# **Recommendation ITU-T Y.3603**

## **Big data – Requirements and conceptual model of metadata for data catalogue**

### **Summary**

Recommendation ITU-T Y.3603 describes the general concept of metadata and its utilization in a big data ecosystem. Also, this Recommendation provides requirements and a conceptual model of metadata for the data catalogue as well as the extensible markup language (XML) schema of metadata as an example. This metadata supports finding data easier and is used for the exchange, preservation, integration and provenance of data in a big data ecosystem.

### **History \***

Edition	Recommendation	Approval	Study Group	Unique ID
1.0	ITU-T Y.3603	2019-12-14	13	11.1002/1000/14137
2.0	ITU-T Y.3603	2023-05-14	13	11.1002/1000/15540

### **Keywords**

Big data, conceptual model, data catalogue, metadata

## FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

## NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

## INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had not received notice of intellectual property, protected by patents/software copyrights, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the appropriate ITU-T databases available via the ITU-T website at <http://www.itu.int/ITU-T/ipr/>.

# **Recommendation ITU-T Y.3603**

## **Big data – Requirements and conceptual model of metadata for data catalogue**

### **1 Scope**

This Recommendation introduces the metadata concept as well as its usage in a big data lifecycle. This Recommendation provides requirements and a conceptual model of metadata for a data catalogue to support the big data ecosystem defined in [ITU-T Y.3600]. The extensible markup language (XML) profiles based on the conceptual model described by the unified modelling language (UML) and examples of metadata are provided in the appendices.

### **2 References**

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. At the time of publication, the editions indicated were valid. All Recommendations and other references are subject to revision; users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations and other references listed below. A list of the currently valid ITU-T Recommendations is regularly published. The reference to a document within this Recommendation does not give it, as a stand-alone document, the status of a Recommendation.

### **3 Definitions**

#### **3.1 Terms defined elsewhere**

This Recommendation uses the following terms defined elsewhere:

**3.1.1 data catalogue** [ITU-T Y.3601]: A listing of all metadata which a data broker makes available.

**3.1.2 metadata** [b-ITU-T H.752]: Structured, encoded data that describe characteristics of information-bearing entities to aid in the identification, discovery, assessment and management of the described entities.

#### **3.2 Terms defined in this Recommendation**

None.

## 4 Abbreviations and acronyms

This Recommendation uses the following abbreviations and acronyms:

API	Application Programming Interface
BDC	Big Data Service Customer
BDSP	Big Data Service Provider
DCAT	Data Catalogue Vocabulary
DP	Data Provider
JSON	JavaScript Object Notation
RDF	Resource Description Framework
Turtle	Terse Resource Description Framework Triple Language
UML	Unified Modelling Language
URI	Uniform Resource Identifier
XML	extensible Markup Language

## 5 Conventions

The keywords "**is required to**" indicate a requirement which must be strictly followed and from which no deviation is permitted if conformance to this document is to be claimed.

The keywords "**is recommended**" indicate a requirement which is recommended but which is not absolutely required. Thus this requirement need not be present to claim conformance.

The keywords "**can optionally**" indicate an optional requirement which is permissible, without implying any sense of being recommended. This term is not intended to imply that the vendor's implementation must provide the option and the feature can be optionally enabled by the network operator/service provider. Rather, it means the vendor may optionally provide the feature and still claim conformance with the specification.

In the body of this document and its annexes, the words shall, shall not, should, and may sometimes appear, in which case they are to be interpreted, respectively, as is required to, is prohibited from, is recommended, and can optionally. The appearance of such phrases or keywords in an appendix or in material explicitly marked as informative are to be interpreted as having no normative intent.

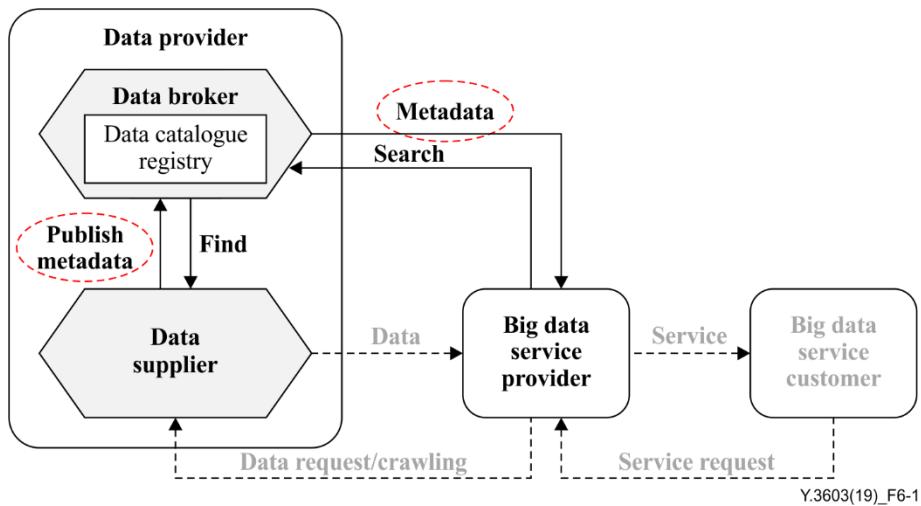

The unified modelling language (UML) schema used in this Recommendation follows [ITU-T Z.109].

## 6 Overview of metadata

### 6.1 Introduction to metadata in the big data ecosystem

Metadata is structured, encoded data that describe characteristics of a dataset to aid in the identification, discovery, assessment and management of the dataset. Metadata summarizes overall information about data, making finding and working with particular data easier. Typically, the metadata structure is highly dependent on data format or application. Therefore, metadata for big data is needed to provide an overarching model to cover the characteristics of big data.

Figure 6-1 illustrates metadata in the big data ecosystem defined in [ITU-T Y.3600]. Metadata is used for data publication and search among roles and sub-roles of the big data ecosystem.

**Figure 6-1 – Metadata in the big data ecosystem**

Regarding the data provider (DP), DP:data broker provides a meta-information registry (e.g., data catalogue registry) to DP:data suppliers for publishing their data sources, and DP:data suppliers are creating and publishing metadata information to DP:data broker. A big data service provider (BDSP) searches information through metadata stored in the DP:data broker's data catalogue registry.

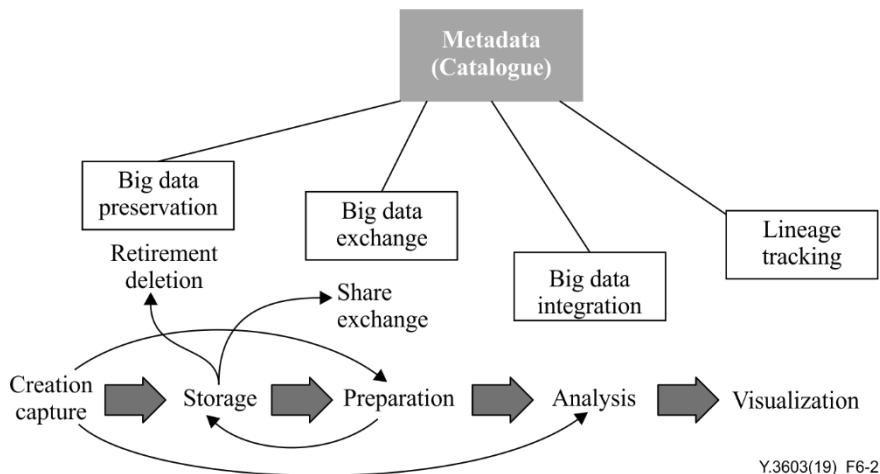

According to [ITU-T Y.3600], metadata provides:

- critical information for identification, access right to data;
- information about the creation, control, and update of data for the management purpose;
- additional information about data integration capabilities.

## 6.2 Introduction to big data lifecycle

Metadata is used for various purposes, such as preserving data, data distribution, data integration and data history management by continuously recording and updating. Figure 6-2 shows the usage of metadata according to the big data lifecycle.

NOTE – An example of a big data lifecycle has a main cycle with creation/capture, storage, preparation, analysis, visualization, and also has branch cycles with retirement/deletion and share/exchange.

**Figure 6-2 – Usage of metadata in the big data lifecycle**

[ITU-T Y.3601] defines the functional requirements for big data exchange. In that Recommendation, DP:data broker provides a common data catalogue schema to exchange big data which covers various

types of data sources. DP: data broker provides meta-information (data catalogue for dataset) registry to a data source. A data source publishes metadata to an online registry for data sharing. This metadata includes:

- data type, format, size and update frequency;
- category (area of data source);
- metadata and its access information (e.g., uniform resource identifier (URI));
- delivery mechanism, and electronic access methods to data (e.g., application programming interface (API)).

And, this metadata can optionally include:

- data rights (e.g., general agreement, copyrights, patents, licenses policies and pricing policies) (e.g., the applied functions with parameter);
- usage of data;
- the quality of data (e.g., sales ranking, and data supplier's credit);
- related keywords; and
- sample data.

DP: data broker also supports data classification with commonly used data vocabulary and taxonomy, and it is recommended to support multiple data classifications by usage area.

[ITU-T Y.3602] defines the functional requirements for big data provenance. Provenance is information about the origin and creation process of data, including the metadata recording process of workflow, annotations and notes about processes. When data are imported from an outside data source and stored, the BDSP generates metadata based on the importing context, including:

- responsible party information;
- timestamp;
- size, etc.

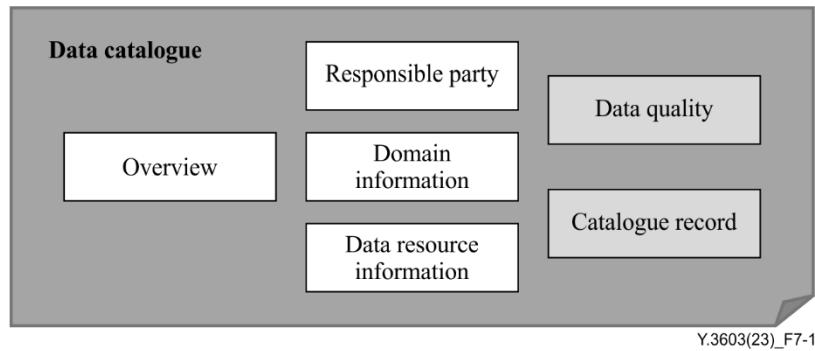

The metadata can be used for recording provenance information according to [ITU-T Y.3602].

For storage efficiency and performance, the BDSP provides data preservation capabilities by monitoring information (e.g., timestamps) included in the metadata. In addition, the BDSP uses metadata to retrieve the data for data preparation (e.g., data integration).

## 7 Requirements of metadata for data catalogue

### 7.1 Metadata for data catalogue

A data catalogue describes the requirements for searching a dataset. It helps the users to evaluate the data resources to determine the suitability of usage of the data. This clause provides six elements and contents of a data catalogue for big data. Figure 7-1 shows the elements of metadata for a data catalogue.

**Figure 7-1 – Elements of metadata for a data catalogue**

A data catalogue **is required to** include the following elements:

- overview (see clause 7.2.1);
- responsible party (see clause 7.2.2);
- data resource information (see clause 7.2.3);
- domain information (see clause 7.2.4).

A data catalogue **is recommended to** include the following elements:

- data quality (see clause 7.2.5);
- catalogue record (see clause 7.2.6).

## 7.2 Requirements of metadata elements

### 7.2.1 Overview element

The overview element provides overall information about the data catalogue and is required to include:

- information about the creation of the data catalogue;  
NOTE 1 – This may include the title, the language used in the text, and the version of the data catalogue specification.
- an informal description of the data catalogue.  
NOTE 2 – An informal description is intended to give a short introduction to the data catalogue and allow a human reader to better understand it.

### 7.2.2 Responsible party element

The responsible party element provides authoritative reference information and is required to include:

- information to identify and communicate with the person(s) and organizations associated with the data catalogue.  
NOTE 1 – This may include the role or function performed by the organization, the organization name, individual name and position name.

The responsible party element is recommended to include the following:

- contact information.  
NOTE 2 – This may include the phone number, address, online resources such as URI and time when individuals may contact the publisher of the data catalogue.

### 7.2.3 Data resource information element

A data catalogue element contains one or more data resources including dataset and data service.

The data resource information of metadata represents the actual data resource as published by the DP:data provider, and is required to include:

- the title of the data resource;
- an informal description of the data resource.

NOTE 1 – An informal description is intended to give a short introduction to the dataset or data service and allow a human reader a better understanding.

- contact point information.

NOTE 2 – Contact point information is represented with the same contents of the responsible party described in clause 7.2.2, but its target is DP:data provider.

The data resource information element is recommended to include:

- dataset distribution information;

NOTE 3 – A dataset may have multiple distribution information.

NOTE 4 – This information may include the distribution format of the dataset, type of dataset (structured, semi-structured, unstructured), access information including user's guide or its URI, size of the dataset, sample data for user's preview and data rights.

- keywords representing dataset;

- endpoint description that provides the information of data service available including data API through the endpoint.

The data resource information may also include the following information optionally:

- the frequency at which the dataset is updated;
- temporal coverage of the dataset which is described by the time.

#### **7.2.4 Domain information element**

The domain information element provides the application area of data resources and is required to include:

- source domain of the data resource for classification.

The domain information element is recommended to include:

- usage domain of the data resource.

#### **7.2.5 Data quality element**

In a big data ecosystem, there are various types and formats of data, each having different quality requirements. Therefore, different quality evaluation methods are applied to different data resources. The data quality element is required to include:

- quality requirement on the data resource;
- the unit of measure for data quality;
- quality evaluation result.

#### **7.2.6 Catalogue record element**

The catalogue record element provides date information for registration and modification for instances of the data catalogue. The catalogue record element is required to include:

- the most recent modified date of the data catalogue.

The catalogue record element of the data catalogue is recommended to include:

- the issued date of listing the data resource in the catalogue.

NOTE – The issued date of listing a data resource in a data catalogue is different than the publication date of the data resource.

## 8 Conceptual model for data catalogue

### 8.1 Overall class diagram

This clause provides a UML model based on clause 7, which describes the requirements of metadata for a data catalogue. Figure 8-1 shows the overall class diagram of the data catalogue using UML to provide the design of a concept for a data catalogue.

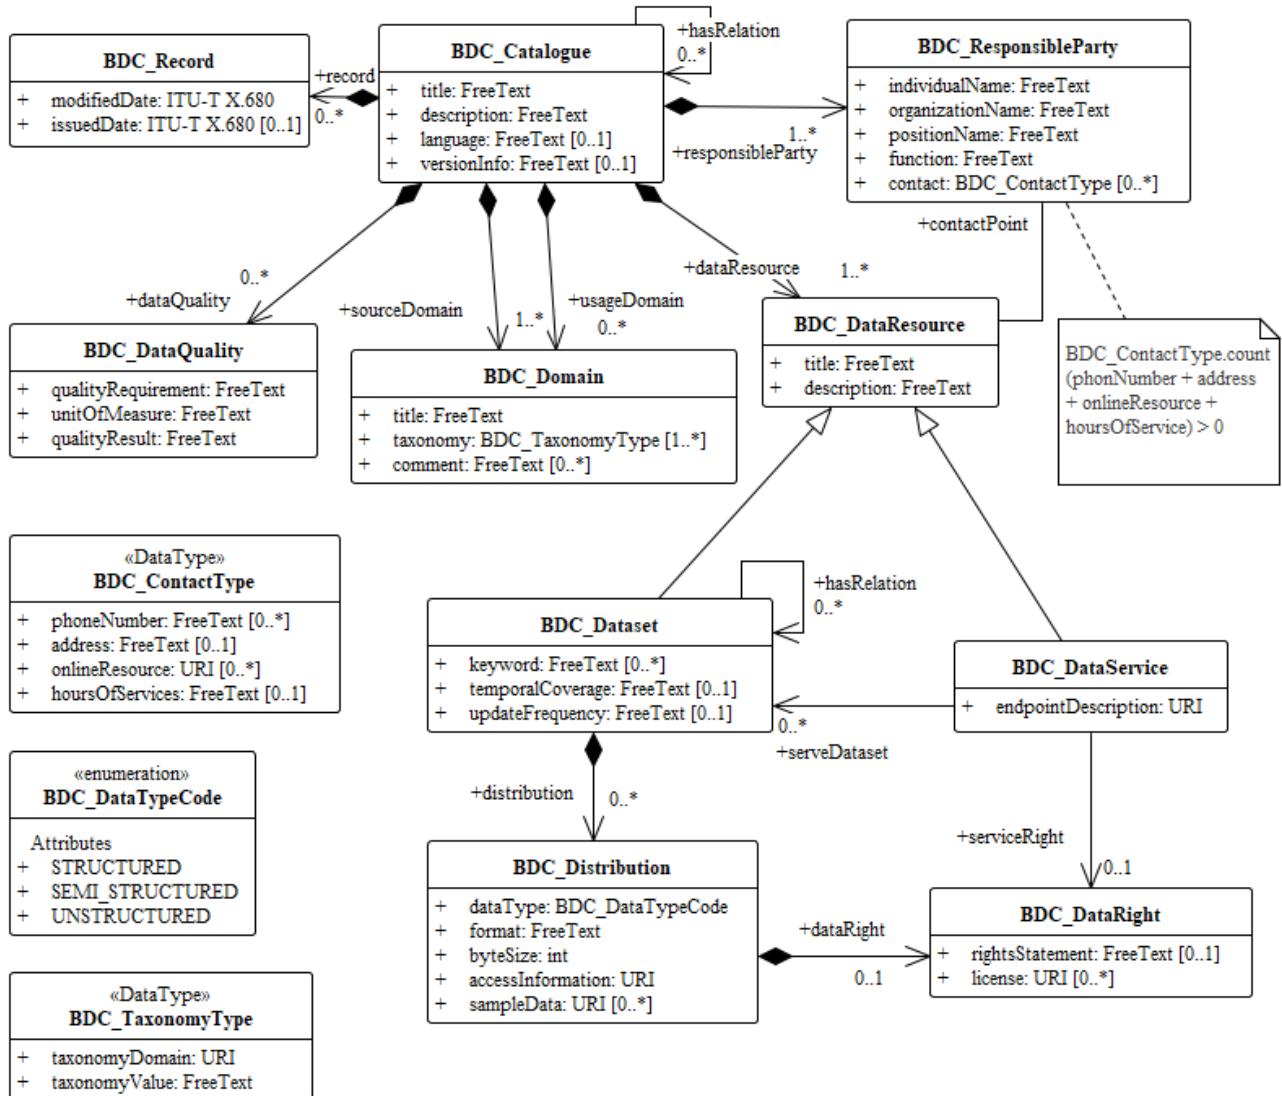

Figure 8-1 – Overall class diagram of data catalogue using UML

### 8.2 Classes and data type

The following descriptors are used to explain the data dictionaries in the clauses that follow.

- Name/Role name: title of class (gray colored row in the table), association (noted as role) and attribute;
- Description: a short description of 'Name/Role name';
- M/R/O: the mandatory/recommended/optional (M/R/O) necessity of each class, association and attribute;
- Cardinality: the maximum number of instances that the metadata entity or metadata element may have. Single occurrences are shown by "1"; repeating occurrences are represented by "N".

- Domain: the values allowed, or the use of free text placed on the contents of the field. "Free text" indicates that no restrictions are placed on the contents of the field. Integer-based codes shall be used to represent values for domains containing code lists.
- Domain code: designated code used in place of the concept.

### **8.2.1 Class: BDC\_Catalogue**

Table 8-1 shows the data dictionary of *BDC\_Catalogue* which describes the overview element information in clause 7.2.1.

**Table 8-1 – Catalogue overview**

	<b>Name/Role name</b>	<b>Description</b>	<b>M/R/O</b>	<b>Cardinality</b>	<b>Domain</b>
1	BDC_Catalogue	root entity which defines metadata about data resource	M	1	Line 2 to 12
2	role: responsibleParty	responsible party information for the data catalogue	M	N	BDC_ResponsibleParty
3	role: dataResource	data resource information for the data catalogue	M	N	BDC_DataResource
4	role: sourceDomain	source domain information for the data catalogue	M	N	BDC_Domain
5	role: usageDomain	usage domain information for the data catalogue	R	N	BDC_Domain
6	role: dataQuality	data quality information for the data catalogue	R	N	BDC_DataQuality
7	role: record	record information for the data catalogue	R	N	BDC_Record
8	role: hasRelation	related data catalogue of the data catalogue	O	N	BDC_Catalogue
9	title	title of data catalogue	M	1	free text
10	description	a short introduction to the data catalogue	M	1	free text
11	language	the language used within the data catalogue	R	1	free text (e.g., RFC 5646 [b-RFC5646])
12	versionInfo	the version of data catalogue specification	R	1	free text (major.minor.patch)

### **8.2.2 Class: BDC\_ResponsibleParty**

Table 8-2 shows the data dictionary of *BDC\_ResponsibleParty* and its data type class *BDC\_ContactType* which describes the responsible party in clause 7.2.2.

**Table 8-2 – Responsible party information**

	<b>Name/Role name</b>	<b>Description</b>	<b>M/R/O</b>	<b>Cardinality</b>	<b>Domain</b>
13	BDC_ResponsibleParty	name and position information for an individual or organization that is responsible for the data catalogue or data resource	M	N	Line 14 to 18
14	individualName	name of the responsible person: surname, given name, title	M	1	free text
15	organisationName	name of the responsible organization	M	1	free text
16	positionName	role or position of the responsible person	M	1	free text
17	function	the function performed by the responsible party	M	1	free text
18	contact	information required to enable contact with the responsible person and/or organization	R	N	BDC_ContactType
19	BDC_ContactType	information required to enable contact with the responsible person and/or organization	R	N	Line 20 to 23
20	phoneNumber	telephone numbers at which the organization or individual may be contacted	R	N	free text
21	address	physical and email address at which the organization or individual may be contacted	R	1	free text
22	onlineResource	on-line information that can be used to contact the individual or organization	R	N	URI
23	hoursOfServices	time(including time zone) when individuals can contact the organization or individual	R	1	free text

### 8.2.3 Class: BDC\_DataResource

Table 8-3 shows the data dictionary of *BDC\_DataResource* and its sub-classes (*BDC\_Dataset*, *BDC\_DataService*, *BDC\_Distribution*, *BDC\_DataRight*) that describes data resource information in clause 7.2.3.

**Table 8-3 – Data resource information**

	<b>Name/Role name</b>	<b>Description</b>	<b>M/R/O</b>	<b>Cardinality</b>	<b>Domain</b>
24	BDC_DataResource	a collection of data which is available for access and/or download	M	N	Line 25 to 27
25	role: contactPoint	contact point information for the data resource	R	N	BDC_Responsible Party
26	title	title of the data resource	M	1	free text
27	description	a short introduction to the data resource	M	1	free text
28	BDC_Dataset	a collection of data which is available for download	M	N	Line 29 to 33
29	role: distribution	information about the distributor of and options for obtaining the dataset	R	N	BDC_Distribution
30	role: hasRelation	related dataset of the dataset	O	N	BDC_Dataset
31	keyword	commonly used word(s) used to describe the dataset	R	N	free text
32	temporalCoverage	time (including time zone) when the dataset was captured	O	1	free text
33	updateFrequency	rate of occurrence of dataset update	O	1	free text
34	BDC_DataService	a collection of operations that provides dataset	M	N	Line 35 to 37
35	role: serveDataset	a collection of data provided by a data service	O	N	BDC_Dataset
36	Role: serviceRight	information about limitations placed upon the use of the data service	O	1	BDC_DataRight
37	endpointDescription	a description of the service available through the endpoint	M	1	URI
38	BDC_Distribution	information about the distributor of and options for obtaining the dataset	R	N	Line 39 to 44
39	role: dataRight	information about limitations placed upon the use of the dataset	R	1	BDC_DataRight
40	dataType	type of information of the dataset	M	1	BDC_DataTypeCode
41	format	format of information of the dataset including a version	M	1	free text
42	byteSize	information about the size of the dataset in bytes	M	1	int

**Table 8-3 – Data resource information**

	<b>Name/Role name</b>	<b>Description</b>	<b>M/R/O</b>	<b>Cardinality</b>	<b>Domain</b>
43	accessInformation	access information to the dataset	M	1	free text
44	sampleData	location information about a sample data described by URI	R	N	URI
45	BDC_DataRight	information about limitations placed upon the use of the dataset and data service	R	1	Line 46 to 47
46	rightStatement	information to the usage permissions being agreed to	R	1	free text
47	license	links to the license document under which the catalogue is made available and not the datasets or data service	R	N	URI

#### 8.2.4 Class: BDC\_Domain

Table 8-4 shows the data dictionary of *BDC\_Domain* which describes domain information in clause 7.2.4.

**Table 8-4 – Domain information**

	<b>Name/Role name</b>	<b>Description</b>	<b>M/R/O</b>	<b>Cardinality</b>	<b>Domain</b>
48	BDC_Domain	source and/or usage information for data catalogue	M	1	Line 49 to 51
49	title	a member item of taxonomy which used for identifying the domain of source and/or usage	M	1	free text
50	taxonomy	taxonomy information including a classification system and authority	M	N	BDC_Taxonomy Type
51	comment	any additional information for the domain	O	N	free text
52	BDC_TaxonomyType	information required to describe the taxonomy and the values used within that taxonomy	R	N	Line 53 to 54
53	taxonomyDomain	location information about a taxonomy described by URI	M	1	URI
54	taxonomyValue	a value used within the taxonomy	M	1	free text

## 8.2.5 Class: BDC\_DataQuality

Table 8-5 shows the data dictionary of *BDC\_DataQuality* which describes data quality in clause 7.2.5.

**Table 8-5 – Data quality information**

	Name/Role name	Description	M/R/O	Cardinality	Domain
55	BDC_DataQuality	data quality information for the data catalogue	R	N	Line 56 to 58
56	qualityRequirement	requirement statement for evaluating the quality of the data resource	M	1	free text
57	unitOfMeausre	standard unit or system of units utilizing which a quantity is accounted for and expressed.	M	1	free text
58	qualityResult	the result of quality evaluation described by the unit of measure	M	1	free text

## 8.2.6 Class: BDC\_Record

Table 8-6 shows the data dictionary of *BDC\_Record* which describes the catalogue record in clause 7.2.6.

**Table 8-6 – Catalogue record information**

	Name/Role name	Description	M/R/O	Cardinality	Domain
59	BDC_Record	record information for the data catalogue	R	N	Line 60 to 61
60	modifiedDate	the most resent modified date of the data catalogue	M	N	ITU-T X.680
61	issuedDate	the issued date of listing the data resource in the catalogue	R	1	ITU-T X.680

## 8.2.6 Data type: BDC\_DataTypeCode

Table 8-7 shows the data dictionary of *BDC\_DataTypeCode* describing the enumerated data type for data distribution.

**Table 8-7 – Data type information**

Name	Domain code	Description
STRUCTURED	001	data that is organized in a format easily used by the formatted repository
SEMI_STRUCTURED	002	data that is neither raw data nor typed data in a conventional database system (e.g., XML, JavaScript Object Notation (JSON))
UNSTRUCTURED	003	data that either does not have a pre-defined data model or is not organized in a pre-defined manner

# Appendix I

## Examples of metadata profile for data catalogue

(This appendix does not form an integral part of this Recommendation.)

This appendix uses the W3C data catalog vocabulary (DCAT) in the XML profile and terse resource description framework triple language (Turtle) profile (see [b-W3C DCAT]). The namespace for DCAT is <http://www.w3.org/ns/dcat#>, but DCAT makes extensive use of terms from other vocabularies. The extended prefix and its namespace for this appendix are "bdc" and "<http://www.itu.int/xml-namespace/itu-t/Y.3603/bigdatacatalogue#>".

### I.1 RDF profiles

This clause provides the XML schema with resource description framework (RDF) format corresponding to the UML model in clause 8.

```
<?xml version="1.0" encoding="utf-8" ?>

## Appendix II

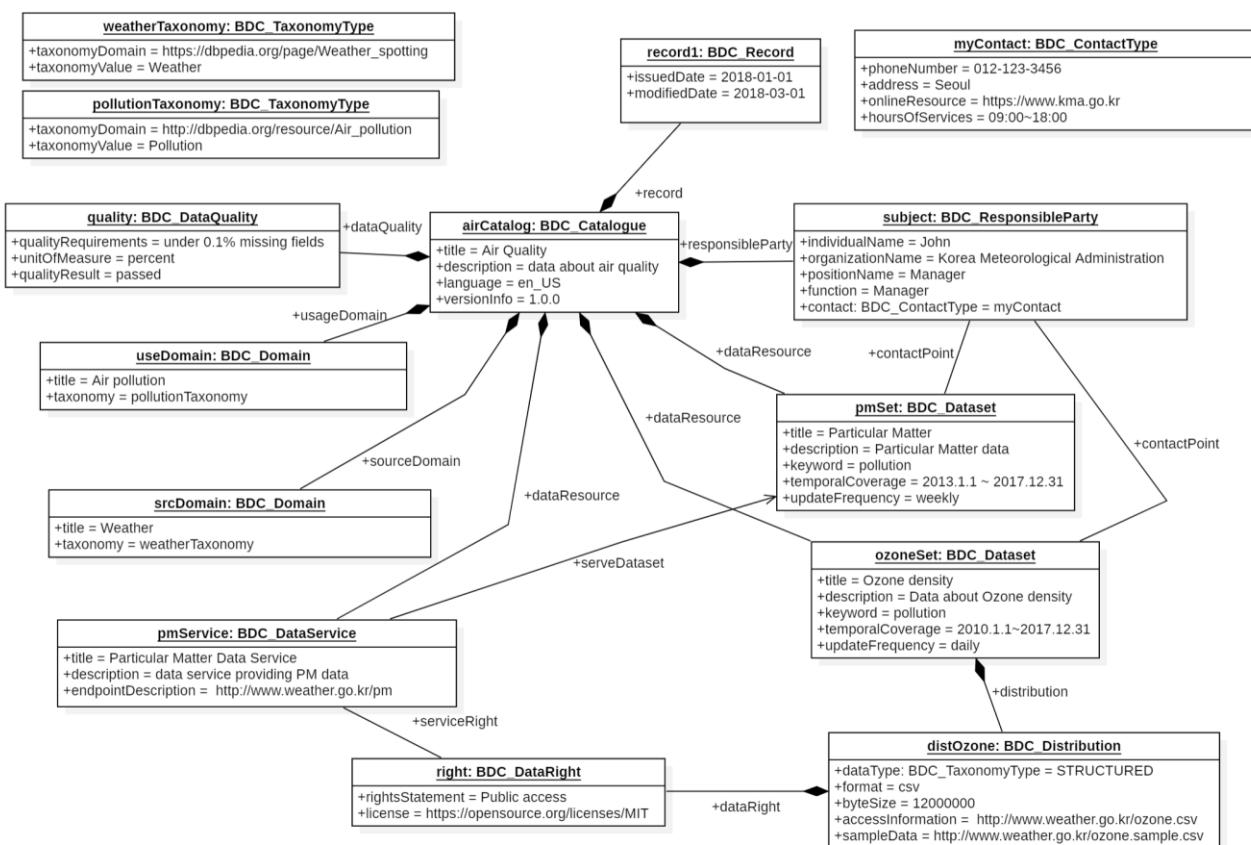

### Examples of metadata instance

(This appendix does not form an integral part of this Recommendation.)

For a better understanding of the conceptual model, this appendix provides examples of metadata instances about healthcare data [b-NHIS]. The UML object diagram, RDF instance and Turtle instances follow the UML and XML models in clause 8 and Appendix I, and these examples provide information on a dataset about 'Health Insurance'.

#### II.1 UML object diagram

An object diagram represents an instance of a class diagram. Figure II.1 is an object diagram derived from the class diagram presented in Figure 8-1. This example describes an air quality data catalogue. A BDC\_Catalogue instance named *airCatalog* contains three BDC\_DataResource instances of *pmSet*, *ozoneSet*, and *pmService*. The *pmSet* instance is a dataset for fine dust. The *ozoneSet* instance indicates ozone density. The *pmService* instance serves the data service for the *pmSet* instance via API. In the case of *distOzone*, it is responsible for the actual distribution of the *ozoneSet* instance in CSV format.

**Figure II.1 – UML object diagram of metadata**

#### II.2 RDF instance

This clause provides an example of metadata instance based on the RDF schema which is described in clause I.1.

## SERIES OF ITU-T RECOMMENDATIONS

Series A	Organization of the work of ITU-T
Series D	Tariff and accounting principles and international telecommunication/ICT economic and policy issues
Series E	Overall network operation, telephone service, service operation and human factors
Series F	Non-telephone telecommunication services
Series G	Transmission systems and media, digital systems and networks
Series H	Audiovisual and multimedia systems
Series I	Integrated services digital network
Series J	Cable networks and transmission of television, sound programme and other multimedia signals
Series K	Protection against interference
Series L	Environment and ICTs, climate change, e-waste, energy efficiency; construction, installation and protection of cables and other elements of outside plant
Series M	Telecommunication management, including TMN and network maintenance
Series N	Maintenance: international sound programme and television transmission circuits
Series O	Specifications of measuring equipment
Series P	Telephone transmission quality, telephone installations, local line networks
Series Q	Switching and signalling, and associated measurements and tests
Series R	Telegraph transmission
Series S	Telegraph services terminal equipment
Series T	Terminals for telematic services
Series U	Telegraph switching
Series V	Data communication over the telephone network
Series X	Data networks, open system communications and security
<b>Series Y</b>	<b>Global information infrastructure, Internet protocol aspects, next-generation networks, Internet of Things and smart cities</b>
Series Z	Languages and general software aspects for telecommunication systems
