-- NOTE – Ce compteur cumulera donc le nombre de notifications

-- de type communicationsAlarm qui ont été émises avec une valeur

-- NLM.ISO9542PDUDiscard dans l'attribut specificProblem.

REGISTERED AS { NLM.aoi invalid9542PDUs (101) };

iSConfigurationTimer ATTRIBUTE

DERIVED FROM "GMI":timer;

BEHAVIOUR resettingTimer-B, iSConfigurationTimer-B BEHAVIOUR

DEFINED AS Value in seconds for the ISO 9542 IS configuration timer.

It is used to determine how often an IS reports configuration information to ESs;;

REGISTERED AS { NLM.aoi iSConfigurationTimer (24) };

iSO9542OperationalSubsets ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.ISO9542Subsets;

MATCHES FOR EQUALITY;

BEHAVIOUR iSO9542OperationalSubsets-B BEHAVIOUR

DEFINED AS The set of ISO 9542 subsets operational on this linkage.;;

BEHAVIOUR linkageld-B BEHAVIOUR
DEFINED AS The naming attribute of the linkage MO instance;;
REGISTERED AS { NLM.aoi linkageld (17) };

manualISSNPAAddress ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.ManualISSNPAAddress;
MATCHES FOR SET-COMPARISON, SET-INTERSECTION;
BEHAVIOUR manualISSNPAAddress-B BEHAVIOUR
DEFINED AS The set of SNPA Addresses to which calls associated with the SNDCF are to be established in the absence of any other information. The maximum set cardinality shall be implementation specific. An attempt to set the value of an element of this set to a type of SNPAAddress which is not supported by this linkage shall result in a failure of the SET operation.;;
REGISTERED AS { NLM.aoi manualISSNPAAddress (28) };

operationalProtocols ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.SupportedProtocols;
MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION;
BEHAVIOUR operationalProtocols-B BEHAVIOUR
DEFINED AS The set of network layer protocols supported by this instance of the linkage MO, expressed as the registered object identifiers of the relevant International Standard.;;
REGISTERED AS { NLM.aoi operationalProtocols (111) };

redirectHoldingTime ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.RedirectHoldingTime;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR redirectHoldingTime-B BEHAVIOUR
DEFINED AS The holding time (in seconds) to be specified in Redirect PDUs generated by this system;;
REGISTERED AS { NLM.aoi redirectHoldingTime (26) };

reserveTimer ATTRIBUTE
DERIVED FROM "GMI":timer;
BEHAVIOUR reserveTimer-B BEHAVIOUR
DEFINED AS Time in seconds to reserve resources for call re-establishment.
This timer determines the interval (in seconds) for which an attempt shall be made to retain those resources, as determined by the implementation, whose retention will increase the probability of successful re-establishment of an idled VC;;
REGISTERED AS { NLM.aoi reserveTimer (32) };

Remplacée par une version plus récente

sN-SAP ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.LocalDistinguishedName;
MATCHES FOR EQUALITY;
BEHAVIOUR sN-SAP-B BEHAVIOUR
DEFINED AS Distinguished name of the service provider SAP MO
(if present).
This is obtained via an internal interface when the linkage is enabled. The sN-SAP may be a relationship to an SAP MO in the Datalink Layer, or it may be a relationship to another Managed Object within the Network Layer which is not an SAP MO.
For example, when operating ITU-T Rec. X.233 | ISO/IEC 8473-1 over the ISO/IEC 8208 or ITU-T Rec. X.25 SNDCF,
it is a relationship to the same x25PLE-DTE MO which is pointed to by the sN-ServiceProvider Attribute. ;;

REGISTERED AS { NLM.aoi sN-SAP (18) };

sN-ServiceProvider ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.LocalDistinguishedName;
MATCHES FOR EQUALITY;
BEHAVIOUR sN-ServiceProvider-B BEHAVIOUR
DEFINED AS Distinguished name of the SN service provider MO.
This attribute identifies the subnetwork entity to be used to support the linkage, when enabled. The subnetwork service provider may be in the Datalink Layer, or it may be in the Network Layer
(for example when operating ITU-T Rec. X.233 | ISO/IEC 8473-1 over the ISO/IEC 8208 or ITU-T Rec. X.25 SNDCF).;;

REGISTERED AS { NLM.aoi sN-ServiceProvider (19) };

suggestedESConfigurationTimer ATTRIBUTE

DERIVED FROM "GMI":timer;

5.8 L'objet géré service de couche réseau en mode connexion

--
-- Il n'existe pas plus d'un seul de ces objets gérés par entité de couche réseau.
-- La définition de cet objet permet de créer et de supprimer explicitement celui-ci
-- au moyen d'une opération de gestion. Mais dans certains systèmes, il aura une existence
-- intrinsèque et il ne sera pas possible de le créer ou de le supprimer par une opération
-- de gestion. Des corrélations de noms sont définies pour ces deux cas.
--
-- Lorsque la machine protocole est exploitable, l'attribut operationalState doit avoir
-- la valeur «activé»; sinon il doit avoir la valeur «désactivé». Les transitions d'état
-- de l'attribut operationalState doivent être signalées au moyen de la
-- notification stateChange. Un objet géré service cONS peut être créé dans
-- l'état opérationnel «activé».
--

5.10.3 L'objet géré ETTD d'entité PLE X.25

- Il peut exister plusieurs instances de ces objets gérés à l'intérieur d'un système,
- correspondant à de multiples entités PLE X.25.
-
- La définition de cet objet géré permet de le créer et de le supprimer explicitement
- ou automatiquement, au moyen d'une opération du système. Lorsqu'une instance de cet
- objet géré est créée automatiquement, on peut utiliser une instance de l'IVMO d'ETTD
- d'entité PLE X.25 comme origine des valeurs initiales pour les attributs de cet objet
- géré.
-
- Lorsque l'entité PLE X.25 est exploitable, l'attribut operationalState doit avoir la valeur
- «activé»; sinon, il doit avoir la valeur «inactivé». Les transitions d'état de l'attribut
- operationalState doivent être signalées au moyen de la notification stateChange.

x25PLEImportedNotifications-B BEHAVIOUR

DEFINED AS The x25PLE-P package imports the communicationsAlarm notification from Rec. X.721 (1992) | ISO/IEC 10165-2.

It is used to report the following x25PLE managed object events.

providerInitiatedDisconnect:

Issued upon receipt of a clear packet with a cause code other than 'DTE originated'.

The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER.

The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.

The value NLM.providerInitiatedDisconnect shall be reported in the specificProblems parameter.

The probableCause shall be set to NLM.communicationsProtocolError.

The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.

No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

Remplacée par une version plus récente

remotelyInitiatedReset:

Issued upon occurrence of a remotely initiated reset.
This event is issued in lieu of a 'providerInitiatedReset' when operating in a DTE-DXE environment.
The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.remotelyInitiatedDisconnect shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

providerInitiatedReset:

Issued upon occurrence of a provider initiated reset.
This event is issued when operating in a DTE-DCE environment.
The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.providerInitiatedReset shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

remotelyInitiatedRestart:

Issued upon receipt of a remotely (including provider) initiated restart.
The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.remotelyInitiatedRestart shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

Remplacée par une version plus récente

restartCountExceeded:

Issued on restart failure due to restart count (R20) exceeded.
The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.restartCountExceeded shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

protocolErrorDetectedLocally:

Issued upon receipt of a packet which causes the "A=Error" action in the ISO/IEC 8208 or ITU-T Rec. X.25 state tables to be taken.
The information relating to the packet shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER. The values of cause and diagnostic codes shall be those which would have been placed in a diagnostic packet had one been generated by the DTE (i.e. as if it were a DTE). The actual generation of such a packet is not required.
The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.
The value NLM.communicationsProtocolErrorDetectedLocally shall be reported in the specificProblems parameter.
The probableCause shall be set to NLM.communicationsProtocolError.
The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.
No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

accusedOfProtocolError:

Issued upon receipt of a diagnostic packet or a clear, reset or restart packet with a cause code equal to one of the following:

Remote Procedure Error,
Incompatible Destination,
Invalid Facility Request,
Local Procedure Error.

No other x25PLE communication alarm shall be generated as a result of this particular instance of packet.

The information relating to the packet shall be reported as a

Remplacée par une version plus récente

parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER

The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.

The value NLM.accusedOfProtocolError shall be reported in the specificProblems parameter. The probableCause shall be set to NLM.communicationsProtocolError.

The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.

No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

callEstablishmentRetryCountExceeded:

Issued on retry failure during call establishment due to retry limit exceeded.

The information relating to the call shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER

The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.

The value NLM.callEstablishmentRetryCountExceeded shall be reported in the specificProblems parameter. The probableCause shall be set to NLM.communicationsProtocolError.

The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.

No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

clearCountExceeded:

Issued on retry failure due to clear limit (R23) exceeded.

The information relating to the call shall be reported as a parameter in the additionalInformation field of the communicationsAlarm, using the notificationData PARAMETER

The significance sub-parameter of each item of additionalInformation shall be set to the value 'False' (i.e. not significant) so that a managing system receiving the event report will be less likely to reject it.

The value NLM.clearCountExceeded shall be reported in the specificProblems parameter. The probableCause shall be set to NLM.communicationsProtocolError.

The perceivedSeverity shall be set to 'Minor'. A subsequent communicationsAlarm with a perceivedSeverity value of 'Cleared' shall not be generated.

No other fields or parameters shall be used, with the exception of further parameters in the additionalInformation field.

 WITH ATTRIBUTE x25PLEId;
BEHAVIOUR x25PLE-networkSubsystem-Automatic-B BEHAVIOUR
DEFINED AS The name binding that applies when the x25PLE Managed Object
or its subclasses are created by automatic operation of the system.
The creation of an instance of the x25PLE MO or its subclass
using this name binding may reference an instance of the x25PLEIVMO
(or of its subclass). The means by which such an instance (if any)
of the x25PLEIVMO (or its subclass) is identified a local matter.
When this occurs,
some of the initial values of the attributes of the instance
of the x25PLE MO (or its subclass) may be supplied by the values of the
attributes in the specified instance of the x25PLEIVMO. However, any
such value may be overridden by a value supplied by local means (for
example across an internal interface). Where values are supplied by the
IVMO, the initial value of an attribute of the x25PLE MO (or its subclass)
shall be the value of the corresponding attribute in the x25PLEIVMO
(that is, which has the same attribute template label). The naming
attribute of the x25PLE MO (or its subclass) is assigned a value
according to local mechanisms;;

as described in ITU-T Recommendation X.2 Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi callRedirection (129) };

callRequestResponseTimer ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR callRequestResponseTimer-B BEHAVIOUR
DEFINED AS Value for Timer T21 (Call Request Response Timer)
in seconds;;
REGISTERED AS { NLM.aoi callRequestResponseTimer (77) };

callTimeouts ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR callTimeouts-B BEHAVIOUR
DEFINED AS Counter of the number of times timer T21 expiry is experienced
by the PLE;;
REGISTERED AS { NLM.aoi callTimeouts (55) };

callsConnected ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR callsConnected-B BEHAVIOUR
DEFINED AS Counter of the total number of calls which have reached the open state;;
REGISTERED AS { NLM.aoi callsConnected (53) };

chargingInformation ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR chargingInformation-B BEHAVIOUR
DEFINED AS The subscription of the charging information facility
as described in ITU-T Recommendation X.2.
Expressed as a boolean where a value of 'True' indicates
subscription and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi chargingInformation (132) };

clearCountsExceeded ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR clearCountsExceeded-B BEHAVIOUR
DEFINED AS Counter associated with the clearCountExceeded event
which generates a communications alarm notification.;;
REGISTERED AS { NLM.aoi clearCountsExceeded (66) };

Remplacée par une version plus récente

clearIndication ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR clearIndication-B BEHAVIOUR
DEFINED AS Value for the Clear Indication, T13 timer, in seconds.;;
REGISTERED AS { NLM.aoi clearIndication (133) };

clearRequestResponseTimer ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR clearRequestResponseTimer-B BEHAVIOUR
DEFINED AS Value for Timer T23 (Clear Request Response Timer)
in seconds;;
REGISTERED AS { NLM.aoi clearRequestResponseTimer (79) };

clearRequestRetransmissionCount ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR clearRequestRetransmissionCount-B BEHAVIOUR
DEFINED AS Value for count R23 (Clear Request Retransmission Count);;
REGISTERED AS { NLM.aoi clearRequestRetransmissionCount (81) };

clearTimeouts ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR clearTimeouts-B BEHAVIOUR
DEFINED AS Counter of the number of times timer T23 expiry is experienced
by the PLE;;
REGISTERED AS { NLM.aoi clearTimeouts (56) };

cUG ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR cUG-B BEHAVIOUR
DEFINED AS The subscription of the closed user group facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi cUG (134) };

cUGWithIncomingAccess ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR cUGWithIncomingAccess-B BEHAVIOUR
DEFINED AS The subscription of the closed user group with incoming access facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi cUGWithIncomingAccess (136) };

Remplacée par une version plus récente

cUGWithOutgoingAccess ATTRIBUTE

 WITH ATTRIBUTE SYNTAX NLM.Boolean;
 MATCHES FOR EQUALITY;
 BEHAVIOUR cUGWithOutgoingAccess-B BEHAVIOUR
 DEFINED AS The subscription of the CUG with outgoing access facility
 as described in ITU-T Recommendation X.2. Expressed as a boolean
 where a value of 'True' indicates subscription
 and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi cUGWithOutgoingAccess (137) };

dBitModification ATTRIBUTE

 WITH ATTRIBUTE SYNTAX NLM.Boolean;
 MATCHES FOR EQUALITY;
 BEHAVIOUR dBitModification-B BEHAVIOUR
 DEFINED AS The subscription of the D bit modification facility
 as described in ITU-T Recommendation X.2. Expressed as a boolean
 where a value of 'True' indicates subscription and a value
 of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi dBitModification (139) };

dataPacketRetransmissionCount ATTRIBUTE

 WITH ATTRIBUTE SYNTAX NLM.Integer;
 MATCHES FOR EQUALITY, ORDERING;
 BEHAVIOUR dataPacketRetransmissionCount-B BEHAVIOUR
 DEFINED AS Value for count R25 (Data Packet Retransmission Count);;
REGISTERED AS { NLM.aoi dataPacketRetransmissionCount (85) };

dataPacketsReceived ATTRIBUTE

 DERIVED FROM "GMI":nonWrapping64BitCounter;
 BEHAVIOUR dataPacketsReceived-B BEHAVIOUR
 DEFINED AS Counter of the total number of data packets received;;
REGISTERED AS { NLM.aoi dataPacketsReceived (51) };

dataPacketsSent ATTRIBUTE

 DERIVED FROM "GMI":nonWrapping64BitCounter;
 BEHAVIOUR dataPacketsSent-B BEHAVIOUR
 DEFINED AS Counter of the total number of data packets sent;;
REGISTERED AS { NLM.aoi dataPacketsSent (50) };

dataRetransmissionTimerExpiries ATTRIBUTE

 DERIVED FROM "GMI":nonWrapping64BitCounter;
 BEHAVIOUR dataRetransmissionTimerExpiries-B BEHAVIOUR
 DEFINED AS Counter of the number of expiries of timer T25.
 Returns zero if the option is not implemented;;
REGISTERED AS { NLM.aoi dataRetransmissionTimerExpiries (58) };

Remplacée par une version plus récente

defaultPacketSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY;
BEHAVIOUR defaultPacketSizes-B BEHAVIOUR
DEFINED AS The default value of the packet sizes.
A value of NULL indicates the ISO/IEC 8208 or ITU-T Rec. X.25 default value of 128. Any other value indicates the value agreed by the nonstandard default packet sizes facility.;;
REGISTERED AS { NLM.aoi defaultPacketSizes (103) };

defaultThroughputClasses ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY;
BEHAVIOUR defaultThroughputClasses-B BEHAVIOUR
DEFINED AS The default throughput class values.
A value of NULL indicates the normal default.
Any other value indicates the value agreed by the defaultThroughputClassesAssignment facility.;;
REGISTERED AS { NLM.aoi defaultThroughputClasses (112) };

defaultThroughputClassesAssignment ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.DefaultTCA;
MATCHES FOR EQUALITY;
BEHAVIOUR defaultThroughputClassesAssignment-B BEHAVIOUR
DEFINED AS The subscription of the default throughput classes assignment facility as described in ITU-T Recommendation X.2. Expressed as a boolean where a value of 'True' indicates subscription and a value of 'False' indicates non-subscription.;;
REGISTERED AS { NLM.aoi defaultThroughputClassesAssignment (144) };

defaultWindowSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY;
BEHAVIOUR defaultWindowSizes-B BEHAVIOUR
DEFINED AS The default value of the window sizes.
A value of NULL indicates the ITU-T Recommendation | International Standard default value of 2. Any other value indicates the value agreed by the nonstandard default window sizes facility.;;
REGISTERED AS { NLM.aoi defaultWindowSizes (104) };

extendedPacketSequenceNumbering ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.PacketSequencing;
MATCHES FOR EQUALITY;
BEHAVIOUR extendedPacketSequenceNumbering-B BEHAVIOUR
DEFINED AS The modulo of the packet sequence number space.
Expressed as an integer. The ITU-T Recommendation | International Standard only requires support for at least one of the two values 8 and 128, but it is possible that some future revision may extend the range. A system is only required to support the setting of values which are also required by the protocol standard. A system shall return an error when an attempt is made to set the value to a value which is not supported by that system.;;
REGISTERED AS { NLM.aoi extendedPacketSequenceNumbering (49) };

Remplacée par une version plus récente

fastSelectAcceptance ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR fastSelectAcceptance-B BEHAVIOUR
DEFINED AS The subscription of the fast select acceptance
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi fastSelectAcceptance (145) };

flowControlParameterNegotiation ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR flowControlParameterNegotiation-B BEHAVIOUR
DEFINED AS The subscription of the flow control parameter negotiation facility
as described in ITU-T Recommendation X.2.
When this has the value 'true', the use of flow control
parameter negotiation (by specifying values for the window
and packet size in call request and accept packets) is
permitted. When it has the value 'false', no such values
shall be specified in call request and accept packets, and
any values specified in an I'MO or via an internal interface
shall be ignored.;;
REGISTERED AS { NLM.aoi flowControlParameterNegotiation (119) };

huntGroup ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR huntGroup-B BEHAVIOUR
DEFINED AS The subscription of the hunt group facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi huntGroup (146) };

incomingCall ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR incomingCall-B BEHAVIOUR
DEFINED AS Value for the Incoming Call, T11 timer, in seconds.;;
REGISTERED AS { NLM.aoi incomingCall (147) };

incomingCallBarredWithinCUG ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR incomingCallBarredWithinCUG-B BEHAVIOUR
DEFINED AS The subscription of the incoming call barred within a CUG facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and
a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi incomingCallBarredWithinCUG (149) };

Remplacée par une version plus récente

incomingCallsBarred ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR incomingCallsBarred-B BEHAVIOUR
DEFINED AS The subscription of the incoming calls barred facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi incomingCallsBarred (148) };

interruptPacketsReceived ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR interruptPacketsReceived-B BEHAVIOUR
DEFINED AS Counter of the number of interrupt packets received
by the PLE or over the PVC/VC;;
REGISTERED AS { NLM.aoi interruptPacketsReceived (68) };

interruptPacketsSent ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR interruptPacketsSent-B BEHAVIOUR
DEFINED AS Counter of the number of interrupt packets sent
by the PLE or over the PVC/VC;;
REGISTERED AS { NLM.aoi interruptPacketsSent (67) };

interruptResponseTimer ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR interruptResponseTimer-B BEHAVIOUR
DEFINED AS Value for Timer T26 (Interrupt Response Timer) in seconds;;
REGISTERED AS { NLM.aoi interruptResponseTimer (82) };

interruptTimerExpiries ATTRIBUTE
DERIVED FROM "GMI":nonWrapping64BitCounter;
BEHAVIOUR interruptTimerExpiries-B BEHAVIOUR
DEFINED AS Counter of the number of expiries of timer T26
experienced by the PLE or over the PVC/VC;;
REGISTERED AS { NLM.aoi interruptTimerExpiries (69) };

localChargingPrevention ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR localChargingPrevention-B BEHAVIOUR
DEFINED AS The subscription of the local charging prevention facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi localChargingPrevention (150) };

Remplacée par une version plus récente

localDTEAddress ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.DTEAddress;
MATCHES FOR EQUALITY;
BEHAVIOUR localDTEAddress-B BEHAVIOUR
DEFINED AS The full DTE address of this PLE
expressed as an X.121, E.164, etc. address;;
REGISTERED AS { NLM.aoi localDTEAddress (39) };

logicalChannelAssignments ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.LogicalChannelAssignments;
MATCHES FOR EQUALITY;
BEHAVIOUR logicalChannelAssignments-B BEHAVIOUR
DEFINED AS Represents the logical channel assignments of this PLE,
expressed as a four-tuple where the values represent
the set (with maximum permitted cardinality (LIC - 1), minimum required
cardinality of zero) of PVC channels (with maximum value (LIC - 1),
and minimum value 1) assigned,
the incoming channel range,
the two-way channel range,
the outgoing channel range,
respectively.

The presence of each of the ranges shall be optional. Absence of a particular range
shall signify that there are no channels of that type assigned. Within each range, the
low value shall be less than or equal to the high value, and there shall be no value in any
set or range which is greater than or equal to a value in a subsequent range when ordered
as above.

This attribute is subject to the rules for logical assignments described in 3.7 of
ISO/IEC 8208 or ITU-T Rec. X.25.;;

REGISTERED AS { NLM.aoi logicalChannelAssignments (48) };

maxActiveCircuits ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.MaxActiveCircuits;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR maxActiveCircuits-B BEHAVIOUR
DEFINED AS The maximum number of active circuits permitted on this PLE.
When the NULL value is specified, the maximum number of active circuits
shall be limited only by the resources available to the entity;;
REGISTERED AS { NLM.aoi maxActiveCircuits (41) };

minimumRecallTimer ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.Integer;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR minimumRecallTimer-B BEHAVIOUR
DEFINED AS Minimum time in seconds before recall permitted.
This timer determines the minimum interval (in seconds) which shall elapse
following an unsuccessful first call attempt before a subsequent call attempt is
permitted;;
REGISTERED AS { NLM.aoi minimumRecallTimer (43) };

Remplacée par une version plus récente

nonStandardDefaultPacketSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.NonStandardDPS;
MATCHES FOR EQUALITY;
BEHAVIOUR nonStandardDefaultPacketSizes-B BEHAVIOUR
DEFINED AS The subscription of the non standard default packet sizes facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi nonStandardDefaultPacketSizes (151) };

nonStandardDefaultWindowSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.NonStandardDWS;
MATCHES FOR EQUALITY;
BEHAVIOUR nonStandardDefaultWindowSizes-B BEHAVIOUR
DEFINED AS The subscription of the non standard default window sizes facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi nonStandardDefaultWindowSizes (152) };

nUIOverride ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR nUIOverride-B BEHAVIOUR
DEFINED AS The subscription of the NUI override facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi nUIOverride (154) };

nUISubscription ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR nUISubscription-B BEHAVIOUR
DEFINED AS The subscription of the NUI subscription facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi nUISubscription (153) };

oneWayLogicalChannellIncoming ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR oneWayLogicalChannellIncoming-B BEHAVIOUR
DEFINED AS The subscription of the one way logical channel incoming facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi oneWayLogicalChannellIncoming (156) };

oneWayLogicalChannelOutgoing ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR oneWayLogicalChannelOutgoing-B BEHAVIOUR
DEFINED AS The subscription of the one way logical channel outgoing facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi oneWayLogicalChannelOutgoing (157) };

onlineFacilityRegistration ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR onlineFacilityRegistration-B BEHAVIOUR
DEFINED AS The subscription of the on-line facility registration facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non subscription;;
REGISTERED AS { NLM.aoi onlineFacilityRegistration (158) };

outgoingCallBarredWithinCUG ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR outgoingCallBarredWithinCUG-B BEHAVIOUR
DEFINED AS The subscription of the outgoing call barred within a CUG facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription
and a value of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi outgoingCallBarredWithinCUG (160) };

outgoingCallsBarred ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR outgoingCallsBarred-B BEHAVIOUR
DEFINED AS The subscription of the outgoing calls barred facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription;;
REGISTERED AS { NLM.aoi outgoingCallsBarred (159) };

packetRetransmission ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR packetRetransmission-B BEHAVIOUR
DEFINED AS The subscription of the packet retransmissions facility
as described in ITU-T Recommendation X.2. Expressed as a boolean
where a value of 'True' indicates subscription and a value
of 'False' indicates non-subscription. If non-subscription,
then the attributes for rejectTimer and rejectCount
will have NULL values.;;
REGISTERED AS { NLM.aoi packetRetransmission (161) };

DEFINED AS Created only by the operation of the protocol or local
interface. The instance name is derived automatically
(as for CREATE WITH-AUTOMATIC-INSTANCE-NAMING).
The creation of an instance of the virtualCall-DTE MO
using this name binding may reference an instance of the
virtualCallIVMO. The means by which such an instance (if any)
of the virtualCallIVMO is identified is a local matter.
When this occurs,
some of the initial values of the attributes of the instance
of the virtualCall-DTE MO may be supplied by the values of the
attributes in the specified instance of the virtualCallIVMO. However, any
such value may be overridden by a value supplied by local means (for
example, across an internal interface). Where values are supplied by the
IVMO, the initial value of an attribute of the virtualCall-DTE MO
shall be the value of the corresponding attribute in the virtualCallIVMO
(that is, which has the same attribute template label). The naming
attribute of the virtualCall-DTE is assigned a value
according to local mechanisms.;;

packetSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY;
BEHAVIOUR packetSizes-B BEHAVIOUR
DEFINED AS The packet sizes for this VC.
In the case of an IVMO MO it is the proposed value of the
packet sizes (incoming and outgoing) to be used when establishing
the virtual call, expressed in octets. The value of NULL
indicates that the default packet size for that direction
(as indicated by the defaultPacketSizes attribute of the
containing X.25 PLE MO), is to be used.
In the case of a non-IVMO MO it is the actual packet sizes
in use for this VC;;
REGISTERED AS { NLM.aoi packetSizes (121) };

redirectReason ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.RedirectReason;
MATCHES FOR EQUALITY;
BEHAVIOUR redirectReason-B BEHAVIOUR
DEFINED AS The reason why the call has been redirected.
This is the reason why the call has been offered or has been
connected to an address different from the originally
called address.
That is, the value of the first octet of the Facility
Parameter Field of the CRCDN or CLAMN facility, indicating
the reason for call redirection or call deflection.
The zero value indicates that the call was not redirected;;
REGISTERED AS { NLM.aoi redirectReason (97) };

Remplacée par une version plus récente

remoteDTEAddress ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.DTEAddress;
MATCHES FOR EQUALITY, SUBSTRINGS;
BEHAVIOUR remoteDTEAddress-B BEHAVIOUR
DEFINED AS The DTE Address of the remote DTE.

In the case of an outgoing call, this is the remote DTE address
from the called address of the transmitted call request packet.
In the case of an incoming call, it is the calling address from
the received call request packet.;;

REGISTERED AS { NLM.aoi remoteDTEAddress (93) };

remoteLogicalChannel ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.LogicalChannelId;
-- Identification de canal à 12 attributs binaires
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR remoteLogicalChannel-B BEHAVIOUR
DEFINED AS The Remote Logical Channel ID for the Permanent Virtual Circuit.;;

REGISTERED AS { NLM.aoi remoteLogicalChannel (162) };

reverseCharging ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR reverseCharging-B BEHAVIOUR
DEFINED AS Use of reverse charging.

When 'True' for an outgoing call, it shall be (for an IVMO), or was
(for a non-IVMO), initiated requesting reverse charging. When
'True' for an incoming call associated with a virtualCall MO,
it indicates that reverse charging was accepted.;;

REGISTERED AS { NLM.aoi reverseCharging (75) };

rOASelection ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR rOASelection-B BEHAVIOUR
DEFINED AS Indicates the use of the registered operating agency selection
facility for that call.;;

REGISTERED AS { NLM.aoi rOASelection (166) };

throughputClasses ATTRIBUTE

WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY, ORDERING;
BEHAVIOUR throughputClasses-B BEHAVIOUR
DEFINED AS The throughput classes in use or to be used.
For an IVMO, this is the throughput classes to be proposed.
For a non-IVMO it is the actual throughput classes in use.
For Virtual Calls this is the result of negotiation.;;

REGISTERED AS { NLM.aoi throughputClasses (96) };

Remplacée par une version plus récente

transitDelaySelectionAndIndication ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.Boolean;
MATCHES FOR EQUALITY;
BEHAVIOUR transitDelaySelectionAndIndication-B BEHAVIOUR
DEFINED AS Indicates the use of the transit delay selection and
indication facility for that call.;;
REGISTERED AS { NLM.aoi transitDelaySelectionAndIndication (169) };

virtualCallIVMOId ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.GraphicString;
MATCHES FOR EQUALITY, SUBSTRINGS;
BEHAVIOUR virtualCallIVMOId-B BEHAVIOUR
DEFINED AS The name of this instance of virtualCallIVMO;;
REGISTERED AS { NLM.aoi virtualCallIVMOId (117) };

virtualCircuitId ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.GraphicString;
MATCHES FOR EQUALITY, SUBSTRINGS;
BEHAVIOUR virtualCircuitId-B BEHAVIOUR
DEFINED AS The name of this instance of virtualCircuit MO or subclass;;
REGISTERED AS { NLM.aoi virtualCircuitId (116) };

windowSizes ATTRIBUTE
WITH ATTRIBUTE SYNTAX NLM.BidirectionalValues;
MATCHES FOR EQUALITY;
BEHAVIOUR windowSizes-B BEHAVIOUR
DEFINED AS The actual window sizes in use for this VC;;
REGISTERED AS { NLM.aoi windowSizes (124) };

7 Conformité

7.1 Conditions de conformité à l'ISO 10733

Une mise en œuvre réputée conforme à cette Norme internationale en tant que mise en œuvre gérée doit:

- a) supporter les objets gérés du sous-système de couche réseau;
- b) supporter, pour chaque objet géré pris en charge, au moins une corrélation des noms, définis dans cette Norme internationale, dont cet objet géré est l'entité subordonnée.

7.2 Conditions de conformité spécifiques au protocole

7.2.1 Une mise en œuvre réputée conforme à l'opération de gestion du service CLNS en tant que mise en œuvre gérée doit:

- a) être conforme à l'ISO/CEI 10733 comme indiqué en 7.1 ci-dessus;
- b) supporter l'objet géré entité de couche réseau, l'objet géré service CLNS, l'objet géré point NSAP et l'objet géré lien.

7.2.2 Une mise en œuvre réputée conforme à l'opération de gestion du service CONS en tant que mise en œuvre gérée doit:

- a) être conforme à l'ISO/CEI 10733 comme indiqué en 7.1 ci-dessus;
- b) supporter l'objet géré entité de couche réseau, l'objet géré service CONS, l'objet géré point NSAP, l'objet géré connexion et l'objet géré lien.

7.2.3 Une mise en œuvre réputée conforme à l'opération de gestion d'ETTD X.25 en tant que mise en œuvre gérée doit:

- a) être conforme à l'ISO/CEI 10733 comme indiqué en 7.1 ci-dessus;
- b) supporter l'objet géré ETTD d'entité PLE X.25 et au moins une classe issue de l'objet ETTD de circuit virtuel.

7.2.4 Une mise en œuvre réputée conforme à l'opération de gestion d'ETCD X.25 en tant que mise en œuvre gérée doit:

- a) être conforme à l'ISO/CEI 10733 comme indiqué en 7.1 ci-dessus;
- b) supporter l'objet géré ETCD d'entité PLE X.25 et au moins une classe issue de l'objet ETCD de circuit virtuel.

NOTE – Les clauses relatives au comportement figurant dans cette Norme ne pourront pas toujours faire l'objet de tests. Lors de la définition de suites de tests de comportements, il y aura lieu de veiller à ne pas ajouter de nouvelles contraintes à celles qui sont définies dans cette Norme pour les mises en œuvre.

Annexe A

Affectation des identificateurs d'objet

(Cette annexe fait partie intégrante de la présente Recommandation)

Les identificateurs d'objet ci-après ont été affectés par la présente Recommandation. Les identificateurs d'objet qui avaient été affectés lorsque l'équivalent de la présente Recommandation se trouvait à l'étape du projet de norme internationale (DIS) à l'ISO/CEI n'ont pas été réaffectés. En cas de modification quelconque, autre qu'un changement apporté à l'article relatif aux comportements, d'un modèle quelconque affecté à un identificateur d'objet, le nouveau modèle a été affecté à un nouvel identificateur d'objet et l'ancien identificateur d'objet [dénoté ainsi: *obsolete (1)*] ne doit pas être réutilisé.

Appendice I

Description abrégée des objets gérés

(Cet appendice ne fait pas partie intégrante de la présente Recommandation)

Les informations contenues dans le présent appendice n'ont pour objet que de présenter les grandes lignes de la spécification relative à la gestion de la couche réseau. Bien que les renseignements donnés ci-dessous soient issus du texte normatif des Directives pour la gestion des objets gérés (GDMO) figurant dans le corps de la présente Recommandation, il y a lieu de traiter ces informations avec précaution car elles peuvent contenir des erreurs.

Les abréviations suivantes sont utilisées pour décrire les listes de propriétés des attributs:

G	Get (obtention)
R	Replace (remplacement)
RWD	Replace With Default (remise à la valeur par défaut)
A	Add (ajonction)
RM	Remove (suppression)

Les abréviations suivantes sont utilisées pour décrire les références aux étiquettes externes:

- DMI: «Rec. X.721 du CCITT | ISO/CEI 10165-2»
GMI: «Rec. X.723 du CCITT | ISO/CEI 10165-5»

Les types de modèles affectés d'un astérisque en suffixe (par exemple ATTRIBUTE*) sont définis dans des lots conditionnels prédéfinis. Tous les modèles hérités, à l'exception de ceux qui héritent du sommet, font partie de chaque classe d'objets gérés.

La hiérarchie d'héritage est décrite à la Figure I.1.

Remplacée par une version plus récente

The subscription of the call deflection facility

callEstablishmentRetryCountsExceeded ATTRIBUTE (G)

Counter associated with the callEstablishmentRetryCountExceeded event

callRequestResponseTimer ATTRIBUTE (G, R, RWD)

Value for Timer T21 (Call Request Response Timer)

callTimeouts ATTRIBUTE* (G)

Counter of the number of times timer T21 expiry is experienced

callsConnected ATTRIBUTE* (G)

Counter of the total number of calls which have reached the open state

clearCountsExceeded ATTRIBUTE* (G)

Counter associated with the clearCountExceeded event

clearRequestResponseTimer ATTRIBUTE (G, R, RWD)

Value for Timer T23 (Clear Request Response Timer)

clearRequestRetransmissionCount ATTRIBUTE (G, R, RWD)

Value for count R23 (Clear Request Retransmission Count)

clearTimeouts ATTRIBUTE* (G)

Counter of the number of times timer T23 expiry is experienced

dataPacketRetransmissionCount ATTRIBUTE* (G, R, RWD)

Value for count R25 (Data Packet Retransmission Count)

dataPacketsReceived ATTRIBUTE* (G)

Counter of the total number of data packets received

dataPacketsSent ATTRIBUTE* (G)

Counter of the total number of data packets sent

dataRetransmissionTimerExpires ATTRIBUTE* (G)

Counter of the number of expiries of timer T25.

defaultPacketSizes ATTRIBUTE (G, R, RWD)

The default value of the packet sizes.

defaultThroughputClasses ATTRIBUTE (G, R, RWD)

The default throughput class values.

defaultWindowSizes ATTRIBUTE (G, R, RWD)

The default value of the window sizes.

extendedPacketSequenceNumbering ATTRIBUTE (G, R, RWD)

The modulo of the packet sequence number space.

flowControlParameterNegotiation ATTRIBUTE (G, R, RWD)

The subscription of the flow control parameter negotiation facility

interruptResponseTimer ATTRIBUTE (G, R, RWD)

Value for Timer T26 (Interrupt Response Timer) in seconds

localDTEAddress ATTRIBUTE (G, R)

The full DTE address of this PLE

logicalChannelAssignments ATTRIBUTE (G, R)

Represents the logical channel assignments of this PLE,

maxActiveCircuits ATTRIBUTE (G, R, RWD)

Remplacée par une version plus récente

The maximum number of active circuits permitted on this PLE.
minimumRecallTimer ATTRIBUTE (G, R, RWD)
Minimum time in seconds before recall permitted.

protocolErrorsAccusedOf ATTRIBUTE (G)
Counter associated with the accusedOfProtocolError event

protocolErrorsDetectedLocally ATTRIBUTE (G)
Counter associated with the protocolErrorDetectedLocally event

protocolVersionSupported ATTRIBUTE (G)
The supported Recommendation | International Standard protocol version

providerInitiatedDisconnects ATTRIBUTE* (G)
Counter for the providerInitiatedDisconnect events

providerInitiatedResets ATTRIBUTE* (G)
Counter associated with the providerInitiatedReset event

registrationPermitted ATTRIBUTE* (G, R, RWD)
When true, the use of online facility registration is permitted.

registrationRequestResponseTimer ATTRIBUTE* (G, R, RWD)
Value for Timer T28 (Registration Request Response Timer) in seconds

registrationRequestRetransmissionCount ATTRIBUTE* (G, R, RWD)
Value for count R28 (Registration Request Retransmission Count)

rejectResponseTimer ATTRIBUTE* (G, R, RWD)
Value for Timer T27 (Reject Response Timer) in seconds

rejectRetransmissionCount ATTRIBUTE* (G, R, RWD)
Value for count R27 (Reject Retransmission Count)

remotelyInitiatedResets ATTRIBUTE* (G)
Counter associated with the remotelyInitiatedReset event

remotelyInitiatedRestarts ATTRIBUTE* (G)
Counter of the number of remotely initiated restarts.

resetRequestResponseTimer ATTRIBUTE (G, R, RWD)
Value for Timer T22 (Reset Request Response Timer) in seconds

resetRequestRetransmissionCount ATTRIBUTE (G, R, RWD)
Value for count R22 (Reset Request Retransmission Count)

resetTimeouts ATTRIBUTE* (G)
Counter of the number of timer T22 expiries experienced

restartCountsExceeded ATTRIBUTE* (G)
Counter associated with the restartCountExceeded event

restartRequestResponseTimer ATTRIBUTE (G, R, RWD)
Value for Timer T20 (Restart Request Response Timer) in seconds

restartRequestRetransmissionCount ATTRIBUTE (G, R, RWD)
Value for count R20 (Restart Request Retransmission Count)

sN-SAP ATTRIBUTE (G)
Distinguished name of the service provider SAP MO

sN-ServiceProvider ATTRIBUTE (G, R, RWD)
Distinguished name of the N service provider MO.

throughputClassNegotiation ATTRIBUTE (G, R, RWD)
The subscription of the throughput class negotiation facility

windowRotationTimer ATTRIBUTE* (G, R, RWD)
Default for Timer T25 (Window Rotation Timer) in seconds

windowStatusTransmissionTimer ATTRIBUTE* (G, R, RWD)
Value for Timer T24 (Window Status Transmission Timer) in seconds

Counter of the number of interrupt packets received

interruptPacketsSent ATTRIBUTE* (G)

Counter of the number of interrupt packets sent

interruptTimerExpires ATTRIBUTE* (G)

Counter of the number of expiries of timer T26

localChargingPrevention ATTRIBUTE* (G, R, RWD)

The subscription of the local charging prevention facility

localDTEAddress ATTRIBUTE (G, R)

The full DTE address of this PLE

logicalChannelAssignments ATTRIBUTE (G, R)

Represents the logical channel assignments of this PLE,

nUIOverride ATTRIBUTE* (G, R, RWD)

The subscription of the NUI override facility

nUISubscription ATTRIBUTE* (G, R, RWD)

The subscription of the NUI subscription facility

nonStandardDefaultPacketSizes ATTRIBUTE* (G, R, RWD)

The subscription of the non standard default packet sizes facility

nonStandardDefaultWindowSizes ATTRIBUTE* (G, R, RWD)

The subscription of the non standard default window sizes facility

oneWayLogicalChannellIncoming ATTRIBUTE* (G, R, RWD)

The subscription of the one way logical channel incoming facility

oneWayLogicalChannelOutgoing ATTRIBUTE (G, R, RWD)

The subscription of the one way logical channel outgoing facility

onlineFacilityRegistration ATTRIBUTE* (G, R, RWD)

The subscription of the on-line facility registration facility

outgoingCallBarredWithinCUG ATTRIBUTE* (G, R, RWD)

The subscription of the outgoing call barred with a CUG facility

outgoingCallsBarred ATTRIBUTE (G, R, RWD)

The subscription of the outgoing calls barred facility

packetRetransmission ATTRIBUTE* (G, R, RWD)

The subscription of the packet retransmissions facility

protocolVersionSupported ATTRIBUTE (G)

The supported Recommendation | International Standard protocol version

providerInitiatedDisconnects ATTRIBUTE* (G)

Counter for the providerInitiatedDisconnect events

providerInitiatedResets ATTRIBUTE* (G)

Counter associated with the providerInitiatedReset event

rPOASubscription ATTRIBUTE* (G, R, RWD)

The subscription of the RPOA Subscription facility

remotelyInitiatedResets ATTRIBUTE* (G)

Counter associated with the remotelyInitiatedReset event

remotelyInitiatedRestarts ATTRIBUTE* (G)

Counter of the number of remotely initiated restarts.

resetIndication ATTRIBUTE* (G, R)

Value for the Reset Indication, T12 timer, in seconds.

resetTimeouts ATTRIBUTE* (G)

Counter of the number of timer T22 expiries experienced

restartIndication ATTRIBUTE* (G, R)

Value for the Restart Indication, T10 timer, in seconds.

Appendice II

Exemples d'utilisation d'attributs relationnels

(Cet appendice ne fait pas partie intégrante de la présente Recommandation)

Le présent appendice donne des exemples d'utilisation d'attributs relationnels, aussi bien à l'intérieur de la couche réseau qu'entre celle-ci et ses couches adjacentes. Ces exemples ne visent pas l'exhaustivité. On pourra construire de façon analogue des relations pour d'autres combinaisons de protocoles. Une mise en œuvre particulière peut gérer plusieurs protocoles simultanément, par exemple des connexions de transport dans le service CONS en même temps que des connexions de transport dans le service CLNS. De telles possibilités n'ont été omises que pour des raisons de concision.

Pour illustrer l'utilisation de relations inter-couches, il a été nécessaire d'insérer des schémas (voir les Figures II.1 à II.3) montrant les objets gérés de couche transport et de couche liaison de données. Mais ces schémas n'ont qu'une valeur indicative et il y a lieu de consulter les Recommandations relatives à la gestion de la couche en question pour trouver des détails précis sur ces objets gérés.

Il est à noter que certaines relations sont impliquées par confinement. Aucun attribut relationnel explicite n'est alors requis. Il n'existe par exemple aucune relation entre un objet géré communication virtuelle et un objet géré connexion par protocole SLP sous-jacent. Cette relation peut se déduire de l'attribut sN-ServiceProvider de l'objet géré entité PLE X.25 associé. La relation entre l'objet géré point TSAP et son objet géré associé entité de transport est un autre exemple.

Les exemples donnés sont les suivants:

- Figure II.1 – Protocole COTP par service CONS sur réseau X.25.
- Figure II.2 – Protocole COTP par service CLNS sur réseau X.25 dans l'exploitation par le service CLNS, l'attribut underlyingConnectionNames de la connexion de transport a une valeur d'ensemble vide. Noter également que, lorsqu'un lien est exploité par un objet géré point SNPA dans la couche réseau par opposition à l'exploitation directe dans la couche liaison de données, les deux attributs relationnels sN-ServiceProvider et sN-SAPLinkage pointent sur le même objet géré dans la couche réseau.
- Figure II.3 – Protocole COTP par service CLNS sur réseau local à accès multiple avec détection de porteuse et de collision (CSMA/CD).
