Recommendation ITU-T G.8151/Y.1374

Management aspects of the MPLS-TP network element

Summary

Recommendation ITU-T G.8151/Y.1374 addresses management aspects of the multi-protocol label switching (MPLS) transport profile (MPLS-TP) capable network element containing transport functions of one or more of the layer networks of the MPLS-TP network. The management of the MPLS-TP layer networks is separable from that of its client layer networks so that the same means of management can be used regardless of the client. The management functions for fault management, configuration management, performance monitoring and security management are specified.

The 2012 edition of this Recommendation aligns with the MPLS-TP architecture and requirements jointly developed by IETF and ITU-T and provides the specification for managing MPLS-TP network elements (NEs) that support the operation, administration and maintenance (OAM) protocol neutral equipment functionality as defined in Recommendation ITU-T G.8121/Y.1381.

FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had not received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at <http://www.itu.int/ITU-T/ipr/>.

Recommendation ITU-T G.8151/Y.1374

Management aspects of the MPLS-TP network element

1 Scope

This Recommendation addresses management aspects of the multi-protocol label switching (MPLS) transport profile (MPLS-TP) capable network element containing transport functions of one or more of the layer networks of the MPLS-TP network. The management of the MPLS-TP layer networks is separable from that of its client layer networks so that the same means of management can be used regardless of the client. In this edition of the Recommendation, fault management, configuration management, performance management and security management are specified. Accounting management is for further study.

The generic requirements for managing transport network elements (NEs) are specified in [ITU-T G.7710] and the requirements for the management of equipment used in networks supporting an MPLS-TP are specified in [b-IETF RFC 5951]. This Recommendation specifies the requirements for managing the following MPLS-TP specific equipment functional blocks, which are defined in [ITU-T G.8121]:

- MPLS-TP layer connection function;
- MPLS-TP layer trail termination functions;
- MPLS-TP server to MPLS-TP client adaptation functions;
- MPLS-TP server to Ethernet client adaptation functions;
- Synchronous digital hierarchy (SDH) server to MPLS-TP client adaptation functions;
- Plesiochronous digital hierarchy (PDH) server to MPLS-TP client adaptation functions;
- Optical transport network (OTN) sever to MPLS-TP client adaptation functions;
- Ethernet MAC layer (ETH) sever to MPLS-TP client adaptation functions.

The management of the adaptation of other clients and servers with respect to MPLS-TP is for further study.

This Recommendation also describes the management network organizational model for communication between an element management layer (EML) operations system and the MPLS-TP equipment management function within an MPLS-TP network element.

The architecture described in this Recommendation for the management of MPLS-TP transport networks is based on the following considerations:

- The management view of network element functional elements should be uniform whether those elements form part of an inter-domain interface or part of an intra-domain interface. Those properties necessary to form such a uniform management view are to be included in this Recommendation;
- MPLS-TP layer network entities (MTLNEs) refer to trail termination, adaptation and connection functions as described in [ITU-T G.8110.1];
- A network element may only contain MPLS-TP layer network entities;
- A network element may contain both MTLNEs and client layer network entities (CLNEs);
- Client layer entities are managed as part of their own logical domain (e.g., Ethernet management network);
- CLNEs and MTLNEs may or may not share a common message communication function (MCF) and management application function (MAF) depending on the application;
- CLNE and MTLNE may or may not share the same agent;

- Server layer network entities (SLNEs) and MTLNEs may or may not share the same agent.

This Recommendation provides a representation of the MPLS-TP technology using the methodologies that have been used for other transport technologies (e.g., SDH, OTN and Ethernet).

2 References

The following ITU-T Recommendations and other references contain provisions which, through reference in this text, constitute provisions of this Recommendation. At the time of publication, the editions indicated were valid. All Recommendations and other references are subject to revision; all users of this Recommendation are therefore encouraged to investigate the possibility of applying the most recent edition of the Recommendations and other references listed below. A list of the currently valid ITU-T Recommendations is regularly published. - 3.1.22 **timed interval:** [ITU-T M.3100]
- 3.1.23 **workstation function (WF):** [ITU-T M.3010]

3.2 Terms defined in this Recommendation

This Recommendation defines the following terms:

3.2.1 MPLS-TP management network (MT.MN): An MPLS-TP management network is a subset of a telecommunication management network (TMN) that is responsible for managing the parts of a network element that contain MPLS-TP layer network entities. A MT.MN may be subdivided into a set of MPLS-TP management subnetworks.

3.2.2 MPLS-TP management subnetwork (MT.MSN): An MPLS-TP management subnetwork (MT.MSN) consists of a set of separate embedded control channels (ECCs) and associated intra-site data communication links, which are interconnected to form a data communication network (DCN) within any given MPLS-TP transport topology. For MPLS-TP, the physical channel supporting the ECC is the MPLS-TP management communication channel (MCC) as defined in [ITU-T G.7712]. A MT.MSN represents an MPLS-TP specific local communication network (LCN) portion of a network operator's overall DCN or telecommunication management network (TMN).

3.2.3 MPLS-TP network element (MT.NE): That part of a network element that contains entities from one or more MPLS-TP layer networks. A MT.NE may therefore be a standalone physical entity or a subset of a network element. It supports at least network element functions (NEFs) and may also support an operations system function (OSF). It contains managed objects (MOs), a message communication function (MCF) and a management application function (MAF). The functions of a MT.NE may be contained within a network element (NE) that also supports other layer networks. These layer network entities are considered to be managed separately from MPLS-TP entities. As such, they are not part of the MPLS-TP management network (MT.MN) or MPLS-TP management subnetwork (MT.MSN).

4 Abbreviations and acronyms

This Recommendation uses the following abbreviations:

AcSL	Accepted Signal Label
AF	Atomic Function
AIS	Alarm Indication Signal
ALM	Alarm reporting
ARC	Alarm Reporting Control
CC	Continuity Check
CLNE	Client Layer Network Entity
CoS	Class of Service

CP	Connection Point
CTP	Connection Termination Point
CtrlP	Control Plane
DCN	Data Communication Network
DEG	Degraded
DLM	Direct Loss Measurement
ECC	Embedded Communication Channel
E-LSP	Explicitly TC-encoded-PSC LSP
EMF	Equipment Management Function
EML	Element Management Layer
EMS	Element Management System
ETH	Ethernet MAC Layer
FCAPS	Fault Management, Configuration Management, Account Management, Performance Management and Security Management
FFS	For Further Study
FLR	Frame Loss Ratio
GNE	Gateway Network Element
ILM	Inferred Loss Measurement
IP	Internet Protocol
LAN	Local Area Network
LCK	Locked
LCN	Local Communication Network
LCT	Local Craft Terminal
L-LSP	Label-only-inferred PSC LSP
LSP	Label Switched Path
MAC	Media Access Control
MAF	Management Application Function
MCC	Management Communication Channel
MCF	Message Communication Function
MD	Mediation Device
MEP	Maintenance entity group End Point
MF	Mediation Function
MI	Management Information
MIB	Management Information Base
MIP	Maintenance entity group Intermediate Point
MN	Management Network
MO	Managed Object
MOC	Managed Object Class
MP	Management Point

MgmtP	Management Plane
MPLS	Multi-Protocol Label Switching
MPLS-TP	MPLS Transport Profile
MSN	Management Subnetwork
MT.C	MPLS-TP Channel layer (Note – Equivalent to MPLS-TP transport service layer)
MT.MN	MPLS-TP MN
MT.MSN	MPLS-TP MSN
MT.NE	MPLS-TP NE
MT.P	MPLS-TP Path layer
MT.S	MPLS-TP Section layer
MTLNE	MPLS-TP Layer Network Entity
MTM-n	MPLS-TP Transport Module layer n
N/A	Not Applicable
NALM	No Alarm reporting
NALM-CD	No Alarm reporting, Count Down
NALM-NR	No Alarm reporting, Not Ready
NALM-QI	No Alarm reporting, Qualified Inhibit
NALM-TI	No Alarm reporting, Timed Inhibit
NE	Network Element
NEF	Network Element Function
NEL	Network Element Layer
OAM	Operations, Administration and Maintenance
OAMP	Operations, Administration, Maintenance and Provisioning
OS	Operations System
OSF	Operations System Function
OSI	Open Systems Interconnection
OTN	Optical Transport Network
PDH	Plesiochronous Digital Hierarchy
PHB	Per Hop Behaviour
PMC	Performance Monitoring Clock
PSC	PHB Scheduling Class
PW	Pseudowire
QoS	Quality of Service
RTC	Real-Time Clock
RTR	Reset Threshold Report
SCC	Signalling Communication Channel
SDH	Synchronous Digital Hierarchy

SES	Severely Errored Seconds
SLNE	Server Layer Network Entity
TC	Traffic Class
TCM	Tandem Connection Monitoring
TLV	Type Length Value
TMN	Telecommunication Management Network
TR	Threshold Report
TTL	Time-To-Live
TTP	Trail Termination Point
WAN	Wide Area Network
WS	Workstation
WTR	Wait To Restore

5 Conventions

In this Recommendation, MT.MN stands for MPLS-TP management network, MT.MSN for MPLS-TP management subnetwork, MT.NE for MPLS-TP NE, MT.C for MPLS-TP channel layer, MT.P for MPLS-TP path layer and MT.S for MPLS-TP section layer.

6 MPLS-TP management architecture

See clause 6 of [ITU-T G.7710] for the generic architecture for managing transport equipment. MPLS-TP specific management architecture is described below.

6.1 MPLS-TP network management architecture

The transport layer network architecture of MPLS-TP is described in [ITU-T G.8110.1]. The management of the MPLS-TP layer networks is separable from that of its client layer networks so that the same means of management can be used regardless of the client.

6.1.1 Relationship between TMN, MT.MN and MT.MSN

The MPLS-TP management network (MT.MN) may be partitioned into MPLS-TP management subnetworks (MT.MSNs). The inter-relationship between a management network, its subnetworks and a telecommunication management network (TMN) as generically described in clause 6 of [ITU-T G.7710] is applicable to MPLS-TP.

6.1.2 Access to the MT.MSN

See clause 6.1.2 of [ITU-T G.7710] for the generic requirements.

6.1.3 MT.MSN requirements

See clause 6.1.3 of [ITU-T G.7710] for the generic requirements.

In addition, all MT.NEs must support message communication functions (MCFs). The MCF of an MT.NE initiates/terminates (in the sense of the lower protocol layers), forwards, or otherwise processes management messages over management communication channels (MCCs), or over other data communication network (DCN) interfaces. In addition:

- All MT.NEs are required to terminate the MT.S-MCCs. In open systems interconnection (OSI) terms, this means that each NE must be able to perform the functions of an end system.

- MT.NEs may also be required to forward management messages between ports according to routing control information held in the MT.NE. In OSI terms, this means that some MT.NEs may be required to perform the functions of an intermediate system.
- In addition to supporting interfaces for the MT.S-MCC, a MT.NE may also be required to support other DCN interfaces, which may include MT.P-MCCs, MT.C-MCCs or an Ethernet DCN interface.

The use of the MT.P-MCCs and MT.C-MCCs for management communications is within the scope of this Recommendation.

6.1.4 MT.MSN data communication network

Refer to clause 6.1.4 of [ITU-T G.7710] for the generic requirements.

6.1.4.1 Management communication channel

The MT.MN supports three management communication channels (MCCs):

1. MT.S-MCC (MCC_S);
2. MT.P-MCC (MCC_P);
3. MT.C-MCC (MCC_C);

The general MT.S-, MT.P- and MT.C-MCCs are described in [ITU-T G.7712].

Figure 6-1 illustrates a network scenario consisting of two operators. Operator B provides an MT.P service to operator A (i.e., operator B transports the MT.P signal that begins and ends in operator A's domain). According to [ITU-T G.8110.1], the MCC_P and the MCC_C signals passed transparently through operator B's network.

Figure 6-1 – MCC scenarios

The physical layer is terminated in every network element and its related adaptation function provides the MT.S signals as well as the MCC_S. Hence, the MCC_S cannot cross administrative domains. Figures 6-1, 6-2 and 6-3 illustrate scenarios where the MCC_P and MCC_C are transported transparently through operator B's domain (the operator B network elements are not shown in Figures 6-2 and 6-3). In these scenarios it is possible that operator B may use the MCC_S within its own domain for the management of its domain.

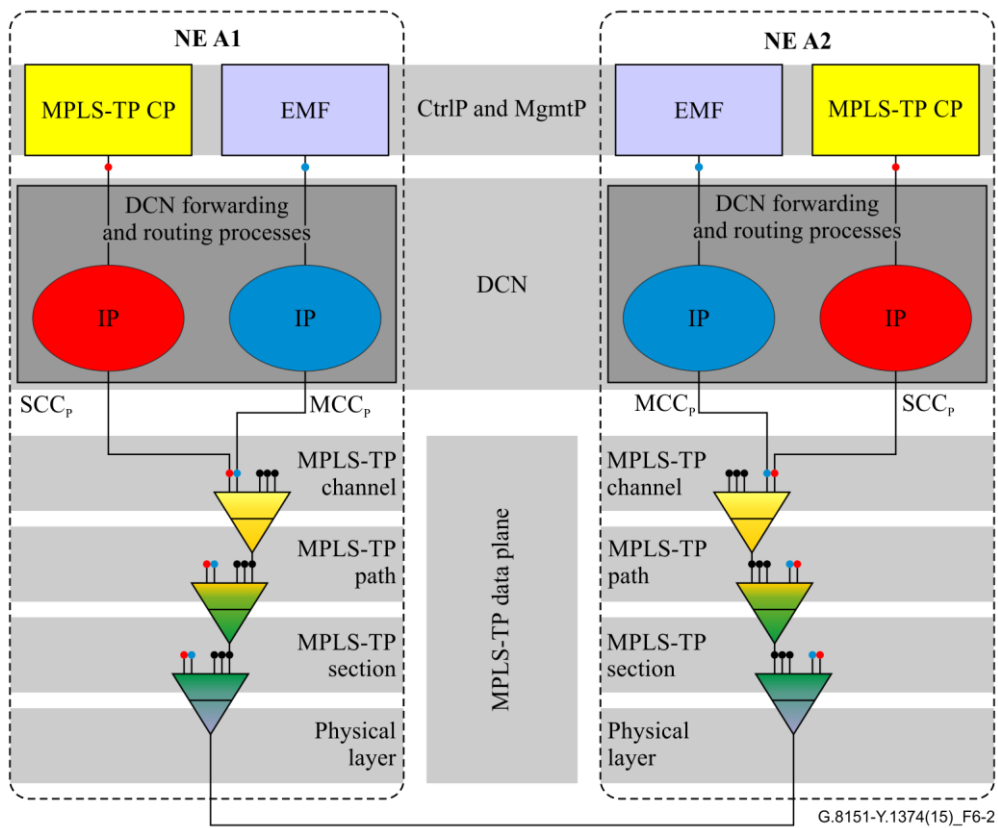

Figure 6-2 – MCC_p scenario example 1

Figure 6-3 – MCC_p scenario example 2

6.1.4.2 MCC physical characteristics

The MT.S-, MT.C- and MT.P-MCCs are logical elements within the MPLS-TP transport module layer n (MTM-n). The MCC provides general management communications between two MPLS-TP network elements with access to the MT.S, MT.P and MT.C characteristic information respectively. The MT.S-, MT.P- or MT.C-MCC is provided by the MPLS-TP operations, administration and maintenance (OAM) function at section, path or channel layer as described in [ITU-T G.7712] or by any other embedded communication channel (ECC) of the MPLS-TP transport network.

The MT.S management communication channel (MCC_S) shall operate as a single message channel between MT.S termination points. The bit rate of the MCC_S shall be configurable.

The MT.P management communication channel (MCC_P) shall operate as a single message channel between any network elements that terminate the MT.P layer. The MCC_P is transported transparently through MT.NEs that only terminates the MT.S layer and forwards the MT.P signal. The bit rate of the MCC_P shall be configurable.

The MT.C management communication channel (MCC_C) shall operate as a single message channel between any network elements that terminate the MT.C layer. The MCC_C is transported transparently through MT.NEs that only terminates the MT.S layer or the MT.S and MT.P layers and forwards the MT.C signal. The bit rate of the MCC_C shall be configurable.

6.1.4.3 MCC data link layer protocol

The MCC data link protocols for management applications are under study for [ITU-T G.7712].

6.1.5 Management of DCN

See clause 6.1.5 of [ITU-T G.7710] for the generic requirements.

6.1.6 Remote log-in

See clause 6.1.6 of [ITU-T G.7710] for the generic requirements.

6.1.7 Relationship between technology domains

See clause 6.1.7 of [ITU-T G.7710] for the generic requirements.

6.2 MPLS-TP equipment management architecture

This clause provides an overview of the minimum functions which are required to support inter-vendor/network communications and single-ended maintenance of MT.NEs within a management subnetwork (MSN), or between communicating peer MT.NEs across a network interface. Single-ended maintenance is the ability to access remotely located MT.NEs to perform maintenance functions (see clause 10.1 of [ITU-T G.7710]).

Note that the management functions have been categorized according to the classifications given in [ITU-T X.700].

Detailed specifications of the management functions, in terms of managed objects classes, attributes and message specification are for further study.

The MPLS-TP equipment management function (EMF) (see Figure 6-4) provides the means through which the MPLS-TP network element function (NEF) is managed by an internal or external manager. If a network element (NE) contains an internal manager, this manager will be part of the MPLS-TP EMF.

The MPLS-TP EMF interacts with the other atomic functions (AFs) (refer to [ITU-T G.8121]) by exchanging information across the MP reference points. See [ITU-T G.806] and [ITU-T G.8121] for more information on atomic functions and on management points (MPs). The MPLS-TP EMF contains a number of functions that provide a data reduction mechanism on the information received

across the MP reference points. The outputs of these functions are available to the agent via the network element resources and management application functions (MAF) which represent this information as managed objects.

Figure 6-4 – MPLS-TP equipment management function

Network element resources provide event processing and storage. The MAF processes the information provided to and by the NE resources. The agent converts this information to management messages and responds to management messages from the manager by performing the appropriate operations on the managed objects.

This information to and from the agent is passed to the message communication function (MCF).

6.3 Information flows over management points

The information flows described in this clause are functional. The existence of these information flows in the equipment will depend on the functionality provided by the MPLS-TP NE and the options selected.

The information flow over the MP reference points that arises from anomalies and defects detected in the atomic functions is described in specific details for each atomic function in [ITU-T G.8121].

The information flow over the MP reference points that arises from provisioning and reporting data is described in specific details for each atomic function in [ITU-T G.8121]. The information listed under the Input columns in the tables in clauses 9, 10 and 11 of [ITU-T G.8121] and in the tables in clause 9 of [ITU-T G.8121.1] and [ITU-T G.8121.2] refers to the provisioning data that is passed from the MPLS-TP EMF to the atomic functions. The information listed under the Output column of those tables refers to the reports passed to the MPLS-TP EMF from the atomic functions.

7 Fault (maintenance) management

Fault management is a set of functions which enables the detection, isolation and correction of abnormal operation of the telecommunication network and its environment. It provides facilities for the performance of the maintenance phases from [ITU-T M.20]. The quality assurance measurements for fault management include component measurements for reliability, availability and survivability.

7.1 Fault management applications

See [ITU-T G.7710] for a description of the basic fault management applications.

7.1.1 Supervision

The supervision process describes the way in which the actual occurrence of a disturbance or fault is analyzed with the purpose of providing an appropriate indication of performance and/or detected fault condition to maintenance personnel. The supervision philosophy is based on the concepts underlying the functional model of [ITU-T G.805], [ITU-T G.8110.1] and the alarm reporting function of [ITU-T X.733].

The five basic supervision categories are related to transmission, quality of service (QoS), processing, equipment and environment. These supervision processes are able to declare fault causes, which need further validation before the appropriate alarm is reported. See [ITU-T G.7710] for additional discussion of these categories.

The MT.NE shall indicate to the OS when a termination point is no longer able to supervise the signal (e.g., implementing equipment has a fault or loss of power).

7.1.1.1 Transmission supervision

See clause 7.1.1.1 of [ITU-T G.7710] for a description of transmission supervision.

For MT.NE, the defects that must be monitored for the purpose of transmission supervision are defined in clause 6.1 of [ITU-T G.8121].

The atomic function associated failure conditions are listed in clause 7.2.1.

7.1.1.2 Quality of service supervision

See [ITU-T G.7710] for a description of quality of service supervision.

7.1.1.3 Processing supervision

See [ITU-T G.7710] for a description of processing supervision.

7.1.1.4 Hardware supervision

See [ITU-T G.7710] for a description of equipment supervision.

7.1.1.5 Environment supervision

See [ITU-T G.7710] for a description of environmental supervision.

7.1.2 Validation

See [ITU-T G.7710] for a description of fault cause validation.

7.1.3 Alarm handling

7.1.3.1 Severity assignment

See [ITU-T G.7710] for a description of severity categories.

7.1.3.2 Alarm reporting control

Alarm reporting control (ARC) provides an automatic in-service provisioning capability.

The following ARC states may be specified for a managed entity:

ALM	Alarm reporting; alarm reporting is turned on.
NALM	No alarm reporting; alarm reporting is turned off.
NALM-CD	No alarm reporting, count down; this is a substate of NALM-QI and performs the persistence timing countdown function when the managed entity is qualified problem free.
NALM-NR	No alarm reporting, not ready; this is a substate of NALM-QI and performs a wait function until the managed entity is qualified problem free.
NALM-QI	No alarm reporting, qualified inhibit; alarm reporting is turned off until the managed entity is qualified problem free for a specified persistence interval.
NALM-TI	No alarm reporting, timed inhibit; alarm reporting is turned off for a specified timed interval.

Alarm reporting may be turned off (using NALM, NALM-TI, or NALM-QI) on a per-managed entity basis to allow sufficient time for customer testing and other maintenance activities in an "alarm free" state. Once a managed entity is ready, alarm reporting is automatically turned on (to alarm reporting (ALM)). The managed entity may be automatically turned on either by using NALM-TI or NALM-QI and allowing the resource to transition out automatically, or by invoking first the NALM state from an element management system (EMS) and when maintenance activity is done, invoking the ALM state. This later automation is carried out by the EMS. For further details relating to ARC, see [ITU-T M.3100].

7.1.3.3 Reportable failures

See [ITU-T G.7710] for a description of reportable failures.

7.1.3.4 Alarm reporting

Alarm surveillance is concerned with the detection and reporting of relevant events and conditions which occur in the network. In a network, events and conditions detected within the equipment and incoming signals should be reportable. In addition, a number of events external to the equipment should also be reportable. Alarms are indications that are automatically generated by an NE as a result of the declaration of a failure. The OS shall have the ability to define which events and conditions generate autonomous reports, and which shall be reported on request.

The following alarm-related functions shall be supported:

1. Autonomous reporting of alarms;
2. Request for reporting of all alarms;
3. Reporting of all alarms;
4. Allow or inhibit of autonomous alarm reporting;
5. Reporting on request status of allow or inhibit alarm reporting;
6. Reporting of protection switch events.

7.1.3.4.1 Local reporting

See [ITU-T G.7710] for a description of local reporting.

7.1.3.4.2 TMN reporting

See [ITU-T G.7710] for a description of TMN reporting.

7.2 Fault management functions

Figure 7-1 contains the functional model of fault management inside the MPLS-TP EMF. This model is consistent with the alarm flow functional model, specified in [ITU-T M.3100]. It must be noted that it does not address configuration aspects relating to fault management, the full ARC functional model, nor does it define where all possible event report parameters get assigned. Figure 7-1 is intended only to illustrate which well-known functions are impacted by the ARC, and which are not, and to provide a generalized alarm flow view.

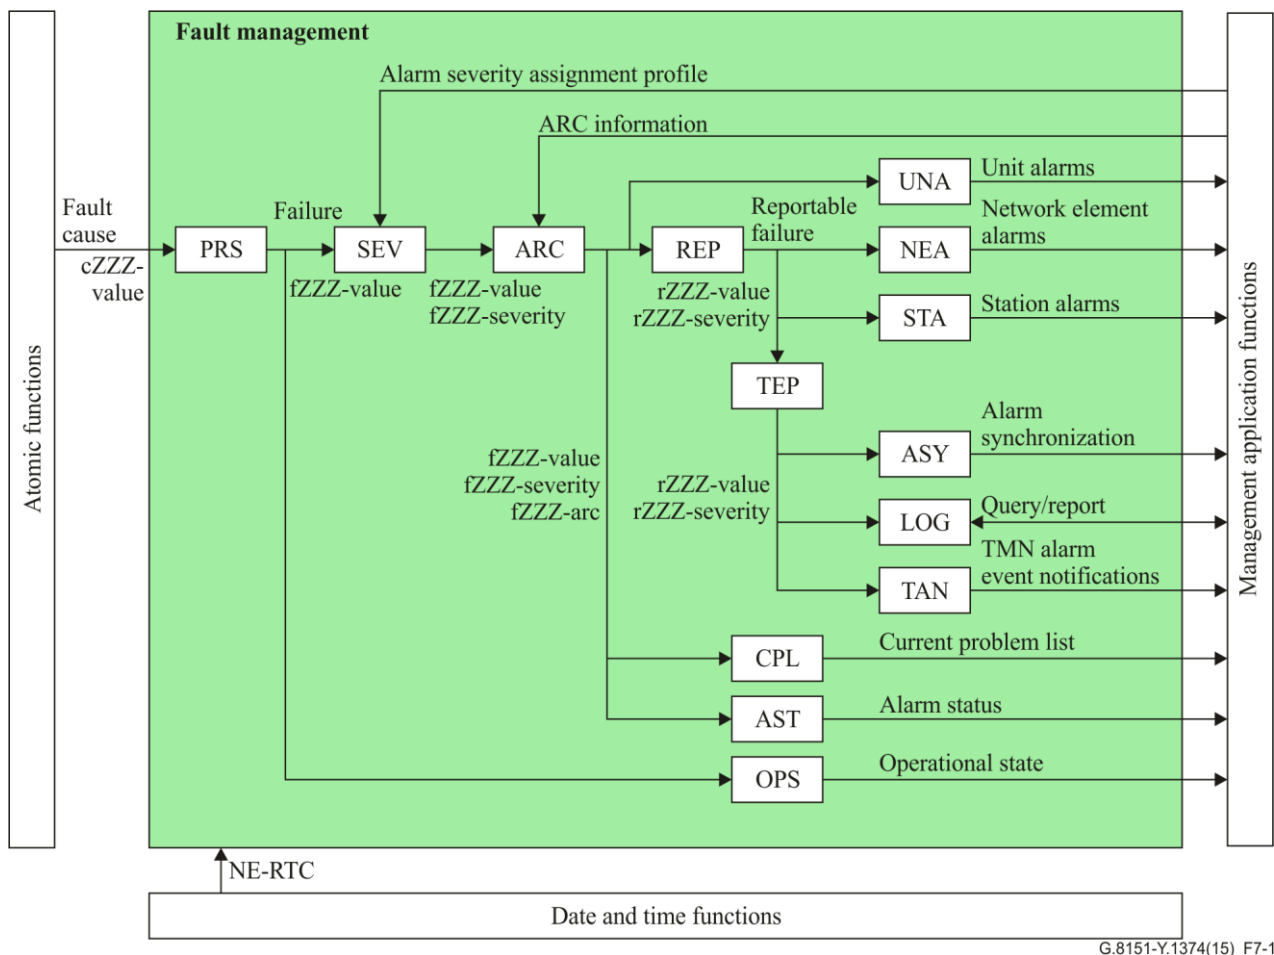

Figure 7-1 – Fault management within the MPLS-TP NEF

7.2.1 Fault cause persistency function – PRS

The defect correlations provide a data reduction mechanism on the fault and performance monitoring primitives' information presented at the MP reference points.

The equipment management function within the network element performs a persistency check on the fault causes (that are reported across the MP reference points) before it declares a fault cause a failure. In addition to the transmission failures, hardware failures with signal transfer interruption are also reported at the input of the fault cause function for further processing. See Figure 7-2.

Symbol

Figure 7-2 – Fault cause persistency function

For MT.NE that supports the following functions specified in [ITU-T G.8121], the EMF PRS process shall support the persistency check for the fault causes listed in Table 7-1.

Inputs and outputs

Table 7-1 – Inputs/outputs for the fault cause persistency function

Atomic function ([ITU-T G.8121])	Input	Output
MT_TT_Sk	cSSF cLCK cLOC cMMG cUNM cUNP cUNC cDEG cRDI	fSSF fLCK fLOC fMMG fUNM fUNP fUNC fDEG fRDI
Sn/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
Sn-X-L/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
Sm/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
Sm-X-L/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
Pq/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
Pq-X-L/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM

Table 7-1 – Inputs/outputs for the fault cause persistency function

Atomic function ([ITU-T G.8121])	Input	Output
ODUkP/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM
ODUkP-X-L/MT_A_Sk	cVcPLM cLFD cEXM cUPM	fVcPLM fLFD fEXM fUPM
ODUkP-h/MT_A_Sk	cPLM cLFD cEXM cUPM	fPLM fLFD fEXM fUPM

See [ITU-T G.7710] for the mapping of failure (fXXX) to the generic probable cause to be used in alarm reporting.

Process

The equipment management function within the network element performs a persistency check on the fault causes before it declares a fault cause a failure.

A transmission failure (fXXX) shall be declared if the fault cause persists continuously for 2.5 ± 0.5 s. The failure shall be cleared if the fault cause is absent continuously for 10 ± 0.5 s.

The specific set of failures associated with each atomic function is listed in Table 7-1.

The failure declaration and clearing shall be time stamped. The time-stamp shall indicate the time at which the fault cause is activated at the input of the fault cause persistency (i.e., defect-to-failure integration) function, and the time at which the fault cause is deactivated at the input of the fault cause persistency function.

7.2.2 Severity assignment function – SEV

See [ITU-T G.7710] for a description of the severity assignment function.

7.2.3 Alarm reporting control function – ARC

The ARC function allows a management system to control the alarm reporting on a managed entity basis as defined in [ITU-T M.3100].

The alarms that can be controlled with this function are defined for each atomic function in [ITU-T G.8121].

The following ARC states may be specified for a managed entity:

- ALM Alarm reporting; alarm reporting is turned on.
- NALM No Alarm reporting; alarm reporting is turned off.
- NALM-CD No Alarm reporting, count down; this is a substate of NALM-QI and performs the persistence timing count down function when the managed entity is qualified problem free.
- NALM-NR No Alarm reporting, not ready; this is a substate of NALM-QI and performs a wait function until the managed entity is qualified problem free.

- NALM-QI No Alarm reporting, qualified inhibit; alarm reporting is turned off until the managed entity is qualified problem free for a specified persistence interval.
- NALM-TI No Alarm reporting, timed inhibit; alarm reporting is turned off for a specified timed interval.

The ALM state is required for all managed entities that can detect alarms.

In addition, at least one of the states: NALM, NALM-TI, or NALM-QI must be supported.

If NALM-QI is supported, then NALM-NR is required and NALM-CD is optional.

For MT.NE that supports the following functions specified in [ITU-T G.8121], the EMF ARC process shall support the ARC function for the failures listed in Table 7-2.

Table 7-2 – ARC specifications for MPLS-TP

Atomic function	Qualified problems	QoS reporting	Default state value
MT_TT_Sk	fSSF fLCK fLOC fMMG fUNM fUNP fUNC fDEG fRDI	FFS	ALM
Sn/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM
Sn-X-L/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM
Sm/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM

Pq-X-L/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM

Table 7-2 – ARC specifications for MPLS-TP

Atomic function	Qualified problems	QoS reporting	Default state value
ODUKP/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM
ODUKP-X-L/MT_A_Sk	fVcPLM fLFD fEXM fUPM	FFS	ALM
ODUKP-h/MT_A_Sk	fPLM fLFD fEXM fUPM	FFS	ALM

7.2.4 Reportable failure function – REP

See [ITU-T G.7710] for a description of the reportable failure function

7.2.5 Unit alarms function – UNA

See [ITU-T G.7710] for a description of the unit alarms function

7.2.6 Network element alarms function – NEA

See [ITU-T G.7710] for a description of the network element alarms function

7.2.7 Station alarms function – STA

See [ITU-T G.7710] for a description of the station alarms function

7.2.8 TMN event pre-processing function – TEP

See [ITU-T G.7710] for a description of the TMN event pre-processing function

7.2.9 Alarm synchronization function – ASY

See [ITU-T G.7710] for a description of the alarm synchronization function

7.2.10 Logging function – LOG

Alarm history management is concerned with the recording of alarms. Historical data shall be stored in registers in the NE. Each register contains all the parameters of an alarm message.

Registers shall be readable on-demand or periodically. The OS can define the operating mode of the registers as wrapping or stop when full. The OS may also flush the registers or stop recording at any time.

NOTE – Wrapping is the deletion of the earliest record to allow a new record when a register is full. Flushing is the removal of all records in the register. See [ITU-T X.735] for additional details.

See [ITU-T G.7710] for a description of the logging function

7.2.11 TMN alarm event notification function – TAN

See [ITU-T G.7710] for a description of the TMN alarm event notification function

7.2.12 Current problem list function – CPL

See [ITU-T G.7710] for a description of the current problem list function

7.2.13 Alarm status function – AST

See [ITU-T G.7710] for a description of the alarm status function

7.2.14 Operational state function – OPS

See [ITU-T G.7710] for a description of the operational state function

For MT.NE that supports the following functions specified in [ITU-T G.8121], the EMF OPS process shall support the failures listed in Table 7-3, which lists the failures that could influence the operational state of the related objects.

Table 7-3 – Operational state function input and output signals for MPLS-TP

Atomic function	Failure input (fZZZ-value)	Operational state output (enabled/disabled)
MT_TT_Sk	fSSF fLCK fLOC fMMG fUNM fUNP fUNC fDEG fRDI	Enabled Enabled Enabled Enabled Enabled Enabled Enabled Enabled Enabled
Sn/MT_A_Sk	fPLM fLFD fEXM fUPM	Enabled Enabled Enabled Enabled
Sn-X-L/MT_A_Sk	fPLM fLFD fEXM fUPM	Enabled Enabled Enabled Enabled

ODUKP-h/MT_A_Sk	fPLM fLFD fEXM fUPM	Enabled Enabled Enabled Enabled

7.2.15 External events

For further study.

8 Configuration management

See [ITU-T G.7710] for the generic requirements for configuration management. MPLS-TP detailed specifications, if needed, are explicitly described.

8.1 Hardware

See [ITU-T G.7710] for a description of hardware management.

8.2 Software

See [ITU-T G.7710/] for a description of software management.

8.3 Protection switching

See [ITU-T G.7710] for a description of the generic management requirements for protection switching. The MPLS-TP specific management requirements will be provided after the protection switching process is defined in [ITU-T G.8121].

8.4 Trail termination

See [ITU-T G.7710] for a description of trail termination management.

This function allows a user to provision and monitor the operation of the MPLS-TP trail termination process.

The management information (MI) signals listed in the table(s) of this clause are communicated between the EMF and the MPLS-TP trail termination process across the MP within the MT.NE.

For MT.NE that supports the MT_TT function specified in [ITU-T G.8121], the EMF shall support the following management functions for the MI listed in Table 8-1:

- Provisioning the trail termination management information;
- Retrieving the trail termination management information;
- Notifying the changes of the trail termination management information;

- Receiving the monitored trail termination management information.

Table 8-1 – Provisioning and reporting for termination functions

MI signal	Value range	Default value
MT_TT_So Provisioning		
MT_TT_So_MI_GAL_Enable	True, false	(Note 3)
MT_TT_So_MI_TTLVALUE	0 to 255	255
MT_TT_So_MI_MEG_ID	String; values are OAM protocol-specific	(Note 1)
MT_TT_So_MI_MEP_ID	String; values are OAM protocol-specific	(Note 1)
MT_TT_So_MI_CC_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	Not applicable (N/A)
MT_TT_So_MI_RDI_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A
MT_TT_So_MI_CC_Enable	True, false	False
MT_TT_So_MI_CVp_Enable	True, false NOTE – The combination of MT_TT_So_MI_CC_Enable=false and MT_TT_So_MI_CVp_Enable=true is not allowed	False

MT_TT_Sk Reporting		
MT_TT_Sk_MI_SvdCC	Last received CC packet(s) that causes the defect	–
NOTE 1 – A value must be provided at provisioning.		
NOTE 2 – The Test ID field is optional when this proactive measurement tool is used.		
NOTE 3 – MI_GAL_Enable must be set to true on label switched paths (LSPs) and sections and to false on pseudowires (PWs). Setting it to true for PWs is for further study.		

8.4.1 Trail termination – ITU-T G.8121.1 specific

For MT.NE that supports the MT_TT function specified in [ITU-T G.8121.1], the EMF shall in addition support the management of the MIs listed in Table 8-1.1:

Table 8-1.1 – Provisioning and reporting for termination functions

MI signal	Value range	Default value
MT_TT_So Provisioning		
MT_TT_So_MI_LMC_Enable	True, false	False
MT_TT_Sk Provisioning		
MT_TT_Sk_MI_LMC_Enable	True, false	False

8.4.2 Trail termination – ITU-T G.8121.2 specific

For MT.NE that supports the MT_TT function specified in [ITU-T G.8121.2], the EMF shall in addition support the management of the MIs listed in Table 8-1.2.

Table 8-1.2 – Provisioning and reporting for termination functions

MI signal	Value range	Default value

MT_TT_Sk_MI_PM_ClearError	–	–
MT_TT_Sk_MI_PM_Responder_Enable	True, false	True
MT_TT_Sk Reporting		
MT_TT_Sk_MI_DMp_ReportError(Error)[1..MDMp]	True, false	False
MT_TT_Sk_MI_LMp_ReportError(Error)[1..MLMp]	True, false	False

8.5 Adaptation

See clause 8.5 of [ITU-T G.7710] for a description of adaptation management

An access point that has multiple adaptation functions connected to it, thereby allowing different clients to be transported via the server signal, requires a mechanism for the selection of the active client.

This function allows a user to provision and monitor the operation of the MPLS-TP adaptation processes.

The MI signals listed in the following tables are communicated between the EMF and the adaptation processes across the MP within the MPLS-TP NE.

For MT.NE that supports the adaptation functions specified in [ITU-T G.8121], the EMF shall support the following management functions for the MI listed in Table 8-2:

- Provisioning the flow forwarding management information;
- Retrieving the flow forwarding management information;
- Notifying the changes of the flow forwarding management information.

Table 8-2 – Provisioning and reporting for adaptation functions

MI signal	Value range	Default value
MT/MT_A_So Provisioning

ETH/MT_A_Sk_MI_APS_OAM_Tool[1...M]	FFS	FFS
NOTE 1 – According to [ITU-T G.8121].		
NOTE 2 – A value must be provided at provisioning.		
NOTE 3 – * indicates ETH OAM related.		
NOTE 4 – MI_GAL_Enable must be set to true on LSPs and sections and to false on PWs. Setting it to true for PWs is for further study.		
NOTE 5 – See clause 8.2.1 of [ITU-T G.8121] for the semantic of A and B.		

8.5.1 Adaptation – ITU-T G.8121.1 specific

For MT.NE that supports the adaptation functions specified in [ITU-T G.8121.1], there is no additional MI to be managed beyond those listed in Table 8-2.

8.5.2 Adaptation – ITU-T G.8121.2 specific

For MT.NE that supports the adaptation functions specified in [ITU-T G.8121.2], the EMF shall in addition support the management of the MIs listed in Table 8-2.1.

Table 8-2.1 – Provisioning and reporting for adaptation functions

MI signal	Value range	Default value
MT/MT_A_Sk Provisioning		
MT/MT_A_Sk_MI_Local_Defect	True, false	False
Sn/MT_A_Sk Provisioning		
Sn/MT_A_Sk_MI_Local_Defect	True, false	False

Sm/MT_A_Sk Provisioning		
Sm/MT_A_Sk_MI_Local_Defect	True, false	False
Sm-X-L/MT_A_Sk Provisioning		
Sm-X-L/MT_A_Sk_MI_Local_Defect	True, false	False
Pq/MT_A_Sk Provisioning		
Pq/MT_A_Sk_MI_Local_Defect	True, false	False
Pq-X-L/MT_A_Sk Provisioning		
Pq-X-L/MT_A_Sk_MI_Local_Defect	True, false	False
ODUKP/MT_A_Sk Provisioning		

Table 8-2.1 – Provisioning and reporting for adaptation functions

MI signal	Value range	Default value
ODUKP/MT_A_Sk_MI_Local_Defect	True, false	False
ODUKP-X-L/MT_A_Sk Provisioning		
ODUKP-X-L/MT_A_Sk_MI_Local_Defect	True, false	False
ODUKP-h/MT_A_Sk provisioning		
ODUKP-h/MT_A_Sk_MI_Local_Defect	True, false	False
ETH/MT_A_Sk Provisioning		
ETH/MT_A_Sk_MI_Local_Defect	True, false	False

8.6 Diagnostic

This clause provides the requirements for the management of the MT diagnostic trail termination functions (MTDe_TT).

For MT.NE that supports the MTDe_TT function specified in [ITU-T G.8121], the EMF shall support the following management functions for the MIs listed in Table 8-3:

- Provisioning the trail termination management information;
- Retrieving the trail termination management information;
- Notifying the changes of the trail termination management information;
- Receiving the monitored trail termination management information.

Table 8-3 – Provisioning and reporting for diagnostic trail termination function

MI signal	Value range	Default value
MTDe_TT_So Provisioning		
MTDe_TT_So_MI_GAL_Enable	True, false	(Note 4)
MTDe_TT_So_MI_TTLVALUE	0 to 255	255
MTDe_TT_So_MI_CV_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A
MTDe_TT_So_MI_CV_Series ()	See Tables 8-3.1 and 8-3.2 for the respective parameters and values	See Tables 8-3.1 and 8-3.2 for the respective parameters and values
MTDe_TT_So_MI_1TH_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A
MTDe_TT_So_MI_1TH_Start(CoS, Pattern, Length, Period) NOTE – Pattern is ITU-T G.8121.1 specific	CoS: 0 to 7 Length: 0 to L. (Note 3) Patterns, Period: FFS	Default value of Length: 0
MTDe_TT_So_MI_1TH_Terminate	–	–
MTDe_TT_So_MI_LMo_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A

MTDi_TT_So Provisioning		
MTDi_TT_So_MI_GAL_Enable	True, false	(Note 4)
MTDi_TT_So_MI_TTLVALUE	0 to 255	255
MTDi_TT_So_MI_MIP_ID	String; values are OAM protocol-specific	(Note 1)
MTDi_TT_So_MI_CV_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A
MTDi_TT_So_MI_DP_Loopback_Enable	True, false	False
MTDi_TT_Sk Provisioning		
MTDi_TT_Sk_MI_GAL_Enable	True, false	(Note 4)
MTDi_TT_Sk_MI_MIP_ID	String; values are OAM protocol-specific	(Note 1)

Table 8-3 – Provisioning and reporting for diagnostic trail termination function

MI signal	Value range	Default value
MTDi_TT_Sk_MI_CV_OAM_Tool	[ITU-T G.8113.1], [ITU-T G.8113.2]	N/A
MTDi_TT_Sk_MI_DP_Loopback_Enable	True, false	False
NOTE 1 – A value must be provided at provisioning. NOTE 2 – The Test ID field is optional when this proactive measurement tool is used. NOTE 3 – The value of L depends on implementation, e.g., may be 2 ³² . NOTE 4 – MI_GAL_Enable must be set to true on LSPs and sections and to false on PWs. Setting it to true for PWs is for further study.		

8.6.1 Diagnostic – ITU-T G.8121.1 specific

For MT.NE that supports the MTDe_TT function specified in [ITU-T G.8121.1], the EMF shall in addition support the management of the MIs listed in Table 8-3.1.

Table 8-3.1 – Provisioning and reporting for termination functions

MI signal	Value range	Default value
MTDe_TT_So Provisioning		
MTDe_TT_So_MI_CV_Series(CoS, N,Length,Period)	Time-to-live (TTL): 0 to 255 CoS: 0 to 7 N: 1 to n. NOTE – The value of n depends on implementation, e.g., may be 2 ³² . Length: 0 to L. NOTE – The value of L depends on implementation, e.g., may be 2 ³² . Period: 5 to 10 s.	Default value of N: 3 Default value of Length: 0 Default value of Period: 5 s.
MTDe_TT_So_MI_CV_Test(CoS, Pattern, Length,Period)	See [ITU-T G.8121.1]	
MTDe_TT_So Reporting		
MTDe_TT_So_MI_CV_Test_Result(Sent, REC, REC,ERR,OO)	See [ITU-T G.8121.1]	
MTDe_TT_So_MI_CV_Series_Result(REC, ERR,OO)	FFS	
MTDe_TT_Sk Provisioning		
MTDe_TT_Sk_MI_MEP_ID	See [ITU-T G.8121.1]	

8.6.2 Diagnostic – ITU-T G.8121.2 Specific

For MT.NE that supports the MT_TT function specified in [ITU-T G.8121.2], the EMF shall in addition support the management of the MIs listed in Table 8-3.2:

Table 8-3.2 – Provisioning and reporting for termination functions

MI signal	Value range	Default value
MTDe_TT_So Provisioning		
MTDe_TT_So_MI_Target_FEC	See [ITU-T G.8121.2]	–

MTDe_TT_Sk_MI_FEC_Checking	True, false	True
MTDe_TT_Sk Reporting		
MTDi_TT_So Provisioning		
MTDi_TT_So_MI_Target_FEC	See [ITU-T G.8121.2]	–
MTDi_TT_So_MI_Iffnum	See [ITU-T G.8121.2]	–
MTDi_TT_So_MI_MTU	See [ITU-T G.8121.2]	–
MTDi_TT_Sk Provisioning		
MTDi_TT_Sk_MI_FEC_Checking	See [ITU-T G.8121.2]	–
NOTE – These MI signals are defined in MTDe_TT_So in [ITU-T G.8121]. [ITU-T G.8121.2] does not use these MI signals as defined in Table 8-3 in this Recommendation.		

8.7 Connection

See clause 8.6 of [ITU-T G.7710] for a description of connection management.

This function allows a user to provision the operation of a MPLS-TP connection process.

The MI signals listed in this clause are communicated from the EMF to the connection process through the MP.

For MT.NE that supports the MT_C function specified in [ITU-T G.8121], the EMF shall support the following management functions for the MIs listed in Table 8-4:

- Provisioning the trail termination management information;
- Retrieving the trail termination management information;
- Notifying the changes of the trail termination management information.

Table 8-4 – Provisioning and reporting for connection functions

MI signal	Value range	Default value
MT_C Provisioning (Per matrix connection)		
MT_C_MI_ConnectionType	Protected, unprotected	Unprotected
MT_C_MI_Return_CP_ID	NULL (for unidirectional), or the connection point (CP) identifier (for bidirectional)	–
MT_C_MI_ConnectionPortIds	Set of connection point identifiers	–

8.7.1 Connection – ITU-T G.8121.1 specific

For MT.NE that supports the MT_C functions specified in [ITU-T G.8121.1], there is no additional MI to be managed beyond those listed in Table 8-4.

8.7.2 Connection – ITU-T G.8121.2 specific

For MT.NE that supports the MT_C functions specified in [ITU-T G.8121.2], there is no additional MI to be managed beyond those listed in Table 8-4.

8.8 DEG thresholds

For further study.

8.9 XXX_Reported

See clause 8.8 of [ITU-T G.7710] for a description of XXX_Reported management.

8.10 Alarm severity

See clause 8.9 of [ITU-T G.7710] for a description of alarm severity.

8.11 Alarm reporting control

See clause 8.10 of [ITU-T G.7710] for a description of ARC.

8.12 PM thresholds

For further study.

8.13 TCM activation

Tandem connection monitoring (TCM) is for further study.

8.14 Date and time

The date and time functions within the MPLS-TP EMF comprise the local real-time clock (RTC) function and the performance monitoring clock (PMC) function. The message communication function within the MPLS-TP NEF shall be capable of setting the local RTC function.

The date and time values are incremented by a free running local clock, or by an external timing source. The fault, configuration, accounting, performance and security (FCAPS) functions need date and time information, e.g., to time stamp event reports. They obtain this information from the date and time function.

8.14.1 Date and time applications

Clause 8.13.1 of [ITU-T G.7710] identifies three date and time applications. These are:

- Time-stamping;
- Performance monitoring clock signals;
- Activity scheduling.

The MPLS-TP NEF functional requirements for these applications are specified in the following clauses.

8.14.1.1 Time-stamping

See clause 8.13.1.1 of [ITU-T G.7710] for a description of the time-stamping application.

8.14.1.2 Performance monitoring clock signals

See clause 8.13.1.2 of [ITU-T G.7710] for a description of the PMC signals.

8.14.1.3 Activity scheduling

See clause 8.13.1.3 of [ITU-T G.7710] for a description of the activity scheduling.

8.14.2 Date and time functions

There are three date and time functions defined. The local RTC function is required for time-stamping and activity scheduling. The local RTC alignment function is required for aligning the clock with an external time reference. The PMC function, in addition to RTC, is typical for digital counter measurements.

8.14.2.1 Local real-time clock function

The local real-time clock function is specified in clause 8.13.2.1 of [ITU-T G.7710].

8.14.2.2 Local real-time clock alignment function with external time reference

The local real-time clock alignment function with external time reference is specified in clause 8.13.2.2 of [ITU-T G.7710].

8.14.2.3 Performance monitoring clock function

The performance monitoring clock function is specified in clause 8.13.2.3 of [ITU-T G.7710].

9 Accounting management

For further study.

10 Performance management

See clause 10 of [ITU-T G.7710] for the generic requirements for performance management. MPLS-TP specific management requirements are described below.

10.1 Performance management applications

See clause 10.1 of [ITU-T G.7710] for the generic description for performance management applications.

10.2 Performance monitoring functions

See clause 10.2 of [ITU-T G.7710] for generic requirements of performance monitoring functions.

The following are MPLS-TP specific performance management requirements:

1. PM measurements are managed at trail termination points (TTPs) and connection termination points (CTPs) (i.e., MEPs/MIPs are created and deleted).
2. One MEP has to be created per TTP if that has to be supervised.
3. Two kinds of measurement activities have to be supported (ProActive, OnDemand).
4. ProActive measurement activities are managed at MEPs (establish, disable, enable, terminate).
5. OnDemand measurement activities are managed at MEPs (establish, modify, abort).
6. On-demand measurements can be done using four different OAM protocol data unit (PDU) generation mechanisms: single instance, repetitive instance, single series and repetitive series. To describe these mechanisms, the following terms are used:
 - OAM PDU generation type:
Generation pattern of the on-demand OAM message;
Valid types are: single instance, repetitive instance, single series and repetitive series.
 - Message period (x)
Frequency of the OAM message generation within a series;
Note that a value of zero (i.e., $x = 0$) means that only one OAM message per measurement interval is generated.
 - Measurement interval (y)
Defines discrete non overlapping periods of time during which measurements are performed (i.e., OAM messages are generated) and reports are gathered at the end of the measurement intervals.
Note that a value of zero means a degenerated measurement interval with a single OAM message and the report is sent as immediately as possible.
 - Repetition period (z)
Defines the time between the start of two measurement intervals;
This is applicable for the repetitive instance type and may be applicable for the repetitive series type.
Note that a value of zero means N/A. This is for the cases of single instance, single series or repetitive series without extra gap in between the measurement intervals (i.e., also known as continuous series).
 - Start time
Define the start of the on-demand session.
 - Stop time
Define the stop of the on-demand session.
 - Session duration
Stop time – Start time.
Note that session duration is not a configuration parameter. That is, it is not needed in the configuration.

The four on-demand measurements are illustrated in Figure 10-1 of [ITU-T G.8051].

Note that in the repetitive series case, if the repetition period $z = y + x$, or the value is not provisioned, then there is no extra gap between the end of the measurement interval and the start of the new measurement interval. This pattern is also known as the continuous series cases. The repetition period (z) is needed if there is extra gap between the measurement intervals.

7. It shall be possible to configure the following on-demand measurement parameters (including the default values):
 - a) OAM PDU generation type; default = repetitive instance;
 - b) Start time; default = current time;
 - c) Stop time; default = current time + 1 hour;
 - d) OAM message period; default = 0;
 - e) Measurement interval; default = 0;
 - f) Repetition period; default = 0.
8. Parallel measurement activities, one per priority, can be established.
9. Performance data is stored in registers associated to the measurement job.
10. On-demand measurement activities are automatically terminated after (last) report is sent.
11. Threshold profiles are managed at the managed element (create, modify, delete).
12. It shall be possible to retrieve the following configuration information:
 - a) All existing MEPs/MIPs within a TP (TTP or CTP);
 - b) All existing measurement activities within a MEP;
 - c) All existing threshold profiles within a network element;
 - d) All threshold settings within a proactive PM measurement activity.
13. It shall be possible to retrieve all proactive PM measurement current and history performance data within a MEP.
14. It shall be possible to request intermediate reports on an on-demand PM measurement activity of "single series" and "repetitive series" types.
15. It shall be possible to request an autonomous continuous reporting of performance data from all proactive PM measurement jobs within a MEP (i.e., automatic "push" of the measured PM data).
16. On-demand loss measurement can be measured by directly counting the data traffic or can be inferred by counting the synthetic traffic. If on-demand loss measurement is supported, for each measurement interval, the MPLS-TP NE should:
 - Receive from the transport plane the measurements (i.e., N_TF, N_LF, F_TF, F_LF) at the end of each measurement interval.

Note that according to the definition of near-end and far-end frame loss in clause 8.1 of [ITU-T G.8013], for a MEP, N_TF and N_LF refer to the transmitted and lost ingress frames while F_TF and F_LF refer to the transmitted and lost egress frames.

Note that on-demand one-way loss measurement can provide only near-end measurement (i.e., N_TF, N_LF).
 - Store the measurements (TN_TF, TN_LF, TF_TF, TF_LF) and calculate the frame loss ratios (FLRs) ($TN_FLR = TN_LF / TN_TF$, $TF_FLR = TF_LF / TF_TF$). The measurements and FLRs shall be reported to the management system.
 - At the instruction of the management system, the NE shall be able to request from the transport plane the intermediate (i.e., before the end of the measurement interval) measurements, calculate the intermediate FLRs and report the intermediate results (TN_TF, TN_LF, TN_FLR, TF_TF, TF_LF, TF_FLR) to the management system.

NOTE – An on-demand LM or DM session could be a single series of OAM messages or a single instance of OAM message. A single instance OAM could be considered as a special case of a single series OAM.

17. Proactive loss measurement can be measured by directly counting the data traffic or can be inferred by counting the synthetic traffic. If proactive loss measurement is supported, for each loss measurement session the MPLS-TP NE should:
- Receive from the transport plane the measurements (i.e., pN_{TF} , pN_{LF} , pF_{TF} , pF_{LF}) for each OAM period.
Note that on-demand one-way loss measurement can support only near-end measurement (i.e., N_{TF} , N_{LF}).
 - Calculate the FLRs ($N_{FLR}=pN_{LF}/pN_{TF}$, $F_{FLR}=pF_{LF}/pF_{TF}$) for each OAM period; store the temporal minimum, average, and maximum statistics (mN_{FLR} , aN_{FLR} , xN_{FLR} , mF_{FLR} , aF_{FLR} , xF_{FLR}) in the current 15-minute and 24-hour registers. The stored statistics shall be available for retrieval by the management system.
 - The FLR measurements of a monitored entity measured during a severely errored seconds (SES) shall be included in the computation of its FLR statistics, unless the SES is part of the unavailable time period.
NOTE – This is in line with the definition made in Note 1 of clause 1 in [ITU-T Y.1563].
 - At the maturity of the current 15-minute and 24-hour periods, the statistics in the current registers shall move to the history registers and then reset the current registers to zeros. See detailed requirements in [ITU-T G.7710].
18. If on-demand one-way DM is supported, for each on-demand one-way DM measurement interval, the MPLS-TP NE should:
- Receive from the transport plane the array of near-end measurements (count, $N_{FD}[]$) at the end of each measurement interval.
 - Store the measurements, compute the corresponding array of $N_{FDV}[]$ and report the near-end measurements (count, $N_{FD}[]$, $N_{FDV}[]$) to the management system.
 - At the instruction of the management system, the NE shall be able to request from the transport plane the intermediate measurements, calculate the intermediate $N_{FDV}[]$ and report the intermediate results (count, $N_{FD}[]$, $N_{FDV}[]$) to the management system.
19. If proactive one-way DM is supported, for each proactive one-way DM session the MPLS-TP NE should:
- Receive from the transport plane the near-end measurements (pN_{FD} , pN_{FDV}) for each OAM period;
 - Store the temporal minimum, average, and maximum (N_{FD} , N_{FDV}) in the current 15-minute and 24-hour registers. The stored statistics shall be available for retrieval by the management system;
 - At the maturity of the current 15-minute and 24-hour periods, the statistics in the current registers shall move to the history registers and then reset the current registers to zeros. See detailed requirements in [ITU-T G.7710].
20. If on-demand two-way DM is supported, for each on-demand two-way DM measurement interval, the MPLS-TP NE should:
- Receive from the transport plane the array of near-end, far-end and bidirectional measurements (count, $N_{FD}[]$, $F_{FD}[]$, $B_{FD}[]$) at the end of each measurement interval;
 - Store the measurements, compute the corresponding array of $FDV[]$, and report the near-end, far-end and bidirectional (two-way) measurements (count, $N_{FD}[]$, $F_{FD}[]$, $B_{FD}[]$; $N_{FDV}[]$, $F_{FDV}[]$, $B_{FDV}[]$) to the management system;
 - At the instruction of the management system, the NE shall be able to request from the transport plane the intermediate measurements, calculate the intermediate $FDV[]$ and

report the intermediate results (count, N_FD[], F_FD[], B_FD[]; N_FDV[], F_FDV[], B_FDV[]) to the management system.

21. If proactive two-way DM is supported, for each proactive two-way DM session the MPLS-TP NE should:
 - Receive from the transport plane the near-end, far-end and bidirectional measurements (N_FD, F_FD, B_FD; N_FDV, F_FDV, B_FDV) for each OAM period;
 - Store the temporal minimum, average, and maximum for each type of the measurements (N_FD, F_FD, B_FD; N_FDV, F_FDV, B_FDV) for the current 15-minute and 24-hour registers. The stored statistics shall be available for retrieval by the management system;
 - At the maturity of the current 15-minute and 24-hour periods, the statistics in the current registers shall move to the history registers and then reset current registers to zeros. See detailed requirements in [ITU-T G.7710].
22. The MPLS-TP NE should support the ability to configure for the start and stop at the respondent-end MEP of a single-ended measurement session.

MPLS-TP NE shall provide the PM management information as depicted in Table 10-1.

Table 10-1 – PM management information
