Recommendation ITU-T T.832

ITU-T

ITU-T T-SERIES RECOMMENDATIONS
TERMINALS FOR TELEMATIC SERVICES

Facsimile – Framework	T.0–T.19
Still-image compression – Test charts	T.20–T.29
Facsimile – Group 3 protocols	T.30–T.39
Colour representation	T.40–T.49
Character coding	T.50–T.59
Facsimile – Group 4 protocols	T.60–T.69
Telematic services – Framework	T.70–T.79
Still-image compression – JPEG-1, Bi-level and JBIG	T.80–T.89
Telematic services – ISDN Terminals and protocols	T.90–T.99
Videotext – Framework	T.100–T.109
Data protocols for multimedia conferencing	T.120–T.149
Telewriting	T.150–T.159
Multimedia and hypermedia framework	T.170–T.189
Cooperative document handling	T.190–T.199
Telematic services – Interworking	T.300–T.399
Open document architecture	T.400–T.429
Document transfer and manipulation	T.430–T.449
Document application profile	T.500–T.509
Communication application profile	T.510–T.559
Telematic services – Equipment characteristics	T.560–T.649
Still-image compression – JPEG 2000	T.800–T.829
Still-image compression – JPEG XR	T.830–T.849
Still-image compression – JPEG-1 extensions	T.850–T.899

For further details, please refer to the list of ITU-T Recommendations.

Information technology – JPEG XR image coding system – Image coding specification

Summary

Recommendation ITU-T T.832 specifies a coded image format, referred to as JPEG XR, which is designed primarily for the storage and interchange of continuous-tone photographic content. The main body of the text specifies the syntax and semantics of JPEG XR coded images and the associated decoding process. Annex A specifies a tag-based file storage format for the storage and interchange of such coded images. Annex B specifies profiles and levels that determine conformance requirements for classes of encoders and decoders. Aspects of colour imagery representations and colour management are discussed in Annex C. The typical expected encoding process is described in Annex D.

The first edition of Recommendation ITU-T T.832 was approved in 03/2009.

Corrigendum 1 (approved 12/2009) contained a set of various minor corrections.

Corrigendum 2 (approved 05/2011) contained additional minor corrections.

The second edition (approved 01/2012) included additional minor corrections.

This third edition (approved 08/2016) adds a media type specification for use in various Internet protocols to identify images encoded according to the tag-based format specified in Annex A of this Recommendation.

This text was developed as a twin text Recommendation corresponding to ISO/IEC 29199-2 in collaboration with ISO/IEC JTC 1/SC 29/WG 1 (JPEG).

History

Edition	Recommendation	Approval	Study Group	Unique ID*
1.0	ITU-T T.832	2009-03-16	16	11.1002/1000/9721

FOREWORD

The International Telecommunication Union (ITU) is the United Nations specialized agency in the field of telecommunications, information and communication technologies (ICTs). The ITU Telecommunication Standardization Sector (ITU-T) is a permanent organ of ITU. ITU-T is responsible for studying technical, operating and tariff questions and issuing Recommendations on them with a view to standardizing telecommunications on a worldwide basis.

The World Telecommunication Standardization Assembly (WTSA), which meets every four years, establishes the topics for study by the ITU-T study groups which, in turn, produce Recommendations on these topics.

The approval of ITU-T Recommendations is covered by the procedure laid down in WTSA Resolution 1.

In some areas of information technology which fall within ITU-T's purview, the necessary standards are prepared on a collaborative basis with ISO and IEC.

NOTE

In this Recommendation, the expression "Administration" is used for conciseness to indicate both a telecommunication administration and a recognized operating agency.

Compliance with this Recommendation is voluntary. However, the Recommendation may contain certain mandatory provisions (to ensure, e.g., interoperability or applicability) and compliance with the Recommendation is achieved when all of these mandatory provisions are met. The words "shall" or some other obligatory language such as "must" and the negative equivalents are used to express requirements. The use of such words does not suggest that compliance with the Recommendation is required of any party.

INTELLECTUAL PROPERTY RIGHTS

ITU draws attention to the possibility that the practice or implementation of this Recommendation may involve the use of a claimed Intellectual Property Right. ITU takes no position concerning the evidence, validity or applicability of claimed Intellectual Property Rights, whether asserted by ITU members or others outside of the Recommendation development process.

As of the date of approval of this Recommendation, ITU had received notice of intellectual property, protected by patents, which may be required to implement this Recommendation. However, implementers are cautioned that this may not represent the latest information and are therefore strongly urged to consult the TSB patent database at <http://www.itu.int/ITU-T/ipr/>.

Introduction

This Recommendation | International Standard specifies requirements and implementation guidelines for the compressed representation of digital images for storage and interchange in a form referred to as JPEG XR. The JPEG XR design provides a practical coding technology for a broad range of applications with excellent compression capability and important additional functionalities. An input image is typically operated on by an encoder to create a JPEG XR coded image. The decoder then operates on the coded image to produce an output image that is either an exact or approximate reconstruction of the input image.

The primary intended application of JPEG XR is the representation of continuous-tone still images, such as photographic images. The manner of representation of the compressed image data and the associated decoding process are specified. These processes and representations are generic, i.e., they are applicable to a broad range of applications using compressed colour and grayscale images in communications and computer systems, and within embedded applications, including mobile devices.

As of 2008, the most widely used digital photography format is a nominal implementation of the first JPEG coding format as specified in Rec. ITU-T T.81 | ISO/IEC 10918-1. This encoding uses a bit depth of 8 for each of three channels, resulting in 256 representable values per channel (a total of 16 777 216 representable colour values).

More demanding applications may require a bit depth of 16, providing 65 536 representable values for each channel, and resulting in over $2.8 * 10^{14}$ colour values. Additional scenarios may necessitate even greater bit depths and sample representation formats. When memory or processing power is at a premium, as few as 5 or 6 bit per channel may be used.

The JPEG XR specification enables greater effective use of compressed imagery with this broadened diversity of application requirements. JPEG XR supports a wide range of colour encoding formats including monochrome, red–green–blue (RGB), cyan–magenta–yellow–key (CMYK) and n-component encodings using a variety of unsigned integer, fixed point, and floating point decoded numerical representations with a variety of bit depths. The primary goal is to provide a compressed format specification appropriate for a wide range of applications while keeping the implementation requirements for encoders and decoders simple. A special focus of the design is support for emerging high dynamic range (HDR) imagery applications.

JPEG XR combines the benefits of optimized image quality and compression efficiency together with low-complexity encoding and decoding implementation requirements. It also provides an extensive set of additional functionalities, including:

- high compression capability;
- low computational and memory resource requirements;
- lossless and lossy compression;
- image tile segmentation for random access and large image formats;
- support for low-complexity compressed-domain image manipulations
- support for embedded thumbnail images and progressive resolution refinement;
- embedded codestream scalability for both image resolution and fidelity;
- alpha plane support;
- bit-exact decoder results for fixed and floating point image formats.

Important detailed design properties include:

- high performance, embedded system friendly compression;
- small memory footprint;
- integer-only operations with no divides;
- a signal processing structure that is highly amenable to parallel processing;
- use of the same signal processing operations for both lossless and lossy compression operation;
- support for a wide range of decoded sample formats (many of which support HDR imagery):
 - monochrome, RGB, CMYK or n-component image representation,
 - 8- or 16-bit unsigned integer,
 - 16- or 32-bit fixed point,
 - 16- or 32-bit floating point,
 - several packed bit formats,
 - 1-bit per sample monochrome,

- 5 or 10bit per sample RGB,
- Radiance red–green–blue–exponent (RGBE).

The algorithm uses a reversible hierarchical lifting-based lapped biorthogonal transform. The transform has lossless image representation capability and requires only a small number of integer processing operations for both encoding and decoding. The processing is based on 16×16 macroblocks in the transform domain, which may or may not affect overlapping areas in the spatial domain (with the overlapping property selected under the control of the encoder). The design provides encoding and decoding with a minimal memory footprint suitable for embedded implementations.

The algorithm provides native support for both RGB and CMYK colour types by converting these colour formats to an internal luma-dominant format through the use of a reversible colour transform. In addition, YUV, monochrome and arbitrary n-channel colour formats are supported.

The transforms employed are reversible; both lossless and lossy operations are supported using the same algorithm. Using the same algorithm for both types of operation simplifies implementation, which is especially important for embedded applications.

A wide range of numerical encodings at multiple bit depths are supported: 8-bit and 16-bit formats, as well as additional specialized packed bit formats, are supported for both lossy and lossless compression. (32-bit formats are supported using lossy compression.) Up to 24 bits are retained through the various transforms. While only integer arithmetic is used for internal processing, lossless and lossy coding are supported for floating point and fixed point image data – as well as for integer image formats.

The main body of this Specification specifies the syntax and semantics of JPEG XR coded images and the associated decoding process that produces an output image from a coded image. Annex A specifies a tag-based file storage format for storage and interchange of such coded images. Annex B specifies profiles and levels, which determine conformance requirements for classes of encoders and decoders. Aspects of colour imagery representations and colour management are discussed in Annex C. The typical expected encoding process is described in Annex D.

Corrigendum 1 (2009) and Corrigendum 2 (2011) introduced a set of various minor corrections to Rec. ITU-T T.832 (2009). Further corrections were introduced in a second edition of Rec. ITU-T T.832 (2012).

Information technology – JPEG XR image coding system – Image coding specification

1 Scope

This Recommendation | International Standard specifies a coding format, referred to as JPEG XR, which is designed primarily for continuous-tone photographic content. The main body of this Recommendation | International Standard specifies the syntax and semantics of JPEG XR coded images and the associated decoding process. Annex A specifies a tag-based file storage format for the storage and interchange of such coded images. Annex B specifies profiles and levels that determine conformance requirements for classes of encoders and decoders. Aspects of colour imagery representations and colour management are discussed in Annex C. The typical expected encoding process is described in Annex D.

2 Normative references

Normative references which have a scope that is limited to the use of the file format specified in Annex A are listed in A.2.

3 Definitions

For the purposes of this Recommendation | International Standard, the following definitions apply. Definitions of terms that have a scope that is limited to the use of the *file format* specified in Annex A are listed in A.3.

In this clause, *italic* is used to identify all occurrences of terms that are defined in this clause.

3.1 adaptive coefficient normalization: A parsing sub-process where *transform coefficients* are dynamically partitioned into a *VLC-coded* part and a *fixed-length coded* part, in a manner designed to control (i.e., "normalize") bits used to represent the *VLC-coded* part. The *fixed-length coded* part of *DC coefficients* and *lowpass coefficients* is called *FLC refinement* and the *fixed-length coded* part of *highpass coefficients* is called *flexbits*.

3.2 adaptive inverse scanning: A parsing sub-process where the *zigzag scan order* associated with a set of *transform coefficients* is dynamically modified, based on the statistics of previously parsed *transform coefficients*.

3.3 adaptive VLC: A parsing sub-process where the code table associated with *VLC* parsing of a particular *syntax element* is switched, among a finite set of fixed tables, based on the statistics of previously parsed instances of this *syntax element*.

3.4 alpha image plane: An optional secondary *image plane* associated with an *image*, of the same dimensions as the *luma component* of the *primary image plane*. The *alpha image plane* has one *component*, a *luma component*.

3.5 block: An $m \times n$ array of *samples* or an $m \times n$ array of *transform coefficients*.

3.6 block index: An integer in the range 0 to 15, identifying, by its position in *raster scan order*, a particular 4×4 *block*, within a partition of a 16×16 *block* into 16 4×4 *blocks*.

3.7 byte: A sequence of 8 bits.

3.8 byte-aligned: A bit in a *codestream* is *byte-aligned* if its position is an integer multiple of 8 bits from the beginning of the *codestream*, where the first bit in the *codestream* is at position 0.

3.9 chroma: A *component* of the *primary image plane* with non-zero index or the *transform coefficients* and sample values associated with this *component*.

3.10 coded block pattern highpass: The *coded block pattern highpass* is a *syntax element* indicating the *coded block status*, i.e., the presence or absence of non-zero *highpass transform coefficients*, for each of the *blocks* in the *macroblock*.

3.11 coded block pattern lowpass: The *coded block pattern lowpass* is a *syntax element* indicating the presence or absence of non-zero *lowpass transform coefficients* in the *macroblock*.

3.12 coded block status: The *coded block status* is an indication of the presence or absence of non-zero *transform coefficients* in that *block*.

- 3.13 codestream:** A sequence of bits contained in a sequence of *bytes* from which syntax elements are parsed, such that the most significant bit of the first *byte* is the first bit of the *codestream*, the next most significant bit of the first *byte* is the second bit of the *codestream*, and so on, to the least significant bit of the first *byte* (which is the eighth bit of the *codestream*), followed by the most significant bit of the second *byte* (which is the ninth bit of the *codestream*), and so on, up to and including the least significant bit of the last *byte* of the sequence of *bytes* (which is the last bit of the *codestream*).
- 3.14 component:** One of the arrays of samples associated with an *image plane*.
- 3.15 context:** A possible value of a specific instance of a *context variable*.
- 3.16 context variable:** A variable used in the *parsing process* to select which data structure is to be used for the *adaptive VLC* parsing of a given syntax element.
- 3.17 DC coefficient:** The first subset when the *transform coefficients*, that are contained in a specific *macroblock* and a specific *component*, are partitioned into 3 subsets.
- 3.18 DC-LP array:** The array of all DC and lowpass (LP) *transform coefficients*, for all *macroblocks* associated with a specific *component*.
- 3.19 decoder:** An embodiment of a *parsing process* and *decoding process*.
- 3.20 decoding process:** The process of computing output sample values from the parsed syntax elements of the *codestream*.
- 3.21 dequantization:** The process of rescaling the quantized *transform coefficients* after their value has been parsed from the *codestream* and before they are presented to the *inverse transform process*.
- 3.22 discriminant:** A collective term for one of DiscrimVal1 or DiscrimVal2, which are the two member variables of an instance of the *adaptive VLC* data structure specified in 5.5.5.
- 3.23 encoder:** An embodiment of an *encoding process*.
- 3.24 encoding process:** The process of converting source sample values into a *codestream* conforming to this Specification.
- 3.25 extended image:** The *image* produced by the *decoding process* prior to *windowing*. The *extended image* has a *luma* array that is an integer multiple of 16 in width and height.
- 3.26 file:** A finite-length sequence of *bytes* that is accessible to a *decoder* in a manner such that the *decoder* can obtain access to the data at specified positions within the sequence of *bytes* (e.g. by storing the entire sequence of *bytes* in random access memory or by performing "position seek" operations to specified positions within the sequence of *bytes*).
- 3.27 file format:** A specified structure for the content of a *file*.
- 3.28 fixed-length code (FLC):** A code which assigns a finite set of allowable bit patterns to a specific set of values, where each bit pattern has the same length.
- 3.29 FLC refinement:** The *fixed-length coded* part of a *DC coefficient* or *lowpass coefficient* that is parsed using adaptive fixed-length codes.
- 3.30 flexbits:** The *fixed-length coded* part of the *highpass coefficient* information which is parsed using adaptive fixed-length codes.
- 3.31 frequency band:** A collective term for one of the following three subsets of the *transform coefficients* for an *image*, which are separately parsed: *DC coefficients*, *lowpass coefficients*, and *highpass coefficients*.
- 3.32 frequency mode:** A *codestream* structure mode where the DC, lowpass, highpass and *flexbits frequency bands* for each *tile* are grouped separately.
- 3.33 hard tiles:** A *codestream* structure mode where the overlap operators are not applied across tile boundaries. Instead, boundary overlap operators are applied at tile boundaries.
- 3.34 highpass coefficients:** The third subset, when the *transform coefficients* that are contained in a specific *macroblock* and a specific *component* are partitioned into three subsets.
- 3.35 image:** The result of the *decoding process*, consisting of a *primary image plane* and an optional *alpha image plane*.
- 3.36 image plane:** A collective term for a grouping of the *components* of the *image*.
- 3.37 initial level value:** One of two values used to compute the *VLC-coded* part of a *transform coefficient*.

- 3.38 internal colour format:** The colour format associated with the spatial-domain samples obtained through the *inverse transform process* and the *sample reconstruction process*, and distinguished from the *output colour format* associated with the *output formatting process*.
- 3.39 inverse core transform (ICT):** The two steps of the *inverse transform process* that involve processing of *transform coefficients* associated with each *macroblock* independently, with no *overlap filtering*.
- 3.40 inverse transform process:** The part of the *decoding process* by which a set of *dequantized transform coefficients* are converted into spatial-domain values.
- 3.41 inverse scanning:** The process of reordering an ordered set of parsed *syntax elements* from the *codestream* to form an array of *transform coefficients* associated with a specific *component* and *macroblock*.
- 3.42 little-endian form:** An ordering of the *bytes* that represent a numerical value as an integer number of *bytes* in which the *bytes* representing the number are in ascending order of significance, i.e., with the least significant *byte* first, followed by the next least significant *byte*, etc.
- 3.43 lowpass coefficients:** The second subset, when the *transform coefficients* that are contained in a specific *macroblock* and a specific *component* are partitioned into three subsets.
- 3.44 luma:** The *component* of an *image plane* with index zero, and the *transform coefficients* and sample values associated with this *component*. Although this term is commonly associated with a signal that conveys perceptual brightness information, as used in this Specification the term is primarily an identifier of a particular array of samples or *transform coefficients* for an *image*.
- 3.45 macroblock:** The collection of *transform coefficients* or samples, across all *components*, that have the same indices *i* and *j* with respect to a *macroblock partition*.
- 3.46 macroblock partition:** The partitioning of each *component*, into 16×16 , 8×8 or 16×8 *blocks*, depending on the *internal colour format*.
- 3.47 output bit depth:** The representation, including the number of bits and the interpretation of the bit pattern, used for the sample values of the output *image* that are the result of the *decoding process*.
- 3.48 output colour format:** The colour format associated with the output *image* that is the result of the *decoding process*.
- 3.49 output formatting process:** The process of converting the arrays of samples – that are the result of the *sample reconstruction process* – into the output samples that constitute the output of the *decoding process*. This specifies a conversion (if necessary) into the appropriate *output colour format* and *output bit depth*.
- 3.50 output image height:** The height of the sub-array of the *luma component* of the *primary image plane* that is output by the *decoding process*.
- 3.51 output image width:** The width of the sub-array, of the *luma component* of the *primary image plane* that is output by the *decoding process*.
- 3.52 overlap filtering:** The steps of the *inverse transform process* that involve processing of *transform coefficients* across adjacent *blocks* and *macroblocks*.
- NOTE – When *overlap filtering* is applied, it is applied across *macroblock* boundaries as well as *block* boundaries. When the *codestream* uses *soft tiles*, the *overlap filtering* is also applied across *tile* boundaries. Otherwise, *overlap filtering* does not occur across *tile* boundaries.
- 3.53 parsing process:** The process of extracting bit sequences from the *codestream*, converting these bit sequences to syntax element values, and setting the values of global variables for use in the *decoding process*.
- 3.54 prediction:** The process of computing an estimate of the sample value or data element that is currently being decoded.
- 3.55 prediction residual:** The difference between the result of a *prediction* process invoked for a sample or data element and its intended value.
- 3.56 primary image plane:** The *image plane* that consists of all *image components* that are not a part of the *alpha image plane*.
- 3.57 QP index:** An integer, which for a particular *frequency band* and *macroblock* specifies the index into the table of *quantization parameters* available for this *frequency band* and *tile*. This *QP index* thereby selects, for this *macroblock*, the *quantization parameter* used for the *dequantization* of the *transform coefficients* in the specific *frequency band*.
- 3.58 QP set:** The set of *quantization parameters* associated with a particular *frequency band*, corresponding to the *luma* and *chroma components*.

- 3.59 quantization parameter (QP):** A value used to compute the scaling factor for the *dequantization* of a *transform coefficient*, before the *inverse transform process* is applied.
- 3.60 raster scan order:** The scan order in which a two-dimensional array of values is scanned row-wise from left to right, and the rows are scanned from the top row to the bottom.
- 3.61 refinement:** The process of modifying a predicted or partially computed *transform coefficient*.
- 3.62 run:** The number of zero valued coefficient levels that precede a non-zero valued coefficient level in the *zigzag scan order* during the *inverse scanning* process.
- 3.63 sample reconstruction process:** The process of converting dequantized *transform coefficients* into samples of the *image*.
- 3.64 soft tiles:** A *codestream* structure mode where the overlap operators are applied across tile boundaries.
- 3.65 spatial co-location:** Sub-arrays of samples are *spatially co-located* across *components* when they correspond to the same spatial region of the decoded *image*. The *macroblock partition* of the *image* ensures that the *i*-th *macroblock* horizontally and *j*-th *macroblock* vertically across all *components* are *spatially co-located*.
- 3.66 spatial mode:** A *codestream* structure mode where the *DC*, *lowpass*, *highpass* and *flexbits frequency bands* for each specific *macroblock* are grouped together.
- 3.67 spatial transformation:** An element in the *codestream* indicating the preferred final displayed orientation of the decoded *image*, as specified in 8.3.8. The *spatial transformation* is only a suggestion, and *decoder conformance* is checked only for the decoded *image* prior to the application of this transformation (i.e., for orientation 0).
- 3.68 start code:** A bit pattern that specifies the beginning of a *tile packet* or other distinguished, contiguous set of syntax elements in the *codestream*.
- 3.69 tile:** The collection of *macroblocks* that have the same indices *i* and *j* with respect to a *tile partition*. Each *tile* corresponds to the *macroblocks* for a rectangular region of the *image*.
- 3.70 tile packet:** A contiguous subset of the *codestream*, which contains the coded *syntax elements* associated with a specific *tile*.
- 3.71 tile partition:** A partition of the *image* into rectangular arrays of *macroblocks*, as specified in 6.4.
- 3.72 transform coefficients:** The values, associated with each specific *macroblock* and specific *component*, that – after *dequantization* – form the input arrays into the *inverse transform process*.
- 3.73 variable-length code (VLC):** A code which assigns a finite set of allowable bit patterns to a specific set of values, where each bit pattern is potentially of a different length.
- 3.74 VLC refinement:** One of two values used to compute the *VLC-coded* part of a *transform coefficient*. The number of bits required to specify the *VLC-refinement* is dependent on the value of the *initial level value*. The *VLC refinement* is added to the *initial level value* to produce the *VLC-coded* part of the transform coefficient.
- 3.75 windowing:** A selection of *spatially co-located* sub-arrays of the *components* of all present *image planes* associated with an *image* that are output by the *decoding process*.
- 3.76 zigzag scan order:** An adaptive ordering for the *inverse scanning* process, which assigns array indices to each subsequent *transform coefficient* parsed from the *codestream*.

4 Abbreviations

For the purposes of this Recommendation | International Standard, the following abbreviations apply. Abbreviations which have a scope that is limited to the use of the file format specified in Annex A are listed in A.4.

CBPHP	Coded Block Pattern Highpass
CBPLP	Coded Block Pattern Lowpass
CMYK	Cyan–Magenta–Yellow–Key
DC	Direct Current
FCT	Forward Core Transform
FLC	Fixed-Length Code
HDR	High Dynamic Range
HP	Highpass

ICT	Inverse Core Transform
JPEG	Joint Photographic Experts Group
LP	Lowpass
LSB	Least Significant Bit
MSB	Most Significant Bit
QP	Quantization Parameter
RGB	Red–Green–Blue
RGBE	Red–Green–Blue–Exponent
VLC	Variable Length Code
XR	extended Range

5 Conventions

5.1 Conformance language

This Recommendation | International Standard consists of normative and informative text.

Normative text is text which expresses mandatory requirements. The word "shall" is used to express mandatory requirements to be followed strictly in order to conform to this Specification and from which no deviation is permitted. A conforming implementation is one that fulfils all mandatory requirements.

Informative text is text that is potentially helpful to the user, but not indispensable and can be removed, changed or added editorially without affecting interoperability. All text in this Recommendation | International Standard is normative, with the following exceptions: the Introduction, any parts of the text that are explicitly labelled as "informative", statements appearing with the preamble "NOTE", behaviour described using the word "should" and pseudocode comments delimited as specified in 5.2.7. The word "should" is used to describe behaviour that is preferred, but is not necessarily required for conformance to this Specification.

The keywords "may" and "need not" indicate a course of action that is permissible in a conforming implementation.

The keyword "reserved" indicates a provision that is not specified at this time, shall not be used in implementations conforming to this version of this Specification and may be specified in the future. The keyword "forbidden" indicates "reserved" and in addition indicates that the provision will never be specified in the future.

5.2 Operators

NOTE – Many of the operators used in this Specification are similar to those used in the C programming language (e.g. as specified in ISO/IEC 9899).

5.2.1 Arithmetic operators

+	Addition
–	Subtraction (as a binary operator) or negation (as a unary prefix operator)
++	Increment by one as a unary postfix operator
--	Decrement by one as a unary postfix operator
*	Multiplication
/	Integer division, where the result is truncated towards zero
÷	Division in mathematical equations where no truncation or rounding is intended
$\frac{x}{y}$	Division in mathematical equations where no truncation or rounding is intended
%	$x \% a$ is defined as the modulus operator for $x \geq 0$ and $a > 0$
%	$x \% a$ is defined as $-(((-x) \% a))$ for $x < 0$ and $a > 0$

NOTE 1 – Although sometimes used as unary prefix operators in the C programming language, the "++" and "--" arithmetic operators are not used as unary prefix operators in this Specification.

NOTE 2 – The division operators used in this Specification differ somewhat from those used in the C programming language.

5.2.2 Logical operators

	Logical OR
&&	Logical AND
!	Logical NOT

TRUE/FALSE convention:

- When a variable or arithmetic expression having a non-zero value is evaluated as a logical condition or as an element of a logical expression, it is evaluated as TRUE, and when a variable or expression having a zero value is evaluated as a logical condition or as an element of a logical expression, it is evaluated as FALSE.
- When the value of a variable or arithmetic expression is compared to the value TRUE (in text or using a relational operator), it is compared to the value 1, and when the value of a variable or arithmetic expression is compared to the value FALSE (in text or using a relational operator), it is compared to the value 0.
- When a variable is set to the value TRUE, it is set to the value 1; and when a variable is set to the value FALSE, it is set to the value 0.

5.2.3 Relational operators

>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
==	Equal to
!=	Not equal to

5.2.4 Bit-wise operators

Bit-wise operators operate on bit pattern values that are produced by conversion of an integer value to an equivalent bit pattern value. Bit-wise operators operate on a two's complement representation of the integer value using a number of bits sufficient to represent the integer value [with a bit equal to 0 in the most significant bit (MSB) of non-negative integer value representations and otherwise with a bit equal to 1 in the MSB]. The result of a bit-wise operator is then interpreted as a two's complement representation of an integer value. The following bit-wise operators are defined:

&	AND. When operating on a bit pattern argument that contains fewer bits than the other argument, the shorter argument is extended by adding more significant bits equal to the MSB of the shorter argument, such that the number of bits representing the shorter argument is made the same as the number of bits for the longer argument.
	OR. When operating on a bit pattern argument that contains fewer bits than the other argument, the shorter argument is extended by adding more significant bits equal to the MSB of the shorter argument, such that the number of bits representing the shorter argument is made the same as the number of bits for the longer argument.
^	XOR. When operating on a bit pattern argument that contains fewer bits than the other argument, the shorter argument is extended by adding more significant bits equal to the MSB of the shorter argument, such that the number of bits representing the shorter argument is made the same as the number of bits for the longer argument.
x >> b	Arithmetic right shift of a two's complement integer representation of x by b binary digits, where b is a non-negative integer. Bits shifted into the MSBs as a result of the right shift have a value equal to the MSB of x prior to the shift operation.
x << b	Arithmetic left shift of a two's complement integer representation of x by b binary digits, where b is a non-negative integer. Bits shifted into the least significant bits (LSBs) as a result of the left shift have a value equal to 0.

5.2.5 Assignment operators

=	Assignment operator
+=	x += a is defined as x = x + a
-=	x -= a is defined as x = x - a
^=	x ^= a is defined as x = x ^ a
*=	x *= a is defined as x = x * a
<<=	x <<= a is defined as x = (x << a)
>>=	x >>= a is defined as x = (x >> a)

5.2.6 Precedence order of operators

Operators are listed below in descending order of precedence. If several operators appear in the same line, they have equal precedence. When several operators of equal precedence appear at the same level in an expression, evaluation proceeds according to the associativity of the operator either from right to left or from left to right. See Table 1.

Table 1 – Precedence order of operators

Operators	Type of operation	Associativity
(), [], .	Expression	Left to Right
++, --	Postfix operators	Right to Left
-, !	Unary	
*, /, %, $\frac{x}{y}$	Multiplication and division	Left to Right
+, -	Addition and subtraction	Left to Right
<<, >>	Arithmetic shift	Left to Right
<, >, <=, >=	Relational	Left to Right
=, !=	Equality test	Left to Right
&, , ^	Bit-wise operator	Left to Right
&&,	Logical operators	Left to Right
?, =, *=, +=, -=, ^=, <<=, >>=	Assignment operators	Right to Left

5.2.7 Pseudocode operations

Pseudocode is organized into "functions" that are specified in tabular form. A sample pseudocode table is presented in Table 2. Pseudocode statements are each expressed as a row of the table. A group of statements enclosed in curly brackets "{...}" is a compound statement and is treated functionally as a single statement. Each function definition begins with a table row specifying the name of the function, the arguments of the function, and containing the opening curly bracket of a compound statement.

Arguments passed to a pseudocode function are listed in parentheses after the function name, and are comma delimited. Two types of arguments are used in pseudocode function definitions, as follows:

- Non-array variables, which are passed by value (e.g., valueArgument1 in Table 2).
- Arrays, which are passed by reference (e.g., arrayArgument2[] in Table 2).

Non-array variables that are passed to a function are addressed within the function using a local variable name, even when a global variable (5.5) has been used when calling the function. Since non-array variables are passed by value rather than by reference, any changes made to the value of the local variable within the function do not affect the value of the (local or global) variable that was used as a calling argument by the invoking process when the function was called. Since arrays are passed to a function by reference rather than by value, any changes made within the function to the values of entries in such an array (specified using a local array name within the function) do persist after the completion of the pseudocode function. Changes made to the values of global variables (5.5) that are specified within a function using the name of the global variable also persist after the completion of the pseudocode function.

Pseudocode functions may or may not return a value. When a function returns a value, the value that is returned is specified by a "return" statement that appears as the last statement in the compound statement that specifies the function, and the value that is returned is the value of the expression that is specified after the term "return" in the pseudocode return statement. Functions that do not return a value do not contain a return statement. Table 2 provides an example of a function definition for a function that returns the value of a variable valueReturn.

Table 2 – Example of a pseudocode table

ExamplePseudocode(valueArgument1, arrayArgument2[]) {	Reference
statement	
return valueReturn	
}	

The pseudocode convention shown in Table 3 is used to indicate an informative comment.

Table 3 – Example of a pseudocode comment

ExamplePseudocodeComment() {	Reference
/* this is a comment start and end */	
}	

The pseudocode convention shown in Table 4 specifies repeated execution of a "condition" checking followed by a "statement" until the "condition" is no longer TRUE.

Table 4 – Example of a pseudocode while statement

ExamplePseudocodeWhileStatement() {	Reference
while (condition)	
statement	
}	

The pseudocode convention shown in Table 5 specifies evaluation of an "initial statement" followed by evaluation of a "condition", and when the "condition" is TRUE, it specifies repeated execution of a "primary statement" followed by a "subsequent statement", and repeating the checking of the condition and the execution of the primary statement and subsequent statement until the checked condition no longer evaluates to the value TRUE.

Table 5 – Example of a pseudocode for statement

ExamplePseudocodeForStatement() {	Reference
for (initial statement; condition; subsequent statement)	
primary statement	
}	

The pseudocode convention shown in Table 6 specifies that a "statement" is executed if a "condition" is TRUE, and that an "alternate statement" is otherwise performed.

Table 6 – Example of a pseudocode conditional statement

ExamplePseudocodeConditionalStatement() {	Reference
if (condition)	
statement	
else	
alternative statement	
}	

The pseudocode convention shown in Table 7 specifies the initialization of the values of entries in an array. In this example, iArr[0] is set equal to 2, iArr[1] is set equal to 4, iArr[2] is set equal to 6, and iArr[3] is set equal to 8.

Table 7 – Example of the initialization of values in an array in pseudocode

ExamplePseudocodeArrayInitialization() {	Reference
iArr[] = {2, 4, 6, 8}	
}	

5.2.8 Mathematical functions

- Ceiling(x) Ceiling function. Returns the smallest integer that is greater than or equal to the real-valued argument x.
- Floor(x) Floor function. Returns the largest integer that is less than or equal to the real-valued argument x.
- Max(a, b) Maximum of two arguments as specified in Table 8.

Table 8 – Definition of mathematical function Max()

Max(a, b) {	Reference
if (a >= b)	
valueReturn = a	
else	
valueReturn = b	
return valueReturn	
}	

Min(a, b) Minimum of two arguments as specified in Table 9.

Table 9 – Definition of mathematical function Min()

Min(a, b) {	Reference
if (a <= b)	
valueReturn = a	
else	
valueReturn = b	
return valueReturn	
}	

Abs(x) Absolute value of an argument as specified in Table 10.

Table 10 – Definition of mathematical function Abs()

Abs(x) {	Reference
if (x >= 0)	
valueReturn = x	
else	
valueReturn = -x	
return valueReturn	
}	

Sign(x) Sign of an argument as specified in Table 11.

Table 11 – Definition of mathematical function Sign()

Sign(x) {	Reference
if (x >= 0)	
valueReturn = 1	
else	
valueReturn = -1	
return valueReturn	
}	

Round(x) Rounding to integer value as specified in Table 12.

Table 12 – Definition of mathematical function Round()

Round(x) {	Reference
valueReturn = Sign(x) * Floor(Abs(x) + 0.5)	
return valueReturn	
}	

Clip(x, iLow, iHigh) Clip integer value to a range between integers iLow and iHigh is specified in Table 13.

Table 13 – Definition of mathematical function Clip()

Clip(x, iLow, iHigh) {	Reference
valueReturn = Max(x, iLow)	
valueReturn = Min(valueReturn, iHigh)	
return valueReturn	
}	

Sqrt(x) Square root of x

Numones(x) Returns the number of bits in an argument that are set, for a positive integer argument x that is represented in two's complement arithmetic as specified in Table 14.

Table 14 – Definition of mathematical function Numones()

Numones(x) {	Reference
valueReturn = 0	
while (x != 0) {	
valueReturn += (x & 1)	
x >>= 1	
}	
return valueReturn	
}	

5.3 Syntax and semantics notation

5.3.1 Method of specifying syntax in tabular form

The syntax tables specify a superset of the syntax of all allowed codestreams. Additional constraints on the syntax may also be specified, either directly or indirectly, in other subclauses.

Table 15 lists an example of pseudocode used to specify the syntax. When the name of a syntax element appears in the first column, it specifies that the syntax element is parsed from the codestream and the codestream pointer is advanced to the next bit position beyond the syntax element in the codestream parsing process.

See 5.3.2 for an example of how the semantics of a syntax element are specified in this Specification.

The column with the heading "Descriptor" specifies the parsing process of an associated syntax element as follows:

- i(n): two's complement signed integer using n bits, where the MSB is the leftmost bit. This indicates a fixed-length syntax element. The value of n is the size of the syntax element in bits. For example, i(3) indicates a 3-bit syntax element, and i(iVar) indicates a syntax element of length iVar, where iVar is a variable computed from the values of other previously parsed syntax elements.
- u(n): unsigned integer using n bits, where the MSB is the leftmost bit. This indicates a fixed-length syntax element. The value of n is the size of the syntax element in bits. For example, u(3) indicates a 3-bit syntax element, and u(iVar) indicates a syntax element of length iVar, where iVar is a variable computed from the values of other previously parsed syntax elements.
- le(n): unsigned integer using n bits in little-endian form, where n is an integer multiple of 8. This indicates a fixed-length syntax element. The value of n is the size of the syntax element in bits. For example, le(16) indicates a 16-bit syntax element, and le(iVar) indicates a syntax element of length iVar, where iVar is a variable having a value that is an integer multiple of 8 that is computed from the values of other previously parsed syntax elements.
- e(v): entropy coded syntax element where the MSB of the code is the leftmost bit. This indicates a variable-length coded syntax element, and a fixed VLC table is used to parse this syntax element.
- ae(v): adaptive entropy coded syntax element where the MSB of the code is the left most bit. This indicates a variable-length coded syntax element, where the VLC table used to parse the syntax element is selected adaptively based on the values of other previously parsed syntax elements.

The column with the heading "Reference" provides one or more links to semantics or information about constraints on an associated syntax element.

Table 15 – Syntax table example

HEADER_EXAMPLE() {	Descriptor	Reference
<i>/* A statement can be a syntax element or a conditional statement that specifies the presence and type of syntax element */</i>		
<i>/* The conditional statements are expressed in terms of the pseudocode operations defined in 5.2.7 */</i>		
if (condition)		
SYNTAX_ELEMENT_EXAMPLE	u(8)	5.3.2
}		

5.3.2 SYNTAX_ELEMENT_EXAMPLE semantics

SYNTAX_ELEMENT_EXAMPLE is an example 8-bit syntax element having semantics and constraints specified in this subclause, as identified in the "Reference" column of Table 15.

5.3.3 Syntax functions

The codestream is formatted as an ordered sequence of bytes. These bytes contain sequences of bits. The syntax elements appear within a sequence of bits in the order specified in the syntax tables, and for each syntax element, the MSB of the syntax element representation is the first bit in the sequence of bits that represents the syntax element and the LSB of the syntax element representation is the rightmost bit. The bits of the syntax elements shall be extracted from the bytes that represent them by extracting the MSB of the first syntax element from the MSB of the first byte, the next bit of the syntax element from the next less significant bit of the byte, etc., proceeding through to the LSB of the byte and then the MSB of the following byte, if the bit pattern for the syntax element is longer than 8, etc. After the bits of the first syntax element, the same convention shall be followed, starting at the next bit, for the bits of the next syntax element and then for the subsequent syntax elements.

Unless otherwise specified, the bytes of the codestream are ordered in the sequence of bytes that forms the codestream such that the conceptually first byte is placed first in the sequence of bytes, the second byte is placed second, etc. (i.e., so-called "network" or "big endian" byte ordering is used for the codestream unless otherwise specified).

The syntax functions IS_BYTE_ALIGNED() and POS_SEEK(iLoc) are used in the specification of some syntax structures. These functions assume the existence of a codestream pointer referring to the position of the next bit to be read from the codestream by the parsing process. Prior to operation of the parsing process, the codestream pointer refers to the position of the first bit of the first byte of the codestream.

IS_BYTE_ALIGNED() is a syntax function specified as follows.

- If the current position in the codestream is on a byte boundary, i.e., the next bit in the codestream is the first bit in a byte, the return value of IS_BYTE_ALIGNED() is equal to TRUE.
- Otherwise, the return value of IS_BYTE_ALIGNED() is equal to FALSE.

POS_SEEK(iLoc) is a syntax function that sets the codestream pointer to the position of the first bit of the byte, i.e., iLoc bytes from the start of the codestream, where iLoc is a non-negative integer argument, and the first byte of the codestream corresponds to iLoc equal to 0.

5.4 Formatting conventions

5.4.1 Variable and array naming conventions

Global variables are in scope throughout more than one subclause. The extent of the scope of each global variable is specified in 5.5. The name of a global variable begins with an upper case letter and includes some lower case letters or numerals, and does not include underscore characters, e.g. as in "ImageWidth". With the exception of image variables (5.5.1), all other global variables are associated with a specific image plane; therefore, a separate instance of each global variable exists for the primary image plane and for the alpha image plane (if an alpha image plane is present).

In the parsing syntax and pseudocode tables of clause 8, the global variable IsCurrPlaneAlphaFlag is used to indicate which set of global variables are referenced in the table; if IsCurrPlaneAlphaFlag is equal to FALSE, the global variables referenced are those of the primary image plane; otherwise (IsCurrPlaneAlphaFlag is equal to TRUE), the global variables referenced are those of the alpha image plane.

The scope of local variables is limited to one subclause. They begin with a lower case letter and may include some upper case letters or numerals and do not include underscore characters, e.g., iValue.

Square brackets are used for the indexing of arrays. Arrays can be either syntax elements or variables. A one-dimensional array is referred to as a list. Array indices count from zero. For example, the first element of arrayExample[] is arrayExample[0].

5.4.2 Data structure naming conventions

An instance of a data structure is labelled by bold-faced letters. The member variables of a data structure are formatted like global variables. To reference a member variable of a data structure instance, the data structure instance's name is associated with the member variable with a period ".", e.g. **AbslevelIndexDCLum**.TableIndex indicates that the member variable TableIndex is part of the data structure instance **AbslevelIndexDCLum**.

5.4.3 Syntax element naming conventions

Syntax elements are labelled by a name in upper case letters, in which at least one underscore character is included.

5.4.4 Syntax structure naming conventions

Syntax structure is a term used to refer to a collection of syntax elements. Syntax structures are identified by a name in upper case letters, in which at least one underscore character is included, followed by a pair of parentheses. Within the parentheses, there may be one or more variables. These variables correspond to variables or values that are associated with the pseudocode table for this syntax structure when the syntax structure is invoked within another syntax structure.

5.4.5 Naming conventions for mnemonic constants

Mnemonics are used to refer to constant values taken by syntax elements in the parsing and decoding process. Mnemonic constants are in upper case letters without underscores and may include numbers, e.g. YUV420. The mnemonic constants that are used are defined in Table 16. The mnemonic constant RESERVED is used to specify a value that is reserved for future use.

Table 16 – Defined mnemonic values

Mnemonics	Syntax element and Reference
YUV444, YUV422, YUV420, YONLY, CMYK, CMYKDIRECT, RGB, RGBE, NCOMPONENT	Table 22 for syntax element OUTPUT_CLR_FMT
YUV444, YUV422, YUV420, YONLY, YUVK, NCOMPONENT	Table 28 for syntax element INTERNAL_CLR_FMT
BD1WHITE1, BD8, BD16, BD16S, BD16F, BD32S, BD5, BD10, BD565, BD1BLACK1	Table 23 for syntax element OUTPUT_BITDEPTH
ALL, NOFLEXBITS, NOHIGHPASS, DCONLY	Table 29 for syntax element BANDS_PRESENT

5.4.6 Naming conventions for numerical values

Integer numbers are expressed as bit patterns, hexadecimal values or decimal numbers. Bit patterns and hexadecimal values have both a numerical value and an associated particular length in bits.

Hexadecimal notation, indicated by prefixing the hexadecimal number by "0x", may be used instead of binary notation to denote a bit pattern having a length that is an integer multiple of 4. For example, 0x41 represents an eight-bit pattern having only its secondmost significant bit and its MSB equal to 1. Numerical values that are specified under a "Code" heading in tables that are referred to as "code tables" are bit pattern values (specified as a string of digits equal to 0 or 1 in which the leftmost bit is considered the MSB). Other numerical values not prefixed by "0x" are decimal values. When used in expressions, a hexadecimal value is interpreted as having a value equal to the value of the corresponding bit pattern evaluated as a binary representation of an unsigned integer (i.e., as the value of the number formed by prefixing the bit pattern with a sign bit equal to 0 and interpreting the result as a two's complement representation of an integer value). For example, the hexadecimal value 0xF is equivalent to the 4-bit pattern '1111' and is interpreted in expressions as being equal to the decimal number 15.

5.4.7 Array dimensions convention

Arrays of height valHeight and width valWidth are denoted as having dimension valHeight×valWidth. For variable and function names, the character "x" is used as the multiplication symbol. Otherwise, the cross symbol "×" is used to indicate multiplication in all other cases.

5.5 Global variables

In 5.5, **bold** is used to identify each global variable in the subclause in which it is described. Changes in value applied to global variables persist beyond single pseudocode functions. The scope of that persistence is specified by the subclause in which the global variable is defined.

5.5.1 Image variables

The following global variables maintain information relevant to the entire image.

ExtendedWidth[i]: This variable specifies the extended image width of component *i*.

ExtendedHeight[i]: This variable holds the extended image height of component *i*.

IndexOffsetTile[n]: This variable specifies the offset of the *n*-th tile packet from the start of the coded image data in bytes.

ImagePrimary[i][x][y]: For each specific triple (*i*, *x*, *y*), where $0 \leq i < \text{NumComponents}$ (subclause 8.4.11), $0 \leq x < \text{ExtendedWidth}[i]$, $0 \leq y < \text{ExtendedHeight}[i]$, the associated variable **ImagePrimary[i][x][y]** holds the image plane sample values associated with the component *i*, located at the sample position indicated by the values *x* and *y*, for the primary image plane.

ImageAlpha[i][x][y]: For each specific triple (*i*, *x*, *y*), where $i = 0$, $0 \leq x < \text{ExtendedWidth}[i]$, $0 \leq y < \text{ExtendedHeight}[i]$, this variable holds the image plane sample value, at the sample position determined by the values *x* and *y*, for the alpha image plane.

MBHeight: This variable holds the value associated with the number of vertical macroblock partitions.

MBWidth: This variable holds the value associated with the number of horizontal macroblock partitions.

NumTileCols: This variable holds the value associated with the number of tile partitions in the image horizontally.

NumTileRows: This variable holds the value associated with the number of tile partitions in the image vertically.

TopMBIndexOfFile[i]: This variable holds the value associated with the macroblock index of the top macroblock row of the *i*-th tile row.

LeftMBIndexOfFile[j]: This variable holds the value associated with the macroblock index of the left macroblock column of the *j*-th tile column.

NumMBInTile[n]: This variable holds the value associated with the number of macroblocks in the *n*-th tile.

NumBandsOfPrimary: This variable holds the value associated with the value of **NumBands** (defined in 5.5.2) for the primary image plane.

SubsequentBytes: This variable holds the value associated with the number of bytes of subsequent data that precede the **CODED_TILES()** (8.2.2) syntax element and follow the image plane headers and the tiles index table.

5.5.2 Image plane variables

The following global variables maintain information relevant for all tiles of the current image plane.

IsCurrPlaneAlphaFlag: This variable is equal to **TRUE** if the current plane that is being parsed or decoded is the alpha image plane; otherwise, this variable is equal to **FALSE**. It is also used to specify which set of image plane variables, tile variables, and macroblock variables are being referenced.

NumComponents: This variable holds the value associated with the number of colour components present in the codestream for the current image plane. For the primary image plane, its value can be obtained by calling **DetermineNumComponents()** (8.4.11). For the alpha image plane, its value is equal to 1.

NumBands: This variable holds the value associated with the number of frequency bands present in the codestream for the current image plane. Its value can be obtained by calling **DetermineNumBands()** (8.4.4).

NumLPQPs: This variable holds the value associated with the number of lowpass QP sets. This variable may have a constant value over an image plane or it may vary from tile to tile.

NumHPQPs: This variable holds the value associated with the number of highpass QP sets. This variable may have a constant value over an image plane or it may vary from tile to tile.

MBQPIndexLP[MBx][MBy]: (**MBx** and **MBy** are defined in 5.5.4) This variable holds the QP index into the table of quantization parameters for LP coefficients, corresponding to the macroblock indexed by **MBx** and **MBy**. The same index applies for all colour components.

MBQPIndexHP[MBx][MBy]: (MBx and MBy are defined in 5.5.4) This variable holds the QP index into the table of quantization parameters for highpass (HP) coefficients, corresponding to the macroblock indexed by MBx and MBy. The same index applies for all colour components.

MbDCLP[MBx][MBy][i][j]: (MBx and MBy are defined in 5.5.4) When j is equal to 0, this variable holds the DC transform coefficient for the macroblock indexed by MBx and MBy, associated with the colour component indexed by i. For non-zero values of the index j, this variable holds the j-th LP transform coefficient for the macroblock indexed by MBx and MBy, and associated with the colour component indexed by i. The index j ranges from 0 to 15 for luma components of all colour formats and chroma components of all colour formats except YUV 4:2:0 and YUV 4:2:2. In the YUV 4:2:0 chroma component case, j ranges from 0 to 3, and in the YUV 4:2:2 chroma component case, j ranges from 0 to 7.

MBBuffer[MBx][MBy][i][j]: (MBx and MBy are defined in 5.5.4) This variable holds the j-th transform coefficient associated with the colour component i – for the macroblock indexed by MBx and MBy. The index j ranges from 0 to 255.

The ordering of the 256 transform coefficients in the macroblock is as follows: let iBlkIndex represent the block index of a 4x4 block of component i in the macroblock, indexed in raster scan order, with iBlkIndex ranging from 0 to 15. Then the 16 transform coefficients for this block (indexed in raster scan order in the block) are represented by the values of MBBuffer[MBx][MBy][i][j], where j ranges from (16*iBlkIndex + 0) to (16*iBlkIndex + 15), inclusive.

MBCBPHP[MBx][MBy][i]: (MBx and MBy are defined in 5.5.4) This variable holds the coded block status for the macroblock indexed by MBx and MBy, associated with the colour component indexed by i. The association of a bit of this variable to the block in the macroblock is specified in subclause 8.7.17.1, and a bit takes the value 1 if the corresponding block has non-zero HP transform coefficients to be scanned.

PredDCLP[MBx][MBy][i][j]: (MBx and MBy are defined in 5.5.4) This variable holds the predicted DC and LP coefficient values, for the macroblock indexed by MBx and MBy, associated with the colour component indexed by i; the index j ranges from 0 to 6. The predicted DC value corresponds to index 0.

ModelBitsMBHP[MBx][MBy][i]: (MBx and MBy are defined in 5.5.4) This variable holds the value of the member variable MBits[i], associated with the data structure ModelHP as defined in 5.5.6, for the macroblock indexed by MBx and MBy. The index i ranges from 0 to 1. For each macroblock, two values are stored: one value for the luma component, and one value for the chroma components.

NOTE – The values ModelBitsMBHP[MBx][MBy][i] are used in the parsing process to communicate the state between the parsing of the syntax structures MB_HP() and MB_FLEXBITS(). See Table 83.

ImagePlane[i][x][y]: This variable holds the sample value associated with the colour component i, located at the position indicated by the values x and y, where $0 \leq i < \text{NumComponents}$, $0 \leq x < \text{ExtendedWidth}[i]$, $0 \leq y < \text{ExtendedHeight}[i]$, for the current image plane being decoded.

5.5.3 Tile variables

The following global variables maintain information that is relevant for all macroblocks in the current tile:

TileIndexx: This variable holds the column index of the current tile. The value of TileIndexx is in the range $0 \leq \text{TileIndexx} < \text{NumTileCols}$.

TileIndexy: This variable holds the row index of the current tile. The value of TileIndexy is in the range $0 \leq \text{TileIndexy} < \text{NumTileRows}$.

NumMBInCurrentTile: This variable holds the value associated with the number of macroblocks in the current tile.

DCQuantParam[i]: This variable holds the DC quantization parameter for the colour component i of the current tile.

LPQuantParam[i][j]: This variable holds the LP quantization parameter for the colour component i, and the quantization parameter index j of the current tile.

HPQuantParam[i][j]: This variable holds the HP quantization parameter for the colour component i and the quantization parameter index j of the current tile.

5.5.4 Macroblock variables

The following global variables hold information relevant for a specific macroblock:

MBx: This variable holds the column index of the current macroblock, with respect to the block indices associated with the macroblock partition of the image.

MBy: This variable holds the row index of the current macroblock, with respect to the block indices associated with the macroblock partition of the image.

MBDCMode: This variable holds the DC coefficient prediction mode for the current macroblock.

MBLPMode: This variable holds the LP coefficient prediction mode for the current macroblock.

MBHPMode: This variable holds the HP coefficient prediction mode for the current macroblock.

DCInput[i]: This variable holds the DC transform coefficient value for each colour component *i*.

LPInput[i][j]: This variable holds the *j*-th LP transform coefficient value for each colour component *i*.

HPInputVLC[i][j][k]: This variable holds the MSBs of the *k*-th HP transform coefficient value for the *j*-th block of the macroblock for each colour component *i*.

HPInputFlex[i][j][k]: This variable holds the LSBs of the *k*-th HP transform coefficient value for the *j*-th block of the macroblock for each colour component *i*.

IsMBLeftEdgeofTileFlag: This variable indicates whether the current macroblock is along the left edge of the tile. It is set equal to TRUE if MBx is equal to LeftMBIndexofTile[TileIndexx]. Otherwise, it is set equal to FALSE.

IsMBTopEdgeofTileFlag: This variable indicates whether current macroblock is along the top edge of the tile. It is set equal to TRUE if MBy is equal to TopMBIndexofTile[TileIndexy]. Otherwise, it is set equal to FALSE.

5.5.5 Data structures for adaptive VLC table selection

5.5.5.1 General

Syntax elements which are parsed using adaptive VLC tables are associated with a set of global state variables. The data structure template **AdaptiveVLC** is used to associate these variables to their respective syntax elements.

AdaptiveVLC data structure template member variables are as follows:

- **DiscrimVal1:** This variable accumulates statistics about the code table choice, used for adaptively switching to other code tables.
- **DiscrimVal2:** This is a second variable used to accumulate statistics about the code table choice, used for adaptively switching to other code tables. When there are more than two code tables for the parsing of a given syntax element, the associated AdaptiveVLC data structure instance requires two discriminants.
- **TableIndex:** The index selecting which code table is used for the current macroblock.
- **DeltaTableIndex:** The index selecting which Delta Table is used for modifying DiscrimVal1, for the current macroblock.
- **Delta2TableIndex:** The index selecting which Delta Table is used for modifying DiscrimVal2, for the current macroblock.

The collective term discriminant is used, when referring to either DiscrimVal1 or DiscrimVal2; these two member variables are jointly referred to as the discriminants associated with a specific AdaptiveVLC data structure instance.

See 5.5.5.2 to 5.5.5.4 for descriptions of instances of the AdaptiveVLC data structure that are used for the parsing of syntax elements associated with DC, LP, and HP transform coefficients.

NOTE – Informative remarks related to this subclause are provided in D.9.

5.5.5.2 DC adaptiveVLC data structure instances

AbslevelIndDCLum: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_DC() (Table 49), referring to luma DC values. The corresponding TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX, which are specified in 8.7.14.5.

AbslevelIndDCChr: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_DC() (Table 49), referring to chroma DC values. The corresponding TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX, which are specified in 8.7.14.5.

5.5.5.3 Lowpass adaptiveVLC data structure instances

DecFirstIndLPLum: This data structure instance accumulates statistics for the FIRST_INDEX syntax element, during parsing of the syntax structure DECODE_FIRST_INDEX() (Table 75) from within DECODE_BLOCK() (Table 72), referring to luma LP values. The corresponding TableIndex chooses between the code tables for the syntax element FIRST_INDEX, which are specified in 8.7.18.9.7.

DecIndLPLum0: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to luma LP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The corresponding TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecIndLPLum1: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to luma LP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The corresponding TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecFirstIndLPChr: This data structure instance accumulates statistics for the FIRST_INDEX syntax element, during parsing of the syntax structure DECODE_FIRST_INDEX() (Table 75) from within DECODE_BLOCK() (Table 72), referring to chroma LP values. The corresponding TableIndex chooses between the code tables for the syntax element FIRST_INDEX, which are specified in 8.7.18.9.7.

DecIndLPChr0: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to chroma LP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The corresponding TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecIndLPChr1: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to chroma LP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The corresponding TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

AbsLevelIndLP0: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_BLOCK() (Table 72), referring to LP values with iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The corresponding TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX, which are specified in 8.7.14.5.

AbsLevelIndLP1: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_BLOCK() (Table 72), referring to LP values with iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The corresponding TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX, which are specified in 8.7.14.5.

5.5.5.4 Highpass adaptiveVLC data structure instances

DecFirstIndHPLum: This data structure instance accumulates statistics for the FIRST_INDEX syntax element, during parsing of the syntax structure DECODE_FIRST_INDEX() (Table 75) from within DECODE_BLOCK() (Table 72), referring to luma HP values. The TableIndex chooses between the code tables for the syntax element FIRST_INDEX, which are specified in 8.7.18.9.7.

DecIndHPLum0: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK (Table 72), referring to luma HP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecIndHPLum1: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to luma HP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecFirstIndHPChr: This data structure instance accumulates statistics for the FIRST_INDEX syntax element, during parsing of the syntax structure DECODE_FIRST_INDEX() (Table 75) from within DECODE_BLOCK() (Table 72), referring to chroma HP values. The TableIndex chooses between the code tables for the syntax element FIRST_INDEX, which are specified in 8.7.18.9.7.

DecIndHPChr0: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to chroma HP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

DecIndHPChr1: This data structure instance accumulates statistics for the INDEX_A syntax element, during parsing of the syntax structure DECODE_INDEX() (Table 74) from within DECODE_BLOCK() (Table 72), referring to chroma HP values, with the local variable iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The TableIndex chooses between the code tables for the syntax element INDEX_A, which are specified in 8.7.18.9.4.

AbsLevelIndHP0: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_BLOCK() (Table 72), referring to HP values with iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 0. The TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX, which are specified in 8.7.14.5.

AbsLevelIndHP1: This data structure instance accumulates statistics for the ABS_LEVEL_INDEX syntax element, during parsing of the syntax structure DECODE_ABS_LEVEL() (Table 50) from within DECODE_BLOCK() (Table 72), referring to HP values with iContext (local to the pseudocode table for DECODE_BLOCK()) equal to 1. The TableIndex chooses between the code tables for the syntax element ABS_LEVEL_INDEX. This syntax element's code tables are specified in 8.7.14.5.

DecNumCBPHP: This data structure instance accumulates statistics for the NUM_CBPHP syntax element, during parsing of the syntax structure MB_CBPHP() (subclause 8.7.17.2). The TableIndex chooses between the code tables for the syntax element NUM_CBPHP, which are specified in 8.7.17.4.1.

DecNumBlkCBPHP: This data structure instance accumulates statistics for the NUM_BLKCBPHP syntax element, during parsing of the syntax structure MB_CBPHP() (subclause 8.7.17.2). The TableIndex chooses between the code tables for NUM_BLKCBPHP, which are specified in 8.7.17.4.2.

NOTE – The number of code tables for the NUM_BLKCBPHP syntax element is either 5 or 9, depending on the INTERNAL_CLR_FMT of the image.

5.5.6 Adaptive coefficient normalization data structure instances

The parsing of syntax elements associated with transform coefficients involves maintaining state variables that are used for adaptive coefficient normalization. Each frequency band (DC, LP, HP) maintains its own collection of state variables to track these statistics. To denote the association of these variables, a data structure is used. The data structure template **Model** is defined as follows.

Model data structure template member variables:

- MState[i]: This variable maintains the associated state, where MState[0] represents the information for the luma component, and MState[1] represents the information for the chroma components;
- MBits[i]: This variable represents the number of bits, where MBits[0] represents the information for the luma component, and MBits[1] represents the information for the chroma components.

The following instances of the **Model** data structure are used for the DC, LP, and HP bands:

ModelDC: This data structure instance maintains the statistics for the DC band;

ModelLP: This data structure instance maintains the statistics for the LP band;

ModelHP: This data structure instance maintains the statistics for the HP band.

5.5.7 Adaptive CBPHP prediction data structure instance

The CBPHP prediction mechanism is adapted based on the statistics of CBPHP of previous macroblocks. Each colour component maintains its own collection of state variables to track these statistics. To denote the association of these variables, the data structure template **CBPHPModel** is defined as follows.

CBPHPModel has three member variables indexed by i, where i is equal to either 0 or 1. This data structure template holds two independent sets of statistics: one for the luma component, corresponding to i = 0, and one for the chroma components, corresponding to i = 1. The three member variables are as follows:

- CBPHPState[i]: This variable maintains the state;
- CountOnes[i]: This variable represents the count of blocks, computed as specified in 8.10.2, with the value of coded status (derived from CBPHP) equal to 1;
- CountZeroes[i]: This variable represents the count of blocks, computed as specified in 8.10.2, with the value of coded status equal to 0.

The following instance of the **CBPHPModel** data structure is used for the HP band.

CBPHPModelHP: This data structure instance maintains the CBPHP statistics for the HP band.

5.5.8 Adaptive count CBPLP variables

The following global variables maintain information that is relevant for the parsing of syntax elements associated with CBPLP:

CountZeroCBPLP: This variable holds the sample value associated with a count the number of times the CBPLP is equal to zero;

CountMaxCBPLP: This variable holds the sample value associated with a count the number of times the CBPLP is equal to its maximum (8.9.3).

5.6 Adaptive VLC deltaDisc tables

The following global variables maintain lists of the appropriate values of deltaDisc when a syntax element is parsed using a VLC having a code table that can be adaptively selected.

AbslevelIndexDelta[i][j]: This variable holds the value associated with the incremental discriminant value for the i-th syntax element and the j-th code table associated with syntax element ABS_LEVEL_INDEX (8.7.14.5).

FirstIndexDelta[i][j]: This variable holds the value associated with the incremental discriminant value for the i-th syntax element and the j-th code table associated with syntax element FIRST_INDEX (8.7.18.9.7).

Index1Delta[i][j]: This variable holds the value associated with the incremental discriminant value for the i-th syntax element and the j-th code table associated with syntax element INDEX_A (8.7.18.9.4).

NumCBPHPDelta[i][j]: This variable holds the value associated with the incremental discriminant value for the i-th syntax element and the j-th code table associated with syntax element NUM_CBPHP (8.7.17.4.1).

NumBlkCBPHPDelta[i][j]: This variable holds the value associated with the incremental discriminant value for the i-th syntax element and the j-th code table associated with syntax element NUM_BLKCBPHP (8.7.17.4.2).

5.7 Adaptive inverse scanning tables

The following global variables maintain lists of the various coefficient scanning orders and related statistics.

LowpassScanOrder[i]: This variable holds the value associated with the location where the i-th lowpass transform coefficient is put into a block in the raster scan order.

HighpassHorScanOrder[i]: This variable holds the value associated with the location where the i-th highpass transform coefficient is put into a block in the raster scan order with horizontal scanning.

HighpassVerScanOrder[i]: This variable holds the value associated with the location where the i-th highpass transform coefficient is put into a block in the raster scan order with vertical scanning.

ScanOrder0[i]: This variable holds the value associated with the first of two possible initialization values for the lowpass and highpass coefficient scans.

ScanOrder1[i]: This variable holds the value associated with the second of two possible initialization values for the lowpass and highpass coefficient scans.

LowpassTotals[i]: This variable holds the value associated with the statistics used to determine how the lowpass scan order is updated.

HighpassHorTotals[i]: This variable holds the value associated with the statistics used to determine how the highpass horizontal scan order is updated.

HighpassVerTotals[i]: This variable holds the value associated with the statistics used to determine how the highpass vertical scan order is updated.

ScanTotals[i]: This variable holds the value associated with the initialization of the lists used to determine how the lowpass and highpass scan order is updated.

6 Image and codestream structures

6.1 General

In this clause, *italic* is used to identify all occurrences of terms defined in clause 3.

6.2 Image planes and component arrays

An *image* is composed of one or two *image planes*: a *primary image plane*, and, when present, an *alpha image plane*. An *image plane* is an ordered set of *components*. A *component* is an array of samples. The *primary image plane* may have multiple *components*; NumComponents (8.4.11) specifies the number of *components*, with $1 \leq \text{NumComponents} \leq 4111$. For this *primary image plane*, each *component* is an $\text{ExtendedHeight}[i] \times \text{ExtendedWidth}[i]$ array of samples, where $\text{ExtendedWidth}[i]$ and $\text{ExtendedHeight}[i]$ specify (respectively) the width and height of the array for the *i*-th *component*, for the index *i*, $0 \leq i < \text{NumComponents}$.

For both the *primary image plane* and the *alpha image plane*, the *component* corresponding to the index $i = 0$ is defined to be the *luma component* of the respective *image plane*; in the case where NumComponents is greater than 1, the *components* of the *primary image plane* corresponding to non-zero indices are defined to be the *chroma components* of this *image plane*.

The *alpha image plane* is an *image plane* that contains exactly one *component*. The dimensions of this *component* are the same as those of the *luma component* of the *primary image plane*.

NOTE – The purpose of an *alpha image plane* is to indicate a level of blend of the *primary image plane* with relation to the background on which the *image* is being rendered. A common interpretation of the *alpha image plane* is as a multiplicative processing (normalized to between 0 and 1) applied to the sample values of the *primary image plane*. The normalized value of the *alpha image plane* determines the proportion of the blending. The value 0 indicates full transparency and the maximum representable value indicates full opacity.

$\text{ExtendedHeight}[0]$ is referred to as the *extended image height*. It specifies the number of rows in the *luma* array that are processed within the *decoding process*. Its value is set equal to $\text{HEIGHT_MINUS1} + 1 + \text{TOP_MARGIN} + \text{BOTTOM_MARGIN}$.

$\text{ExtendedWidth}[0]$ is referred to as the *extended image width*. It specifies the number of columns in the *luma* array that are processed within the *decoding process*. Its value is set equal to $\text{WIDTH_MINUS1} + 1 + \text{LEFT_MARGIN} + \text{RIGHT_MARGIN}$.

The *chroma component* array sizes are specified such that $\text{ExtendedHeight}[i]$ is equal to $\text{ExtendedHeight}[1]$ and $\text{ExtendedWidth}[i]$ is equal to $\text{ExtendedWidth}[1]$ for all $i > 1$. The values of $\text{ExtendedHeight}[1]$ and $\text{ExtendedWidth}[1]$ are specified in Table 17.

Table 17 – Pseudocode to calculate chroma component array sizes

CalculateChromaComponentArraySizes() {	Reference
if (INTERNAL_CLR_FMT == YUV420) {	
$\text{ExtendedHeight}[1] = \text{ExtendedHeight}[0] / 2$	
$\text{ExtendedWidth}[1] = \text{ExtendedWidth}[0] / 2$	
} else if (INTERNAL_CLR_FMT == YUV422) {	
$\text{ExtendedHeight}[1] = \text{ExtendedHeight}[0]$	
$\text{ExtendedWidth}[1] = \text{ExtendedWidth}[0] / 2$	
} else {	
$\text{ExtendedHeight}[1] = \text{ExtendedHeight}[0]$	
$\text{ExtendedWidth}[1] = \text{ExtendedWidth}[0]$	
}	
}	

6.3 Image windowing

Image windowing is specified by four syntax elements: TOP_MARGIN, BOTTOM_MARGIN, RIGHT_MARGIN, and LEFT_MARGIN. These syntax elements determine the columns and rows of the *extended image* that are not present in the output *image*. With respect to a *raster scan ordering* in the *luma* array of an *image plane*, the first TOP_MARGIN rows are not output, nor are the last BOTTOM_MARGIN rows; also, the first LEFT_MARGIN columns are not output, nor are the last RIGHT_MARGIN columns of the *luma component*. Similarly, the *spatially co-located* portions of the *chroma components* are not output, in a manner that retains the ratios between the sizes of the arrays for the *chroma components* and that of the *luma component*, as specified in 6.2.

6.4 Image partitioning

The *luma component* is partitioned horizontally and vertically into an integer number of 16×16 *blocks* of samples. Label these *blocks* arrayLumaMB[j][k], where $0 \leq j < (\text{ExtendedWidth}[0] / 16)$ and $0 \leq k < (\text{ExtendedHeight}[0] / 16)$ are the *block* indices defined by this partitioning. MBHeight is defined to be equal to $\text{ExtendedHeight}[0] / 16$, and MBWidth is defined to be equal to $\text{ExtendedWidth}[0] / 16$.

In a similar fashion, the *chroma components* are partitioned into *blocks* arrayChromaMB[i][j][k] of size 8×8 for 4:2:0 sampling, of size 16×8 for 4:2:2 sampling or of size 16×16 in the default case.

This partitioning of the *components* into *blocks* is called a *macroblock partition*.

For each specific pair of indices (j, k), the *macroblock* arrayMB[j][k] is defined to be the collection of *blocks* arrayComponentMB[i][j][k], for $0 \leq i < \text{NumComponents}$. Across all *components* (all values of i), arrayComponent[i][j][k] and arrayChromaMB[i][j][k] are *spatially co-located*.

Let $0 = \text{LeftMBIndexOfTile}[0] < \text{LeftMBIndexOfTile}[1] < \dots < \text{LeftMBIndexOfTile}[\text{NumTileCols}] = \text{MBWidth}$, and $0 = \text{TopMBIndexOfTile}[0] < \text{TopMBIndexOfTile}[1] < \dots < \text{TopMBIndexOfTile}[\text{NumTileRows}] = \text{MBHeight}$ be two increasing sequences of integers, where the sequences are of length NumTileCols + 1 and NumTileRows + 1, respectively. LeftMBIndexOfTile[] is calculated by calling DetermineLeftBoundaryofTile() (8.3.25) and TopMBIndexOfTile[] is calculated by calling DetermineTopBoundaryofTile() (8.3.26). Associated with any such pair of sequences, a *tile partition* may be defined: partition the *macroblocks* of each into *tiles* arrayTile[m][n], for $0 \leq m < \text{NumTileCols}$, and $0 \leq n < \text{NumTileRows}$, where arrayTile[m][n] is defined to be the set of all *macroblocks* MB[j][k] $\text{LeftMBIndexOfTile}[m] \leq j < \text{LeftMBIndexOfTile}[m+1]$ and $\text{TopMBIndexOfTile}[n] \leq k < \text{TopMBIndexOfTile}[n+1]$.

The i-th *tile column* corresponds to the set of all *tiles* of the form arrayTile[i][n], for $0 \leq n < \text{NumTileRows}$; similarly, the j-th *tile row* corresponds to the set of all *tiles* arrayTile[m][j], for $0 \leq m < \text{NumTileCols}$. The i-th *tile width* is defined to be $\text{LeftMBIndexOfTile}[i+1] - \text{LeftMBIndexOfTile}[i]$; likewise, the i-th *tile height* is defined to be $\text{TopMBIndexOfTile}[i+1] - \text{TopMBIndexOfTile}[i]$. Both the *tile width* and the *tile height* correspond to an integer number of *macroblocks*. The *codestream* specifies a *tile partition* for the *image*, which impacts the order of the parsing of sample values associated with the *image*, as specified in the *codestream parsing and decoding processes*. The *tile partition* shall satisfy $1 \leq \text{NumTileCols} \leq 4096$, and $1 \leq \text{NumTileRows} \leq 4096$.

NOTE – Figure 1 provides an informative overview of the *image plane* partitions and implicit *windowing* where; a) the *extended image plane* dimension is indicated by a bold rectangle; b) the output *image plane* edges on left and bottom are indicated by dashed lines); c) 2×4 regular tiling pattern is shown; d) a *macroblock* in tile (1,2) is shown; and e) *blocks* within the *macroblock* are shown in an expanded window. Colour *components* are not explicitly shown.

6.5 Transform coefficients and frequency bands

The *decoding process* includes an inverse transform operation. The *transform coefficients* associated with each *component* and each *macroblock* are split into three subsets or *frequency bands*, which are called the *DC coefficient*, the *lowpass coefficients*, and the *highpass coefficients*.

For each colour *component* of the *macroblock*, one of the following three conditions holds.

- If the *component* is a *luma component* or a *chroma component* with no down sampling, the following is true. The *component* contains 256 *transform coefficients* for each *macroblock*. These 256 *transform coefficients* are partitioned into three subsets. One set is of size 1, and this coefficient constitutes the *DC coefficient* of this *component*. Another set is of size 15; this set constitutes the *lowpass coefficients*. The third set is of size 240, and constitutes the *highpass coefficients*.
- If the *component* is a *chroma component* with a sampling rate of 1/2 for both the horizontal and vertical directions, the following holds true. The *component* contains 64 *transform coefficients* for each *macroblock*. These 64 *transform coefficients* are partitioned into three subsets. One set is of size 1, and this coefficient constitutes the *DC coefficient* of this *component*. Another set is of size 3; this set constitutes the *lowpass coefficients*. The third set is of size 60, and constitutes the *highpass coefficients*.
- If the *component* is a *chroma component* with a sampling rate of 1/2 for the horizontal direction and a sampling rate of 1 for the vertical direction, the following holds true. The *component* contains 128 *transform coefficients* for each *macroblock*. These 128 *transform coefficients* are partitioned into three subsets. One set is of size 1, and this coefficient constitutes the *DC coefficient* of this *component*. Another set is of size 7; this set constitutes the *lowpass coefficients*. The third set is of size 120, and constitutes the *highpass coefficients*.

NOTE 1 – The partitioning of *transform coefficients* into three sets, and the use of the terms DC, lowpass, and highpass is based on the hierarchical nature of the transform.

Transform coefficients are dynamically partitioned into a *VLC-coded part* and a *fixed-length coded part*. The *fixed-length coded part* of the DC and lowpass coefficient is called *FLC refinement*.

The *fixed-length coded part* of the highpass coefficient is called *flexbits*. *Flexbits* can be carried in a separate *tile packet* as specified in 6.6.

NOTE 2 – This partition of *transform coefficients* is designed to control the number of bits used to represent the *VLC-coded part*.

6.6 Codestream structure

A *codestream* is laid out in one of two orderings called the *spatial mode* and the *frequency mode*. In both modes, the *codestream* is laid out as a header, followed by a sequence of *tile packets*.

NOTE – Figure 2 provides an informative overview of the *codestream* structure for the *spatial mode* and the *frequency mode*. The fact that *tiles* can be out of order, and the fact that there can be *codestream* segments of unspecified content between the *tiles* is not shown in Figure 2.

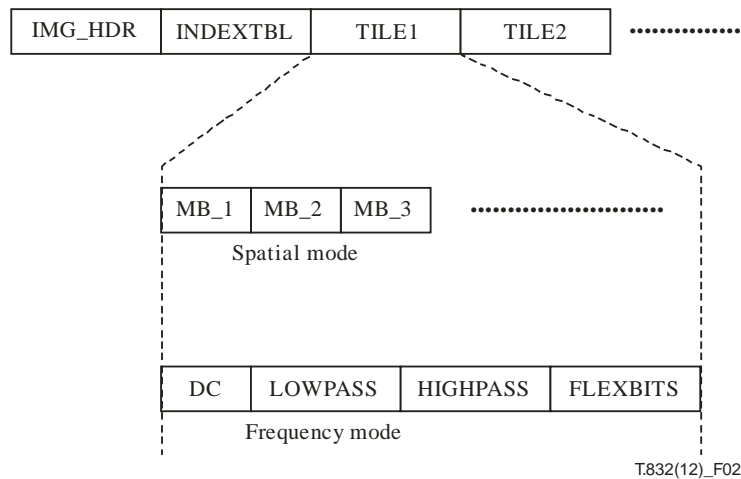

Figure 2 – Informative overview of codestream structure. Image header is followed by a sequence of tiles which are in spatial or frequency mode

In the *spatial mode*, a single *tile packet* carries the *codestream* of each *tile* in *macroblock* raster scan order (scanning left to right, top to bottom). The bits associated with each *macroblock* are located together.

In the *frequency mode*, the *codestream* of each *tile* is carried in multiple *tile packets*, where each *tile packet* carries *transform coefficients* of one *frequency band* of that *tile*. The DC *tile packet* carries information of the DC value of each *macroblock*, in *raster scan order*. The LP *tile packet* carries information of the LP coefficients value of each *macroblock*.

The HP *tile packet* carries information of the VLC-coded part of the HP coefficients of each *macroblock*. Finally, the *flexbits tile packet* carries information regarding the low order bits of the HP coefficients.

6.7 Precision and word length

This subclause is informative: It is not an integral part of this Specification.

The SCALED_FLAG syntax element specifies whether scaling is performed in the output formatting stage. If SCALED_FLAG is equal to TRUE, the final output is divided by 8 in the output formatting stage and thus the effective precision of the *decoding processes* such as the inverse transform is higher. If SCALED_FLAG is equal to FALSE, there is no such division operation on the final output and the effective precision of the *decoding processes* of the inverse transform is lower.

NOTE – Encoding with SCALED_FLAG equal to TRUE typically improves rate-distortion performance for lossy coding.

7 Overview of decoder

This clause is informative: it is not an integral part of this Specification.

7.1 General

A block diagram of the decoder, comprising of the parsing process and decoding process, is shown in Figure 3.

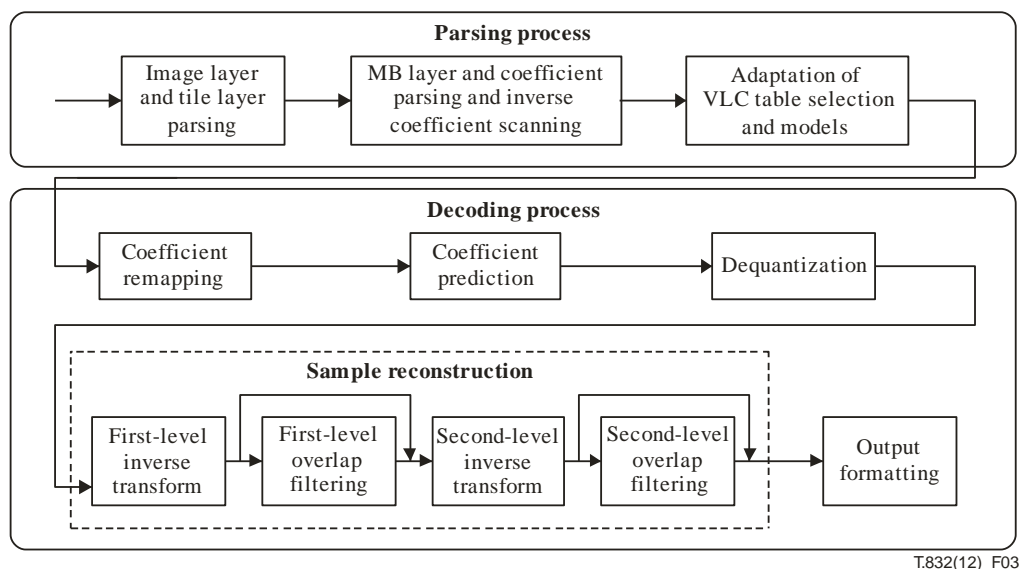

Figure 3 – Informative decoding process block diagram

The parsing process consists of the following stages:

- 1) image layer and tile layer codestream parsing;
- 2) macroblock layer codestream parsing which includes parsing the transform coefficients and inverse scanning;
- 3) adaptation of VLC table selection and context models.

The decoding process consists of the following stages:

- 4) coefficient remapping;
- 5) coefficient prediction;
- 6) dequantization;
- 7) sample reconstruction, which consists of the following stages:
 - a) first level inverse transform,

- b) when indicated, a first level overlap filter,
 - c) second level inverse transform,
 - d) when indicated, a second level overlap filter:
- 8) output formatting.

Clause 8 specifies the stages in the parsing processes. An overview of these steps is provided in 7.2.

Clause 9 specifies the stages in the decoding processes. An overview of these processes is provided in 7.3.

7.2 Overview of parsing process

7.2.1 Overview of image layer codestream parsing

The image level codestream structure is specified in 8.2. It consists of the image header, the header of the primary image plane, and, when present, the header of the alpha image plane. The syntax of the image header is specified in 8.3.

The image plane header defines information that is unique to that plane, and its syntax is specified in 8.4.

The tile index table is used to locate the data that corresponds to a particular tile. The syntax of tile index table is specified in 8.5.

7.2.2 Overview of tile layer codestream parsing

The syntax of the tile layer is specified in 8.7. A tile-packet consists of a tile-packet header, followed by compressed data associated with macroblocks of the tile.

In spatial mode, all the compressed data pertinent to a macroblock is located together in a single tile-packet and the parsing of syntax elements for a spatial-mode tile is specified in 8.7.2.

In frequency mode, each tile packet contains the data associated with a particular transform band; in this mode, a tile-packet is classified as a DC tile-packet, an LP tile-packet, a HP tile-packet or a flexbits tile-packet.

The syntax elements contained in the DC tile-packet, LP tile-packet, HP tile-packet and flexbits tile-packet are specified in 8.7.3, 8.7.5, 8.7.7, and 8.7.9, respectively.

If the quantization parameters associated with each band are not specified at the image plane header; they are specified at the tile level.

7.2.3 Overview of macroblock layer codestream parsing

The macroblock layer is parsed to generate the coefficients of the different frequency bands. These coefficients are inverse transformed to reconstruct the macroblock.

See 8.7.11 for the specification of the syntax structure `MB_DC()`, which parses the syntax elements related to the DC coefficient, for each component.

See 8.7.16.1 for the specification of the syntax structure `MB_LP()`, which parses the syntax elements related to the lowpass coefficients for each component and also performs inverse scanning of the coefficients.

The first step in decoding the HP coefficients involves derivation of CBPHP, which determines which 4×4 blocks of the macroblock have non-zero coefficients. The CBPHP is parsed as specified by the function `MB_CBPHP` in 8.7.17.2. See 8.7.18.2 for the specification of the syntax structure `MB_HP()`, which parses the syntax elements for parsing the VLC part of the HP coefficients, and also performs the inverse scanning of the coefficients. The process of parsing syntax elements related to Flexbits and thus refine the HP coefficients is specified in 8.7.19.1.

The VLC table used to parse the syntax elements can be adapted based on the value of previously parsed syntax elements. The adaptation processes for VLC table selection and other context models are also specified in pseudocode in these subclauses.

7.3 Overview of the decoding process

7.3.1 Overview of coefficient mapping

The DC, LP and HP transform coefficients are remapped, and this remapping process is specified in 9.5.

7.3.2 Overview of coefficient prediction

The transform coefficient may be predicted from the coefficients of the neighbouring blocks and macroblocks, and this prediction process is specified in 9.6.

7.3.3 Overview of dequantization

The dequantization process specifies how the transform coefficients are scaled by the quantizer parameter, and this process is specified in 9.8. The derivation of the quantization parameter is specified in 9.7.

7.3.4 Overview of sample reconstruction

See 9.9 for a specification of the sample reconstruction process.

The inverse transform takes a two-level lapped transform. The steps are as follows.

- An inverse core transform (ICT) is applied to each 4×4 block corresponding to reconstructed DC and LP coefficients arranged in an array known as the DC-LP array. The first level inverse transform process is specified in 9.9.2.
- An overlap filter operation, when indicated, is applied to 4×4 areas evenly straddling blocks in the DC-LP array. For images with soft tiles, this filter is applied to all such blocks. For images with hard tiles, this filter is applied only to the interior of tiles. Furthermore, an overlap filter is applied to boundary 2×4 and 4×2 areas, as well as the four 2×2 corner areas. For images with hard tiles, these filters are additionally applied at tile boundaries. The first level overlap filtering process is specified in 9.9.3. For INTERNAL_CLR_FMT equal to YUV420 or YUV422, alternate filter operations are applied to the 2×2 interior blocks and 2×1 and 1×2 edge blocks of the chroma components. For these cases, a prediction process is used for the corner samples, denoted 'OverlapPostFilter1' in Figure 4 and detailed in Table 154 and Table 155.
- The resulting array contains coefficients of the 4×4 blocks corresponding to the first level transform. These coefficients are combined with the reconstructed HP coefficients into a larger array. This coefficient combination process is specified in 9.9.4.
- An ICT is applied to each 4×4 block. The second level inverse transform process is specified in 9.9.5.
- An overlap filter operation, when indicated, is applied to 4×4 areas evenly straddling blocks in the DC-LP array. For images with soft tiles, this filter is applied to all such blocks. For images with hard tiles, this filter is applied only to the interior of tiles. Furthermore, an overlap filter is applied to boundary 2×4 and 4×2 areas, as well as the four 2×2 corner areas. For images with hard tiles, these filters are additionally applied at tile boundaries. The second level overlap filtering process is specified in 9.9.6.

The flow chart for the sample reconstruction process is shown in Figure 4.

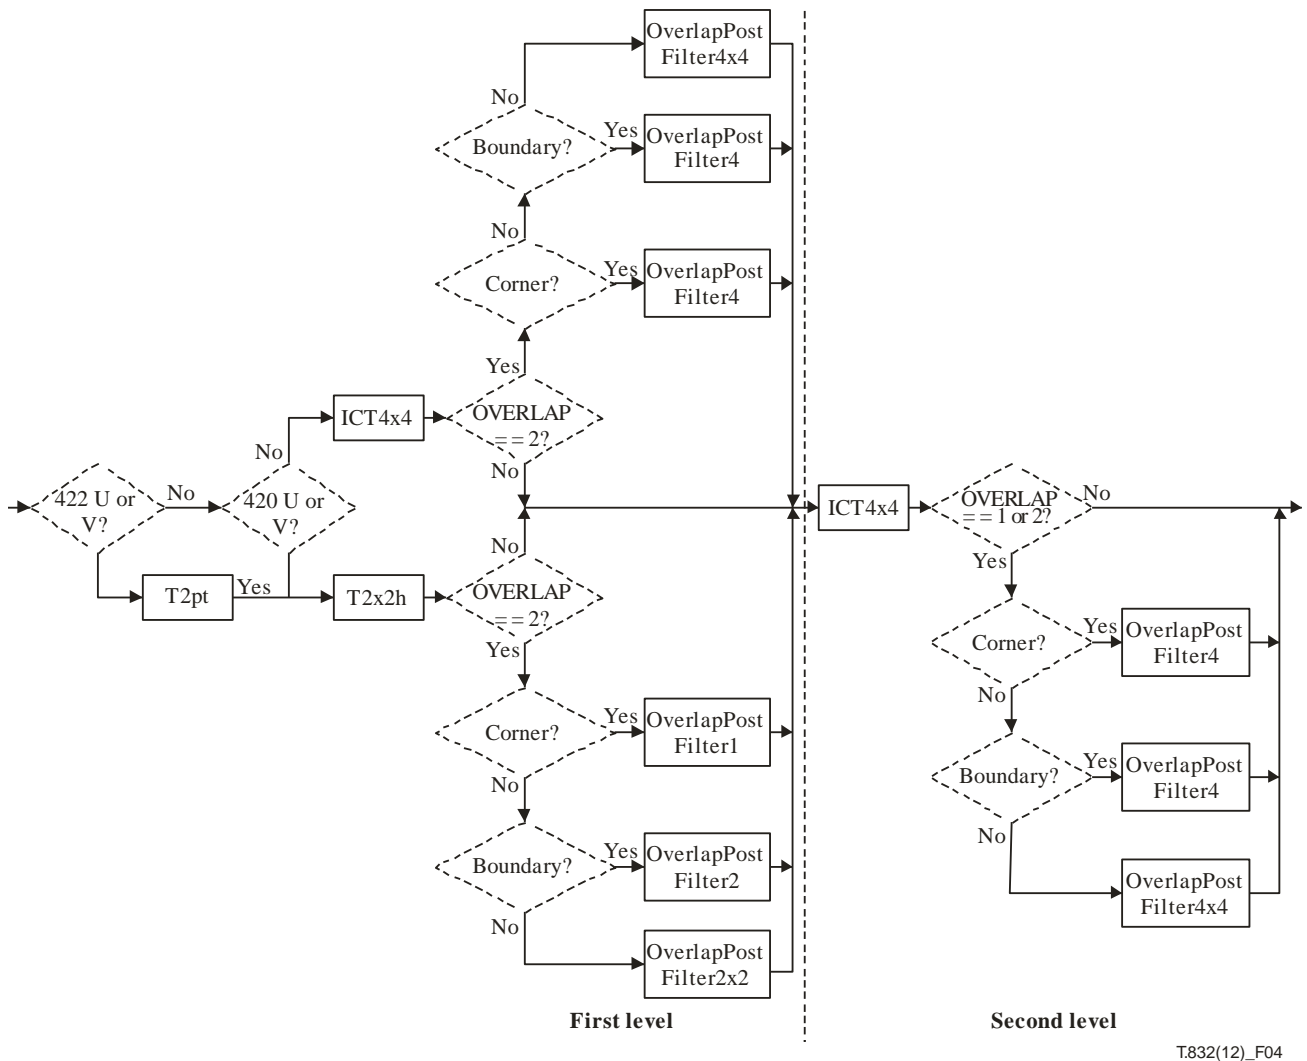

Figure 4 – Informative overview of sample reconstruction process

7.3.5 Overview of output formatting

See 9.10 for a specification of the outputting process that accounts for the various transformations required to handle the different colour formats and bit depths.

8 Syntax, semantics, and parsing process

8.1 General

This clause specifies the codestream layout and the processes related to parsing syntax elements from the codestream. The parsing of syntax elements requires information about the order of syntax elements as they occur in the codestream, along with the manner of correctly interpreting these syntax elements. At a given point in the parsing of the codestream, the order and presence of syntax elements is conditional upon the state of the decoder itself at that time (based on the previously parsed and interpreted syntax elements as specified by the pseudocode of this subclause).

This clause also specifies the adaptation processes that are associated with variable-length decoding, and with adaptive coefficient normalization. These adaptation processes require specific state variables to be maintained by the decoder in order to properly parse the syntax elements of the codestream. Therefore, the processes of initializing and updating these state variables are also specified in this clause.

The codestream is comprised of the following layers: image; tile; macroblock; and block. Furthermore, the macroblock and block layers are laid out differently for the spatial and frequency modes of the codestream. The parsing processes of this subclause are organized by this hierarchy. Below the macroblock level, the parsing processes are further grouped by frequency band; separate syntax structures specify the decoding of the DC, LP and HP frequency bands.

8.2 CODED_IMAGE()

8.2.1 Syntax structure

The CODED_IMAGE() syntax structure is specified in Table 18.

NOTE – Throughout the parsing of syntax elements, it is assumed that, if ALPHA_IMAGE_PLANE_FLAG is equal to TRUE, there are two sets of parsed syntax elements: one set corresponding to the primary image plane and used if IsCurrPlaneAlphaFlag is equal to FALSE, and one set corresponding to the alpha image plane and used if IsCurrPlaneAlphaFlag is equal to TRUE.

Table 18 – CODED_IMAGE() syntax structure

CODED_IMAGE() {	Descriptor	Reference
IMAGE_HEADER()		8.3
IsCurrPlaneAlphaFlag = FALSE		
IMAGE_PLANE_HEADER()		8.4
if (ALPHA_IMAGE_PLANE_FLAG) {		
IsCurrPlaneAlphaFlag = TRUE		
IMAGE_PLANE_HEADER()		8.4
}		
if (INDEX_TABLE_PRESENT_FLAG)		
INDEX_TABLE_TILES()		8.5
SubsequentBytes = VLW_ESC()		8.2.4
if (SubsequentBytes > 0) {		
iBytes = PROFILE_LEVEL_INFO()		8.6
valueAdditionalBytes = SubsequentBytes – iBytes		
for (iBytes = 0; iBytes < valueAdditionalBytes; iBytes++)		
RESERVED_A_BYTE	u(8)	8.2.3
}		
CODED_TILES()		8.7
}		

8.2.2 SubsequentBytes

SubsequentBytes specifies the number of bytes of subsequent data that precede the CODED_TILES(). The value of this variable is determined by a VLW_ESC() syntax structure as specified in 8.2.4. When SubsequentBytes is not equal to 0, it is a requirement of codestream conformance that SubsequentBytes shall not be less than 4.

The value of the variable valueAdditionalBytes is derived from the value of SubsequentBytes as shown in Table 18.

The value of valueAdditionalBytes shall be equal to 0 in codestreams encoded according to this version of this Specification. The use of other values of valueAdditionalBytes is reserved for future specification by ITU-T | ISO/IEC. Decoders shall allow this variable to have any value and shall use this value to determine the quantity of RESERVED_A_BYTE syntax elements that follow.

NOTE – The purpose of the specification for decoders to allow this variable to have any value is to enable the future definition of a backward-compatible usage of different values of this variable.

8.2.3 RESERVED_A_BYTE

RESERVED_A_BYTE is an 8-bit syntax element. The use of this syntax element is reserved for future specification by ITU-T | ISO/IEC. When present, the value of this syntax element shall be ignored by the decoder.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_A_BYTE is to enable the future definition of a backward-compatible usage of this syntax element.

8.2.4 VLW_ESC()

8.2.4.1 Syntax structure

The VLW_ESC() syntax structure is specified in Table 19.

Table 19 – VLW_ESC() syntax structure

VLW_ESC() {	Descriptor	Reference
FIRST_BYTE	u(8)	8.2.4.2
if (FIRST_BYTE < 0xFB) {		
SECOND_BYTE	u(8)	8.2.4.3
iValue = FIRST_BYTE * 256 + SECOND_BYTE		
} else if (FIRST_BYTE == 0xFB) {		
FOUR_BYTES	u(32)	8.2.4.4
iValue = FOUR_BYTES		
} else if (FIRST_BYTE == 0xFC) {		
EIGHT_BYTES	u(64)	8.2.4.5
iValue = EIGHT_BYTES		
} else /* FIRST_BYTE is 0xFD, or 0xFE, or 0xFF */		
iValue = 0 /* Escape Mode */		
return iValue		
}		

8.2.4.2 FIRST_BYTE

FIRST_BYTE is an 8-bit syntax element that affects the computation of iValue as specified in 8.2.4.1.

8.2.4.3 SECOND_BYTE

SECOND_BYTE is an 8-bit syntax element that affects the computation of iValue as specified in 8.2.4.1.

8.2.4.4 FOUR_BYTES

FOUR_BYTES is a 32-bit syntax element that affects the computation of iValue as specified in 8.2.4.1.

8.2.4.5 EIGHT_BYTES

EIGHT_BYTES is a 64-bit syntax element that affects the computation of iValue as specified in 8.2.4.1.

8.3 IMAGE_HEADER()

8.3.1 Syntax structure

The IMAGE_HEADER() syntax structure is specified in Table 20.

Table 20 – IMAGE_HEADER() syntax structure

IMAGE_HEADER() {	Descriptor	Reference
GDI_SIGNATURE	u(64)	8.3.2
RESERVED_B	u(4)	8.3.3

HEIGHT_MINUS1	u(32)	8.3.22
}		
if (TILING_FLAG) {		
NUM_VER_TILES_MINUS1	u(12)	8.3.23
NUM_HOR_TILES_MINUS1	u(12)	8.3.24
}		
for (n = 0; n < NUM_VER_TILES_MINUS1; n++)		
if (SHORT_HEADER_FLAG)		
TILE_WIDTH_IN_MB[n]	u(8)	8.3.25
else		
TILE_WIDTH_IN_MB[n]	u(16)	8.3.25
for (n = 0; n < NUM_HOR_TILES_MINUS1; n++)		
if (SHORT_HEADER_FLAG)		
TILE_HEIGHT_IN_MB[n]	u(8)	8.3.26
else		
TILE_HEIGHT_IN_MB[n]	u(16)	8.3.26
if (WINDOWING_FLAG) {		
TOP_MARGIN	u(6)	8.3.27
LEFT_MARGIN	u(6)	8.3.28
BOTTOM_MARGIN	u(6)	8.3.29
RIGHT_MARGIN	u(6)	8.3.30
}		
}		

8.3.2 GDI_SIGNATURE

GDI_SIGNATURE is a 64-bit syntax element that identifies the codestream. It shall have the value 0x574D50484F544F00.

NOTE – This signature corresponds to "WMPHOTO" using the UTF-8 character set encoding specified in Annex D of ISO/IEC 10646, followed by a byte equal to 0.

8.3.3 RESERVED_B

RESERVED_B is a 4-bit syntax element that shall be equal to 1 in all codestreams conforming to this version of this Specification. All other values are reserved.

NOTE – Alternative values for RESERVED_B may be specified in the future as an indication of a codestream that is not compatible with prior decoder versions.

8.3.4 HARD_TILING_FLAG

HARD_TILING_FLAG is a 1-bit syntax element. If HARD_TILING_FLAG is equal to TRUE, overlap filtering is not performed across tile boundaries (hard tiles). Otherwise (HARD_TILING_FLAG is equal to FALSE), overlap filtering is performed across tile boundaries (soft tiles).

8.3.5 RESERVED_C

RESERVED_C is a 3-bit syntax element that shall be equal to 1 in all codestreams conforming to this version of this Specification. All other values are reserved. Decoders conforming to this version of this Specification shall ignore the value of RESERVED_C.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_C is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.3.6 TILING_FLAG

TILING_FLAG is a 1-bit syntax element. If TILING_FLAG is equal to TRUE, both the syntax elements NUM_VER_TILES_MINUS1 and NUM_HOR_TILES_MINUS1 are present in the codestream. Otherwise, these syntax elements are not present, and the number of tiles is equal to 1.

8.3.7 FREQUENCY_MODE_CODESTREAM_FLAG

FREQUENCY_MODE_CODESTREAM_FLAG is a 1-bit syntax element.

If FREQUENCY_MODE_CODESTREAM_FLAG is equal to FALSE, the codestream is laid out in the spatial mode. If FREQUENCY_MODE_CODESTREAM_FLAG is equal to TRUE, the codestream is laid out in the frequency mode.

8.3.8 SPATIAL_XFRM_SUBORDINATE

SPATIAL_XFRM_SUBORDINATE is a 3-bit syntax element that, in the absence of any overriding indication as determined by the application or by a file format usage context, indicates a preferred spatial transformation that should be applied to the decoded image, as specified in Table 21 as follows.

- The "RCW" table column, when equal to 1, indicates a 90° clockwise rotation request of the output image.
- The "FlipH" table column, when equal to 1, indicates a horizontal flip request of the output image.
- The "FlipV" table column, when equal to 1, indicates a vertical flip request of the output image.
- The "Example" table column visually illustrates the application of the requested transformation to an image of the character "P".
- The "Fill" table column indicates the location of the [0][0] image sample coordinate position after application of the requested transformation, as follows:
 - "TL" indicates that row 0 represents the top edge of the image and column 0 represents the left edge of the image.
 - "BL" indicates that row 0 represents the bottom edge of the image and column 0 represents the left edge of the image.
 - "TR" indicates that row 0 represents the top edge of the image and column 0 represents the right edge of the image.
 - "BR" indicates that row 0 represents the bottom edge of the image and column 0 represents the right edge of the image.
 - "RT" indicates that row 0 represents the right edge of the image and column 0 represents the top edge of the image.
 - "RB" indicates that row 0 represents the right edge of the image and column 0 represents the bottom edge of the image.

- "LT" indicates that row 0 represents the left edge of the image and the column 0 represents the top edge of the image.
- "LB" indicates that row 0 represents the left edge of the image and column 0 represents the bottom edge of the image.

NOTE – The TIFF Revision 6.0 specification includes an "Orientation" tag with a similar purpose. The TIFF Orientation tag values that correspond to the SPATIAL_XFRM_SUBORDINATE values 0, 1, 2, 3, 4, 5, 6, and 7 are 1, 4, 2, 3, 6, 7, 5, and 8, respectively.

Table 21 – Interpretation of SPATIAL_XFRM_SUBORDINATE

SPATIAL_XFRM_SUBORDINATE	RCW	FlipH	FlipV	Example	Fill
0	0	0	0		TL
1	0	0	1		BL
2	0	1	0		TR
3	0	1	1		BR
4	1	0	0		RT
5	1	0	1		RB
6	1	1	0		LT
7	1	1	1		LB

8.3.9 INDEX_TABLE_PRESENT_FLAG

INDEX_TABLE_PRESENT_FLAG is a 1-bit syntax element that specifies whether the index table is present in the codestream. If FREQUENCY_MODE_CODESTREAM_FLAG is equal to TRUE or NUM_VER_TILES_MINUS1 is greater than 0 or NUM_HOR_TILES_MINUS1 is greater than 0, it is a requirement of codestream conformance that INDEX_TABLE_PRESENT_FLAG shall be equal to TRUE. If INDEX_TABLE_PRESENT_FLAG is equal to TRUE, the index table is present in the codestream. Otherwise, the index table is not present in the codestream. See 8.5.

8.3.10 OVERLAP_MODE

OVERLAP_MODE is a 2-bit syntax element that specifies the overlap processing mode.

When OVERLAP_MODE is equal to 0, no overlap filtering is performed. Otherwise, if OVERLAP_MODE is equal to 1, only the second level overlap filtering is performed. Otherwise, if OVERLAP_MODE is equal to 2, both first level and second level overlap filtering are performed. The value 3 is reserved.

NOTE – The trade-offs between complexity and compression efficiency related to the different overlap modes are discussed in D.4.

8.3.11 SHORT_HEADER_FLAG

SHORT_HEADER_FLAG is a 1-bit syntax element that specifies the number of bits required to represent the syntax elements for the width and the height of the image and the tiles. If SHORT_HEADER_FLAG is equal to TRUE, WIDTH_MINUS1 and HEIGHT_MINUS1 are 16-bit syntax elements, and TILE_WIDTH_IN_MB[n], when present, and TILE_HEIGHT_IN_MB[n], when present, are 8-bit syntax elements. Otherwise, WIDTH_MINUS1 and HEIGHT_MINUS1 are 32-bit syntax elements, and TILE_WIDTH_IN_MB[n], when present, and TILE_HEIGHT_IN_MB[n], when present, are 16-bit syntax elements.

8.3.12 LONG_WORD_FLAG

LONG_WORD_FLAG is a 1-bit syntax element that specifies the range of values of variables associated with the decoding process (clause 9). The constraints imposed by LONG_WORD_FLAG equal to FALSE have the following scope:

- All values of the global array variable MbDCLP[][][]
- All values of the global array variable MBBuffer[][][]
- All values of the global array variable PredDCLP[][][]
- Values of global array variable ImagePlane[][][] in the sample reconstruction process specified in 9.9.

NOTE 1 – Values of the global array variable ImagePlane[][][] in the output formatting process specified in 9.10 are not included in the scope of the constraints imposed by LONG_WORD_FLAG equal to FALSE.

- All values of local variables used in the sample reconstruction process specified in clause 9.9 except the index variables used to address the elements of arrays.

NOTE 2 – Local variables used in the output formatting process specified in 9.10 are not included in the scope of the constraints imposed by LONG_WORD_FLAG equal to FALSE.

The variables associated with the decoding process specified in clause 9 shall be constrained as follows:

- If LONG_WORD_FLAG is equal to TRUE, it is a requirement for codestream conformance to this Specification that the range of values of all variables associated with the decoding process (clause 9) shall not exceed the signed 32-bit range from -2^{31} range to $2^{31}-1$, inclusive, although the range of values of these variables may exceed the signed 16-bit range from -2^{15} range to $2^{15}-1$, inclusive. Thus all variables of the decoding process can be stored by decoders as 32 bit two's complement integers while producing output conforming to this Specification (regardless of the value of LONG_WORD_FLAG).
- Otherwise (LONG_WORD_FLAG is equal to FALSE), it is a requirement for codestream conformance to this Specification that the range of values of the specific affected variables listed above shall not exceed the signed 16-bit range from -2^{15} range to $2^{15}-1$, inclusive, and that the range of values of all intermediate expressions and other variables associated with the decoding process for the codestream shall not exceed the signed 32-bit range from -2^{31} range to $2^{31}-1$, inclusive. In this case, it is sufficient for decoders to store the affected variables of the decoding process as 16 bit two's complement integers in order to produce output images conforming to this Specification.

NOTE 3 – Decoder implementations need not use two's complement arithmetic using fixed-word-length storage and processing. However, if such a representation is used, 32-bit variable storage and 32-bit arithmetic processing elements are sufficient to decode an image, regardless of the value of LONG_WORD_FLAG. The LONG_WORD_FLAG element can be used by the decoder to optimize its resource usage for the sample reconstruction process.

8.3.13 WINDOWING_FLAG

WINDOWING_FLAG is a 1-bit syntax element that specifies whether syntax elements specifying windowing dimensions (TOP_MARGIN, LEFT_MARGIN, BOTTOM_MARGIN, and RIGHT_MARGIN as specified in 8.3.27 to 8.3.30) are present in the codestream. If WINDOWING_FLAG is equal to TRUE, these syntax elements are present in the codestream. If WINDOWING_FLAG is equal to FALSE, these syntax elements are not present in the codestream.

8.3.14 TRIM_FLEXBITS_FLAG

TRIM_FLEXBITS_FLAG is a 1-bit syntax element that specifies whether TRIM_FLEXBITS syntax element is present in the TILE_SPATIAL() syntax structure and TILE_FLEXBITS() syntax structure. If TRIM_FLEXBITS_FLAG is equal to TRUE, TRIM_FLEXBITS is present. Otherwise, TRIM_FLEXBITS is not present.

8.3.15 RESERVED_D

RESERVED_D is a 1-bit syntax element. The value of RESERVED_D shall be equal to 0. Other values are reserved. Decoders shall ignore the value of this syntax element.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_D is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.3.16 RED_BLUE_NOT_SWAPPED_FLAG

RED_BLUE_NOT_SWAPPED_FLAG is a 1-bit syntax element. Its interpretation is specified as follows.

- If OUTPUT_CLR_FMT is equal to RGB and OUTPUT_BITDEPTH is equal to BD5, BD565 or BD10, the value of RED_BLUE_NOT_SWAPPED_FLAG affects the operation of the output formatting process.
- Otherwise, the value of RED_BLUE_NOT_SWAPPED_FLAG shall be equal to 0 in all codestreams conforming to this version of this Specification. The value 1 is reserved. Decoders conforming to this version of this Specification shall ignore the value of RED_BLUE_NOT_SWAPPED_FLAG in this case.

NOTE – The specification of semantics for RED_BLUE_NOT_SWAPPED_FLAG was not included in the original edition of this Specification. The specification of RED_BLUE_NOT_SWAPPED_FLAG was added later to address a problem with respect to the observed behaviour of existing implementations. In principle, when OUTPUT_CLR_FMT is equal to RGB and OUTPUT_BITDEPTH is equal to BD5, BD565, or BD10, the value 1 for RED_BLUE_NOT_SWAPPED_FLAG should ordinarily provide better compression capability than the value 0. However, early product implementations of this Specification have operated in a manner corresponding to the value 0.

8.3.17 PREMULIPLIED_ALPHA_FLAG

PREMULIPLIED_ALPHA_FLAG is a 1-bit syntax element that can be used, when an alpha image plane is present, to indicate that the coded image channels other than the alpha channel are considered to be in pre-multiplied form in relation to the alpha channel.

NOTE 1 – The designation of an alpha channel as pre-multiplied indicates that the decoded sample values do not require multiplication by the alpha channel values when performing compositing (as any such necessary multiplication process was performed as a pre-processing step prior to encoding).

When `PREMULTIPLIED_ALPHA_FLAG` is equal to `TRUE` in the `IMAGE_HEADER()` of the coded image that contains the alpha image plane, the channels other than the alpha channel are indicated to be in pre-multiplied form in relation to the alpha channel.

When no alpha image plane is present, `PREMULTIPLIED_ALPHA_FLAG` shall be equal to `FALSE`, and decoders shall ignore the value of this syntax element.

When an alpha image plane is present as a separate alpha image plane, `PREMULTIPLIED_ALPHA_FLAG` shall be equal to `FALSE` in the `IMAGE_HEADER()` of the coded image that does not contain the alpha image plane, and decoders shall ignore the value of this syntax element in the `IMAGE_HEADER()` of the coded image that does not contain the alpha image plane.

When an alpha image plane is present and `PREMULTIPLIED_ALPHA_FLAG` is equal to `FALSE` in the `IMAGE_HEADER()` of the coded image that contains the alpha image plane, other indicators provided by other means not specified in the main body of this Specification should be used to determine whether the channels other than the alpha channel (when present) are considered to be in pre-multiplied form in relation to the alpha channel. When an alpha image plane is present and `PREMULTIPLIED_ALPHA_FLAG` is equal to `FALSE` in the `IMAGE_HEADER()` of the coded image that contains the alpha image plane and such other indicators are not available, it is suggested that the default interpretation should be that the channels other than the alpha channel are considered not to be in pre-multiplied form in relation to the alpha channel.

NOTE 2 – The specification of semantics for `PREMULTIPLIED_ALPHA_FLAG` was not included in the original edition of this Specification. The specification of `PREMULTIPLIED_ALPHA_FLAG` was added later to correct for the ambiguity of interpretation resulting from absence of such an indicator (when no indication is provided by other means outside the coded image syntax). In the original edition of this Specification, the bit corresponding to `PREMULTIPLIED_ALPHA_FLAG` was required to be equal to 0 and decoders were required to ignore the value of this bit.

NOTE 3 – When the file format specified in Annex A is used, the `PIXEL_FORMAT` value indicates whether the channels other than the alpha channel (when present) are considered to be in pre-multiplied form in relation to the alpha channel, and the value of `PREMULTIPLIED_ALPHA_FLAG` is required to be consistent with the `PIXEL_FORMAT` value. When the codestream is conveyed by some means other than the file format specified in Annex A, some indicator may be available to indicate whether the channels other than the alpha channel (when present) are considered to be in pre-multiplied form in relation to the alpha channel, and the value of `PREMULTIPLIED_ALPHA_FLAG` should be set to be consistent with any such indicator.

8.3.18 ALPHA_IMAGE_PLANE_FLAG

`ALPHA_IMAGE_PLANE_FLAG` is a 1-bit syntax element that specifies whether an alpha image plane is present in the codestream. If `ALPHA_IMAGE_PLANE_FLAG` is equal to `TRUE`, an alpha image plane is present. If `ALPHA_IMAGE_PLANE_FLAG` is equal to `FALSE`, no alpha image plane is present in the codestream.

NOTE – If `ALPHA_IMAGE_PLANE_FLAG` is equal to `FALSE`, an alpha image plane can be carried as a separate image within a system or file.

8.3.19 OUTPUT_CLR_FMT

`OUTPUT_CLR_FMT` is a 4-bit syntax element that specifies the colour format of the output image as specified in Table 22.

Table 22 – OUTPUT_CLR_FMT

OUTPUT_CLR_FMT	Mnemonic
0	YONLY
1	YUV420
2	YUV422
3	YUV444
4	CMYK
5	CMYKDIRECT
6	NCOMPONENT
7	RGB
8	RGBE
9-15	RESERVED

If `IsCurrPlaneAlphaFlag` is equal to `TRUE`, the value of `OUTPUT_CLR_FMT` shall be equal to 0.

For the cases where OUTPUT_CLR_FMT is equal to YUV420, YUV422 or YUV444, there are three output colour components: the component corresponding to index 0 is the Y component, while the U and V correspond to colour components 1 and 2, respectively. For CMYK and CMYKDIRECT, components 0, 1, 2, and 3 correspond to the C, M, Y, and K components, respectively. For RGB, components 0, 1 and 2 correspond to R, G, and B, respectively and for RGBE, components 0, 1, 2, and 3 correspond to the R, G, B, and E components, respectively.

8.3.20 OUTPUT_BITDEPTH

OUTPUT_BITDEPTH is a 4-bit syntax element that specifies the bit depth and corresponding representation of the output image, as specified in Table 23. BD1WHITE1, BD1BLACK1, BD8, BD16, BD5 and BD10 are unsigned integer formats, corresponding to 1, 1, 8, 16, 5 and 10 bits per component, respectively, having a representation specified in 9.10.8. In BD1WHITE1, a value of 0 indicates the minimum level or black for the specific channel and the value 1 indicates the maximum value for that channel. In BD1BLACK1, a value of 1 indicates the minimum level or black for the specific channel and the value 0 indicates the maximum value for that channel. BD16S and BD32S are signed (two's complement) integer formats corresponding to 16 and 32 bits per component, respectively. BD16F is 16-bit Half float (1-bit sign, 5-bit exponent and 10-bit mantissa where the MSB is the sign bit) having a representation as specified in 9.10.7.3. BD32F is 32-bit float (1-bit sign, 8-bit exponent, and 23-bit mantissa where the MSB is the sign bit) having a representation as specified in 9.10.7.3. BD565 corresponds to unsigned integer formats where the R, G and B components have 5, 6 and 5 bits, respectively, having a representation as specified in 9.10.8.

The values of OUTPUT_BITDEPTH and OUTPUT_CLR_FMT shall be constrained as specified in 9.10.

NOTE – See 9.10.7 for more details on the representation of these formats.

Table 23 – OUTPUT_BITDEPTH

OUTPUT_BITDEPTH	Mnemonic
0	BD1WHITE1
1	BD8
2	BD16
3	BD16S
4	BD16F
5	RESERVED
6	BD32S
7	BD32F
8	BD5
9	BD10
10	BD565
11-14	RESERVED
15	BD1BLACK1

8.3.21 WIDTH_MINUS1

WIDTH_MINUS1 plus 1 is the output image width. If SHORT_HEADER_FLAG is equal to TRUE, WIDTH_MINUS1 is a 16-bit syntax element. Otherwise, WIDTH_MINUS1 is a 32-bit syntax element. When OUTPUT_CLR_FMT is equal to YUV420 or YUV422, it is a requirement of codestream conformance to this Specification that the value of WIDTH_MINUS1 + 1 shall be an integer multiple of 2.

It is a requirement of codestream conformance to this Specification that the value of WIDTH_MINUS1 + 1 + LEFT_MARGIN + RIGHT_MARGIN shall be an integer multiple of 16. When INTERNAL_CLR_FMT is equal to YUV420 or YUV422 and OVERLAP_MODE is equal to 2, it is a requirement of codestream conformance to this Specification that the value of WIDTH_MINUS1 + 1 + LEFT_MARGIN + RIGHT_MARGIN shall be greater than or equal to 32.

NOTE – Images with INTERNAL_CLR_FMT equal to YUV420 or YUV422 and OVERLAP_MODE equal to 2 must have a width of at least 2 macroblocks due to the adjacent coefficient residual process described in 9.9.3.1.

8.3.22 HEIGHT_MINUS1

HEIGHT_MINUS1 plus 1 is the output image height. If SHORT_HEADER_FLAG is equal to TRUE, HEIGHT_MINUS1 is a 16-bit syntax element. Otherwise, HEIGHT_MINUS1 is a 32-bit syntax element. When OUTPUT_CLR_FMT is equal to YUV420, it is a requirement of codestream conformance to this Specification that the value of HEIGHT_MINUS1 + 1 shall be an integer multiple of 2.

It is a requirement of codestream conformance to this Specification that the value of HEIGHT_MINUS1 + 1 + TOP_MARGIN + BOTTOM_MARGIN shall be an integer multiple of 16.

8.3.23 NUM_VER_TILES_MINUS1

NUM_VER_TILES_MINUS1 is a 12-bit syntax element that is present when TILING_FLAG is equal to TRUE, and specifies the number of tiles in a row minus 1. When NUM_VER_TILES_MINUS1 is not present, its value shall be inferred to be equal to 0.

NOTE – "Vertical" indicates that the partitioning of the image corresponding to these tiles runs in the vertical direction.

8.3.24 NUM_HOR_TILES_MINUS1

NUM_HOR_TILES_MINUS1 is a 12-bit syntax element that is present when TILING_FLAG is equal to TRUE, and specifies the number of tiles in a column minus 1. When NUM_HOR_TILES_MINUS1 is not present, its value shall be inferred to be equal to 0.

NOTE – "Horizontal" indicates that the partitioning of the image corresponding to these tiles runs in the horizontal direction.

8.3.25 TILE_WIDTH_IN_MB[n]

TILE_WIDTH_IN_MB[n] is a syntax element that specifies the width (in macroblock units) of the n-th tile column, where the 0-th tile column is the leftmost tile column in the image, and subsequent tile columns are numbered consecutively, left to right. If SHORT_HEADER_FLAG is equal to TRUE, TILE_WIDTH_IN_MB[n] is an 8-bit syntax element. Otherwise, it is a 16-bit syntax element.

The width of the rightmost tile in macroblock units is derived by subtracting the cumulative width of the previous tiles from the width of the coded area in macroblock units ExtendedWidth[0] divided by 16.

The position of the left boundary of the tile, LeftMBIndexofTile[], is calculated by calling DetermineLeftBoundaryofTile() in the pseudocode in Table 24.

Table 24 – Pseudocode to determine the position of the left boundaries of the tiles

DetermineLeftBoundaryofTile() {	Reference
LeftMBIndexofTile[0] = 0	
for (n = 0; n < NUM_VER_TILES_MINUS1; n++)	
LeftMBIndexofTile[n+1] = LeftMBIndexofTile[n] + TILE_WIDTH_IN_MB[n]	
LeftMBIndexofTile[NUM_VER_TILES_MINUS1 + 1] = MBWidth	
}	

When INTERNAL_CLR_FMT is equal to YUV420 or YUV422, OVERLAP_MODE is equal to 2, and HARD_TILING_FLAG is equal to TRUE, TILE_WIDTH_IN_MB[n] shall be greater than or equal to 2 for all tiles.

When INTERNAL_CLR_FMT is equal to YUV420 or YUV422, OVERLAP_MODE is equal to 2, and HARD_TILING_FLAG is equal to TRUE, MBWidth – LeftMBIndexofTile[NUM_VER_TILES_MINUS1] shall be greater than or equal to 2.

8.3.26 TILE_HEIGHT_IN_MB[n]

TILE_HEIGHT_IN_MB[n] is a syntax element that specifies the height (in macroblock units) of the n-th tile row, where the 0-th tile row is the top tile row in the image, and subsequent tile rows are numbered consecutively, top to bottom. If SHORT_HEADER_FLAG is equal to TRUE, TILE_HEIGHT_IN_MB[n] is an 8-bit syntax element. Otherwise, it is a 16-bit syntax element.

The height of the bottom tile in macroblock units is derived by subtracting the transmitted heights (plus 1) from the height of the coded area in macroblock units ExtendedHeight[0] divided by 16.

The position of the top boundary of the tile, TopMBIndexofTile[], is calculated by calling DetermineTopBoundaryofTile() as specified in the pseudocode in Table 25.

Table 25 – Pseudocode to determine the position of the top boundaries of the tiles

DetermineTopBoundaryofTile() {	Reference
TopMBIndexofTile[0] = 0	
for (n = 0; n < NUM_HOR_TILES_MINUS1; n++)	
TopMBIndexofTile[n+1] = TopMBIndexofTile[n] + TILE_HEIGHT_IN_MB[n]	
TopMBIndexofTile[NUM_HOR_TILES_MINUS1 + 1] = MBHeight	
}	

The number of macroblocks in a tile, NumMBInTile[], is calculated by calling DetermineNumMBInTile() as specified in the pseudocode in Table 26.

Table 26 – Pseudocode to determine the number of macroblocks in each tile

DetermineNumMBInTile() {	Reference
n = 0	
for (i = 0; i < NUM_HOR_TILES_MINUS1 + 1; i++)	
for (j = 0; j < NUM_VER_TILES_MINUS1 + 1; j++) {	
NumMBInTile[n] = TILE_HEIGHT_IN_MB[i] * TILE_WIDTH_IN_MB[j]	
n++	
}	
}	

8.3.27 TOP_MARGIN

TOP_MARGIN is a 6-bit syntax element that is present when WINDOWING_FLAG is equal to TRUE, and specifies the vertical offset of the top boundary of the output image relative to the top edge of the extended image. When TOP_MARGIN is not present, its value shall be inferred to be equal to 0. When OUTPUT_CLR_FMT is equal to YUV420, it is a requirement of codestream conformance to this Specification that the value of TOP_MARGIN shall be an integer multiple of 2.

8.3.28 LEFT_MARGIN

LEFT_MARGIN is a 6-bit syntax element that is present when WINDOWING_FLAG is equal to TRUE, and specifies the horizontal offset of the left boundary of the output image relative to the left edge of the extended image. When LEFT_MARGIN is not present, its value shall be inferred to be equal to 0. When OUTPUT_CLR_FMT is equal to YUV420 or YUV422, it is a requirement of codestream conformance to this Specification that the value of LEFT_MARGIN shall be an integer multiple of 2.

8.3.29 BOTTOM_MARGIN

BOTTOM_MARGIN is a 6-bit syntax element that is present when WINDOWING_FLAG is equal to TRUE, and specifies the vertical offset of the bottom of the output image relative to the bottom edge of the extended image. When BOTTOM_MARGIN is not present, its value shall be inferred as follows:

- If HEIGHT_MINUS1 + 1 is an integer multiple of 16, BOTTOM_MARGIN shall be inferred to be equal to 0.
- Otherwise, BOTTOM_MARGIN shall be inferred to be equal to $16 - ((\text{HEIGHT_MINUS1} + 1) \% 16)$.

When OUTPUT_CLR_FMT is equal to YUV420, it is a requirement of codestream conformance to this Specification that the value of BOTTOM_MARGIN shall be an integer multiple of 2.

8.3.30 RIGHT_MARGIN

RIGHT_MARGIN is a 6-bit syntax element that is present when WINDOWING_FLAG is equal to TRUE, and specifies the horizontal offset of the right boundary of the output image relative to the right edge of the extended image. When RIGHT_MARGIN is not present, its value shall be inferred as follows:

- If WIDTH_MINUS1 + 1 is an integer multiple of 16, RIGHT_MARGIN shall be inferred to be equal to 0.
- Otherwise, RIGHT_MARGIN shall be inferred to be equal to $16 - ((\text{WIDTH_MINUS1} + 1) \% 16)$.

When OUTPUT_CLR_FMT is equal to YUV420 or YUV422, it is a requirement of codestream conformance to this Specification that the value of RIGHT_MARGIN shall be an integer multiple of 2.

8.4 IMAGE_PLANE_HEADER()

8.4.1 Syntax structure

The IMAGE_PLANE_HEADER() syntax structure is specified in Table 27.

Table 27 – IMAGE_PLANE_HEADER() syntax structure

IMAGE_PLANE_HEADER() {	Descriptor	Reference
INTERNAL_CLR_FMT	u(3)	8.4.2

}		
}		
}		
while (!IS_BYTE_ALIGNED())		
BYTE_ALIGNMENT_BIT	u(1)	8.4.21
}		

8.4.2 INTERNAL_CLR_FMT

INTERNAL_CLR_FMT is a 3-bit syntax element that specifies the internal colour format of the coded image as specified in Table 28. For OUTPUT_BITDEPTH of BD16F and BD32F and OUTPUT_CLR_FMT of RGBE, only YUV444 shall be used. The values of INTERNAL_CLR_FMT and OUTPUT_CLR_FMT shall be constrained as specified in 9.10.

Table 28 – INTERNAL_CLR_FMT

INTERNAL_CLR_FMT	Mnemonic
0	YONLY
1	YUV420
2	YUV422
3	YUV444
4	YUVK
5	RESERVED
6	NCOMPONENT
7	RESERVED

When IsCurrPlaneAlphaFlag is equal to TRUE, the value of INTERNAL_CLR_FMT shall be equal to 0.

For the cases where INTERNAL_CLR_FMT is equal to YUV420, YUV422 or YUV444, there are three internal colour components: the component corresponding to index 0 is the Y component, and the U and V correspond to colour components 1 and 2, respectively. For YUVK, components 0, 1, 2, and 3 correspond to the Y, U, V, and K components, respectively.

8.4.3 SCALED_FLAG

SCALED_FLAG is a 1-bit syntax element that specifies whether scaling is performed in the output formatting stage. If SCALED_FLAG is equal to FALSE, scaling is not performed. If SCALED_FLAG is equal to TRUE, scaling is performed as specified in 9.10.6.

8.4.4 BANDS_PRESENT

BANDS_PRESENT is a 4-bit syntax element that indicates whether the various frequency bands are present in the codestream, as specified in Table 29.

Table 29 – BANDS_PRESENT

BANDS_PRESENT	Mnemonic	Interpretation
0	ALL	All sub-bands are present
1	NOFLEXBITS	Flexbits is not present
2	NOHIGHPASS	Flexbits and HP are not present
3	DONLY	Only DC is present
4-15	RESERVED	

The number of bands present in the codestream, NumBands, is specified by calling DetermineNumBands(), which is specified by the pseudocode in Table 30. When IsCurrPlaneAlphaFlag is equal to TRUE, it is a requirement of codestream conformance to this Specification that the value of NumBands shall be less than or equal to the value of NumBandsOfPrimary.

Table 30 – Pseudocode to determine the number of bands present in the codestream, NumBands

DetermineNumBands() {	Reference
if (BANDS_PRESENT == ALL)	
NumBands = 4	
else if (BANDS_PRESENT == NOFLEXBITS)	
NumBands = 3	
else if (BANDS_PRESENT == NOHIGHPASS)	
NumBands = 2	
else /* (BANDS_PRESENT == DONLY) */	
NumBands = 1	
if (IsCurrPlaneAlphaFlag == FALSE)	
NumBandsOfPrimary = NumBands	
}	

8.4.5 RESERVED_E_BIT

RESERVED_E_BIT is a 1-bit syntax element and is present when INTERNAL_CLR_FMT is equal to YUV422 or INTERNAL_CLR_FMT is equal to YUV420.

When RESERVED_E_BIT is present, its value shall be equal to 0. The value 1 for RESERVED_E_BIT is reserved.

The value of RESERVED_E_BIT shall be ignored by decoders.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_E_BIT is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.6 CHROMA_CENTERING_X

CHROMA_CENTERING_X is a 3-bit syntax element. It is present when INTERNAL_CLR_FMT is equal to YUV422 or YUV420. When CHROMA_CENTERING_X is not present, its value should be inferred to be equal to 0.

CHROMA_CENTERING_X indicates the positioning alignment of the chroma sampling grid with respect to the luma sampling grid. When present and in the range of 0 to 4, inclusive, CHROMA_CENTERING_X indicates that the left-most sample of each row of each chroma array of the image is considered to be horizontally positioned at the position CHROMA_CENTERING_X with respect to the left-most sample of each row of the luma array, in units of quarter luma sample positions. When present and equal to 7, CHROMA_CENTERING_X indicates that the positioning alignment is unknown or unspecified.

For example, when CHROMA_CENTERING_X is equal to 0 and INTERNAL_CLR_FMT is equal to YUV422 or YUV420, each chroma sample is considered to be horizontally located at the same position as the left-most sample of a pair of luma samples.

The value of CHROMA_CENTERING_X shall be equal to 0, 1, 2, 3, 4, or 7. The values 5 and 6 are reserved. Decoders conforming to this version of this Specification should treat the values 5 and 6 as equivalent to the value 7.

NOTE – CHROMA_CENTERING_X is useful to aid in performing appropriate upsampling conversion from 4:2:0 or 4:2:2 to 4:4:4. However, the use of CHROMA_CENTERING_X is not required for decoder conformance to this Specification, as the manner of performing such an upsampling process is outside the scope of this Specification.

8.4.7 RESERVED_F

RESERVED_F is a 4-bit syntax element that is present when INTERNAL_CLR_FMT is equal to YUV444.

When RESERVED_F is present, its value shall be equal to 0. Decoders shall ignore the value of this syntax element.

NOTE – The specification for decoders to ignore the value of RESERVED_F is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.8 RESERVED_G_BIT

RESERVED_G_BIT is a 1-bit syntax element that is present when INTERNAL_CLR_FMT is equal to YUV420.

When RESERVED_G_BIT is present, its value shall be equal to 0. The value 1 for RESERVED_G_BIT is reserved.

Decoders shall ignore the value of RESERVED_G_BIT.

NOTE – The specification for decoders to ignore the value of RESERVED_G_BIT is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.9 CHROMA_CENTERING_Y

CHROMA_CENTERING_Y is a 3-bit syntax element. It is present when INTERNAL_CLR_FMT is equal to YUV420. When CHROMA_CENTERING_Y is not present, its value should be inferred to be equal to 0.

CHROMA_CENTERING_Y indicates the positioning alignment of the chroma sampling grid with respect to the luma sampling grid. When present and in the range of 0 to 4, inclusive, CHROMA_CENTERING_Y indicates that the topmost sample of each column of each chroma array of the image is considered to be vertically positioned at the position CHROMA_CENTERING_Y with respect to the topmost sample of each column of the luma array, in units of quarter luma sample positions. When present and equal to 7, CHROMA_CENTERING_Y indicates that the positioning alignment is unknown or unspecified.

For example, when CHROMA_CENTERING_Y is equal to 0 and INTERNAL_CLR_FMT is equal to YUV420, each chroma sample is considered to be vertically located at the same position as the upper sample of a pair of luma samples.

The value of CHROMA_CENTERING_Y shall be equal to 0, 1, 2, 3, 4 or 7. The values 5 and 6 are reserved. Decoders conforming to this version of this Specification should treat the values 5 and 6 as equivalent to the value 7.

NOTE – CHROMA_CENTERING_Y is useful to aid in performing appropriate upsampling conversion from 4:2:0 to 4:2:2 or 4:4:4. However, the use of CHROMA_CENTERING_Y is not required for decoder conformance to this Specification, as the manner of performing such an upsampling process is outside the scope of this Specification.

8.4.10 RESERVED_H

RESERVED_H is a 4-bit syntax element that is present when INTERNAL_CLR_FMT is equal to one of YUV444, YUV422, or NCOMPONENT.

When RESERVED_H is present, its value shall be equal to 0. Decoders shall ignore the value of this syntax element.

NOTE – The specification for decoders to ignore the value of RESERVED_H is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.11 NUM_COMPONENTS_MINUS1

NUM_COMPONENTS_MINUS1 is a 4-bit syntax element that is present when INTERNAL_CLR_FMT is equal to NCOMPONENT.

The number of components, NumComponents, is specified in pseudocode in Table 31.

8.4.12 NUM_COMPONENTS_EXTENDED_MINUS16

NUM_COMPONENTS_EXTENDED_MINUS16 is a 12-bit syntax element that is present when NUM_COMPONENTS_MINUS1 is equal to 0xF.

The number of components, NumComponents, is specified in pseudocode in Table 31.

Table 31 – Pseudocode to determine the number of components present in the codestream

DetermineNumComponents() {	Reference
if (INTERNAL_CLR_FMT == NCOMPONENT)	
if (NUM_COMPONENTS_MINUS1 == 0xF)	
NumComponents = NUM_COMPONENTS_EXTENDED_MINUS16 + 16	
else	
NumComponents = NUM_COMPONENTS_MINUS1 + 1	
else if (INTERNAL_CLR_FMT == YONLY)	
NumComponents = 1	
else if (INTERNAL_CLR_FMT == YUV420 INTERNAL_CLR_FMT == YUV422 INTERNAL_CLR_FMT == YUV444)	
NumComponents = 3	
else if (INTERNAL_CLR_FMT == YUVK)	
NumComponents = 4	
}	

8.4.13 SHIFT_BITS

SHIFT_BITS is an 8-bit syntax element that is present when OUTPUT_BITDEPTH is equal to BD16, BD16S or BD32S. SHIFT_BITS is used to left-shift the sample values in the output formatting stage as specified in 9.10.7.

8.4.14 LEN_MANTISSA

LEN_MANTISSA is an 8-bit syntax element that is present when OUTPUT_BITDEPTH is equal to BD32F. It specifies the number of mantissa bits that are specified by the integer representation of floating point data as specified in 9.10.7 prior to output conversion processing.

8.4.15 EXP_BIAS

EXP_BIAS is an 8-bit syntax element that is present when OUTPUT_BITDEPTH is equal to BD32F. This element specifies the bias of the exponent in the representation of floating point data as specified in 9.10.7.

8.4.16 DC_IMAGE_PLANE_UNIFORM_FLAG

DC_IMAGE_PLANE_UNIFORM_FLAG is a 1-bit syntax element that specifies whether a single QP set is used for the DC band for all the macroblocks in the corresponding image plane. If DC_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, a single QP set is used for the DC band of all tiles in the image (and hence for all macroblocks of all tiles), and this QP set is present in the image plane header. In this case, the DC QP set used for all tiles shall be set equal to the value specified in the image plane header. If DC_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE, the DC band of each tile may use a different QP set, and these QP sets are specified in the tile headers.

8.4.17 RESERVED_I_BIT

RESERVED_I_BIT is a 1-bit syntax element. It is a requirement of codestream conformance to this Specification that the value of RESERVED_I_BIT shall be equal to FALSE. Decoders shall ignore (remove from the codestream and discard) the value of RESERVED_I_BIT.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_I_BIT is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.18 LP_IMAGE_PLANE_UNIFORM_FLAG

LP_IMAGE_PLANE_UNIFORM_FLAG is a 1-bit syntax element that specifies whether a single QP set is used for the LP band. If LP_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, a single QP set is used for the LP band of all tiles in the image (and hence for all macroblocks of all tiles), and this QP set is specified in the image plane header. In this case, the LP QP set for all tiles shall be set equal to the corresponding values specified in the image plane header. If LP_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE, the LP band of each tile may use a different QP set, and these QP sets are specified in the tile header.

8.4.19 RESERVED_J_BIT

RESERVED_J_BIT is a 1-bit syntax element. It is a requirement of codestream conformance to this Specification that the value of RESERVED_J_BIT shall be equal to FALSE. Decoders shall ignore (remove from the codestream and discard) the value of RESERVED_J_BIT.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_J_BIT is to enable the future definition of a backward-compatible usage of different values of this syntax element.

8.4.20 HP_IMAGE_PLANE_UNIFORM_FLAG

HP_IMAGE_PLANE_UNIFORM_FLAG is a 1-bit syntax element that specifies whether a single QP set is used for the HP band. If HP_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, a single QP set shall be used for the HP band of all tiles in the image (and hence for all macroblocks of all tiles), and this QP set is specified in the image plane header. In this case, the HP QP set for all tiles shall be set equal to the values specified in the image plane header. If HP_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE, multiple QP sets may be used for the HP bands of each colour component in each tile, and these QP sets are specified in the tile headers.

8.4.21 BYTE_ALIGNMENT_BIT

BYTE_ALIGNMENT_BIT is a 1-bit syntax element. When it is present, its value shall be equal to 0. The value 1 is reserved.

8.4.22 DC_QP()

8.4.22.1 Syntax structure

The DC_QP() syntax structure is specified in Table 32.

Table 32 – DC_QP() syntax structure

DC_QP() {	Descriptor	Reference
if (NumComponents != 1)		
COMPONENT_MODE	u(2)	8.4.22.2
if (COMPONENT_MODE == UNIFORM)		
DC_QUANT	u(8)	8.4.22.3
else if (COMPONENT_MODE == SEPARATE) {		
DC_QUANT_LUMA	u(8)	8.4.22.4
DC_QUANT_CHROMA	u(8)	8.4.22.5
} else if (COMPONENT_MODE == INDEPENDENT)		
for (i = 0; i < NumComponents; i++)		
DC_QUANT_CH[i]	u(8)	8.4.22.6
}		

NOTE – This function, DC_QP(), is called from two locations: IMAGE_PLANE_HEADER or TILE_HEADER_DC. Care should be taken to use the correct value of DC_QUANT_CH[] when quantization parameters vary on a per tile basis.

8.4.22.2 COMPONENT_MODE

COMPONENT_MODE is a 2-bit syntax element that is present if NumComponents > 1, and specifies whether the colour components use or do not use the same QP set across components as specified in subclauses 8.4.22, 8.4.23 and 8.4.24. If NumComponents == 1, the value of COMPONENT_MODE is inferred to be UNIFORM.

Table 33 – COMPONENT_MODE

Value	COMPONENT_MODE
0	UNIFORM
1	SEPARATE
2	INDEPENDENT
3	RESERVED

8.4.22.3 DC_QUANT

DC_QUANT is an 8-bit syntax element that is present if COMPONENT_MODE is equal to UNIFORM. In this case, the value of the DC QP for all the colour components shall be set to DC_QUANT.

8.4.22.4 DC_QUANT_LUMA

DC_QUANT_LUMA is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the DC QP for the luma component shall be set to DC_QUANT_LUMA.

8.4.22.5 DC_QUANT_CHROMA

DC_QUANT_CHROMA is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the DC QP for the chroma components shall be set to DC_QUANT_CHROMA.

8.4.22.6 DC_QUANT_CH[i]

DC_QUANT_CH[i] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to INDEPENDENT. In this case, the value of the DC QP for the i-th colour component shall be set to DC_QUANT_CH[i].

8.4.23 LP_QP()

8.4.23.1 Syntax structure

The LP_QP() syntax structure is specified in Table 34.

Table 34 – LP_QP() syntax structure

LP_QP() {	Descriptor	Reference
for (q = 0; q < NumLPQPs; q++) {		
if (NumComponents != 1)		
COMPONENT_MODE	u(2)	8.4.22.2
if (COMPONENT_MODE == UNIFORM)		
LP_QUANT[q]	u(8)	8.4.23.2
else if (COMPONENT_MODE == SEPARATE) {		
LP_QUANT_LUMA[q]	u(8)	8.4.23.3
LP_QUANT_CHROMA[q]	u(8)	8.4.23.4
} else if (COMPONENT_MODE == INDEPENDENT)		
for (i = 0; i < NumComponents; i++)		
LP_QUANT_CH[i][q]	u(8)	8.4.23.5
}		
}		

NOTE – This function, LP_QP(), is called from two locations: IMAGE_PLANE_HEADER or TILE_HEADER_LOWPASS. Care should be taken to use the correct value of LP_QUANT_CH[][] when quantization parameters vary on a per tile basis.

8.4.23.2 LP_QUANT[q]

LP_QUANT[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to UNIFORM. In this case, the value of the q-th LP QP for all the colour components shall be set to LP_QUANT[q].

8.4.23.3 LP_QUANT_LUMA[q]

LP_QUANT_LUMA[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the q-th LP QP for the luma component shall be set to LP_QUANT_LUMA[q].

8.4.23.4 LP_QUANT_CHROMA[q]

LP_QUANT_CHROMA[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the q-th LP QP for the chroma components shall be set to LP_QUANT_CHROMA[q].

8.4.23.5 LP_QUANT_CH[i][q]

LP_QUANT_CH[i][q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to INDEPENDENT. In this case, the value of the q-th LP QP for the i-th colour component shall be set to LP_QUANT_CH[i][q].

8.4.24 HP_QP()

8.4.24.1 Syntax structure

The HP_QP() syntax structure is specified in Table 35.

Table 35 – HP_QP() syntax structure

HP_QP() {	Descriptor	Reference
for (q = 0; q < NumHPQPs; q++) {		
if (NumComponents != 1)		
COMPONENT_MODE	u(2)	8.4.22.2
if (COMPONENT_MODE == UNIFORM)		
HP_QUANT[q]	u(8)	8.4.24.2
else if (COMPONENT_MODE == SEPARATE) {		
HP_QUANT_LUMA[q]	u(8)	8.4.24.3
HP_QUANT_CHROMA[q]	u(8)	8.4.24.4
} else if (COMPONENT_MODE == INDEPENDENT)		
for (i = 0; i < NumComponents; i++)		
HP_QUANT_CH[i][q]	u(8)	8.4.24.5
}		
}		

NOTE – This function, HP_QP(), is called from two locations: IMAGE_PLANE_HEADER or TILE_HEADER_HIGHPASS. Care should be taken to use the correct value of HP_QUANT_CH[][] when quantization parameters vary on a per tile basis.

8.4.24.2 HP_QUANT[q]

HP_QUANT[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to UNIFORM. In this case, the value of the q-th HP QP for all the colour components shall be set to HP_QUANT[q].

8.4.24.3 HP_QUANT_LUMA[q]

HP_QUANT_LUMA[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the q-th HP QP for the luma component shall be set to HP_QUANT_LUMA[q].

8.4.24.4 HP_QUANT_CHROMA[q]

HP_QUANT_CHROMA[q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to SEPARATE. In this case, the value of the q-th HP QP for the chroma components shall be set to HP_QUANT_CHROMA[q].

8.4.24.5 HP_QUANT_CH[i][q]

HP_QUANT_CH[i][q] is an 8-bit syntax element that is present if COMPONENT_MODE is equal to INDEPENDENT. In this case, the value of the q-th HP QP for the i-th colour component shall be set to HP_QUANT_CH[i][q].

8.5 INDEX_TABLE_TILES()

8.5.1 Syntax structure

The INDEX_TABLE_TILES() syntax structure is specified in Table 36.

Table 36 – INDEX_TABLE_TILES() syntax structure

INDEX_TABLE_TILES() {	Descriptor	Reference
if (FREQUENCY_MODE_CODESTREAM_FLAG == FALSE)		
valueNumIndexTableEntries = (NUM_HOR_TILES_MINUS1 + 1) * (NUM_VER_TILES_MINUS1 + 1)		
else /* FREQUENCY_MODE_CODESTREAM_FLAG == TRUE */		
valueNumIndexTableEntries = (NUM_HOR_TILES_MINUS1 + 1) * (NUM_VER_TILES_MINUS1 + 1) * NumBandsOfPrimary		
INDEX_TABLE_STARTCODE	u(16)	8.5.2
for (n = 0; n < valueNumIndexTableEntries; n++)		
IndexOffsetTile[n] = VLW_ESC()		8.5.3
}		

8.5.2 INDEX_TABLE_STARTCODE

INDEX_TABLE_STARTCODE is a 16-bit syntax element which indicates the start of the INDEX_TABLE_TILES(). This element shall have the value 0x0001. Other values of INDEX_TABLE_STARTCODE are reserved.

8.5.3 IndexOffsetTile[n]

IndexOffsetTile[n] is a variable that specifies the offset of the n-th tile packet from the start of the coded image data. The value of this variable is determined by a VLW_ESC() syntax structure.

The ordering of this information is as follows. Index offset elements corresponding to each tile shall be consecutively ordered in low-to-high order of the frequency, i.e., DC followed by lowpass, highpass, and flexbits. IndexOffsetTile entries are ordered in the raster scan order of the respective tiles, i.e. left-to-right for the top row of the tile, followed by left-to-right for the next row, and so on through to the bottom row of the tile.

For spatial mode codestreams, only one IndexOffsetTile is sent per tile. For images with missing sub-bands (such as when BANDS_PRESENT is not equal to ALL), Index Offset elements are sent only for the sub-bands that are present. An example of this syntax element for an image with four spatial tiles and two frequency bands (DC and LP, i.e. BANDS_PRESENT is equal to NOHIGHPASS) is specified below. Here, pDCTile[n] and pLPTile[n] are the index offset elements of the DC and LP bands of tile n:

pDCTile[0] pLPTile[0] pDCTile[1] pLPTile[1] pDCTile[2] pLPTile[2] pDCTile[3] pLPTile[3]

When the number of tile packets is 1, the index offset of the only packet is 0.

8.6 PROFILE_LEVEL_INFO()

8.6.1 Syntax structure

The PROFILE_LEVEL_INFO() syntax structure is specified in Table 37.

Table 37 – PROFILE_LEVEL_INFO() syntax structure

PROFILE_LEVEL_INFO() {	Descriptor	Reference
numBytes = 0		
for (iLast = 0; iLast == 0; iLast = LAST_FLAG) {		
PROFILE_IDC	u(8)	8.6.2
LEVEL_IDC	u(8)	8.6.3
RESERVED_L	u(15)	8.6.4
LAST_FLAG	u(1)	8.6.5
numBytes += 4		
}		
return numBytes		
}		

8.6.2 PROFILE_IDC

PROFILE_IDC (when present) is an 8-bit syntax element. When present, the values of PROFILE_IDC and LEVEL_IDC indicate a set of profile and level constraints as specified in Annex B.

8.6.3 LEVEL_IDC

LEVEL_IDC (when present) is an 8-bit syntax element. When present, the values of PROFILE_IDC and LEVEL_IDC indicate a set of profile and level constraints as specified in Annex B.

8.6.4 RESERVED_L

RESERVED_L is a 15-bit syntax element. When present, the value of RESERVED_L shall be equal to 0. Other values are reserved. Decoders shall ignore the value of this syntax element.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_L is to enable the future definition of a backward-compatible usage of different values of this syntax element.

No particular combination of PROFILE_IDC, LEVEL_IDC, and RESERVED_L shall appear more than once in the PROFILE_LEVEL_INFO() syntax structure.

8.6.5 LAST_FLAG

LAST_FLAG (when present) is a 1-bit syntax element. It indicates whether the preceding PROFILE_IDC, LEVEL_IDC, and RESERVED_L syntax elements are the last such syntax elements in the PROFILE_LEVEL_INFO() syntax structure.

8.7 CODED_TILES()

8.7.1 Syntax structure

The CODED_TILES() syntax structure is specified in Table 38.

Table 38 – CODED_TILES() syntax structure

CODED_TILES() {	Descriptor	Reference
if (FREQUENCY_MODE_CODESTREAM_FLAG == FALSE)

while (!IS_BYTE_ALIGNED())		
BYTE_ALIGNMENT_BIT	u(1)	8.4.21
}		

8.7.10 Tile-level semantics

8.7.10.1 TILE_STARTCODE

TILE_STARTCODE is a 24-bit syntax element that is present at the beginning of tile-level syntax structures. The value of TILE_STARTCODE shall be equal to 0x000001.

NOTE 1 – Decoders should check the value of TILE_STARTCODE to ensure that it has the correct value. If some value other than 0x000001 is detected, decoders should infer the presence of an error condition. It is suggested that the subsequent data for any tiles that begin with an incorrect value of TILE_STARTCODE should be discarded. When such an error condition is detected and the tile is not a flexbits tile-packet, it is suggested for the decoder to infer zero values for the transform coefficients in such a packet. When such an error condition is detected and the tile is a flexbits tile-packet, it is suggested for the decoder to infer zero values for all flexbits of such a tile-packet. Alternative approaches to handling such conditions may be preferable in some uses.

NOTE 2 – There is no guarantee that a byte-aligned 24-bit pattern evaluating to 0x000001 will not occur at any other location in the codestream. Therefore, TILE_STARTCODE can only be used to reconfirm the start of a tile in conjunction with the index table entries and not as a guaranteed indicator of the start of a tile.

8.7.10.2 ARBITRARY_BYTE

ARBITRARY_BYTE is an 8-bit syntax element. This syntax element may have any value. The value of this syntax element shall be ignored by the decoder.

8.7.10.3 TRIM_FLEXBITS

TRIM_FLEXBITS is a 4-bit syntax element that is present if TRIM_FLEXBITS_FLAG is equal to TRUE. Otherwise, TRIM_FLEXBITS shall be inferred to be equal to 0.

NOTE – The number of bits per transform coefficient that are present in the flexbits tile-packet is specified by the value of (ModelBitsMBHP[MBx][MBy][i] – TRIM_FLEXBITS) as specified in 8.7.18.3 and 8.7.19.1.

8.7.10.4 USE_DC_QP_FLAG

USE_DC_QP_FLAG is a 1-bit syntax element which specifies whether the LP band uses the same QP set as the DC band. If USE_DC_QP_FLAG is equal to TRUE, the values of the LP QP set are set to those of the DC band QP set; otherwise, the values of the LP QP set are explicitly specified in the codestream. When USE_DC_QP_FLAG is not present, its value shall be inferred to be equal to FALSE.

8.7.10.5 NUM_LP_QPS_MINUS1

NUM_LP_QPS_MINUS1 is a 4-bit syntax element that is present if LP_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE. This syntax element specifies the number of LP band QPs, per colour component in each tile, minus 1.

8.7.10.6 USE_LP_QP_FLAG

USE_LP_QP_FLAG is a 1-bit syntax element that specifies whether the HP band uses the same QP sets as the LP band. If USE_LP_QP_FLAG is equal to TRUE, the values of the HP QP sets are set to those of the LP band QP sets; otherwise, the values of the HP QP sets are explicitly specified in the codestream. When USE_LP_QP_FLAG is not present, its value shall be inferred to be equal to FALSE.

8.7.10.7 NUM_HP_QPS_MINUS1

NUM_HP_QPS_MINUS1 is a 4-bit syntax element that is present if HP_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE. This syntax element specifies the number of HP band QPs, per colour component in each tile, minus 1.

8.7.10.8 LP_QP_INDEX[n]

LP_QP_INDEX[n] is a variable-length syntax element that is present when BANDS_PRESENT is not equal to DONLY, NumLPQPs is greater than 1, and USE_DC_QP_FLAG is equal to FALSE. It specifies the QP index used for the LP band of the n-th macroblock, in raster scan order, of the tile. The LP band QP for each colour component shall be derived from the q-th QP set when LP_QP_INDEX[n] takes the value q. The LP QP index is parsed using the syntax structure DECODE_QP_INDEX(). When LP_QP_INDEX[n] is not present, its value shall be inferred to be equal to 0.

8.7.10.9 HP_QP_INDEX[n]

HP_QP_INDEX[n] is a variable-length syntax element that is present when BANDS_PRESENT is not equal to DONLY or NOHIGHPASS, NumHPQPs is greater than 1, and USE_LP_QP_FLAG is equal to FALSE. It specifies the QP index for the HP band of the n-th macroblock, in raster scan order, of the tile. The HP band QP for each colour component shall be derived from the q-th QP set when HP_QP_INDEX[n] takes the value q. The HP QP index is parsed using the syntax structure DECODE_QP_INDEX(). When HP_QP_INDEX[n] is not present, its value shall be inferred as follows:

- If USE_LP_QP_FLAG is equal to TRUE, HP_QP_INDEX[n] shall be inferred to be equal to LP_QP_INDEX[n].
- Otherwise, HP_QP_INDEX[n] shall be inferred to be equal to 0.

8.7.10.10 DECODE_QP_INDEX()

DECODE_QP_INDEX() is called when there is a table of quantization parameters associated with either the LP or HP band. When called, DECODE_QP_INDEX() returns the index into this table, that represents the quantization parameter to be used. This syntax structure takes the parameter iNumQP, which specifies the size of the relevant quantization parameter table.

The syntax structure DECODE_QP_INDEX() is specified in Table 47.

Table 47 – DECODE_QP_INDEX() syntax structure

DECODE_QP_INDEX(iNumQP) {	Descriptor	Reference
iBitsQPIndex[] = {0, 0, 1, 1, 2, 2, 3, 3, 3, 3, 4, 4, 4, 4, 4, 4}		
iBits = iBitsQPIndex[iNumQP]		
IS_QPINDEX_NONZERO_FLAG	u(1)	8.7.10.11
if (IS_QPINDEX_NONZERO_FLAG == FALSE)		
iQPIndex = 0		
else { /* iBits > 0 as iNumQP > 1 */		
QPINDEX_REF	u(iBits)	8.7.10.12
iQPIndex = QPINDEX_REF + 1		
}		
return iQPIndex		
}		

8.7.10.11 IS_QPINDEX_NONZERO_FLAG

IS_QPINDEX_NONZERO_FLAG is a 1-bit syntax element. If IS_QPINDEX_NONZERO_FLAG is equal to TRUE, the QP index is derived from the syntax element QPINDEX_REF. Otherwise, the QP index is set to 0.

8.7.10.12 QPINDEX_REF

QPINDEX_REF is a syntax element that specifies the QP index when IS_QPINDEX_NONZERO_FLAG is equal to TRUE. The value of QPINDEX_REF shall be in the range of 0 to iNumQP-2. All other values are reserved.

8.7.11 MB_DC()

The MB_DC() syntax structure is specified in Table 48.

Table 48 – MB_DC() syntax structure

MB_DC() {	Descriptor	Reference

8.7.14 Macroblock DC() semantics

8.7.14.1 IS_DC_CH_FLAG

IS_DC_CH_FLAG is a 1-bit syntax element that is present if INTERNAL_CLR_FMT is one of YONLY, YUVK or NCOMPONENT. If IS_DC_CH_FLAG is equal to TRUE, the variable-length coded part of the DC coefficient of the corresponding colour component is specified in the codestream. If IS_DC_CH_FLAG is equal to FALSE, the variable-length coded part of the DC coefficient of the corresponding colour component is equal to 0.

8.7.14.2 VAL_DC_YUV

VAL_DC_YUV is a variable-length syntax element that is present if INTERNAL_CLR_FMT is not one of YONLY, YUVK or NCOMPONENT. The value of VAL_DC_YUV is a 3-bit number, which jointly specifies the zero/non-zero status of the DC coefficients of the Y, U and V, respectively (i.e., (VAL_DC_YUV & 4) specifies the Y, (VAL_DC_YUV & 2) specifies the U, and (VAL_DC_YUV & 1) specifies the V). The code table used in parsing VAL_DC_YUV is specified in Table 51.

Table 51 – Code table for VAL_DC_YUV

Code	Value
10	0
001	1
0000 1	2
0001	3
11	4
010	5
0000 0	6
011	7

8.7.14.3 DC_REF

DC_REF is a syntax element which specifies the FLC refinement in the DC value. The number of bits, iModelBits, needed to specify DC_REF is computed as specified in 8.7.12.

8.7.14.4 SIGN_FLAG

SIGN_FLAG is a 1-bit syntax element which specifies the sign of a coefficient. If SIGN_FLAG is equal to TRUE, the coefficient is negative. Otherwise, the coefficient is positive.

8.7.14.5 ABS_LEVEL_INDEX

ABS_LEVEL_INDEX is a variable-length syntax element that has a value in the range of 0 to 6, inclusive. This syntax element is used in the computation of the VLC-coded part of the transform coefficient. The VLC-coded part of a transform coefficient is parsed in two stages: the initial level value and the VLC refinement. If ABS_LEVEL_INDEX is less than 6, the initial level and the number of bits required to specify the VLC refinement are specified by this syntax element. If ABS_LEVEL_INDEX is equal to 6, further syntax elements are parsed to determine the initial level value and the number of bits required to specify the VLC refinement, as specified in 8.7.13.

The coding of this syntax element uses one of two tables, adaptively determined as specified by the parsing process (see 8.8). The two code tables are specified in Table 52.

Table 52 – Code table for ABS_LEVEL_INDEX

Code 0	Code 1	Value
01	1	0
10	01	1
11	001	2
001	0001	3
0001	00001	4
00000	000000	5
00001	000001	6

8.7.14.6 LEVEL_REF

LEVEL_REF is a syntax element which specifies the VLC refinement. The number of bits, iFixed, needed to specify this syntax element is computed as specified in 8.7.13 from ABS_LEVEL_INDEX if ABS_LEVEL_INDEX is less than 6 or from FIXED_NUM, FIXED_NUM_EXT and FIXED_NUM_EXT2 if ABS_LEVEL_INDEX is greater than or equal to 6.

8.7.14.7 FIXED_NUM

FIXED_NUM is a 4-bit syntax element that is present if ABS_LEVEL_INDEX is equal to 6. It specifies the number of bits needed to specify the initial level value.

8.7.14.8 FIXED_NUM_EXT

FIXED_NUM_EXT is a 2-bit syntax element that is present if FIXED_NUM is equal to 15. It specifies the number of extension bits needed to specify the initial level value.

8.7.14.9 FIXED_NUM_EXT2

FIXED_NUM_EXT2 is a 3-bit syntax element that is present if FIXED_NUM is equal to 15 and FIXED_NUM_EXT is equal to 3. It specifies the number of additional extension bits needed to specify the initial level value.

8.7.15 Macroblock lowpass

8.7.16 General

This subclause specifies the derivation of the LP coefficients of the blocks in a macroblock. The presence of non-zero entropy coded LP coefficients, i.e. coded block pattern lowpass, in a macroblock is represented by the variable iCBPLP as computed, as specified in Table 53, from the syntax elements CBPLP_YUV1 or CBPLP_YUV2 or CBPLP_CH_BIT.

If INTERNAL_CLR_FMT is not equal to YUV420 or YUV422, the coded block status of the n-th colour component is specified by $((iCBPLP \gg n) \& 1)$. If INTERNAL_CLR_FMT is equal to YUV420 or YUV422, the coded block status of the luma component is specified by $(iCBPLP \& 1)$. If the coded block status bit of a component is non-zero, there can be up to 15 non-zero LP coefficients associated with that component. These coefficients are parsed by invoking the process DECODE_BLOCK() specified in 8.7.18.5, and the inverse scanning order is determined by invoking the process AdaptiveLPScan().

If INTERNAL_CLR_FMT is equal to YUV420 or YUV422, the coded block status of the U and V component is jointly specified by $((iCBPLP \gg 1) \& 1)$. If the coded block status bit is non-zero, the LP coefficients of U and V are parsed jointly by invoking the process DECODE_BLOCK() specified in 8.7.18.5. The U and V coefficients are interleaved, and a fixed inverse scanning order (specified by iRemapArr and iRemapOffset) is used. If INTERNAL_CLR_FMT is equal to YUV420, there can be up to 3 U and 3 V coefficients and the inverse scanning order is U[1], V[1], U[2], V[2], U[3], V[3]. If INTERNAL_CLR_FMT is equal to YUV422, there can be up to 7 U and 7 V coefficients and the inverse scanning order is U[4], V[4], U[1], V[1], U[2], V[2], U[3], V[3], U[5], V[5], U[6], V[6].

The value of the LP coefficients is refined by invoking the process REFINE_LP(), and this process is invoked irrespective of the value of iCBPLP.

8.7.16.1 MB_LP()

The MB_LP() syntax structure is specified in Table 53.

Table 53 – MB_LP() syntax structure

MB_LP() {	Descriptor	Reference

8.7.16.3 MB_LP() and REFINE_LP() semantics

8.7.16.3.1 CBPLP_YUV1

CBPLP_YUV1 is a syntax element that is present if INTERNAL_CLR_FMT is one of YUV420, YUV422 or YUV444, and also CountZeroCBPLP is less than or equal to 0 or CountMaxCBPLP is less than 0; it jointly specifies the coded block pattern lowpass of the Y, U and V colour components as follows:

- if INTERNAL_CLR_FMT is YUV444, the parsing of CBPLP_YUV1 is specified in Table 55:
- if INTERNAL_CLR_FMT is YUV420 or YUV422, the parsing of CBPLP_YUV1 is specified in Table 56.

NOTE – If (CountZeroCBPLP > 0 && CountMaxCBPLP >= 0), the coded block pattern lowpass band is computed as specified in 8.7.16.1.

Table 55 – Code table for CBPLP_YUV1 when INTERNAL_CLR_FMT is equal to YUV444

Code	Value
0	0
100	1
1010	2
1011	3
1100	4
1101	5
1110	6
1111	7

Code	Value
0	0
10	1
110	2
111	3

8.7.16.3.2 CBPLP_YUV2

CBPLP_YUV2 is a syntax element that is present when INTERNAL_CLR_FMT is equal to YUV420, YUV422 or YUV444, and CountZeroCBPLP is greater than 0 and CountMaxCBPLP is greater than or equal to 0. The number of bits required to specify this syntax element is specified by iFullPlanes.

8.7.16.3.3 CBPLP_CH_BIT

CBPLP_CH_BIT is a 1-bit syntax element that is present for each colour component in an image when INTERNAL_CLR_FMT is not one of YUV422, YUV420 or YUV444. It specifies the coded block pattern lowpass of the corresponding colour component. If CBPLP_CH_BIT is equal to 0, all the coefficients in the LP band for this macroblock of the corresponding colour component are set to the value 0. If CBPLP_CH_BIT is equal to 1, the LP band for this macroblock of the corresponding component is non-zero.

8.7.16.3.4 COEFF_REF

COEFF_REF is a syntax element that refines the value of LP coefficients. The number of bits used to parse this syntax element is specified by iModelBits.

8.7.17 Coded block pattern highpass (CBPHP)

8.7.17.1 General

The CBPHP derivation process is hierarchical, and proceeds as follows.

First step: the syntax element NUM_CBPHP and REFINE_CBPHP() process specify the residual CBPHP status of block groups where each block group consists of multiple blocks as specified in the following.

If INTERNAL_CLR_FMT is equal to YUV444, YUV422 or YUV420, there is a NUM_CBPHP syntax element for each macroblock and each block group consists of 2×2 group of luma blocks, and the co-located chroma blocks. For each 2×2 group of luma block, the co-located chroma blocks consists of: a) 2×2 group of U blocks and 2×2 group of V blocks for YUV444, b) 2×1 group of U blocks and 2×1 group of V blocks for YUV422; and c) 1 U block and 1 V block for YUV420. Thus, there are 4 block groups in each macroblock. NUM_CBPHP takes a value between 0 and 4 and specifies the number of block groups where CBPHP residual values are non-zero, i.e. block groups that have CBPHP status that differ from their predicted values. The REFINE_CBPHP() process is invoked to determine which of the block groups has non-zero residual CBPHP values.

If INTERNAL_CLR_FMT is equal to YONLY, YUVK or NCOMPONENT, there is a NUM_CBPHP syntax for each colour component in that macroblock, and each block group consists of 2×2 groups of blocks in that colour component. Thus, there are 4 block groups for each colour component. NUM_CBPHP takes a value between 0 and 4 and specifies the number of block groups (in that colour component) where CBPHP residual values are non-zero, and the REFINE_CBPHP() process is invoked to determine which of the block groups has non-zero residual CBPHP values.

Second step: If the residual CBPHP status of a block group is equal to 0, the residual CBPHP of all the blocks in the group is inferred to be equal to 0. If the residual CBPHP status of a given block group is non-zero, the NUM_BLKCBPHP and subsequent syntax elements are used to indicate the residual CBPHP of specific blocks in that block group as summarized in the following.

If INTERNAL_CLR_FMT is equal to YUV444, YUV422 or YUV420, there is a NUM_BLKCBPHP syntax element for each block group with non-zero residual CBPHP status. NUM_BLKCBPHP takes a value between 0 and 8. If NUM_BLKCBPHP plus 1 is less than 6, it indicates that the residual CBPHP of all the chroma blocks in the block group are equal to 0. The luma blocks that have non-zero residual CBPHP are indicated by the value of NUM_BLKCBPHP and CODE_INC. If NUM_BLKCBPHP plus 1 is greater than or equal to 6, the residual CBPHP of at least some chroma blocks in this block group are non-zero, and the syntax elements CHR_CBPHP is parsed to specify if a) the U or b) V or c) both U and V, colour components have blocks with non-zero residual CBPHP. In this case, the luma blocks that have non-zero residual CBPHP are indicated by the value of NUM_BLKCBPHP, VAL_INC and CODE_INC.

If INTERNAL_CLR_FMT is equal to YUV444 or YUV422, the chroma component with non-zero residual CBPHP has multiple blocks. If INTERNAL_CLR_FMT is equal to YUV444, the syntax element NUM_CH_BLK and the process REFINE_CBPHP() specify the chroma blocks that have non-zero residual CBPHP. If INTERNAL_CLR_FMT is equal to YUV422, the syntax element CBPHP_CH_BLK specifies the chroma blocks that have non-zero residual CBPHP.

If INTERNAL_CLR_FMT is equal to YONLY, YUVK or NCOMPONENT, there is a NUM_BLKCBPHP syntax element for each block group (in each colour component) where residual CBPHP status is non-zero. NUM_BLKCBPHP takes a value between 0 and 4. The blocks in this block group that have non-zero residual CBPHP are indicated by the value of NUM_BLKCBPHP and CODE_INC.

Third step: On the completion of the second step for all block groups in a macroblock, the residual CBPHP values for all the blocks in colour component *i* are stored in the corresponding *iDiffCBPHP[i]* variable. These values are stored in a hierarchical raster scan order, where each consecutive nibble of 4 bits corresponds to one 2×2 block group. Within each nibble, the blocks of a block group are in raster scan order, and 2×2 block groups in a macroblock are also in raster scan order. If INTERNAL_CLR_FMT is equal to YUV422 or YUV420), the hierarchical scan order for the chroma components is identical to the normal scan order.

The PredCBPHP() process is invoked to compute the actual CBPHP values from the residual CBPHP values. The value of ((MBCBPHP[MBx][MBy][i] >> j) & 1) specifies the coded block status of the *j*-th block (in the same hierarchical raster scan order as *iDiffCBPHP*) associated with the *i*-th colour component in the macroblock indexed by MBx and MBy.

8.7.17.2 MB_CBPHP()

The MB_CBPHP() syntax structure is specified in Table 57.

Table 57 – MB_CBPHP() syntax structure

8.7.17.4 MB_CBPHP() and REFINE_CBPHP() semantics

8.7.17.4.1 NUM_CBPHP

NUM_CBPHP is a variable syntax element that specifies the number of block groups where CBPHP residual values CBPHP status differs from their predicted values as specified in 8.7.17.1. NUM_CBPHP is parsed using one of two VLC tables specified in Table 59. The adaptive VLC structure used to parse NUM_CBPHP is initialized to the VLC table corresponding to Code 0 as specified in 8.8.3.4, and the structure is updated as specified in 8.8.4.

Table 59 – Code table for NUM_CBPHP()

Code 0	Code 1	Value
1	1	0
01	000	1
001	001	2
0000	010	3
0001	011	4

8.7.17.4.2 NUM_BLKCBPHP

NUM_BLKCBPHP is a variable-length syntax element that specifies the CBPHP status of each block group where residual CBPHP status is non-zero as specified in 8.7.17.1. If INTERNAL_CLR_FMT is equal to YUVK, NCOMPONENT or YONLY, NUM_BLKCBPHP is coded using one of the two VLC tables specified in Table 60. Otherwise, NUM_BLKCBPHP is parsed using one of the two VLC tables specified in Table 61. The adaptive VLC structure used to parse NUM_BLKCBPHP is initialized to the VLC table corresponding to Code 0 as specified in 8.8.3.4, and the structure is updated as specified in 8.8.4.

**Table 60 – Code table for NUM_BLKCBPHP
if INTERNAL_CLR_FMT is one of {YUVK, NCOMPONENT, YONLY}**

Code 0	Code 1	Value
1	1	0
01	000	1
001	001	2
0000	010	3
0001	011	4

**Table 61 – Code table for NUM_BLKCBPHP
if INTERNAL_CLR_FMT is not one of {YUVK, NCOMPONENT, YONLY}**

Code 0	Code 1	Value
010	1	0
00000	001	1
0010	010	2
00001	0001	3
00010	000001	4
1	011	5
011	00001	6
00011	0000000	7
0011	0000001	8

8.7.17.4.3 CHR_CBPHP

CHR_CBPHP is a syntax element that specifies the chroma components have non-zero CBPHP in a block group as specified in 8.7.17.1. The VLC used to parse CHR_CBPHP is specified in Table 62.

Table 62 – Code table for CHR_CBPHP, VAL_INC, and CBPHP_CH_BLK

Code	Value
1	0
01	1
00	2

NOTE – Non-zero residual CBPHP in: a) U component blocks are indicated by CHR_CBPHP = 0; b) V component blocks are indicated by CHR_CBPHP = 1; and c) both U and V component blocks are indicated by CHR_CBPHP = 2.

8.7.17.4.4 VAL_INC

VAL_INC is a syntax element that refines the CBPHP of a block group as specified in 8.7.17.1 when NUM_BLKCBPHP plus 1 is greater than or equal to 9. The VLC that specifies the parsing of VAL_INC is specified in Table 62.

8.7.17.4.5 CODE_INC

CODE_INC is a syntax element that specifies the location of coded blocks in a block group as specified in 8.7.17.1. The size of this syntax element is specified by iFLC[iVal], where iFLC[] and iVal are specified in 8.7.17.2.

8.7.17.4.6 NUM_CH_BLK

When INTERNAL_CLR_FMT is equal to YUV444, NUM_CH_BLK is a syntax element that specifies the number of coded chroma blocks in a 2×2 block group as specified in 8.7.17.1. The VLC that specifies the parsing of NUM_CH_BLK is specified in Table 63.

Table 63 – Code table for NUM_CH_BLK

Code	Value
1	0
01	1
000	2
001	3

8.7.17.4.7 CBPHP_CH_BLK

When INTERNAL_CLR_FMT is equal to YUV422, CBPHP_CH_BLK is a syntax element that refines the chroma CBPHP for a block group as specified in 8.7.17.1. The VLC that specifies the parsing of CBPHP_CH_BLK is specified in Table 62.

8.7.17.4.8 REF_CBPHP1

REF_CBPHP1 is a variable size syntax element that refines the CBPHP of a block group as specified in 8.7.17.1. The VLC that specifies the parsing of REF_CBPHP1 is specified in Table 64.

Table 64 – Code table for REF_CBPHP1

Code	Value
00	3
01	5
100	6
101	9
110	10
111	12

8.7.17.4.9 REF_CBPHP

REF_CBPHP is a 2-bit syntax element that refines the CBPHP of a block group as specified in 8.7.17.1.

8.7.17.5 CBPHP prediction

The CBPHP of neighbouring blocks is used to predict the CBPHP of current block as specified in 8.7.17.5.1. The prediction of CBPHP in each component is performed independently. The prediction of CBPHP for the U and V components in the YUV422 case is specified in 8.7.17.5.3. The prediction of CBPHP for the U and V components in the YUV420 is specified in 8.7.17.5.4. In all other cases, the prediction of CBPHP is specified in 8.7.17.5.2. After the CBPHP of the current block is reconstructed, the CBPHP prediction model is updated as specified in 8.10.2.

8.7.17.5.1 PredCBPHP()

The pseudocode for the function PredCBPHP() is specified in Table 65.

Table 65 – Pseudocode for the function PredCBPHP()

PredCBPHP(iDiffCBPHP[]) {	Reference
bInitializeContext = (IsMBLeftEdgeOfTileFlag && IsMBTopEdgeOfTileFlag)

8.7.18 Macroblock highpass

8.7.18.1 General

The presence of non-zero HP coefficients in the j-th block in the colour component is specified by $((MBCBPHP[MBx][MBy][i] \gg j) \& 1)$, where the blocks are scanned in the hierarchical raster scan order specified in 8.7.17.1. If there are non-zero coefficients in a block, these coefficients are parsed by invoking the process DECODE_BLOCK_ADAPTIVE(), specified in 8.7.18.4, which in turn invokes the process DECODE_BLOCK() specified in 8.7.18.5 for parsing the coefficients and invokes the process AdaptiveHPScan() to determine the inverse scanning order of the coefficients.

8.7.18.2 MB_HP()

The MB_HP() syntax structure is specified in Table 69.

Table 69 – MB_HP () syntax structure

}		

8.7.18.9 Block-level semantics

8.7.18.9.1 RUN_VALUE

RUN_VALUE is a variable-length syntax element that is present when iMaxRun is greater than 1 and iMaxRun is less than 5. It specifies the value of run. If iMaxRun is equal to 2, the parsing of RUN_VALUE is specified in Table 76. Otherwise, if iMaxRun is equal to 3, the parsing of RUN_VALUE is specified in Table 77. Otherwise, (if iMaxRun is equal to 4), the parsing of RUN_VALUE is specified in Table 78.

Table 76 – Code table of RUN_VALUE if iMaxRun == 2

Code	Value
1	1
0	2

Table 77 – Code table of RUN_VALUE if iMaxRun = = 3

Code	Value
1	1

1	1
01	2
001	3
000	4

8.7.18.9.2 RUN_INDEX

RUN_INDEX is a variable-length syntax element that is present when iMaxRun is greater than or equal to 5. It specifies the value of iRun in 8.7.18.6. The parsing of RUN_INDEX is specified in Table 79.

Table 79 – Code table of RUN_INDEX

Code	Value
1	0
01	1
001	2
0000	3
0001	4

8.7.18.9.3 RUN_REF

RUN_REF is a fixed-length syntax element that specifies the value of iRun in 8.7.18.6. The presence and size of the RUN_REF syntax element is indicated by iFixed, as specified in 8.7.18.6.

8.7.18.9.4 INDEX_A

INDEX_A is a variable-length syntax element that is present when iLocation is less than 15. It has a value in the range of 0 to 5, inclusive. The coding of this symbol uses one of four tables. The choice of table is adaptively determined as specified in 8.8.4. The VLC tables are specified in Table 80.

Table 80 – Code table for INDEX_A

Code 0	Code 1	Code 2	Code 3	Value
1	01	0000	0 0000	0
0 0000	0000	0001	0 0001	1
001	10	01	01	2
0 0001	0001	10	1	3
01	11	11	0001	4
0001	001	001	001	5

INDEX_A jointly codes the following two events.

- The binary event of whether the magnitude of the next non-zero coefficient is equal to 1 or greater than 1 as follows.
 - If (INDEX_A & 1) is equal to 0, this magnitude is equal to 1.
 - Otherwise, this magnitude is greater than 1.
- The ternary of event whether this coefficient is the last coefficient in the block, and if there are more non-zero coefficients, whether the run before the next non-zero coefficient is zero or non-zero, as follows.

- If (INDEX_A >> 1) is equal to 0, this coefficient is the last coefficient in the block.
- Otherwise, if (INDEX_A >> 1) is equal to 1, the run before the next non-zero coefficient is zero.
- Otherwise (i.e. when (INDEX_A >> 1) is equal to 2), the run before the next non-zero coefficient is non-zero.

NOTE – Thus INDEX_A has an alphabet size of $2^3=6$.

8.7.18.9.5 INDEX_B

INDEX_B is a variable-length syntax element that is present when iLocation is equal to 15. It has a value in the range of 0 to 3, inclusive. The VLC table is specified in Table 81.

Table 81 – Code table for INDEX_B

Code	Value
0	0
10	2
110	1
111	3

INDEX_B jointly codes the following two events.

- The binary event of whether the magnitude of the next non-zero coefficient is equal to 1 or greater than 1 as follows.
 - If (INDEX_B & 1) is equal to 0, this magnitude is equal to 1.
 - Otherwise, this magnitude is greater than 1.
- The binary event of whether this coefficient is the last coefficient in the block or if there are more non-zero coefficients, as follows.
 - If (INDEX_B >> 1) is equal to 0, this coefficient is the last coefficient in the block.
 - Otherwise, the run before the next non-zero coefficient is zero.

NOTE – Thus INDEX_B has an alphabet size of $2^2=4$.

8.7.18.9.6 INDEX_C_FLAG

INDEX_C_FLAG is a 1-bit syntax element that is present when iLocation is equal to 16. It specifies the presence of subsequent run/level symbols.

8.7.18.9.7 FIRST_INDEX

FIRST_INDEX is a variable-length syntax element that has a value in the range of 0 to 11, inclusive. The coding of this syntax element uses one of five tables. The choice of table is adaptively determined as specified in 8.8.4. The VLC tables are specified in Table 82.

Table 82 – Code table for FIRST_INDEX

Code 0	Code 1	Code 2	Code 3	Code 4	Value
0000 1	0010	11	001	010	0
0000 01	0001 0	001	11	1	1
0000 000	0000 00	0000 000	0000 000	0000 001	2
0000 001	0000 01	0000 001	0000 1	0001	3
0010 0	0011	0000 1	0001 0	0000 010	4
010	010	010	010	011	5
0010 1	0001 1	0000 010	0000 001	0000 0000	6
1	11	011	011	0010	7
0011 0	011	100	0001 1	0000 011	8
0001	100	101	100	0011	9
0011 1	0000 1	0000 011	0000 01	0000 0001	10
011	101	0001	101	0000 1	11

FIRST_INDEX jointly codes the following three events.

- The binary event of whether the run before the first non-zero coefficient is non-zero or zero as follows.

- If (FIRST_INDEX & 1) is equal to 0, this run is non-zero.
 - Otherwise this run is zero.
- The binary event of whether the magnitude of the first non-zero coefficient is equal to 1 or greater than 1 as follows.
- If (FIRST_INDEX & 2) is equal to 0, this magnitude is equal to 1.
 - Otherwise, this magnitude is greater than 1.
- The ternary event of whether the first coefficient is the last coefficient in the block, and if there are more non-zero coefficients whether the run before the next non-zero coefficient is zero or non-zero, as follows.
- If (FIRST_INDEX >> 2) is equal to 0, the first coefficient is the last coefficient in the block.
 - Otherwise, if (FIRST_INDEX >> 2) is equal to 1, the run before the next non-zero coefficient is zero.
 - Otherwise ((FIRST_INDEX >> 2) is equal to 2), the run before the next non-zero coefficient is non-zero.
- NOTE – Thus FIRST_INDEX has an alphabet size of $2^3 \times 3 = 12$.

8.7.19 Macroblock FLEXBITS

8.7.19.1 MB_FLEXBITS()

The MB_FLEXBITS() syntax structure is specified in Table 83.

Table 83 – MB_FLEXBITS() syntax structure

MB_FLEXBITS() {	Descriptor	Reference
/* IsCurrPlaneAlphaFlag is equal to TRUE for parsing alpha image plane, and IsCurrPlaneAlphaFlag is equal to FALSE for parsing primary image plane */		
iHierScanOrder[] = {0, 1, 4, 5, 2, 3, 6, 7, 8, 9, 12, 13, 10, 11, 14, 15}

if (iFlexBitsLeft < 0)		
iFlexBitsLeft = 0		
if (iFlexBitsLeft)		
for (n =1; n < 16; n++)		
HPInputFlex[iComponent][iBlock][iTranspose444[n]]= DECODE_FLEX(HPInputVLC[iComponent][iBlock][iTranspose444[n]], iFlexBitsLeft) << iTrimFlexBits		8.7.19.3
}		

8.7.19.3 DECODE_FLEX()

The DECODE_FLEX() syntax structure is specified in Table 85.

Table 85 – DECODE_FLEX() syntax structure

DECODE_FLEX(iVLCCoeff, iFlexBitsLeft) {	Descriptor	Reference
FLEX_REF	u(iFlexBitsLeft)	8.7.19.4.1
if (iVLCCoeff > 0)		
iFlexCoeff = FLEX_REF		
else if (iVLCCoeff < 0)		
iFlexCoeff = –FLEX_REF		
else {		
iFlexCoeff = FLEX_REF		
if (iFlexCoeff) {		
SIGN_FLAG	u(1)	8.7.14.4
if (SIGN_FLAG)		
iFlexCoeff = –iFlexCoeff		
}		
}		
return iFlexCoeff		
}		

8.7.19.4 FLEXBITS semantics

8.7.19.4.1 FLEX_REF

FLEX_REF is a syntax element that specifies the flexbits part of the HP coefficient. The size of this syntax element is specified by iFlexBits.

8.8 Adaptive VLC code table selection

8.8.1 General

Adaptive VLC table selection is a process by which the entropy coding method adapts to image statistics and thus provides better compression. First, a few representative VLC tables are predefined. These tables are designed to be suitable for a wide range of statistics. During the entropy coding process, the most appropriate code table is selected based on the history of recently coded symbols. The VLC tables and the information required for adaptation are precomputed as follows.

Let the set of VLC tables be: **vT1**, **vT2**, ..., **vTn** where the ordering of the tables is predefined based on their relative similarity. That is **vT1** and **vT2** exhibit greater similarity to each other than **vT1** and **vT3** do to each other. The measure of similarity between tables can be qualified by using relative entropy. Let table **vTi** be a VLC table used for entropy coding of symbol *iX*, and let **vTj** and **vTk** be the two nearest tables (in terms of similarity). For each value of symbol *iX*,

a metric deltaDisc estimating the relative advantage of coding this value using table \mathbf{vTj} or table \mathbf{vTk} instead of table \mathbf{vTi} is precomputed and stored in tables $\mathbf{vTi.DeltaTableIndex}$ and $\mathbf{vTi.Delta2TableIndex}$. This deltaDisc is positive if this symbol is more efficiently coded by the new table instead of the current table. This deltaDisc is negative if this symbol is less efficiently coded by the new table instead of the current table. For example, if a given value of the symbol requires 3 bits in the new table, while it requires 5 bits in the current table, this value is more efficiently coded in the new table and the corresponding deltaDisc is $(5 - 3 = 2)$.

The table selection proceeds as follows: After entropy coding a symbol, the adaptation process computes the relative advantage of the two nearest tables for coding this symbol. The weights obtained from the tables $\mathbf{vTi.DeltaTableIndex}$ and $\mathbf{vTi.Delta2TableIndex}$ are added to two discriminants, $\mathbf{vTi.DiscrimVal1}$ and $\mathbf{vTi.DiscrimVal2}$, that are used for accumulating the statistics regarding code table transition. The $\text{AdaptVLCTable1}()$ (8.8.4.4) and the $\text{AdaptVLCTable2}()$ (8.8.4.5) pseudocode functions specify how these discriminants are compared to predefined threshold, and decide whether to continue to use the current table or to transition to one of the nearest tables. If there is a transition, the discriminants are reset to zero.

As the discriminants are computed based on previously coded symbols both at the encoder and at the decoder, there is no need for additional side information to signal the selected VLC. For coding some symbols, there are only two code tables, and there is only one possible transition. The adaptation complexity is further reduced in these cases as there is only the DeltaTableIndex and only one discriminant is required.

NOTE – Informative remarks related to this subclause are provided in D.9.

8.8.2 Adaptive VLC deltaDisc tables

When a syntax element is parsed using a VLC having a code table that can be adaptively selected, the associated AdaptiveVLC data structure's member variables DiscrimVal1 and DiscrimVal2 are modified by adding an amount deltaDisc . The specific value of this deltaDisc is dependent on the syntax element being parsed, the VLC code table currently being used to parse this syntax element, the current value of this syntax element and (when there are two discriminants) which discriminant is being modified.

Based on these factors, the appropriate values of deltaDisc are specified by collecting them in tables. For each syntax element, a distinct collection of tables of deltaDisc values is defined; from here on these tables are called deltaDisc tables. A syntax element which is parsed using adaptive VLC tables will have N code tables for each syntax element, for some positive integer $N > 1$. If there are N code tables for a syntax element, there are $N - 1$ deltaDisc tables (one deltaDisc table for switching between code tables i and $i + 1$, for i ranging between 0 and $N - 2$ inclusive). The AdaptiveVLC data structure associates to DiscrimVal1 the associated variable DeltaTableIndex (Delta2TableIndex for DiscrimVal2); DeltaTableIndex defines which of the $N - 1$ deltaDisc tables is in use for the current macroblock.

The syntax element itself takes values between 0 and $M - 1$, where M represents the number of entries in this syntax element's code table. For each of these values, there is defined an associated deltaDisc value. In this way, when the syntax element takes the value $i\text{Val}$, the modification of an AdaptiveVLC data structures discriminants is specified as follows (here, $\mathbf{sAdaptVLC}$ is a local variable used in place of particular AdaptiveVLC data structure instance).

- $\mathbf{sAdaptVLC.DiscrimVal1}$ is incremented by $\text{deltaDisc}[\mathbf{sAdaptVLC.DeltaTableIndex}][i\text{Val}]$.
- $\mathbf{sAdaptVLC.DiscrimVal2}$ is incremented by $\text{deltaDisc}[\mathbf{sAdaptVLC.Delta2TableIndex}][i\text{Val}]$.

Table 86, Table 87, Table 88, Table 89, Table 90 and Table 91 specify the set of deltaDisc code tables for adaptive VLC syntax elements.

For the syntax element ABS_LEVEL_INDEX (8.7.14.5), there is one deltaDisc table for switching between Code tables 0 and 1, as specified in Table 86.

Table 86 – Constant table $\text{AbslevelIndexDelta}[m][n]$

Index value n	Value for $m = 0$
0	1
1	0
2	-1
3	-1
4	-1
5	-1
6	-1

For the syntax element FIRST_INDEX (8.7.18.9.7), there are four Delta tables, with the table associating a different deltaDisc value for each DeltaTableIndex and each value of FIRST_INDEX; the deltaDisc values are specified in Table 87.

Table 87 – Constant table FirstIndexDelta[m][n]

Index value n	Value for m = 0	Value for m = 1	Value for m = 2	Value for m = 3
0	1	2	-1	0
1	1	2	1	1
2	1	-1	0	0
3	1	-1	2	1
4	1	-1	0	-2
5	0	0	0	0
6	0	-2	0	-1
7	-1	-1	0	-1
8	2	0	-2	-2
9	1	0	0	-1
10	0	-2	1	-2
11	0	-1	1	-2

For the syntax element INDEX_A (8.7.18.9.4), there are three Delta tables, as specified in Table 88.

Table 88 – Constant table Index1Delta[m][n]

Index value n	Value for m = 0	Value for m = 1	Value for m = 2
0	-1	-2	-1
1	1	0	-1
2	1	0	0
3	1	2	1
4	0	0	-2
5	1	0	0

For the syntax element NUM_CBPHP (8.7.17.4.1), there is one deltaDisc table for switching between Code tables 0 and 1 as specified in Table 89.

Table 89 – Constant table NumCBPHPDelta[m][n]

Index value n	Value for m = 0
0	0
1	-1
2	0
3	1
4	1

For the syntax element NUM_BLKCBPHP (8.7.17.4.2), there is one deltaDisc table for switching between Code tables 0 and 1. In the case where the INTERNAL_CLR_FMT is YONLY, NCOMPONENT or YUVK, the code tables have five symbols and the deltaDisc table is specified in Table 90.

**Table 90 – Constant table NumBlkCBPHPDelta[m][n]
when INTERNAL_CLR_FMT is
YONLY, NCOMPONENT or YUVK**

Index value n	Value for m = 0
0	0
1	-1
2	0
3	1
4	1

For all other values of INTERNAL_CLR_FMT, the code table for NUM_BLKCBPHP has nine symbols, and the deltaDisc table is specified in Table 91.

**Table 91 – Constant table NumBlkCBPHPDelta
for INTERNAL_CLR_FMT other than
YONLY, NCOMPONENT, and YUVK**

8	-3

8.8.3 Initialization

The relevant adaptive VLC data structures that are associated with each of the three bands DC, LP and HP are initialized by the functions InitializeDCVLC(), InitializeLPVLC() and InitializeHPVLC(). These functions are specified in 8.8.3.1, 8.8.3.2, and 8.8.3.3, respectively. The adaptive VLC structure associated with CBPHP is initialized by the function InitializeCBPHPVLC() that is specified in 8.8.3.4.

These functions in turn make use of the functions InitializeVLCTable1() and InitializeVLCTable2() which are specified in 8.8.3.5 and 8.8.3.6, respectively.

NOTE – InitializeVLCTable1() is used for initializing VLC code tables when there are exactly two code tables. If there are more than two code table tables, InitializeVLCTable2() is used.

8.8.3.1 InitializeDCVLC()

The pseudocode for the function InitializeDCVLC() is specified in Table 92.

Table 92 – Pseudocode for the function InitializeDCVLC()

InitializeDCVLC() {	Reference
AbsLevelIndDCLum = InitializeVLCTable1(AbsLevelIndDCLum)	8.8.3.5
AbsLevelIndDCChr = InitializeVLCTable1(AbsLevelIndDCChr)	8.8.3.5
}	

8.8.3.2 InitializeLPVLC()

The pseudocode for the function InitializeLPVLC() is specified in Table 93.

Table 93 – Pseudocode for the function InitializeLPVLC()

InitializeLPVLC() {	Reference
DecFirstIndLPLum = InitializeVLCTable2(DecFirstIndLPLum)	8.8.3.6
DecIndLPLum0 = InitializeVLCTable2(DecIndLPLum0)	8.8.3.6

sAdaptVLC.DiscrimVal2 = 0	
return sAdaptVLC	
}	

8.8.4 Update of adaptive VLC code table selection

The relevant adaptive VLC data structures that are associated with each of the three bands DC, LP and HP are updated by the functions AdaptDC(), AdaptLP() and AdaptHP(), respectively. The pseudocode for the functions AdaptDC(), AdaptLP() and AdaptHP() are specified in 8.8.4.1, 8.8.4.2 and 8.8.4.3, respectively:

The functions AdaptLP() and AdaptHP() perform the updates by using the functions AdaptVLCTable1() and AdaptVLCTable2() which are specified in 8.8.4.4 and 8.8.4.5.

8.8.4.1 AdaptDC()

The pseudocode for the function AdaptDC() is specified in Table 98.

Table 98 – Pseudocode for the function AdaptDC()

AdaptDC() {	Reference
AbsLevelIndDCLum = AdaptVLCTable1(AbsLevelIndDCLum)	8.8.4.4
AbsLevelIndDCChr = AdaptVLCTable1(AbsLevelIndDCChr)	8.8.4.4
}	

8.8.4.2 AdaptLP()

The pseudocode for the function AdaptLP() is specified in Table 99.

Table 99 – Pseudocode for the function AdaptLP()

AdaptLP() {	Reference
DecFirstIndLPLum = AdaptVLCTable2(DecFirstIndLPLum, 4)	8.8.4.5
DecIndLPLum0 = AdaptVLCTable2(DecIndLPLum0, 3)	8.8.4.5
DecIndLPLum1 = AdaptVLCTable2(DecIndLPLum1, 3)	8.8.4.5
DecFirstIndLPChr = AdaptVLCTable2(DecFirstIndLPChr, 4)	8.8.4.5
DecIndLPChr0 = AdaptVLCTable2(DecIndLPChr0, 3)	8.8.4.5
DecIndLPChr1 = AdaptVLCTable2(DecIndLPChr1, 3)	8.8.4.5
AbsLevelIndLP0 = AdaptVLCTable1(AbsLevelIndLP0)	8.8.4.4
AbsLevelIndLP1 = AdaptVLCTable1(AbsLevelIndLP1)	8.8.4.4
}	

8.8.4.3 AdaptHP()

The pseudocode for the function AdaptHP() is specified in Table 100.

Table 100 – Pseudocode for the function AdaptHP()

AdaptHP() {	Reference
DecFirstIndHPLum = AdaptVLCTable2(DecFirstIndHPLum, 4)	8.8.4.5
DecIndHPLum0 = AdaptVLCTable2(DecIndHPLum0, 3)	8.8.4.5
DecIndHPLum1 = AdaptVLCTable2(DecIndHPLum1, 3)	8.8.4.5
DecFirstIndHPChr = AdaptVLCTable2(DecFirstIndHPChr, 4)	8.8.4.5
DecIndHPChr0 = AdaptVLCTable2(DecIndHPChr0, 3)	8.8.4.5
DecIndHPChr1 = AdaptVLCTable2(DecIndHPChr1, 3)	8.8.4.5
AbsLevelIndHP0 = AdaptVLCTable1(AbsLevelIndHP0)	8.8.4.4
AbsLevelIndHP1 = AdaptVLCTable1(AbsLevelIndHP1)	8.8.4.4
DecNumCBPHP = AdaptVLCTable1(DecNumCBPHP)	8.8.4.4
DecNumBlkCBPHP = AdaptVLCTable1(DecNumBlkCBPHP)	8.8.4.4
}	

8.8.4.4 AdaptVLCTable1()

AdaptVLCTable1() is used for choosing VLC code tables when there are exactly two code tables. In this case, the index TableIndex takes only the values 0 or 1, and there is only one parameter (DiscrimVal1) which determines the selection of VLC code tables. DeltaTableIndex takes only the value 0, and there is only the one deltaDisc table.

The pseudocode for the function AdaptVLCTable1() is specified in Table 101.

Table 101 – Pseudocode for the function AdaptVLCTable1()

AdaptVLCTable1(sAdaptVLC) {	Reference
/* sAdaptVLC is an instance of the AdaptiveVLC data structure */	
iMaxTableIndex = 1 /* Only two code tables */	
cLowerBound = -8	
cUpperBound = 8	
/* sAdaptVLC.DeltaTableIndex = 0, since only 2 code tables */	
if (sAdaptVLC.DiscrimVal1 < cLowerBound && sAdaptVLC.TableIndex != 0) {	
sAdaptVLC.TableIndex--	
sAdaptVLC.DiscrimVal1 = 0	
} else if (sAdaptVLC.DiscrimVal1 > cUpperBound && sAdaptVLC.TableIndex != iMaxTableIndex) {	
sAdaptVLC.TableIndex++	
sAdaptVLC.DiscrimVal1 = 0	
} else {	

/* no change to table, but clip the discriminant */	
if (sAdaptVLC.DiscrimVal1 < -64)	
sAdaptVLC.DiscrimVal1 = -64	
if (sAdaptVLC.DiscrimVal1 > 64)	
sAdaptVLC.DiscrimVal1 = 64	
}	
return sAdaptVLC	
}	

8.8.4.5 AdaptVLCTable2()

AdaptVLCTable2() is used for choosing VLC code tables when there are more than two possible code tables. In this case, the index TableIndex can take values between 0 and the maximum table index for that set of VLC code tables. This maximum table index is contained in the parameter iMaxTableIndex. For AdaptVLCTable2(), there are two parameters (DiscrimVal1 and DiscrimVal2) which determine the selection of VLC code tables. DiscrimVal1 determines whether the code table index should be decreased, while DiscrimVal2 determines whether the code table index should be increased.

The pseudocode for the function Adapt VLCTable2() is specified in Table 102.

Table 102 – Pseudocode for the function AdaptVLCTable2()

AdaptVLCTable2(sAdaptVLC, iMaxTableIndex) {	Reference
/* sAdaptVLC is an instance of the AdaptiveVLC struct */	
/* iMaxTableIndex – max table index possible for this struct instance */	
bChange = FALSE	
iDiscrimLow = sAdaptVLC.DiscrimVal1	
iDiscrimHigh = sAdaptVLC.DiscrimVal2	
cLowerBound = -8	
cUpperBound = 8	
if (iDiscrimLow < cLowerBound && sAdaptVLC.TableIndex != 0) {	
sAdaptVLC.TableIndex--	
bChange = TRUE	
} else if (iDiscrimHigh > cUpperBound && sAdaptVLC.TableIndex != iMaxTableIndex) {	
sAdaptVLC.TableIndex++	
bChange = TRUE	
}	
if (bChange) {	
sAdaptVLC.DiscrimVal1 = 0	
sAdaptVLC.DiscrimVal2 = 0	
if (sAdaptVLC.TableIndex == iMaxTableIndex) {	
sAdaptVLC.DeltaTableIndex = sAdaptVLC.TableIndex - 1	
sAdaptVLC.Delta2TableIndex = sAdaptVLC.TableIndex - 1	
} else if (sAdaptVLC.TableIndex == 0) {	
sAdaptVLC.DeltaTableIndex = sAdaptVLC.TableIndex	
sAdaptVLC.Delta2TableIndex = sAdaptVLC.TableIndex	
} else {	
sAdaptVLC.DeltaTableIndex = sAdaptVLC.TableIndex - 1	
sAdaptVLC.Delta2TableIndex = sAdaptVLC.TableIndex	
}	
} else { /* no change to table, but clip the discriminant */	
if (sAdaptVLC.DiscrimVal1 < -64)	
sAdaptVLC.DiscrimVal1 = -64	
if (sAdaptVLC.DiscrimVal1 > 64)	
sAdaptVLC.DiscrimVal1 = 64	
if (sAdaptVLC.DiscrimVal2 < -64)	
sAdaptVLC.DiscrimVal2 = -64	
if (sAdaptVLC.DiscrimVal2 > 64)	
sAdaptVLC.DiscrimVal2 = 64	
}	
return sAdaptVLC	
}	

8.9 Adaptation of CBPLP state variables

8.9.1 General

The parsing of CBPLP depends on the value of the variables CountZeroCBPLP and CountMaxCBPLP. The functions specified in this subclause specify the initialization and updating of these constants.

8.9.2 InitializeCountCBPLP()

The variable CountZeroCBPLP and CountMaxCBPLP for LP coefficients are initialized by the function InitializeCountCBPLP() specified in Table 103.

Table 103 – Pseudocode for function InitializeCountCBPLP()

InitializeCountCBPLP() {	Reference
CountZeroCBPLP = 1	
CountMaxCBPLP = 1	
}	

8.9.3 UpdateCountCBPLP()

The function UpdateCountCBPLP() updates the variables CountZeroCBPLP and CountMaxCBPLP. The pseudocode for this function is specified in Table 104.

Table 104 – Pseudocode for function UpdateCountCBPLP()

UpdateCountCBPLP(iCBPLP, iMax) {	Reference
CountZeroCBPLP += 1 - (4 * (iCBPLP == 0))	
CountZeroCBPLP = Max(-8, Min(7, CountZeroCBPLP))	
CountMaxCBPLP += 1 - (4 * (iCBPLP == iMax))	
CountMaxCBPLP = Max(-8, Min(7, CountMaxCBPLP))	
}	

8.10 Adaptive CBPHP prediction

CBPHP prediction depends on the value of member variables of the data structure instance **CBPHPModelHP**. The functions specified in this subclause specify the initialization and updating of this data structure.

8.10.1 InitializeCBPHPModel()

The data structure instance **CBPHPModelHP** is initialized in the function InitializeCBPHPModel() specified in Table 105.

Table 105 – Pseudocode for function InitializeCBPHPModel()

InitializeCBPHPModel() {	Reference
CBPHPModelHP .CBPHPState[0] = CBPHPModelHP .CBPHPState[1] = 0	
CBPHPModelHP .CountOnes[0] = CBPHPModelHP .CountOnes[1] = -4	
CBPHPModelHP .CountZeroes[0] = CBPHPModelHP .CountZeroes[1] = 4	
}	

8.10.2 UpdateCBPHPModel()

The variables associated with the data structure instance **CBPHPModelHP** are updated by the function UpdateCBPHPModel() as specified in Table 106.

Table 106 – Pseudocode for function UpdateCBPHPModel()

UpdateCBPHPModel(i, iNOrig) {	Reference
iNDiff = 3	
CBPHPModelHP.CountOnes[i] += iNOrig - iNDiff	
CBPHPModelHP.CountOnes[i] = Clip(CBPHPModelHP.CountOnes[i], -16,15)	
CBPHPModelHP.CountZeroes[i] += 16 - iNOrig - iNDiff	
CBPHPModelHP.CountZeroes[i] = Clip(CBPHPModelHP.CountZeroes[i], -16, 15)	
if (CBPHPModelHP.CountOnes[i] < 0)	
if (CBPHPModelHP.CountOnes[i] < CBPHPModelHP.CountZeroes[i])	
CBPHPModelHP.CBPHPState[i] = 1	
else	
CBPHPModelHP.CBPHPState[i] = 2	
else if (CBPHPModelHP.CountZeroes[i] < 0)	
CBPHPModelHP.CBPHPState[i] = 2	
else	
CBPHPModelHP.CBPHPState[i] = 0	
}	

8.11 Adaptive inverse scanning

The parsing of syntax elements corresponding to LP and HP coefficients depends on the state of the inverse scanning tables LowpassScanOrder[i], HighpassHorScanOrder[i], and HighpassVerScanOrder[i]. The functions specified in this subclause define the initialization and updating of these tables.

8.11.1 Adaptive inverse scanning tables

The inverse scanning order of transform coefficients is a permutation of the integers 1 to 15. Let the integer i represent the order in which a given transform coefficient is parsed from the codestream, and let the local example list listScanOrder[] specify an inverse scanning order as follows: the i-th transform coefficient is put into the block in the j-th position in raster scan order, where j is equal to listScanOrder[i].

The three lists LowpassScanOrder[], HighpassHorScanOrder[] and HighpassVerScanOrder[] are used to specify the inverse scanning order of LP coefficients, HP coefficients in the case of prediction from the left (9.6) and HP coefficients in the case of prediction from the top, respectively. These lists are initialized to scan orders as specified in the following. However, the lists are adaptive, and thus may change over the course of parsing, based on the statistics of non-zero transform coefficients in the codestream.

The three lists LowpassScanOrder[], HighpassHorScanOrder[] and HighpassVerScanOrder[] are initialized as specified in 8.11.2 and 8.11.3. The initial orders are specified by the two lists ScanOrder0[] and ScanOrder1[], which are specified in Table 107.

Table 107 – Definitions of ScanOrder0 and ScanOrder1

i	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ScanOrder0[i]	4	1	5	8	2	9	6	12	3	10	13	7	14	11	15
ScanOrder1[i]	1	2	5	4	3	6	9	8	7	12	15	13	10	11	14

Each of the lists LowpassScanOrder[], HighpassHorScanOrder[] and HighpassVerScanOrder[] also has an associated list that determines how the scan order is updated. These corresponding lists are LowpassTotals[], HighpassHorTotals[] and HighpassVerTotals[], respectively. These associated lists are initialized to be equal to the list ScanTotals[], which is specified in Table 108.

Table 108 – Definition of ScanTotals

i	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
ScanTotals[i]	32	30	28	26	24	22	20	18	16	14	12	10	8	6	4

The three lists LowpassScanOrder[], HighpassHorScanOrder[] and HighpassVerScanOrder[] are updated as specified in 8.11.

8.11.2 InitializeAdaptiveScanLP()

The adaptive inverse scanning tables for LP coefficients are initialized in the function InitializeAdaptiveScanLP() specified in Table 109.

Table 109 – Pseudocode for function InitializeAdaptiveScanLP()

InitializeAdaptiveScanLP() {	Reference
for (i = 1; i <= 15; i++) {	
LowpassScanOrder[i] = ScanOrder0[i]	ScanOrder0[i] specified in 8.11.1
LowpassTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
}	
}	

8.11.3 InitializeAdaptiveScanHP()

The adaptive inverse scanning tables for HP coefficients are initialized in the function InitializeAdaptiveScanHP() specified in Table 110.

Table 110 – Pseudocode for function InitializeAdaptiveScanHP()

InitializeAdaptiveScanHP() {	Reference
for (i = 1; i <= 15; i++) {	
HighpassHorScanOrder[i] = ScanOrder0[i]	ScanOrder0[i] specified in 8.11.1
HighpassVerScanOrder[i] = ScanOrder1[i]	ScanOrder1[i] specified in 8.11.1
HighpassHorTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
HighpassVerTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
}	
}	

8.11.4 ResetTotalsAdaptiveScanLP()

The list LowpassTotals of the adaptive inverse scanning tables for LP coefficients is reset in the function ResetTotalsAdaptiveScanLP() specified in Table 111.

Table 111 – Pseudocode for function ResetTotalsAdaptiveScanLP()

ResetTotalsAdaptiveScanLP() {	Reference
for (i = 1; i <= 15; i++)	
LowpassTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
}	

8.11.5 ResetTotalsAdaptiveScanHP()

The lists HighpassHorTotals and HighpassVerTotals of the adaptive inverse scanning tables for HP coefficients are reset in the function ResetTotalsAdaptiveScanHP() specified in Table 112.

Table 112 – Pseudocode for function ResetTotalsAdaptiveScanHP()

ResetTotalsAdaptiveScanHP() {	Reference
for (i = 1; i <= 15; i++) {	
HighpassHorTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
HighpassVerTotals[i] = ScanTotals[i]	ScanTotals[i] specified in 8.11.1
}	
}	

8.11.6 AdaptiveLPScan()

The function AdaptiveLPScan() updates the list LPInput[k] and also updates the variables associated with tracking and modifying the LP scan order LowpassScanOrder[i] as specified in Table 113.

Table 113 – Pseudocode for function AdaptiveLPScan()

AdaptiveLPScan(n, i, iValue) {	Reference
k = LowpassScanOrder[i]	
LPInput[n][k] = iValue	
LowpassTotals[i]++	
if ((i > 1) && (LowpassTotals[i] > LowpassTotals[i-1])) {	
valueTemp = LowpassTotals[i]	
LowpassTotals[i] = LowpassTotals[i-1]	
LowpassTotals[i-1] = valueTemp	
valueTemp = LowpassScanOrder[i]	
LowpassScanOrder[i] = LowpassScanOrder[i-1]	
LowpassScanOrder[i-1] = valueTemp	
}	
}	

8.11.7 AdaptiveHPScan()

The function AdaptiveHPScan() updates the list HPInputVLC[iComponent][iBlock][k], and also updates the variables associated with tracking and modifying the HP scan orders HighpassHorScanOrder[i] and HighpassVerScanOrder[i] as specified in Table 114.

Table 114 – Pseudocode for function AdaptiveHPScan()

AdaptiveHPScan(iComponent, iBlock, i, iValue) {	Reference
if (MBHPMode == 1) { /* vertical scan order */	
k = HighpassVerScanOrder[i]	
HighpassVerTotals[i]++	
HPInputVLC[iComponent][iBlock][k] = iValue	
if ((i > 1) &&	
(HighpassVerTotals[i] > HighpassVerTotals[i-1])) {	
valueTemp = HighpassVerTotals[i]	
HighpassVerTotals[i] = HighpassVerTotals[i-1]	
HighpassVerTotals[i-1] = valueTemp	
valueTemp = HighpassVerScanOrder[i]	
HighpassVerScanOrder[i] = HighpassVerScanOrder[i-1]	
HighpassVerScanOrder[i-1] = valueTemp	
}	
} else { /* horizontal scan order */	
k = HighpassHorScanOrder[i]	
HighpassHorTotals[i]++	
HPInputVLC[iComponent][iBlock][k] = iValue	
if ((i > 1) &&	
(HighpassHorTotals[i] > HighpassHorTotals[i-1])) {	
valueTemp = HighpassHorTotals[i]	
HighpassHorTotals[i] = HighpassHorTotals[i-1]	
HighpassHorTotals[i-1] = valueTemp	
valueTemp = HighpassHorScanOrder[i]	
HighpassHorScanOrder[i] = HighpassHorScanOrder[i-1]	
HighpassHorScanOrder[i-1] = valueTemp	
}	
}	
}	

The variable MBHPMode is computed during the HP prediction direction computation process specified in 9.6.3.2. The scan order is selected based on the value of the variable MBHPMode. AdaptiveHPScan() shall only be invoked on a

macroblock after the HP prediction direction computation process specified in 9.6.3.2 has been invoked and completed for this macroblock. The HP prediction direction process shall be invoked only after the completion of the LP transform coefficient parsing process.

NOTE – See 9.6 for more information.

8.12 Adaptive coefficient normalization

8.12.1 InitializeModelMB()

The initialization of the **Model** data structure is specified by the function InitializeModelMB() as specified in Table 115.

Table 115 – Pseudocode for function InitializeModelMB()

InitializeModelMB(Model, iBand) {	Reference
<i>/* iBand is the frequency band (DC = 0, LP = 1, HP = 2) */</i>

}	

9 Decoding process

9.1 General

This clause specifies the decoding process. The decoding process is interdependent with the initialization of variables and parsing of syntax elements as specified in clause 8.

The decoding process specified in this clause is distinguished from the codestream parsing process in the following manner: the codestream parsing process manages all control flow regarding the correct parsing of codestream syntax elements. This includes maintaining state variables for adaptive VLC selection, adaptive coefficient normalization, and other related information. The processes in this clause therefore are written with the assumption that, when they are invoked, the input variables required for this process have been correctly parsed from the codestream.

The decoding process is specified so that the decoded samples from any two JPEG XR decoders will be numerically identical. Any decoder which produces results that match the process specified here conforms to the requirements of this Specification.

The image decoding process proceeds as specified in clause 9.2.

9.2 Image decoding

The outputs of this process are the output samples of the image.

The image decoding process proceeds as specified in Table 117.

Table 117 – Pseudocode for function ImageDecoding()

ImageDecoding() {	Reference
ImagePlaneDecoding()	9.3

outputWidth = WIDTH_MINUS1 + 1	
for (y = 0; y < outputHeight; y++)	
for (x = 0; x < outputWidth; x++)	
ImagePrimary[i][x][y] = ImagePlane[i][x][y]	
}	
if (ALPHA_IMAGE_PLANE_FLAG == TRUE)	
ImagePlaneDecoding() /* resulting sample values, corresponding to the alpha image plane, are stored in the variables ImagePlane[0][x][y] */	9.3
for (y = 0; y <= HEIGHT_MINUS1; y++)	
for (x = 0; x <= WIDTH_MINUS1; x++)	
ImageAlpha[0][x][y] = ImagePlane[0][x][y]	
}	

NOTE – Throughout the parsing of syntax elements in clause 8, it is assumed that if ALPHA_IMAGE_PLANE_FLAG is equal to TRUE, there are two sets of parsed syntax elements: one set corresponding to the primary image plane and another to the alpha image plane. In the same manner, this subclause assumes that there are two sets of global variables being used in the decoding process, corresponding to the primary and alpha image planes, respectively.

9.3 Image plane decoding

This process is invoked for each image plane.

The outputs of this process are the decoded samples for this image plane, ImagePlane[i][x][y].

The image plane decoding process proceeds as specified in Table 118.

Table 118 – Pseudocode for function ImagePlaneDecoding()

ImagePlaneDecoding() {	Reference
ImagePlaneDCQP()	9.7.1.1
ImagePlaneLPQP()	9.7.2.1
ImagePlaneHPQP()	9.7.3.1
for (TileIndexy = 0; TileIndexy < NumTileRows; TileIndexy++)	
for (TileIndexx = 0; TileIndexx < NumTileCols; TileIndexx++)	
TileTransformCoefficientProcessing() /* At this point, transform coefficients for the entire image plane have been obtained */	9.4.1
SampleReconstruction() /* This process performs both levels of the inverse transform and overlap operations on the entire image */	9.9.1
OutputFormatting()	9.10.2
}	

9.4 Tile transform coefficient processing

9.4.1 Overview

This process is invoked for each tile. The inputs to this process are the horizontal and vertical indices of the current tile.

The outputs of this process are transform coefficients for each macroblock in the tile.

The transform coefficient processing proceeds as specified in Table 119.

Table 119 – Pseudocode for function TileTransformCoefficientProcessing()

TileTransformCoefficientProcessing() {	Reference
TileLevelDCQP()	9.7.1.2
TileLevelLPQP()	9.7.2.2
TileLevelHPQP()	9.7.3.2
n = 0	
for (MBy = TopMBIndexOfTile[TileIndexy]; MBy < TopMBIndexOfTile[TileIndexy + 1]; MBy++)	
for (MBx = LeftMBIndexOfTile[TileIndexx]; MBx < LeftMBIndexOfTile[TileIndexx + 1]; MBx++) {	
MBQPIndexLP[MBx][MBy] = LP_QP_INDEX[n]	
MBQPIndexHP[MBx][MBy] = HP_QP_INDEX[n]	
DCTransformCoefficientDecoding()	9.4.2
LPTransformCoefficientDecoding()	9.4.3
HPTransformCoefficientDecoding()	9.4.4
n += 1	
}	
}	

NOTE – The computation of the global variable MBHPMode is dependent upon the completion of the LP transform coefficient decoding process. MBHPMode is computed at the beginning of the HP coefficient decoding process.

9.4.2 DC transform coefficient decoding

The outputs of this process are DC transform coefficients for each colour component of the current macroblock.

The DC transform coefficient processing proceeds as specified in Table 120.

Table 120 – Pseudocode for function DCTransformCoefficientDecoding()

DCTransformCoefficientDecoding() {	Reference
DCMBCoefficientRemap()	9.5.1
DCPredictionGeneral()	9.6.1.1
DequantizeDCCoefficients()	9.8.1
}	

9.4.3 Lowpass transform coefficient decoding

The outputs of this process are LP transform coefficients for each colour component of the current macroblock.

The LP transform coefficient processing proceeds as specified in Table 121.

Table 121 – Pseudocode for function LPTransformCoefficientDecoding()

LPTransformCoefficientDecoding() {	Reference
LPMBCoefficientRemap()	9.5.2
LPPredictionGeneral()	9.6.2.1

}	

9.5 Coefficient remapping

This subclause specifies the coefficient remapping processes for DC, LP and HP coefficients.

9.5.1 DC coefficient remapping

Input to this process is a list DCInput[i] of DC level values for each colour component i, and the variables MBx and MBy, which identify the current macroblock.

The output of this process is the list of values MbDCLP[MBx][MBy][i][0], of DC transform coefficients, for each colour component i of the current macroblock.

NOTE – The values DCInput[i] are the outputs of the MB_DC() syntax structure of 8.7.11.

The values in the array MbDCLP[MBx][MBy][i][0] are set by Table 123.

Table 123 – Pseudocode for function DCMBCoefficientRemap()

DCMBCoefficientRemap() {	Reference
for (i = 0; i < NumComponents; i++)	
MbDCLP[MBx][MBy][i][0] = DCInput[i]	
}	

9.5.2 Lowpass coefficient remapping

Inputs to this process are a list of variables LPInput[i][j] which hold the j-th LP transform coefficient value for each colour component i.

The output of this process is the array of variables MbDCLP[MBx][MBy][i][j] which hold the j-th LP transform coefficients, indexed in raster scan order, of colour component i.

The LP coefficient remapping process proceeds as specified in Table 124.

Table 124 – Pseudocode for function LPMBCoefficientRemap()

LPMBCoefficientRemap() {	Reference
for (i = 0; i < NumComponents; i++)	
if (i != 0) && ((INTERNAL_CLR_FMT == YUV422) (INTERNAL_CLR_FMT == YUV420))	
if (INTERNAL_CLR_FMT == YUV422)	
for (j = 1; j <= 7; j++)	
if (BANDS_PRESENT != DCONLY)	
MbDCLP[MBx][MBy][i][j] = LPInput[i][j]	
else	
MbDCLP[MBx][MBy][i][j] = 0	
else /* INTERNAL_CLR_FMT == YUV420 */	
for (j = 1; j <= 3; j++)	
if (BANDS_PRESENT != DCONLY)	
MbDCLP[MBx][MBy][i][j] = LPInput[i][j]	
else	
MbDCLP[MBx][MBy][i][j] = 0	
else	
for (j = 1; j <= 15; j++)	
if (BANDS_PRESENT != DCONLY)	
MbDCLP[MBx][MBy][i][j] = LPInput[i][j]	

LPMBCoefficientRemap() {	Reference
else	
MbDCLP[MBx][MBy][i][j] = 0	
}	

9.5.3 Highpass macroblock coefficient remapping

The HP coefficient remapping process proceeds as specified in Table 125.

Table 125 – Pseudocode for function HPMBCoefficientRemap()

HPMBCoefficientRemap() {	Reference
for (i = 0; i < NumComponents; i++) {	
if (i != 0 && INTERNAL_CLR_FMT == YUV420)	
jMax = 3	
else if (i != 0 && INTERNAL_CLR_FMT == YUV422)	
jMax = 7	
else	
jMax = 15	
for (j = 0; j <= jMax; j++)	
HPBlockCoefficientRemap(i, j)	9.5.4
}	
}	

9.5.4 Highpass block coefficient remapping

Inputs to this process are: the array HPInputVLC[currentComponent][blkIndex][j] for the current colour component currentComponent, and the current block index blkIndex, with j ranging from 1 to 15, the array HPInputFlex[currentComponent][blkIndex][j] for the current colour component currentComponent, and the current block index blkIndex, with j ranging from 1 to 15, the variable ModelBits[MBx][MBy], representing the number of flexbits for the current macroblock, and the variables MBx and MBy, which identify the current macroblock.

Outputs of this process are the values MBBuffer[MBx][MBy][currentComponent][k] of HP transform coefficients, with k ranging from (16 * blkIndex + 1) to (16 * blkIndex + 15), corresponding to the current block. Pseudocode for this process is specified in Table 126.

Table 126 – Pseudocode for function HPBlockCoefficientRemap()

HPBlockCoefficientRemap(currentComponent, blkIndex) {	Reference
if (currentComponent == 0)	
iIndex = 0	
else	
iIndex = 1	
for (j = 1; j <= 15; j++) {	
k = 16 * blkIndex + j	
if (BANDS_PRESENT == ALL BANDS_PRESENT == NOFLEXBITS)	
MBBuffer[MBx][MBy][currentComponent][k] = HPInputVLC[currentComponent][blkIndex][j] << ModelBitsMBHP[MBx][MBy][iIndex]	
else	
MBBuffer[MBx][MBy][currentComponent][k] = 0	
if (BANDS_PRESENT == ALL)	
MBBuffer[MBx][MBy][currentComponent][k] += HPInputFlex[currentComponent][blkIndex][j]	
}	
}	

9.6 Transform coefficient prediction

9.6.1 DC coefficient prediction

9.6.1.1 Overview of DC prediction

This subclause is informative: it is not an integral part of this Specification.

Four modes are defined for the prediction of the DC coefficient of a macroblock. These modes are:

- predict from left;
- predict from top;
- predict from left and top;
- no prediction.

The prediction mode is determined from the position of the macroblock, as well as the DC values to the left, top and top-left of the macroblock. Furthermore, if the image has chroma components, the corresponding DC values of the chroma components are also used.

9.6.1.2 DCPredictionGeneral()

Inputs to this process are the Boolean variables IsMBLeftEdgeofTileFlag and IsMBTopEdgeofTileFlag, as well as the values MbDCLP[MBx][MBy][i][0], for each colour component i of the current macroblock. The variable IsMBLeftEdgeofTileFlag is equal to TRUE when the current macroblock is at the left edge of the tile; IsMBTopEdgeofTileFlag is equal to TRUE when the current macroblock is at the top edge of the current tile.

NOTE – The values MbDCLP[MBx][MBy][i][0] come from the DC coefficient remapping process of clause 9.5.1.

Outputs of this process are the updated values MbDCLP[MBx][MBy][i][0], for each colour component i of the current macroblock.

The DC prediction process proceeds as specified in Table 127.

Table 127 – Pseudocode for function DCPredictionGeneral()

DCPredictionGeneral() {	Reference
CalcDCPredMode()	9.6.1.3
DCCoefficientPrediction()	9.6.1.4
UpdateDCPredictionVariables()	9.6.1.5
}	

9.6.1.3 DC prediction direction computation

Inputs to this process are the variables IsMBLeftEdgeofTileFlag and IsMBTopEdgeofTileFlag, and the values PredDCLP[MBx-1][MBy][i][0], PredDCLP[MBx][MBy-1][i][0] and PredDCLP[MBx-1][MBy-1][i][0], for each colour component i.

The output of this process is the value of MBDCMode. The possible values of MBDCMode are as follows: 0 specifies prediction from the left macroblock; 1 specifies prediction from the top macroblock; 2 specifies prediction from both the top and left macroblocks; and 3 specifies no prediction.

The DC prediction direction process proceeds as specified in Table 128.

Table 128 – Pseudocode for function CalcDCPredMode()

CalcDCPredMode() {	Reference
if (IsMBLeftEdgeofTileFlag == TRUE && IsMBTopEdgeofTileFlag == TRUE)	
MBDCMode = 3 /* no prediction */	
else if (IsMBLeftEdgeofTileFlag == TRUE && IsMBTopEdgeofTileFlag == FALSE)	
MBDCMode = 1 /* prediction from top only */	
else if (IsMBLeftEdgeofTileFlag == FALSE && IsMBTopEdgeofTileFlag == TRUE)	
MBDCMode = 0 /* prediction from left only */	
else /* if (IsMBLeftEdgeofTileFlag == FALSE && IsMBTopEdgeofTileFlag == FALSE) */ {	
iLeft = PredDCLP[MBx-1][MBy][0][0]	
iTop = PredDCLP[MBx][MBy-1][0][0]	
iTopLeft = PredDCLP[MBx-1][MBy-1][0][0]	

CalcDCPredMode() {	Reference
if (INTERNAL_CLR_FMT == Y_ONLY INTERNAL_CLR_FMT == NCOMPONENT) {	
iStrHor = Abs(iTopLeft - iLeft)	
iStrVer = Abs(iTopLeft - iTop)	
} else {	
iLeftU = PredDCLP[MBx-1][MBy][1][0]	
iTopU = PredDCLP[MBx][MBy-1][1][0]	
iTopLeftU = PredDCLP[MBx-1][MBy-1][1][0]	
iLeftV = PredDCLP[MBx-1][MBy][2][0]	
iTopV = PredDCLP[MBx][MBy-1][2][0]	
iTopLeftV = PredDCLP[MBx-1][MBy-1][2][0]	
iScale = 2	
if (INTERNAL_CLR_FMT == YUV420)	
iScale = 8	
if (INTERNAL_CLR_FMT == YUV422)	
iScale = 4	
iStrHor = Abs(iTopLeft - iLeft) * iScale + Abs(iTopLeftU - iLeftU) + Abs(iTopLeftV - iLeftV)	
iStrVer = Abs(iTopLeft - iTop) * iScale + Abs(iTopLeftU - iTopU) + Abs(iTopLeftV - iTopV)	
}	
iOrWt = 4	
if ((iStrHor * iOrWt) < iStrVer)	
MBDCMode = 1	
else if ((iStrVer * iOrWt) < iStrHor)	
MBDCMode = 0	
else	
MBDCMode = 2	
}	
}	

The value MBDCMode is used in subsequent stages of the DC prediction process.

9.6.1.4 DC coefficient prediction

This process occurs when MBDCMode is not equal to 3.

Inputs to this process are the variable MBDCMode representing the DC prediction direction, and the array variable MbDCLP[MBx][MBy][i][0] for each colour component i.

Outputs to this process are the updated values MbDCLP[MBx][MBy][i][0], for each colour component i of the current macroblock.

The DC coefficient prediction process proceeds as specified in Table 129.

Table 129 – Pseudocode for function DCCoefficientPrediction()

DCCoefficientPrediction() {	Reference
for (i = 0; i < NumComponents; i++) {	
iLeft = PredDCLP[MBx-1][MBy][i][0]	
iTop = PredDCLP[MBx][MBy-1][i][0]	
if (MBDCMode == 0)	
MbDCLP[MBx][MBy][i][0] += iLeft	
else if (MBDCMode == 1)	
MbDCLP[MBx][MBy][i][0] += iTop	
else if (MBDCMode == 2) {	
if (i == 0) ((INTERNAL_CLR_FMT != YUV420) && (INTERNAL_CLR_FMT != YUV422))	
MbDCLP[MBx][MBy][i][0] += (iTop + iLeft) >> 1	
else /* (INTERNAL_CLR_FMT == YUV420 INTERNAL_CLR_FMT == YUV422)*/	
MbDCLP[MBx][MBy][i][0] += (iTop + iLeft + 1) >> 1	
}	
}	

9.6.1.5 Update of DC prediction variables

Outputs of this process are the updated variables $\text{PredDCLP}[\text{MBx}][\text{MBy}][i]$, for each colour component i , where MBx and MBy are indexing the current macroblock.

The update of DC prediction variables process proceeds as specified in Table 130.

Table 130 – Pseudocode for function UpdateDCPredictionVariables()

UpdateDCPredictionVariables() {	Reference
for ($i = 0$; $i < \text{NumComponents}$; $i++$)	
$\text{PredDCLP}[\text{MBx}][\text{MBy}][i][0] = \text{MbDCLP}[\text{MBx}][\text{MBy}][i][0]$	
}	

9.6.2 Lowpass prediction

9.6.2.1 Overview of lowpass prediction

This subclause is informative: it is not an integral part of this Specification.

Three modes are defined for the prediction of the LP coefficient of the inner transform of a macroblock. These modes are:

- prediction from left when MBLPMode is equal to 0;
- prediction from top when MBLPMode is equal to 1;
- no prediction when MBLPMode is equal to 2.

The LP coefficient prediction mode (MBLPMode) is determined by the DC coefficient prediction mode, together with the quantization parameters of both the current block and the block from which the DC values were predicted.

This rule ensures that prediction of LP coefficients does not take place across macroblocks with different quantization parameters.

Not all the LP coefficients associated with a macroblock are predicted. The definition and indices of DC and LP coefficients that are predicted are shown in Figure 5. The DC coefficient of the blocks shown in dark grey is at position 0 and the LP coefficients that can be predicted are shown in light grey. For the colour format YUV422, the LP coefficient associated with position 5 is predicted from position 1 in Figure 5, and if MBDCMode is equal to 1, irrespective of the value of MBLPMode , the LP coefficient associated with position 4 (indicated by crosshatching) can be predicted from both top and left.

T.832(12)_F05

Figure 5 – DC and LP coefficients in: (a) 4x4; (b) 422 chroma; and (c) 420 chroma block

9.6.2.2 LPPredictionGeneral()

Inputs to this process are the variable MBDCMode for the current macroblock, as well as the values $\text{MbDCLP}[\text{MBx}][\text{MBy}][i][j]$, for each colour component i of the current macroblock, and index j referencing the LP transform coefficients, indexed in raster scan order.

NOTE – The values $\text{MbDCLP}[\text{MBx}][\text{MBy}][i][j]$ come from the LP coefficient remapping process of 9.5.2.

Outputs to this process are the values $\text{MbDCLP}[\text{MBx}][\text{MBy}][i][j]$, for each colour component i of the current macroblock.

The LP prediction process proceeds as specified in Table 131.

Table 131 – Pseudocode for function LPPredictionGeneral()

LPPredictionGeneral() {	Reference
CalcLPPredMode()	9.6.2.3
LPCoefficientPrediction()	9.6.2.4
UpdateLPPredictionVariables()	9.6.2.5
}	

9.6.2.3 Lowpass prediction direction computation

Inputs to this process are the variables MBDCMode and MBQPIndexLP[MBx][MBy].

The output to this process is the value of MBLPMode. The possible values of MBLPMode are as follows: the value 0 represents prediction from the left macroblock; the value 1 represents prediction from the top macroblock; and the value 2 represents no prediction.

The LP prediction direction process proceeds as specified in Table 132.

Table 132 – Pseudocode for function CalcLPPredMode()

CalcLPPredMode() {	Reference
if (MBDCMode == 0 && MBQPIndexLP[MBx][MBy] == MBQPIndexLP[MBx-1][MBy])

/* In this line, prediction occurs using the current macroblock's data */	
} else if (MBDCMODE == 1)	
MbDCLP[MBx][MBy][i][5] += MbDCLP[MBx][MBy][i][1]	
/* When the colour format is YUV422, MBLPMODE is equal to 2 (no prediction), and MBDCMODE is equal to 1 (prediction from the top), the LP coefficient associated with j=5 is predicted from that for j=1 */	
}	
}	

9.6.2.5 Update of lowpass prediction variables

Inputs to this process are the variables MBx and MBy, which index the current macroblock in the image.

Outputs of this process are the variables PredDCLP[MBx][MBy][i][j], for each colour component i, and selected LP indices j.

The update of LP prediction variables process proceeds as specified in Table 134.

Table 134 – Pseudocode for function UpdateLPPredictionVariables()

UpdateLPPredictionVariables() {	Reference
for (i = 0; i < NumComponents; i++) {	
if (i == 0 ((INTERNAL_CLR_FMT != YUV420) && (INTERNAL_CLR_FMT != YUV422))) {

PredDCLP[MBx][MBy][i][6] = MbDCLP[MBx][MBy][i][6]	
}	
}	
}	

9.6.3 Highpass prediction

9.6.3.1 Overview of highpass prediction

This subclause is informative: it is not an integral part of this Specification.

There are two prediction processes involving HP coefficients: the HP prediction direction process and the HP prediction process. The process that computes HP prediction direction also sets the HP direction variable MBHPMode, which determines the initial HP inverse scanning order. Therefore, the process that computes HP prediction direction shall be executed before the HP coefficient inverse scanning process. The HP prediction process is executed after the HP coefficient remapping process.

Information in the LP transform coefficients is used to compute a simple metric to determine the *orientation* of prediction of HP coefficients associated with each macroblock. Three modes are defined for the prediction of the HP coefficients of the outer transform. The same mode is used for all blocks within a macroblock for which in-macroblock prediction is possible. For blocks that have no valid reference within the macroblock, null prediction is used. The three modes are:

- prediction from left when MBHPMode is equal to 0;
- prediction from top when MBHPMode is equal to 1;
- no prediction when MBHPMode is equal to 2.

Prediction from left is shown in Figure 6. Prediction from top is similar, with the pattern of arrows transposed to point downwards.

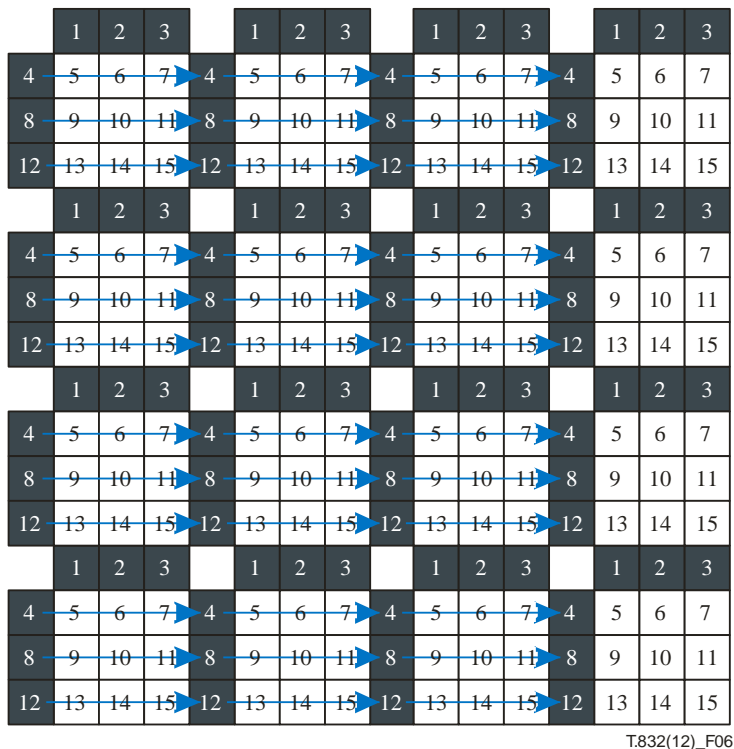

Figure 6 – HP prediction from left

NOTE – In the implementation of a decoder, the only information that needs to be available for future use is 1 DC + 6 LP = 7 coefficients per macroblock component (fewer for YUV420 / YUV422 chrominance). Therefore, at most for YUV444, 21 coefficients need to be cached per macroblock. Furthermore, the coefficients used for prediction from left can be discarded after the next macroblock is predicted. For YUV444, therefore, it is necessary to only cache 12 coefficients per macroblock for use in the next row of macroblocks. More state is required on the encoder side: the HP coefficients must be maintained throughout this process, as the encoding of HP coefficients is dependent on the encoding of LP coefficients.

9.6.3.2 Highpass prediction direction computation

Inputs to this process are the variables MBx and MBy, indexing the location of the current macroblock in the image.

The output of this process is the variable MBHPMode for the current macroblock.

The HP prediction process proceeds as specified in Table 135.

Table 135 – Pseudocode for function CalcHPPredMode()

CalcHPPredMode() {	Reference

}	
}	
iOrWt = 4	
if (iStrHor * iOrWt < iStrVer)	
MBHPMode = 0 /* predict from left */	
else if (iStrVer * iOrWt < iStrHor)	
MBHPMode = 1 /* predict from top */	
else	
MBHPMode = 2 /* no prediction */	
}	

9.6.3.3 Highpass prediction

Inputs to this process are: the variable MBHPMode, which indicates the HP prediction direction; the values MBx and MBy, which index the current macroblock in the image; and the values MBBuffer[MBx][MBy][i][j], which hold the HP transform coefficients obtained from the HP coefficient remapping process of 9.5.3. The outputs of this process are the updated values MBBuffer[MBx][MBy][i][k] of HP transform coefficients.

The HP prediction process proceeds as specified in Table 136.

Table 136 – Pseudocode for function HPCoefficientPrediction()

HPCoefficientPrediction() {	Reference
if (INTERNAL_CLR_FMT == YUV420) (INTERNAL_CLR_FMT == YUV422)	
iComponents = 1	
else	
iComponents = NumComponents	
for (i = 0; i < iComponents; i++) {	
if (MBHPMode == 0) {	
blkId[] = {1,2,3,5,6,7,9,10,11,13,14,15}	
for (j = 0; j < 12; j++) {	
MBBuffer[MBx][MBy][i][16*blkId[j] + 4] += MBBuffer[MBx][MBy][i][16*(blkId[j] - 1) + 4]	
MBBuffer[MBx][MBy][i][16*blkId[j] + 8] += MBBuffer[MBx][MBy][i][16*(blkId[j] - 1) + 8]	
MBBuffer[MBx][MBy][i][16*blkId[j] + 12] += MBBuffer[MBx][MBy][i][16*(blkId[j] - 1) + 12]	
}	
} else if (MBHPMode == 1) {	
blkId[] = {4,5,6,7,8,9,10,11,12,13,14,15}	
for (j = 0; j < 12; j++) {	
MBBuffer[MBx][MBy][i][16*blkId[j] + 1] += MBBuffer[MBx][MBy][i][16*(blkId[j] - 4) + 1]	

9.7 Derivation of quantization parameters

9.7.1 Derivation of DC quantization parameters

9.7.1.1 Image plane level derivation of DC quantization parameters

This process derives the array DCQuantParam[i] of image plane level DC quantization parameters for each colour component i, if these parameters are specified at the image plane level; otherwise, it does nothing, and it is expected that the tile-level derivation process will derive the array DCQuantParam[i], for each tile in the image plane.

The image plane level derivation process of DC quantization parameters proceeds as specified in Table 137.

Table 137 – Pseudocode for function ImagePlaneDCQP()

ImagePlaneDCQP() {	Reference
if (DC_IMAGE_PLANE_UNIFORM_FLAG == TRUE)	
AssignDCQuantizationParameters()	9.7.1.3
}	

NOTE – If DC_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE, the quantization parameters are specified at tile level.

9.7.1.2 Tile level derivation of DC quantization parameters

If these parameters are specified at the tile level, this process derives the array DCQuantParam[i] of tile-level DC quantization parameters for each colour component i. Otherwise, it does nothing and it is assumed that the image plane level derivation process has already derived the array DCQuantParam[i].

The tile-level derivation process of DC quantization parameters proceeds as specified in Table 138.

Table 138 – Pseudocode for function TileLevelDCQP()

TileLevelDCQP() {	Reference
if (DC_IMAGE_PLANE_UNIFORM_FLAG == FALSE)	
AssignDCQuantizationParameters()	9.7.1.3
}	

NOTE – If DC_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, quantization parameters were set at the image plane level.

9.7.1.3 Assignment of DC quantization parameters

The assignment process of DC quantization parameters proceeds as specified in Table 139.

Table 139 – Pseudocode for function AssignDCQuantizationParameters()

AssignDCQuantizationParameters() {	Reference
if (COMPONENT_MODE == UNIFORM)	
for (i = 0; i <= NumComponents-1; i++)	
DCQuantParam[i] = DC_QUANT	
else if (COMPONENT_MODE == SEPARATE) {	
DCQuantParam[0] = DC_QUANT_LUMA	
for (i = 1; i <= NumComponents-1; i++)	
DCQuantParam[i] = DC_QUANT_CHROMA	
} else if (COMPONENT_MODE == INDEPENDENT)	
for (i = 0; i <= NumComponents-1; i++)	
DCQuantParam[i] = DC_QUANT_CH[i]	
}	

9.7.2 Derivation of lowpass quantization parameters

9.7.2.1 Image plane level derivation of lowpass quantization parameters

This process derives the values `LPQuantParam[i][j]` of image plane level LP quantization parameters, for each colour component `i`, and each allowable index `j` (for image plane level LP quantization parameters, `j` can only take the value 0). These values are derived if `LP_IMAGE_PLANE_UNIFORM_FLAG` is equal to `TRUE`, which indicates that these quantization parameters are specified at the image plane level; otherwise, it does nothing, and it is expected that the tile-level derivation process will derive the array `LPQuantParam[i][j]`, for each tile in the image plane.

The image plane level derivation process of LP quantization parameters proceeds as specified in Table 140.

Table 140 – Pseudocode for function ImagePlaneLPQP()

ImagePlaneLPQP() {	Reference
if (<code>LP_IMAGE_PLANE_UNIFORM_FLAG</code>)	
<code>AssignLPQuantizationParameters()</code>	9.7.2.3
}	

NOTE 1 – When `LP_IMAGE_PLANE_UNIFORM_FLAG` is equal to `TRUE`, `NumLPQPs` is always equal to 1.

NOTE 2 – If `LP_IMAGE_PLANE_UNIFORM_FLAG` is equal to `FALSE`, quantization parameters are set at the tile level.

9.7.2.2 Tile level derivation of lowpass quantization parameters

This process derives the values `LPQuantParam[i][j]` of tile-level LP quantization parameters, for each colour component `i`, and each allowable index `j` (ranging from 0 to `NumLPQPs-1`). These values are derived if these quantization parameters are specified at the tile level; otherwise, it does nothing, and the image plane level derivation process derived the array `LPQuantParam[i][j]`, used for each tile in the current image plane.

The tile-level derivation process of LP quantization parameters proceeds as specified in Table 141.

Table 141 – Pseudocode for function TileLevelLPQP()

TileLevelLPQP() {	Reference
if (<code>(LP_IMAGE_PLANE_UNIFORM_FLAG != TRUE) &&</code> <code>(USE_DC_QP_FLAG == TRUE)</code>) {	
<code>NumLPQPs = 1</code>	
for (<code>i = 0; i <= NumComponents-1; i++</code>)	
<code>LPQuantParam[i][0] = DCQuantParam[i]</code>	
} else if (<code>LP_IMAGE_PLANE_UNIFORM_FLAG != TRUE</code>)	
<code>AssignLPQuantizationParameters()</code>	9.7.2.3
}	

NOTE – When `LP_IMAGE_PLANE_UNIFORM_FLAG` is equal to `TRUE`, nothing is done in this function, because quantization parameters were set at image plane level.

9.7.2.3 Assignment of lowpass quantization parameters

The assignment process of LP quantization parameters proceeds as specified in Table 142.

Table 142 – Pseudocode for function AssignLPQuantizationParameters()

AssignLPQuantizationParameters() {	Reference
for (j = 0; j < NumLPQPs; j++) {	
if (COMPONENT_MODE == UNIFORM)	
for (i = 0; i <= NumComponents-1; i++)	
LPQuantParam[i][j] = LP_QUANT[j]	
else if (COMPONENT_MODE == SEPARATE) {	
LPQuantParam[0][j] = LP_QUANT_LUMA[j]	
for (i = 1; i <= NumComponents-1; i++)	
LPQuantParam[i][j] = LP_QUANT_CHROMA[j]	
} else if (COMPONENT_MODE == INDEPENDENT)	
for (i = 0; i <= NumComponents-1; i++)	
LPQuantParam[i][j] = LP_QUANT_CH[i][j]	
}	
}	

9.7.3 Derivation of highpass quantization parameters

9.7.3.1 Image plane level derivation of highpass quantization parameters

This process derives the values HPQuantParam[i][j] of image plane level HP quantization parameters, for each colour component i, and each allowable index j. These values are derived if these quantization parameters are specified at the image plane level; otherwise, it does nothing, and it is expected that the tile-level derivation process will derive the array HPQuantParam[i][j], for each tile in the image plane.

The image plane level derivation process of HP quantization parameters proceeds as specified in Table 143.

Table 143 – Pseudocode for function ImagePlaneHPQP()

ImagePlaneHPQP() {	Reference
if (HP_IMAGE_PLANE_UNIFORM_FLAG)	
AssignHPQuantizationParameters()	9.7.3.3
}	

NOTE 1 – When HP_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, NumHPQPs is always equal to 1.

NOTE 2 – When HP_IMAGE_PLANE_UNIFORM_FLAG is equal to FALSE, quantization parameters are set at the tile level.

9.7.3.2 Tile level derivation of highpass quantization parameters

This process derives the values HPQuantParam[i][j] of tile-level HP quantization parameters, for each colour component i, and each allowable index j (ranging from 0 to NumHPQPs-1). These values are derived if these quantization parameters are specified at the tile level; otherwise, this process has no effect, and it is expected that the image plane level derivation process derived the array HPQuantParam[i][j], used for each tile in the current image plane.

The tile-level derivation process of HP quantization parameters proceeds as specified in Table 144.

Table 144 – Pseudocode for function TileLevelHPQP()

TileLevelHPQP() {	Reference
if ((HP_IMAGE_PLANE_UNIFORM_FLAG != TRUE) && (USE_LP_QP_FLAG == TRUE)) {	
NumHPQPs = NumLPQPs	
for (i = 0; i <= NumComponents-1; i++)	
for (j = 0; j <= NumLPQPs; j++)	
HPQuantParam[i][j] = LPQuantParam[i][j]	
} else if (HP_IMAGE_PLANE_UNIFORM_FLAG != TRUE)	
AssignHPQuantizationParameters()	9.7.3.3
}	

NOTE – When HP_IMAGE_PLANE_UNIFORM_FLAG is equal to TRUE, nothing is done in this function, because quantization parameters were set at image plane level.

9.7.3.3 Assignment of highpass quantization parameters

The assignment process of HP quantization parameters proceeds as specified in Table 145.

Table 145 – Pseudocode for function AssignHPQuantizationParameters()

AssignHPQuantizationParameters() {	Reference
for (j = 0; j < NumHPQPs; j++) {	
if (COMPONENT_MODE == UNIFORM)	
for (i = 0; i <= NumComponents-1; i++)	
HPQuantParam[i][j] = HP_QUANT[j]	
else if (COMPONENT_MODE == SEPARATE) {	
HPQuantParam[0][j] = HP_QUANT_LUMA[j]	
for (i = 1; i <= NumComponents-1; i++)	
HPQuantParam[i][j] = HP_QUANT_CHROMA[j]	
} else if (COMPONENT_MODE == INDEPENDENT)	
for (i = 0; i <= NumComponents-1; i++)	
HPQuantParam[i][j] = HP_QUANT_CH[i][j]	
}	
}	

9.8 Dequantization

9.8.1 Dequantization of DC coefficients

This process is applied for the DC coefficients of a macroblock, for all colour components.

The input to this process is the array DCQuantParam[i] of DC quantization parameters for each colour component i; the array MbDCLP[MBx][MBy][i][0] of DC transform coefficients for each colour component i of the current macroblock; and the variables MBx and MBy which identify the current macroblock in the image.

This process uses the local variable array iQuantScalingFactor[i], holding the scaling factor, for each colour component i.

The output of this process is an array of scaled DC transform coefficients MbDCLP[MBx][MBy][i][0], for each colour component i.

The dequantization process for DC coefficients proceeds as specified in Table 146.

Table 146 – Pseudocode for function DequantizeDCCoefficients()

DequantizeDCCoefficients() {	Reference
for (i = 0; i < NumComponents; i++) {	
if (i == 0)	
iQuantScalingFactor[i] = QuantMap(DCQuantParam[i], 1)	9.8.4
else	
iQuantScalingFactor[i] = QuantMap(DCQuantParam[i], 0)	9.8.4
MbDCLP[MBx][MBy][i][0] = MbDCLP[MBx][MBy][i][0] * iQuantScalingFactor[i]	
}	
}	

9.8.2 Dequantization of lowpass coefficients

This process is applied for the LP coefficients of an entire macroblock, for all colour components.

Inputs to this process are the values LPQuantParam[i][j] of LP quantization parameters, for each colour component i and index j; the quantization parameter index MBQPIndexLP[MBx][MBy]; the array MbDCLP[MBx][MBy][i][j] of LP transform coefficients, with i representing the colour component, and j referencing the LP transform coefficients, indexed in raster scan order.

The output of this process is an array of scaled LP transform coefficients MbDCLP[MBx][MBy][i][j], for each colour component i and index j ranging from 1 to 15, referencing the respective LP transform coefficient.

The dequantization process for LP coefficients proceeds as specified in Table 147.

Table 147 – Pseudocode for function DequantizeLPCoefficients()

DequantizeLPCoefficients() {	Reference
for (i = 0; i < NumComponents; i++) {	
k = MBQPIndexLP[MBx][MBy]	
valueQP[i] = LPQuantParam[i][k]	
if (i == 0)	
iQuantScalingFactor[i] = QuantMap(valueQP[i], 1)	9.8.4
else	
iQuantScalingFactor[i] = QuantMap(valueQP[i], 0)	9.8.4
if (i == 0) /* Luma Component */	
for (j = 1; j <= 15; j++)	
MbDCLP[MBx][MBy][i][j] = MbDCLP[MBx][MBy][i][j] * iQuantScalingFactor[i]	
else if ((INTERNAL_CLR_FMT != YUV422) && (INTERNAL_CLR_FMT != YUV420))	
for (j = 1; j <= 15; j++)	
MbDCLP[MBx][MBy][i][j] = MbDCLP[MBx][MBy][i][j] * iQuantScalingFactor[i]	
else if (INTERNAL_CLR_FMT == YUV422)	
for (j = 1; j <= 7; j++)	
MbDCLP[MBx][MBy][i][j] = MbDCLP[MBx][MBy][i][j] * iQuantScalingFactor[i]	
else /* if (INTERNAL_CLR_FMT == YUV420) */	
for (j = 1; j <= 3; j++)	
MbDCLP[MBx][MBy][i][j] = MbDCLP[MBx][MBy][i][j] * iQuantScalingFactor[i]	
}	
}	

9.8.3 Dequantization of highpass coefficients

This process is applied for the HP coefficients of an entire macroblock, for all colour components.

Inputs to this process are the values HPQuantParam[i][j] of HP quantization parameters, for each colour component i and index j; the quantization parameter index MBQPIndexHP[MBx][MBy]; the array MBBuffer[MBx][MBy][i][j] of HP transform coefficients, where i and j are indices, with i representing the colour component, and j ranging from 1 to 255.

The output of this process is an array of scaled HP transform coefficients $MBBuffer[MBx][MBy][i][j]$, for each colour component i and index j ranging from 1 to 255, referencing the respective HP transform coefficient.

The dequantization process for HP coefficients proceeds as specified in Table 148.

Table 148 – Pseudocode for function DequantizeHPCoefficients()

DequantizeHPCoefficients() {	Reference
for (i = 0; i < NumComponents; i++) {	
k = MBQPIndexHP[MBx][MBy]	
valueQP[i] = HPQuantParam[i][k]	
iQuantScalingFactor[i] = QuantMap(valueQP[i], 1)	9.8.4
if (i == 0) /* Luma Component */	
for (blkIndex = 0; blkIndex <= 15; blkIndex++)	
for (j = 1; j <= 15; j++)	
MBBuffer[MBx][MBy][i][16*blkIndex + j] =	
MBBuffer[MBx][MBy][i][16*blkIndex + j] *	
iQuantScalingFactor[i]	
else if ((INTERNAL_CLR_FMT != YUV422) &&	
(INTERNAL_CLR_FMT != YUV420))	
for (blkIndex = 0; blkIndex <= 15; blkIndex++)	
for (j = 1; j <= 15; j++)	
MBBuffer[MBx][MBy][i][16*blkIndex + j] =	
MBBuffer[MBx][MBy][i][16*blkIndex + j] *	
iQuantScalingFactor[i]	
else if (INTERNAL_CLR_FMT == YUV422)	
for (blkIndex = 0; blkIndex <= 7; blkIndex++)	
for (j = 1; j <= 15; j++)	
MBBuffer[MBx][MBy][i][16*blkIndex + j] =	
MBBuffer[MBx][MBy][i][16*blkIndex + j] *	
iQuantScalingFactor[i]	
else /* if (INTERNAL_CLR_FMT == YUV420) */	
for (blkIndex = 0; blkIndex <= 3; blkIndex++)	
for (j = 1; j <= 15; j++)	
MBBuffer[MBx][MBy][i][16*blkIndex + j] =	
MBBuffer[MBx][MBy][i][16*blkIndex + j] *	
iQuantScalingFactor[i]	
}	
}	

9.8.4 QuantMap()

The function QuantMap is used above to compute the scaling parameters based on the parsed syntax elements QP. The pseudocode for this function is specified in Table 149.

Table 149 – Pseudocode for function QuantMap()

QuantMap(iQP, iScaledShift) {	Reference
if (0 == iQP)	
iQuantScalingFactorResult = 1	
else if (!SCALED_FLAG) {	
iNotScaledShift = -2	
if (iQP < 32) {	
iMan = (iQP + 3) >> 2	
iExp = 0	
} else if (iQP < 48) {	
iMan = (16 + (iQP % 16) + 1) >> 1	
iExp = (iQP >> 4) + iNotScaledShift	
} else {	
iMan = 16 + (iQP % 16)	
iExp = (iQP >> 4) - 1 + iNotScaledShift	
}	
iQuantScalingFactorResult = iMan << iExp	
} else /* SCALED_FLAG is TRUE, but not (0 == iQP) */	

QuantMap(iQP, iScaledShift) {	Reference
if (iQP < 16) {	
iMan = iQP	
iExp = iScaledShift	
} else {	
iMan = 16 + (iQP % 16)	
iExp = ((iQP >> 4) - 1) + iScaledShift	
}	
iQuantScalingFactorResult = iMan << iExp	
}	
return iQuantScalingFactorResult	
}	

NOTE – The input parameter iScaledShift takes the value of either 0 or 1, dependent on the component and band. When SCALED_FLAG is equal to TRUE, the quantization scaling factor value can be modified by a power of 2. See the Note to 9.9.2.

9.9 Sample reconstruction

9.9.1 Overview

Inputs to this process are the values MbDCLP[MBx][MBy][i][j] and MBBuffer[MBx][MBy][i][j] for the entire image plane, and the syntax element OVERLAP_MODE.

Outputs of this process are the decoded samples for the image plane.

The sample reconstruction process proceeds as specified in Table 150.

Table 150 – Pseudocode for function SampleReconstruction()

SampleReconstruction() {	Reference
FirstLevelInverseTransform()	9.9.2
if (OVERLAP_MODE == 2)	
FirstLevelOverlapFiltering()	9.9.3
SecondLevelCoefficientCombination()	9.9.4
SecondLevelInverseTransform()	9.9.5
if (OVERLAP_MODE != 0)	
SecondLevelOverlapFiltering()	9.9.6
}	

NOTE – Because the first level overlap filtering process in general involves interaction with adjacent macroblocks, the first level transform process must be complete for these adjacent macroblocks, prior to the overlap filtering process being invoked. The precedence of this relationship also holds between the second level processes: the second level's transform process must be complete for the adjacent macroblocks prior to the second level overlap filtering process.

9.9.2 First level inverse transform

Inputs to this process are the values MbDCLP[MBx][MBy][i][j] for the entire colour component.

Outputs to this process are the modified values MbDCLP[MBx][MBy][i][j] for the current macroblock.

The first level inverse transform process is specified as specified in Table 151.

Table 151 – Pseudocode for function FirstLevelInverseTransform()

FirstLevelInverseTransform() {	Reference
for (i = 0; i < NumComponents; i++)	
for (MBy = 0; MBy < MBHeight; MBy++)	
for (MBx = 0; MBx < MBWidth; MBx++)

if ((i > 0) && SCALED_FLAG)	
for (j = 0; j <= 3; j++)	
MbDCLP[MBx][MBy][i][j] = 2 * MbDCLP[MBx][MBy][i][j]	
} else if (INTERNAL_CLR_FMT == YUV422) {	
arrayLocal[] = {MbDCLP[MBx][MBy][i][0], MbDCLP[MBx][MBy][i][4]}	
T2pt(arrayLocal[])	9.9.7.7
MbDCLP[MBx][MBy][i][0] = arrayLocal[0]	
MbDCLP[MBx][MBy][i][4] = arrayLocal[1]	
T2x2h(MbDCLP[MBx][MBy][i][], 0)	9.9.7.2
arrayLocal[] = {MbDCLP[MBx][MBy][i][1], MbDCLP[MBx][MBy][i][2]}	
InvPermute2pt(arrayLocal[])	9.9.7.6
MbDCLP[MBx][MBy][i][1] = arrayLocal[0]	
MbDCLP[MBx][MBy][i][2] = arrayLocal[1]	
arrayLocal[] = {MbDCLP[MBx][MBy][i][4], MbDCLP[MBx][MBy][i][6], MbDCLP[MBx][MBy][i][5], MbDCLP[MBx][MBy][i][7]}	
T2x2h(arrayLocal[], 0)	9.9.7.2
MbDCLP[MBx][MBy][i][4] = arrayLocal[0]	
MbDCLP[MBx][MBy][i][6] = arrayLocal[1]	
MbDCLP[MBx][MBy][i][5] = arrayLocal[2]	
MbDCLP[MBx][MBy][i][7] = arrayLocal[3]	
arrayLocal[] = {MbDCLP[MBx][MBy][i][5], MbDCLP[MBx][MBy][i][6]}	
InvPermute2pt(arrayLocal[])	9.9.7.6
MbDCLP[MBx][MBy][i][5] = arrayLocal[0]	
MbDCLP[MBx][MBy][i][6] = arrayLocal[1]	
if ((i > 0) && SCALED_FLAG)	
for (j = 0; j <= 7; j++)	
MbDCLP[MBx][MBy][i][j] = 2 * MbDCLP[MBx][MBy][i][j]	
}	
}	
}	

NOTE – The purpose of the multiplication by 2 for chroma components, in circumstances where scaling is involved, is to re-normalize the chroma with respect to the Y component. Due to possible conversion from RGB to YUV during encoding, the U and V components may have a numerical range that has increased by one bit. If SCALED_FLAG is equal to TRUE, the dynamic range of the (DC and LP) U and V component values could potentially grow beyond 16 bits, due to the numerical range expansion associated with the two levels of transform on the encode side (for the DC and LP coefficients). Therefore, the quantization parameter for these chroma components is set to half the value used for luma components. The coefficients are scaled by this factor of two at the end of the first level transform process.

9.9.3 First level overlap filtering

9.9.3.1 Overview

NOTE – The process specification in this subclause formalizes the geometric nature of the overlap filtering process. The various cases are described in the following.

- interior: At every point where four 4×4 blocks meet in a corner, the 4×4 overlap filter process is applied to the 4×4 block straddling these four blocks evenly (i.e., overlapping with a 2×2 corner of each block). When HARD_TILING_FLAG is equal to FALSE, the 4×4 overlap filter process is applied across tile boundaries as well.
- top and bottom two rows: Along both the top two sample rows and the bottom two sample rows, a 4-point overlap filter process is applied evenly across adjacent block boundaries (overlapping with a 1×2 strip of each block). When HARD_TILING_FLAG is equal to TRUE, the 4-point overlap filter process is applied across the top 2 rows and bottom 2 rows of tiles as well.
- rightmost and leftmost two columns: Along both the leftmost two sample columns and the rightmost two sample columns, a 4-point overlap filter process is applied evenly across adjacent block boundaries (overlapping with a 2×1 strip of each block). When HARD_TILING_FLAG is equal to TRUE, the 4-point overlap filter process is applied across the top 2 columns and bottom 2 columns of tiles as well.
- four corners: Over the corner 2×2 blocks in the top-left, top-right, bottom-left and bottom-right, a 4-point overlap filter process is applied in a raster scan order (top-left, top-right, bottom-left, then bottom-right). When HARD_TILING_FLAG is equal to TRUE, the 4-point overlap filter process is applied to the four corners of each tile as well.

Additionally, when INTERNAL_CLR_FMT is equal to either YUV422 or YUV420, alternate processes are considered for the chroma components for each of the above cases. These cases are described in the following.

- chroma interior: The 2×2 overlap filter process is applied to the 2×2 block straddling interior block boundaries. When HARD_TILING_FLAG is equal to FALSE, the 2×2 overlap filter process is applied across tile boundaries as well.
- chroma top and bottom rows: Along both the top sample row and the bottom sample row, a 2-point overlap filter process is applied evenly across adjacent block boundaries. When HARD_TILING_FLAG is equal to TRUE, the 2-point overlap filter process is applied across the top row and bottom row of tiles as well.
- chroma rightmost and leftmost columns: Along both the leftmost sample column and the rightmost sample column, a 2-point overlap filter process is applied evenly across adjacent block boundaries. When HARD_TILING_FLAG is equal to TRUE, the 2-point overlap filter process is applied across the top column and bottom column of tiles as well.
- chroma four corners: Over the corner 1×1 blocks in the top-left, top-right, bottom-left and bottom-right, an adjacent coefficient residual process (specified in 9.9.3.3 and 9.9.3.4) is applied. When HARD_TILING_FLAG is equal to TRUE, the adjacent coefficient residual process is applied to the four corners of each tile as well.

Inputs to this process are the values MbDCLP[MBx][MBy][i][j] for the entire image plane, and the values MBWidth and MBHeight.

Outputs to this process are the modified values MbDCLP[MBx][MBy][i][j] for the current macroblock.

The first level overlap filtering process is specified in Table 152.

Table 152 – Pseudocode for function FirstLevelOverlapFiltering()

FirstLevelOverlapFiltering() {	Reference

9.9.4 Second level coefficient combination

NOTE – At this point in the process, the DC-LP array coefficients have gone through the first level transform and overlap filtering. The DC-LP array coefficients and the HP coefficients are then combined in an image plane represented by the values ImagePlane[i][x][y], where the colour component is specified by i, and x and y mark the location of the sample in the image plane.

Inputs to this process are the values MbDCLP[MBx][MBy][i][j] and MBBuffer[MBx][MBy][i][j], for the current macroblock.

Outputs to this process are the values of ImagePlane[i][x][y], for the current macroblock.

The second level coefficient combination process proceeds as specified in Table 157.

Table 157 – Pseudocode for function SecondLevelCoefficientCombination()

SecondLevelCoefficientCombination() {	Reference
for (i = 0; i < NumComponents; i++) {	
for (MBy = 0; MBy < MBHeight; MBy++)

ImagePlane[i][x+3][y+3] = arrayLocal[15]	
}	
}	

9.9.6 Second level overlap filtering

Inputs to this process are the values ImagePlane[i][x][y] for the entire image plane.

Outputs to this process are the modified values ImagePlane[i][x][y] for the entire image plane.

Outputs to this process are the modified values ImagePlane[i][x][y] for the current macroblock.

NOTE – The process specification below formalizes the geometric nature of the overlap filtering process. There are 4 cases.

- (1) (interior): at every point in the image plane where 4 blocks meet in a corner, the 4×4 overlap filter is applied to the 4×4 block straddling these 4 blocks evenly (i.e., overlapping with a 2×2 corner of each block).
- (2) (top and bottom 2 rows): along both the top two sample rows and the bottom two sample rows of the image plane, the 4-point overlap filter is applied evenly across adjacent block boundaries (overlapping with a 1×2 strip of each block).
- (3) (rightmost and leftmost columns): along both the leftmost two sample columns and the rightmost two sample columns, the 4-point overlap filter is applied evenly across adjacent block boundaries (overlapping with a 2×1 strip of each block).
- (4) (four corners of the image plane): over the corner 2×2 blocks in the top-left, top-right, bottom-left and bottom-right, the 4-point overlap filter process is applied in a raster scan order (top-left, top-right, bottom-left, then bottom-right).

The second level overlap filtering process is specified in Table 159.

Table 159 – Pseudocode for function SecondLevelOverlapFiltering()

9.9.7 Inverse transform basic operations

9.9.7.1 ICT4x4()

NOTE 1 – The 2D ICT4x4() is built using the three operators: T2x2h, InvTodd and InvToddodd, preceded by the permutation function InvPermute. After the initial permutation, the transform operation consists of two stages, where each stage operates on all 16 of the input values.

The function ICT4x4() is specified by the pseudocode in Table 160.

Table 160 – Pseudocode for function ICT4x4()

iCoeff[11] = arrayLocal[3]	
}	

NOTE 2 – Each stage consists of four 2×2 transforms that may be done in any arbitrary sequence or concurrently within the stage. However, the first stage transforms must be complete before any of the second stage transforms are initiated.

9.9.7.2 T2x2h()

The function T2x2h() is specified in Table 161.

NOTE – The variable valRound is a rounding control variable. The value of valRound is set to 0 or 1 by the function that invokes T2x2h(). The inverse of T2x2Th() is two successive applications of T2x2Th, operating on variables of the array iCoeff[] with the same value of valRound.

Table 161 – Pseudocode for function T2x2h()

T2x2h(iCoeff[], valRound) {	Reference
iCoeff[0] += iCoeff[3]	
iCoeff[1] -= iCoeff[2]

iCoeff[3] = ((iCoeff[0] + 1) >> 1) - iCoeff[3]	
iCoeff[1] += iCoeff[2]	
iCoeff[0] -= iCoeff[3]	
}	

9.9.7.4 InvToddodd()

The function, InvToddodd() is specified by the pseudocode in Table 163.

Table 163 – Pseudocode for function InvToddodd

InvToddodd(iCoeff[]) {	Reference
iCoeff[3] += iCoeff[0]	
iCoeff[2] -= iCoeff[1]	
valT1 = iCoeff[3] >> 1	
valT2 = iCoeff[2] >> 1	
iCoeff[0] -= valT1	
iCoeff[1] += valT2	
iCoeff[0] -= ((iCoeff[1] * 3 + 3) >> 3)	
iCoeff[1] += ((iCoeff[0] * 3 + 3) >> 2)	
iCoeff[0] -= ((iCoeff[1] * 3 + 4) >> 3)	
iCoeff[1] -= valT2	
iCoeff[0] += valT1	
iCoeff[2] += iCoeff[1]	
iCoeff[3] -= iCoeff[0]	
iCoeff[1] = -iCoeff[1]	
iCoeff[2] = -iCoeff[2]	
}	

9.9.7.5 InvPermute()

The function InvPermute() operates on an ordered array of 16 sample values, producing a permuted list. The input to this function is the ordered array arrayInput[i], for i ranging from 0 to 15. The output of this function is the re-ordered array arrayInput[i].

To define the permutation, the array InvPermArr[i] is specified, for i ranging from 0 to 15, in Table 164.

Table 164 – Inverse Permutation

i	InvPermArr[i]
0	0
1	8
2	4
3	13
4	2

i	InvPermArr[i]
5	15
6	3
7	14
8	1
9	12
10	5
11	9
12	7
13	11
14	6
15	10

The function `InvPermute()` is specified in Table 165.

Table 165 – Pseudocode for function `InvPermute()`

InvPermute(arrayInput[]) {	Reference
for (i = 0; i <= 15; i++)	
arrayTemp[InvPermArr[i]] = arrayInput[i]	
for (i = 0; i <= 15; i++)	
arrayInput[i] = arrayTemp[i]	
}	

9.9.7.6 `InvPermute2pt()`

The function `InvPermute2pt()` operates on an ordered array of 2 sample values, producing a permuted list. The input to this function is the ordered array `arrayInput[i]`, for `i` ranging from 0 to 1. The output of this function is the re-ordered array `arrayInput[i]`.

The function `InvPermute2pt()` is specified in Table 166.

Table 166 – Pseudocode for function `InvPermute2pt()`

InvPermute2pt() {	Reference

iCoeff[3] -= iCoeff[0]	
}	

9.10 Output formatting

The final stage of the decoder consists of converting the sample values reconstructed in the internal format to the intended output format as specified in 9.10.2.

9.10.1 Overview

This subclause is informative: it is not an integral part of this Specification.

First, the decoder may be required to perform upsampling to obtain an intermediate YUV444 format. Next, colour format conversion is applied to convert the internal colour formats to output formats. The colour format conversions are specified in the following. A bias is added to the sample values, to re-centre the values around the nominal value for a neutral or zero intensity representation. When the scaling mode is used, on the decoder side, the values are rounded down after colour conversion. For high numerical range formats (BD16, BD16S, BD32S and BD32F), the internal integer representations need to be converted to output representations. Finally, the values are clipped to fit the appropriate range.

9.10.2 Output formatting stage

At the completion of the transform and overlap filtering, the sample values for the image are reconstructed in an internal colour format and an internal two's complement integer representation. The output formatting stage converts the decoded image plane data into a representation specified by the OUTPUT_CLR_FMT and the output bit depth. In the specification of output formatting, the term INTERNAL_CLR_FMT refers to the corresponding syntax element of the primary image plane.

The output formatting process is specified for the combinations of OUTPUT_BITDEPTH and OUTPUT_CLR_FMT that are listed in Table 176.

In Table 176, "+" indicates that output formatting is specified for the corresponding combinations of OUTPUT_BIT_DEPTH and OUTPUT_CLR_FMT. The combination of OUTPUT_BIT_DEPTH and OUTPUT_CLR_FMT shall not have the value corresponding to empty cells.

Table 176 – Conformance-specified output formatting combinations of OUTPUT_BITDEPTH and OUTPUT_CLR_FMT

OUTPUT_BITDEPTH	OUTPUT_CLR_FMT								
	YONLY	YUV420	YUV422	YUV444	RGB	RGBE	CMYK	CMYKDIRECT	NCOMPONENT
BD1WHITE1	+								
BD1BLACK1	+								
BD5					+				
BD565					+				
BD8	+	+	+	+	+	+	+	+	+
BD10			+	+	+				
BD16	+		+	+	+		+	+	+
BD16S	+			+	+				
BD16F	+				+				
BD32S	+				+				
BD32F	+				+				

The output formatting stage consists of several sub-processes that are performed as specified in Table 177.

Table 177 – Pseudocode for function OutputFormatting()

OutputFormatting() {	Reference

PostscalingProcess()	9.10.7.1
ClippingAndPackingStage()	9.10.8.1
}	

9.10.3 Sampling conversion

9.10.3.1 General

The sampling conversion process is specified in Table 178.

The combinations of INTERNAL_CLR_FMT and OUTPUT_CLR_FMT for which sampling conversions are specified for conformance purposes are specified in Table 179. In Table 179, "+" indicates that no sampling conversion is required. It is a requirement of codestream conformance to this Specification that the combination of INTERNAL_CLR_FMT and OUTPUT_CLR_FMT shall not have a value corresponding to any empty cell in Table 179.

In the illustrated case in Table 178 in which upsampling is specified both vertically and horizontally for INTERNAL_CLR_FMT equal to YUV420, the upsampling process to be performed by the decoder shall produce an array of two-dimensionally upsampled samples at the index values for which such samples are produced as specified in Table 178. However, decoders may use alternative upsampling methods (different from that specified in Table 178) – the actual filtering method used to produce the values of the entries in the upsampled array is outside the scope of this Specification. The particular filtering method specified in Table 178 is an example of how such upsampled array values may be produced. For example, upsampling may be applied both vertically and horizontally as a single process or the relative ordering of the vertical and horizontal upsampling may be switched.

NOTE – When TILING_FLAG is equal to TRUE and the transform processing does not cross tile boundaries (due either to HARD_TILING_FLAG being equal to TRUE or OVERLAP_MODE being equal to 0), the example upsampling method illustrated in Table 178 for cases with INTERNAL_CLR_FMT equal to YUV422 or YUV420 will produce an upsampled image in which the output samples next to tile boundaries may be affected by the values of decoded samples in other tiles. For many applications, it may be desirable to instead design the upsampling process to be performed separately within each tile in order to avoid this cross-tile dependency.

Table 178 – Pseudocode for function SamplingConversion()

SamplingConversion() {	Reference
if (((INTERNAL_CLR_FMT == YUV422) (INTERNAL_CLR_FMT == YUV420)) && ((OUTPUT_CLR_FMT == YUV444) (OUTPUT_CLR_FMT == RGB)) {

CMYK					+	
CMYKDIRECT					+	
NCOMPONENT						+

9.10.3.2 Upsample()

In the chroma upsampling function, for the chroma component i ($1 \leq i < \text{NumComponents}$), let $i\text{OriArray}[]$ be the original sample array before upsampling, and $i\text{IntArray}[]$ be the upsampled array. If upsampling is performed in the horizontal direction, $i\text{OriArray}[]$ is one input sample row of length $\text{ExtendedWidth}[i]$ and $i\text{IntArray}[]$ is one output sample row of length $\text{ExtendedWidth}[0]$, and the variable $i\text{OriLength}$ is set equal to $\text{ExtendedWidth}[i]$. Otherwise, $i\text{OriArray}[]$ is one input sample column of length $\text{ExtendedHeight}[i]$ and $i\text{IntArray}[]$ is one output sample column of length $\text{ExtendedHeight}[0]$, and $i\text{OriLength}$ is set equal to $\text{ExtendedHeight}[i]$.

The upsampling process to be performed by the decoder shall produce an array of upsampled samples at the index values for which such samples are produced as specified in Table 180. However, decoders may use alternative upsampling methods (different from that specified in Table 180) – the actual filtering method used to produce the values of the entries in the upsampled array is outside the scope of this Specification. The particular filtering method specified in Table 180 is an example of how such upsampled array values may be produced. For example, a different type of filtering or a different number of taps may be used during the upsampling process than the two-tap filtering specified in Table 180.

Table 180 – Pseudocode for function Upsample()

Upsample() {	Reference
for ($k = 0$; $k < i\text{OriLength}$; $k++$) {	
$i\text{IntArray}[2 * k] = ((iH[2] * i\text{OriArray}[\text{Max}(0, k - 1)] + iH[3] * i\text{OriArray}[k] + 4) \gg 3)$	
$i\text{IntArray}[2 * k + 1] = ((iH[0] * i\text{OriArray}[k] + iH[1] * i\text{OriArray}[\text{Min}(i\text{OriLength} - 1, k + 1)] + 4) \gg 3)$	
}	
}	

The values of the filter coefficients iH[0], iH[1], iH[2], iH[3] for the chroma positions are specified in Table 181 as a function of the variable chromaCentering. If Upsample() is applied in the horizontal direction, chromaCentering is set equal to CHROMA_CENTERING_X; otherwise, it is set equal to CHROMA_CENTERING_Y.

Table 181 – Upsampling filter coefficient for different chroma positions

chromaCentering	iH[0]	iH[1]	iH[2]	iH[3]
0	4	4	0	8
1	5	3	1	7
2	6	2	2	6
3	7	1	3	5
4	8	0	4	4

9.10.4 Conversion from INTERNAL_CLR_FMT to OUTPUT_CLR_FMT

9.10.4.1 Overview

The conversion process proceeds as specified in Table 182.

The combinations of INTERNAL_CLR_FMT and OUTPUT_CLR_FMT for which colour format conversions are specified for conformance purposes are specified in Table 183. In Table 183, "+" indicates that no colour format conversion is required. For cases that require colour format conversion, the function name for the conversion process is specified in the table cell. It is a requirement of codestream conformance to this Specification that the combination of INTERNAL_CLR_FMT and OUTPUT_CLR_FMT shall not have a value corresponding to any empty cell in Table 183.

Table 183 – Conformance-specified colour format conversions

}	
}	
}	
}	

9.10.7 Postscaling process

9.10.7.1 Overview

The function PostscalingProcess() is specified in Table 190.

Table 190 – Pseudocode for function PostscalingProcess()

PostscalingProcess() {	Reference
if (OUTPUT_CLR_FMT == RGBE)	
for (y = 0; y < ExtendedHeight[0]; y++)	
for (x = 0; x < ExtendedWidth[0]; x++) {	
for (k = 0; k < 3; k++)	
localArrayIn[k] = ImagePlane[k][x][y]	
PostScalingF2(localArrayOut[], localArrayIn[]) /* Produces 4 outputs for 3 inputs */	9.10.7.4
for (k = 0; k < 4; k++)	
ImagePlane[k][x][y] = localArrayOut[k]	
}	
else {	
if ((OUTPUT_CLR_FMT == RGB) (OUTPUT_CLR_FMT == YUV444)	
(OUTPUT_CLR_FMT == YUV422) (OUTPUT_CLR_FMT == YUV420))	
outputComponents = 3	
else	
outputComponents = NumComponents	
for (i = 0; i < outputComponents; i++) {	
if ((i > 0) && (OUTPUT_CLR_FMT == YUV420))	
outputHeight = ExtendedHeight[0] / 2	
else	
outputHeight = ExtendedHeight[0]	
if ((i > 0) &&	
((OUTPUT_CLR_FMT == YUV422) (OUTPUT_CLR_FMT == YUV420)))	
outputWidth = ExtendedWidth[0] / 2	
else	
outputWidth = ExtendedWidth[0]	
if ((OUTPUT_BITDEPTH == BD16) (OUTPUT_BITDEPTH == BD16S)	
(OUTPUT_BITDEPTH == BD32S))	
for (y = 0; y < outputHeight; y++)	
for (x = 0; x < outputWidth; x++)	
ImagePlane[i][x][y] = PostScalingInt(ImagePlane[i][x][y])	9.10.7.2
else if ((OUTPUT_BITDEPTH == BD32F) (OUTPUT_BITDEPTH == BD16F))	
for (y = 0; y < outputHeight; y++)	
for (x = 0; x < outputWidth; x++)	
ImagePlane[i][x][y] = PostScalingFl(ImagePlane[i][x][y])	9.10.7.3
}	
}	
}	

9.10.7.2 PostScalingInt()

The sample values are left-shifted by the amount determined by SHIFT_BITS. For input value inX, the output shifted value outX is determined as specified in Table 191.

Table 191 – Pseudocode for function PostScalingInt()

PostScalingInt(inX) {	Reference
outX = inX << SHIFT_BITS	
return outX	
}	

NOTE – In this manner, the output is moved from a 27-bit or 24-bit nominal range scaling to the range scaling specified for image reconstruction. The 27-bit range scaling applies when the data is scaled, and the 24-bit range scaling applies when the data is unscaled.

9.10.7.3 PostScalingFl()

When OUTPUT_BITDEPTH is equal to BD32F or BD16F, the integer sample value iX is converted to a value fV that can be interpreted as a floating point representation.

The PostScalingFl() process computes the value fV as specified in Table 192.

Table 192 – Pseudocode for function PostScalingFl()

PostScalingFl(iX) {	Reference
if (iX < 0)	
iS = 1	
else	
iS = 0	
if (OUTPUT_BITDEPTH == BD16F) {	
iEM = Min(Abs(iX), 32767)	
fV = ((iS << 15) iEM) /* Concatenate these fields*/	
} else { /* OUTPUT_BITDEPTH == BD32F */	
iX = Abs(iX)	
iE = (iX >> LEN_MANTISSA)	
iM = ((iX & ((1 << LEN_MANTISSA) - 1)) (1 << LEN_MANTISSA))	
if (iE == 0) {	
iM ^= (1 << LEN_MANTISSA)	
iE = 1	
}	
iE = iE - EXP_BIAS + 127	
while ((iM < (1 << LEN_MANTISSA)) && (iE > 1) && (iM > 0)) {	
iE -= 1	
iM <<= 1	
}	
if (iM < (1 << LEN_MANTISSA))	
iE = 0	
else	
iM ^= (1 << LEN_MANTISSA)	
iM <<= (23 - LEN_MANTISSA)	
fV = ((iS << 31) (iE << 23) iM) /* Concatenate these fields */	
}	
return fV	
}	

9.10.7.4 PostScalingF2()

When OUTPUT_CLR_FMT is equal to RGBE, the three integer sample values of array arrayIn[] (R, G, and B) are converted to an array arrayOut[] of four integer values forming the RGBE representation (Rrgbe, Grgbe, Brgbe and Ergbe). The function PostScalingF2() specified in Table 193 performs the conversion.

Table 193 – Pseudocode for function PostScalingF2()

PostScalingF2(arrayOut[], arrayIn[]) {	Reference
/* arrayIn[] = {R, G, B} */	
/* arrayOut[] = {Rrgbe, Grgbe, Brgbe, Ergbe} */

} else {	
arrayOut[2] = arrayIn[2]	
iEb = 1	
}	
arrayOut[3] = Max(iEr, Max(iEg, iEb))	
if (arrayOut[3] > iEr) {	
iShift = (arrayOut[3] - iEr)	
arrayOut[0] = ((2 * arrayOut[0] + 1) >> (iShift + 1))	
}	
if (arrayOut[3] > iEg) {	
iShift = (arrayOut[3] - iEg)	
arrayOut[1] = ((2 * arrayOut[1] + 1) >> (iShift + 1))	
}	
if (arrayOut[3] > iEb) {	
iShift = (arrayOut[3] - iEb)	
arrayOut[2] = ((2 * arrayOut[2] + 1) >> (iShift + 1))	
}	
}	

9.10.8 Clipping and packing stage

9.10.8.1 General

The ClippingAndPackingStage() process by which clipping, packing, and windowing are performed is specified in Table 194. The clipping ensures that the sample values are constrained to the appropriate range. The packing process packs multiple samples into single variables for some values of OUTPUT_BITDEPTH. The windowing process uses the LEFT_MARGIN, TOP_MARGIN, WIDTH_MINUS1 and HEIGHT_MINUS1 syntax elements to discard the data outside of the image area that is to be output.

Table 194 – Pseudocode for function ClippingAndPackingStage()

ClippingAndPackingStage() {	Reference

Annex A

Tag-based file format

(This annex forms an integral part of this Recommendation | International Standard.)

A.1 General

This annex specifies a format for files containing JPEG XR images. It uses syntax structures (IFD_ENTRY() structures as specified in A.7) that each contain a syntax element (FIELD_TAG as specified in A.7.2) that can be referred to as a tag. Therefore, this file format is referred to as being tag-based. The value of the tag serves as an identifier of the type of data contained in the syntax structure that is associated with the tag.

NOTE 1 – The file format specified in this annex is based on that specified for use in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451), and is intended to provide a form of consistency and compatibility with those documents – e.g. to enable the sharing of some functional components designed for reading, writing, and otherwise making use of such files.

NOTE 2 – This specification of this file format does not preclude the existence of alternative file format specifications for files containing JPEG XR images.

NOTE 3 – When a file is formatted as specified in this annex, in addition to the syntax structures that are specified by this annex, arbitrary data (formatted in a manner not specified by this annex) may also be present at locations within the file that lie between or beyond the locations in the file that contain the syntax structures specified by this annex.

NOTE 4 – The use of the filename extension ".jxr" is suggested for files conforming to the file format specified in this annex.

The FILE_HEADER() syntax structure specified in clause A.5 shall be present at the beginning of the file (at byte position 0).

The variable FileSizeInBytes is considered to be equal to the total number of bytes in the file. The method of determining the value of FileSizeInBytes is determined by the application and is not specified in this Specification. The value of FileSizeInBytes shall not exceed $2^{32} - 1$.

For purposes of this Specification, a decoder is assumed to be capable of either storing the entire file in random access memory or performing random access seek operations to access the data at arbitrary specified positions in the file.

A.2 Normative references

The following Recommendations and International Standards contain provisions which, through reference in this text, constitute provisions of this annex to this Recommendation | International Standard. At the time of publication, the editions indicated were valid. All Recommendations and Standards are subject to revision, and parties to agreements based on this Recommendation | International Standard are encouraged to investigate the possibility of applying the most recent edition of the Recommendations and Standards listed below. Members of IEC and ISO maintain registers of currently valid International Standards. The Telecommunication Standardization Bureau of the ITU maintains a list of currently valid ITU-T Recommendations.

A.2.1 Identical Recommendations | International Standards

None.

A.2.2 Paired Recommendations | International Standards equivalent in technical content

None.

A.2.3 Additional references

- ISO/IEC 10646:2014, *Information technology – Universal Coded Character Set (UCS)*.
- ISO/IEC/IEEE 60559 (2011), *Information technology – Microprocessor Systems – Floating-Point arithmetic*.

A.3 Definitions

For the purposes of this annex to this Recommendation | International Standard, the following definitions apply. In this clause, *italic* is used to identify all occurrences of terms that are defined in this subclause or in clause 3.

A.3.1 interleaved alpha image plane: *Images* with the value of ALPHA_IMAGE_PLANE_FLAG set equal to 1 have an *interleaved alpha image plane*.

A.3.2 separate alpha image plane: *Images* with optional *alpha image plane* and the value of ALPHA_IMAGE_PLANE_FLAG set equal to zero have a *separate alpha image plane*. For such *images*, data relating to

the *alpha image plane* is present in the CODED_IMAGE() syntax structure specified by the ALPHA_OFFSET syntax element.

A.3.3 universal multiple-octet coded character set transformation format 8 (UTF-8): The 8-bit character set encoding specified in Annex D of ISO/IEC 10646.

A.4 Abbreviations

For the purposes of this annex to this Recommendation | International Standard, the following abbreviations apply.

CIE	Commission Internationale de l'Eclairage (International Commission on Illumination)
FCC	Federal Communications Commission
ICC	International Color Consortium
NTSC	National Television System Committee
RP	Recommended Practice
SMPTE	Society of Motion Picture and Television Engineers
UTF	Universal multiple-octet coded character set Transformation Format (as specified by ISO/IEC 10646)
UUID	Universal Unique Identifier (as specified in Annex A of ISO/IEC 11578)

A.5 FILE_HEADER()

A.5.1 Syntax structure

The FILE_HEADER() syntax structure is specified in Table A.1.

Table A.1 – FILE_HEADER() syntax structure

FILE_HEADER() {	Descriptor	Reference
FIXED_FILE_HEADER_II_2BYTES	u(16)	A.5.2
FIXED_FILE_HEADER_0XBC_BYTE	u(8)	A.5.3
FILE_VERSION_ID	u(8)	A.5.4
FIRST_IFD_OFFSET	le(32)	A.5.5
}		

A.5.2 FIXED_FILE_HEADER_II_2BYTES

FIXED_FILE_HEADER_II_2BYTES shall be equal to 0x4949.

A.5.3 FIXED_FILE_HEADER_0XBC_BYTE

FIXED_FILE_HEADER_0XBC_BYTE shall be equal to 0xBC.

A.5.4 FILE_VERSION_ID

FILE_VERSION_ID shall be equal to 1. Other values of FILE_VERSION_ID are reserved for future use, as modified in additional parts or amendments, by ITU-T | ISO/IEC.

A.5.5 FIRST_IFD_OFFSET

FIRST_IFD_OFFSET specifies the byte position, relative to the beginning of the file, of the first IMAGE_FILE_DIRECTORY() syntax structure (A.6) in the file. The value of FIRST_IFD_OFFSET shall be an integer multiple of 2.

A.6 IMAGE_FILE_DIRECTORY()

A.6.1 Syntax structure

The IMAGE_FILE_DIRECTORY() syntax structure is specified in Table A.2.

Table A.2 – IMAGE_FILE_DIRECTORY() syntax structure

IMAGE_FILE_DIRECTORY() {	Descriptor	Reference
NUM_ENTRIES	le(16)	A.6.2
for (iNumEntries = 0; iNumEntries < NUM_ENTRIES; iNumEntries++)		
IFD_ENTRY()		A.7
ZERO_OR_NEXT_IFD_OFFSET	le(32)	A.6.3
}		

A.6.2 NUM_ENTRIES

NUM_ENTRIES specifies the number of entries in the IMAGE_FILE_DIRECTORY() syntax structure. NUM_ENTRIES shall not be equal to 0. The value 0 for NUM_ENTRIES is reserved for future use by ITU-T | ISO/IEC.

A.6.3 ZERO_OR_NEXT_IFD_OFFSET

ZERO_OR_NEXT_IFD_OFFSET is interpreted as follows.

- If ZERO_OR_NEXT_IFD_OFFSET is equal to 0, this indicates that no additional IMAGE_FILE_DIRECTORY() syntax structures are present in the file.
- Otherwise, ZERO_OR_NEXT_IFD_OFFSET specifies the byte position, relative to the beginning of the file, to the next IMAGE_FILE_DIRECTORY() syntax structure in the file.

The value of ZERO_OR_NEXT_IFD_OFFSET shall be an integer multiple of 2.

Decoders may ignore any IMAGE_FILE_DIRECTORY() syntax structures at locations in the file specified by any ZERO_OR_NEXT_IFD_OFFSET syntax element.

A.7 IFD_ENTRY()

A.7.1 Syntax structure

The IFD_ENTRY() syntax structure is specified in Table A.3.

Table A.3 – IFD_ENTRY() syntax structure

IFD_ENTRY() {	Descriptor	Reference
FIELD_TAG	le(16)	A.7.2
ELEMENT_TYPE	le(16)	A.7.3
NUM_ELEMENTS	le(32)	A.7.4
VALUES_OR_OFFSET	le(32)	A.7.5
}		

The interpretation and presence of syntax elements of the IFD_ENTRY() syntax structure is specified in Table A.4. The data associated with a FIELD_TAG value is interpreted as the value of the syntax element or syntax structure in the "Syntax element or syntax structure" column. The term "variable" is used in Table A.4 to indicate cases in which NUM_ELEMENTS may have any value corresponding to the quantity of associated data. The "Presence" column is interpreted as follows.

- "Required" specifies that the FIELD_TAG value shall be present in an IFD_ENTRY() syntax structure of each IMAGE_FILE_DIRECTORY() syntax structure in the file.
- "Optional" indicates that the FIELD_TAG value may or may not be present in an IFD_ENTRY() syntax structure of each IMAGE_FILE_DIRECTORY() syntax structure in the file.

IFD entries with combinations of FIELD_TAG, ELEMENT_TYPE, and NUM_ELEMENTS that do not appear in Table A.4, with the FIELD_TAG value in the range of 0x1000 to 0x3FFF and 0x5000 to 0x7FFF are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore (parse and discard) any IFD_ENTRY() syntax structures in which such combinations appear.

NOTE 1 – The purpose of the specification for decoders to ignore IFD entries with such combinations of FIELD_TAG, ELEMENT_TYPE, and NUM_ELEMENTS is to enable the future definition of a backward-compatible usage of additional combinations.

IFD entries with combinations of FIELD_TAG, ELEMENT_TYPE and NUM_ELEMENTS that do not appear in Table A.4, with the FIELD_TAG value in the range of 0x0000 to 0x0FFF, 0x4000 to 0x4FFF, and 0x8000 to 0xFFFF are available for unspecified use and interpretation as determined by the application. Decoders shall parse any IFD_ENTRY() syntax structures in which such combinations appear and, for purposes relevant to determining conformance to this Specification, shall ignore these syntax structures. Any use of such FIELD_TAG values shall not affect the expressed requirements for conformance to this Specification. Additionally, ITU-T and ISO/IEC reserve the ability to potentially specify uses for such FIELD_TAG values in future revisions of this Specification.

NOTE 2 – Since interpretation of such FIELD_TAG values may be application specific, it is recommended that any such IFD_ENTRY() syntax structures that have unknown interpretations be removed when transferring files between differing application domains.

NOTE 3 – The use of a field tag value equal to 0x02BC in tag-based encoded files [such as files formatted according to ISO 12234-2, ISO 12639, TIFF Revision 6.0 or EXIF 2.2 (JEITA CP-3451)], is specified in ISO 16684-1. The use of a field tag value equal to 0x8769 is specified in section 4.6.3 of the EXIF 2.2 (JEITA CP-3451) specification. The use of a field tag value equal to 0x8773 is specified in clause B.3 of the ICC.1:2001-04 (ICC version 2.4.0.0) specification and in clause B.3 of ISO 15076-1:2010, which specify two versions of ICC profile data. The provision to allow these field tag values to be present is intended to allow the use of ISO 16684-1, EXIF 2.2 (JEITA CP-3451), ICC.1:2001-04 and ISO 15076-1:2010 specifications with files encoded according to this Specification (without imposing normative conformance requirements related to such use). The use of ICC profile data is further discussed in Annex C.

Table A.4 – Interpretation, allowed combinations, and presence of syntax elements of the IFD_ENTRY() syntax structure

FIELD_TAG	ELEMENT_TYPE	NUM_ELEMENTS	Syntax element or syntax structure	Presence
0x010D	UTF8	variable	DOCUMENT_NAME	Optional
0x010E	UTF8	variable	IMAGE_DESCRIPTION	Optional
0x010F	UTF8	variable	EQUIPMENT_MAKE	Optional
0x0110	UTF8	variable	EQUIPMENT_MODEL	Optional
0x011D	UTF8	variable	PAGE_NAME	Optional
0x0129	USHORT	2	PAGE_NUMBER	Optional
0x0131	UTF8	variable	SOFTWARE_NAME_VERSION	Optional
0x0132	UTF8	20	DATE_TIME	Optional
0x013B	UTF8	variable	ARTIST_NAME	Optional
0x013C	UTF8	variable	HOST_COMPUTER	Optional
0x8298	UTF8	variable	COPYRIGHT_NOTICE	Optional
0xA001	USHORT	1	COLOR_SPACE	Optional
0xBC01	BYTE	16	PIXEL_FORMAT	Required
0xBC02	BYTE, USHORT, or ULONG	1	SPATIAL_XFRM_PRIMARY	Optional
0xBC04	ULONG	1	IMAGE_TYPE	Optional
0xBC05	BYTE	4	PTM_COLOR_INFO()	Optional
0xBC06	BYTE	variable	PROFILE_LEVEL_CONTAINER()	Optional
0xBC80	BYTE, USHORT, or ULONG	1	IMAGE_WIDTH	Required
0xBC81	BYTE, USHORT, or ULONG	1	IMAGE_HEIGHT	Required
0xBC82	FLOAT	1	WIDTH_RESOLUTION	Optional
0xBC83	FLOAT	1	HEIGHT_RESOLUTION	Optional
0xBCC0	BYTE, USHORT, or ULONG	1	IMAGE_OFFSET	Required
0xBCC1	BYTE, USHORT, or ULONG	1	IMAGE_BYTE_COUNT	Required
0xBCC2	BYTE, USHORT, or ULONG	1	ALPHA_OFFSET	Optional
0xBCC3	BYTE, USHORT, or ULONG	1	ALPHA_BYTE_COUNT	Optional
0xBCC4	BYTE	1	IMAGE_BAND_PRESENCE	Optional
0xBCC5	BYTE	1	ALPHA_BAND_PRESENCE	Optional
0xEA1C	UNDEFINED	variable	PADDING_DATA	Optional

A.7.2 FIELD_TAG

FIELD_TAG identifies the data contained in the IFD_ENTRY() syntax structure. When the IFD_ENTRY() syntax structure is not the first IFD_ENTRY() syntax structure of the IMAGE_FILE_DIRECTORY() syntax structure, the value of FIELD_TAG shall be greater than the value of FIELD_TAG in the preceding IFD_ENTRY() syntax structure of the IMAGE_FILE_DIRECTORY() syntax structure.

A.7.3 ELEMENT_TYPE

ELEMENT_TYPE identifies the type of data contained in the IFD_ENTRY() syntax structure as specified in Table A.5.

Table A.5 – ELEMENT_TYPE

ELEMENT_TYPE	Mnemonic	SizeOfElement
0	RESERVED	Not specified
1	BYTE	1
2	UTF-8	1
3	USHORT	2
4	ULONG	4
5	URATIONAL	8
6	SBYTE	1
7	UNDEFINED	1
8	SSHORT	2
9	SLONG	4
10	SRATIONAL	8
11	FLOAT	4
12	DOUBLE	8
13-65535	RESERVED	Not specified

The value of ELEMENT_TYPE shall not be equal to RESERVED in files conforming to this version of this annex. Such values are reserved for use in future versions of this Specification. Decoders that encounter files containing ELEMENT_TYPE equal to RESERVED shall ignore the associated data.

When ELEMENT_TYPE is equal to UNDEFINED, the value of FIELD_TAG shall be equal to 0x8773 if it is not equal to 0xEA1C in files conforming to this version of this annex. Other values of ELEMENT_TYPE are reserved for use in future versions of this Specification.

The quantity of data associated with each syntax element VALUES_OR_OFFSET, as specified by ELEMENT_TYPE in units of bytes, is specified in the SizeOfElement column of Table A.5. The interpretation of the data elements associated with each value of ELEMENT_TYPE is specified as follows.

- If ELEMENT_TYPE is equal to BYTE, USHORT or ULONG, each data element is interpreted as an unsigned integer of the specified length in little-endian form.
- Otherwise, if ELEMENT_TYPE is equal to SBYTE, SSHORT or SLONG, each data element is interpreted as a two's complement signed integer of the specified length in little-endian form.
- Otherwise, if ELEMENT_TYPE is equal to UTF8, each data element is interpreted as a UTF-8 character set code as specified by Annex D of ISO/IEC 10646, and the value of the last data element of the IFD_ENTRY() shall be equal to 0 (null). Any such field may contain multiple strings of UTF-8 characters, each terminated with a 0-valued character. The NUM_ELEMENTS for such multi-string payloads is the total number of bytes in all of the associated strings including the 0-valued byte at the end of each such string. Within the associated NUM_ELEMENTS bytes, there shall not be any two consecutive bytes equal to 0.
- Otherwise, if ELEMENT_TYPE is equal to UNDEFINED, the interpretation of the data elements depends on the FIELD_TAG value as follows:
 - If the value of FIELD_TAG is equal to 0xEA1C (PADDING_DATA), the interpretation of each data element is specified in clause A.7.33.
 - Otherwise, the interpretation of the data elements is not specified by this Specification.
- Otherwise, if ELEMENT_TYPE is equal to URATIONAL, each data element is interpreted as a rational number having a numerator equal to the first 4 bytes of the data element value, interpreted as an unsigned integer of the

specified length in little-endian form, and a denominator equal to the remaining 4 bytes of the data element value, interpreted as an unsigned integer of the specified length in little-endian form.

- Otherwise, if `ELEMENT_TYPE` is equal to `SRATIONAL`, each data element is interpreted as a rational number having a numerator equal to the first 4 bytes of the data element value, interpreted as a two's complement signed integer of the specified length in little-endian form, and a denominator equal to the remaining 4 bytes of the data element value, interpreted as a two's complement signed integer of the specified length in little-endian form.
- Otherwise, if `ELEMENT_TYPE` is equal to `FLOAT`, each data element is interpreted as a 4-byte ISO/IEC/IEEE 60559 floating-point number in little-endian form.
- Otherwise (`ELEMENT_TYPE` is equal to `DOUBLE`), each data element is interpreted as an 8-byte ISO/IEC/IEEE 60559 floating-point number in little-endian form.

A.7.4 NUM_ELEMENTS

`NUM_ELEMENTS` specifies the number of data elements associated with the `IFD_ENTRY()` syntax structure. Let `iSizeOfElement` be equal to the value in the `SizeOfElement` column of Table A.5 for the value of `ELEMENT_TYPE`. The total number of bytes of data associated with the `IFD_ENTRY()` syntax structure is `NUM_ELEMENTS * iSizeOfElement`.

NOTE – `NUM_ELEMENTS` must be set to the total quantity of data elements, including termination indicator values such as null-valued terminators as applicable.

A.7.5 VALUES_OR_OFFSET

`VALUES_OR_OFFSET` is interpreted as follows:

- Let `iSizeOfElement` be equal to the value in the `SizeOfElement` column of Table A.5 for the value of `ELEMENT_TYPE`. If `NUM_ELEMENTS * iSizeOfElement` is less than or equal to 4, `VALUES_OR_OFFSET` contains the data elements associated with the `IFD_ENTRY()` syntax structure.
- Otherwise, `VALUES_OR_OFFSET` specifies the byte position, relative to the beginning of the file, of the data elements associated with the `IFD_ENTRY()` syntax structure. In this case, the value of the `VALUES_OR_OFFSET` syntax element shall be an integer multiple of 2.

A.7.6 DOCUMENT_NAME

`DOCUMENT_NAME` (when present) provides, as a UTF-8 character string, a name for the image. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the `ELEMENT_TYPE` definition of the UTF-8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – `DOCUMENT_NAME` is specified here in a manner that is intended to be consistent with the "DocumentName" tag specified in ISO 12639 and TIFF Revision 6.0.

A.7.7 IMAGE_DESCRIPTION

`IMAGE_DESCRIPTION` (when present) provides, as a UTF-8 character string, a title or description of the image subject matter. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the `ELEMENT_TYPE` definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – `IMAGE_DESCRIPTION` is specified here in a manner that is intended to be consistent with the "ImageDescription" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451).

A.7.8 EQUIPMENT_MAKE

`EQUIPMENT_MAKE` (when present) provides, as a UTF-8 character string, a name for the manufacturer or vendor of the camera, image-capturing device, scanner or other equipment that generated the image. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the `ELEMENT_TYPE` definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – `EQUIPMENT_MAKE` is specified here in a manner that is intended to be consistent with the "Make" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451).

A.7.9 EQUIPMENT_MODEL

When present, `EQUIPMENT_MODEL` provides, as a UTF-8 character string, a model name or model number of the camera, image-capturing device, scanner or other equipment that generated the image. There are no specific conformance

requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – EQUIPMENT_MODEL is specified here in a manner that is intended to be consistent with the "Model" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451).

A.7.10 PAGE_NAME

PAGE_NAME (when present) provides, as a UTF-8 character string, a name to be considered to be the name of a page to which the image is considered to belong. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – PAGE_NAME is specified here in a manner that is intended to be consistent with the "PageName" tag specified in ISO 12639 and TIFF Revision 6.0.

A.7.11 PAGE_NUMBER

PAGE_NUMBER (when present) provides, as a pair of unsigned integers, a "page number" (the first number) to be considered the page number of a page from a sequence of pages (the second number) to which the image is considered to belong. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the USHORT data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – PAGE_NUMBER is specified here in a manner that is intended to be consistent with the "PageNumber" tag specified in TIFF Revision 6.0.

A.7.12 SOFTWARE_NAME_VERSION

SOFTWARE_NAME_VERSION (when present) provides, as a UTF-8 character string, name and version number information for one or more software packages used in generating the image or file. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – SOFTWARE_NAME_VERSION is specified here in a manner that is intended to be consistent with the "Software" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451).

A.7.13 DATE_TIME

DATE_TIME (when present) provides, as a UTF-8 character string, the date and time of the creation or last modification of the image.

The value of NUM_ELEMENTS for the DATE_TIME tag shall be equal to 20.

The interpretation of the UTF-8 character string associated with the DATE_TIME tag shall be as follows.

- If the UTF-8 character string associated with the DATE_TIME tag is the string "0000:00:00 00:00:00" or this string with all "0" characters replaced by space (0x20) characters as in the string " : : : : ", followed by a byte equal to 0, this indicates that the date and time are unknown.
- Otherwise, the UTF-8 character string associated with the DATE_TIME tag shall be formatted as "YYYY:MM:DD HH:MM:SS", followed by a byte equal to 0, where the formatting of this string shall be as follows.
 - The "YYYY" part of the string shall contain a character string representation of a four-digit decimal number for a calendar year.
 - Each colon character ":" part of the string shall be a colon ":" character (a byte equal to 0x3A).
 - The "MM" part of the string shall contain a character string representation of a two-digit decimal number in the range from "01" to "12" for a month within the year (where "01" indicates January, "02" indicates February, etc.) or two space (0x20) characters.
 - The "DD" part of the string shall contain a character string representation of a two-digit decimal number in the range from "01" to "31" for a day within the month (where "01" indicates the first day of the month, "02" indicates the second day of the month, etc.).
 - The character separating the "DD" and "HH" parts of the string shall be a space character " " (a byte equal to 0x20).

- The "HH" part of the string shall contain a character string representation of a two-digit decimal number in the range from "00" to "23" for an hour within the day, following a 24-hour time of day convention (where "00" indicates a time in the first hour of the day, "01" indicates a time in the second hour of the day, etc.).

NOTE 1 – The time 00:00:00 is used to indicate midnight. Similarly, 00:00:01 indicates one second after midnight and 23:59:59 indicates one second prior to midnight.

- The "MM" part of the string shall contain a character string representation of a two-digit decimal number in the range from "00" to "59" for a minute within the hour (where "00" indicates a time in the first minute of the hour, "01" indicates a time within the second minute of the hour, etc.).
- The "SS" part of the string shall contain a character string representation of a two-digit decimal number in the range from "00" to "59" for a second within the minute (where "00" indicates a time in the first second of the minute, "01" indicates a time within the second second of the minute, etc.).

The time zone for the date and time are not specified in this version of this Specification.

NOTE 2 – For example, the date and time may be referenced to the local time zone in which the encoding equipment is operated or is ordinarily kept.

There are no additional specific conformance requirements for the content of the associated character string.

NOTE 3 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 4 – DATE_TIME is specified here in a manner that is intended to be consistent with the "DateTime" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451).

A.7.14 ARTIST_NAME

ARTIST_NAME (when present) provides, as a UTF-8 character string, one or more names and possibly additional information relating to persons involved in the creation of the image. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – ARTIST_NAME is specified here in a manner that is intended to be consistent with the "Artist" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451). An example preferred use of ARTIST_NAME is the string value "Camera owner, John Smith; Photographer, Michael Brown; Image creator, Ken James" (followed by a byte equal to 0).

A.7.15 HOST_COMPUTER

HOST_COMPUTER (when present) provides, as a UTF-8 character string, an indication of a computer, operating system or other system used in generating the image or file. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – HOST_COMPUTER is specified here in a manner that is intended to be consistent with the "HostComputer" tag specified in ISO 12639 and TIFF Revision 6.0.

A.7.16 COPYRIGHT_NOTICE

COPYRIGHT_NOTICE (when present) provides, as a UTF-8 character string, an indication of copyright rights associated with the image or file. There are no specific conformance requirements for the content of the associated character string (other than that it follows the format conventions of the ELEMENT_TYPE definition of the UTF8 data type as specified in A.7.3).

NOTE 1 – The name of this syntax element alludes to the intended interpretation instead of any normative meaning.

NOTE 2 – COPYRIGHT_NOTICE is specified here in a manner that is intended to be consistent with the "Copyright" tag specified in ISO 12234-2, ISO 12639, TIFF Revision 6.0, and EXIF 2.2 (JEITA CP-3451). A complete copyright statement should be listed in the character string including any dates and statements of claims – e.g., "Copyright, John Smith, 2009. All rights reserved" (followed by a byte equal to 0). When desired, this character string can also list a royalty clearing house. The string may be used to indicate either or both photographer and editor copyrights as well as any additional or alternative copyrights that apply to the image or file. When a photographer statement is included, it should appear first. When no photographer copyright statement is included and an editor or additional or alternative copyright statement is included, the absence of a photographer copyright statement should be indicated by a space character (0x20) followed by a byte equal to 0 (null) at the beginning of the character string. When an editor copyright statement is included, it should appear next. When no editor copyright statement is included and some additional or alternative copyright statement is included, the absence of an editor copyright statement should be indicated by a space character (0x20) followed by a byte equal to 0 (null) at the position in the character string at which the editor copyright statement would otherwise appear. When some additional or alternative copyright statement is included, it should appear next. When present, each additional or alternative copyright statement should end with a byte equal to 0 (null). When a royalty clearing house listing is included, this listing should appear last.

A.7.17 COLOR_SPACE

COLOR_SPACE (when present) equal to 1, when the value in the Num column in Table A.6 for the line corresponding to the value of PIXEL_FORMAT is equal to UINT, indicates that the associated image should be interpreted according to the sRGB specification IEC 61966-2-1. COLOR_SPACE equal to 0xFFFF, when used with an unsigned pixel format as specified by PIXEL_FORMAT, indicates that the sRGB specification may not be the preferred method of interpretation of the associated image.

COLOR_SPACE shall not be equal to 1 when PIXEL_FORMAT specifies a fixed or floating point pixel format.

When present, COLOR_SPACE shall be equal to 1 or 0xFFFF. All other values are reserved for future use by ITU-T | ISO/IEC. All values other than 1 and 0xFFFF shall be treated the same as the value 0xFFFF by decoders.

NOTE – sRGB image data is used in many systems, being interpreted directly by various receiving devices.

A.7.18 PIXEL_FORMAT

PIXEL_FORMAT consists of a string of 16 BYTE values. The values of the bytes ordered from first to last in this string are interpreted as digit pairs appearing from left to right in the hexadecimal integer values specified in Table A.6.

NOTE 1 – The PIXEL_FORMAT values specified in Table A.6 originated as UUID values as specified by ISO/IEC 11578. UUID values are commonly shown as a string of hexadecimal digits separated by dash "-" characters. The bytes of such a UUID value are typically stored in a file using a rearranged form of such a typical dashed-form description. In Table A.6, that convention is not followed. Instead, the values are specified in a manner intended to ease the interpretation of the value as a string of 16 BYTE values that can be directly compared to the provided strings of hexadecimal digits. The rearrangement of the common form of UUID specification to produce the equivalent ordered string of BYTE values as shown in Table A.6 can be performed as follows.

- The first (leftmost) 4 bytes (which precede the first dash character in the common form of UUID value specification) are ordered first, represented in little-endian (byte-reversed) form.
- The next two bytes (which precede the second dash character in the common form of UUID value specification) are ordered next, represented in little-endian (byte-reversed) form.
- The next two bytes (which precede the third dash character in the common form of UUID value specification) are ordered next, represented in little-endian (byte-reversed) form.
- The remaining bytes in the common form of UUID value specification follow, in left-to-right order.

The headings of Table A.6 are interpreted as follows:

- "Mnemonic name" indicates a string associated with the syntax element corresponding to the value of PIXEL_FORMAT.
- "NC" specifies the following.
 - If the value of PIXEL_FORMAT specifies that no alpha channel is present (as specified by the entry in the "Alpha" column), it is a requirement for file format conformance to this annex that the value of NumComponents as calculated in Table 31 shall be equal to the value of the entry in the "NC" column.
 - Otherwise, if the alpha channel is present as a separate alpha image plane (as specified by the entry in the "Alpha" column and the presence of ALPHA_OFFSET), it is a requirement for file format conformance to this annex that the value of NumComponents as calculated in Table 31 for the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET shall be equal to the value of the entry in the "NC" column minus 1, and the value of NumComponents as calculated in Table 31 for the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET shall be equal to 1.
 - Otherwise (the alpha channel is present as an interleaved alpha image plane), it is a requirement for file format conformance to this annex that the value of NumComponents as calculated in Table 31 for the primary image plane shall be equal to the value of the entry in the "NC" column minus 1, and the value of NumComponents as calculated in Table 31 for the alpha image plane shall be equal to 1.
- "Alpha" specifies whether the PIXEL_FORMAT specifies the presence of an alpha channel. An entry marked with "✓" indicates that an alpha channel is present and an entry not marked with "✓" indicates that an alpha channel is not present.
- "BPC" specifies a requirement for file format conformance to this annex that the value of the OUTPUT_BITDEPTH syntax element of the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET shall be equal to the value of the entry in the "BPC" column and, when present, the value of the OUTPUT_BITDEPTH syntax element of the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET shall be equal to value of the entry in the "BPC" column.
- "Num" specifies the numeric interpretation of values in the decoded image.

- "Colour" specifies a requirement for file format conformance to this annex that the value of the OUTPUT_CLR_FMT syntax element of the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET shall be equal to the value of the entry in the "Colour" column.

NOTE 2 – Image data may be structured as single channel monochrome "Gray", three-channel "RGB", four-channel "CMYK" or n-Channel ("NCOMPONENT") with n in the range of 2 to 16, inclusive.

Table A.6 – Interpretation of PIXEL_FORMAT

PIXEL_FORMAT value	Mnemonic	NC	Alpha	BPC	Num	Colour
0x24C3DD6F034EFE4BB1853D77768DC90D	24bppRGB	3		BD8	UINT	RGB

The manner of output for the decoded image data produced from a conforming decoder may be determined by the application. However, each PIXEL_FORMAT value specified in Table A.6 has a corresponding defined output format that is specified for reference purposes as the output of a hypothetical reference decoder. This reference output format is in the form of an ordered string of bytes defined as follows.

- If PIXEL_FORMAT is equal to 24bppRGB, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, and each sample value for each channel is output as a single byte.
 - Otherwise, if PIXEL_FORMAT is equal to 32bppRGBE, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is B, then G, then R, then E, and each sample value for each channel is output as a single byte.
 - Otherwise, if PIXEL_FORMAT is equal to 48bppRGB, 48bppRGBFixedPoint or 48bppRGBHalf, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, and each sample value for each channel is output using 16 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 96bppRGBFixedPoint, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, and each sample value for each channel is output using 32 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 64bppRGBFixedPoint or 64bppRGBHalf, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, then a padding channel, and each sample value for each channel is output using 16 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 128bppRGBFixedPoint or 128bppRGBFloat, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, then a padding channel, and each sample value for each channel is output using 32 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 64bppRGBA, 64bppRGBAFixedPoint, 64bppRGBHalf or 64bppPRGBA, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, then Alpha, and each sample value for each channel is output using 16 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 128bppRGBAFixedPoint, 128bppRGBAFloat or 128bppPRGBAFloat, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is R, then G, then B, then Alpha, and each sample value for each channel is output using 32 bits in little-endian form.
 - Otherwise, if PIXEL_FORMAT is equal to 24bppBGR, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is B, then G, then R, and each sample value for each channel is output as a single byte.
 - Otherwise, if PIXEL_FORMAT is equal to 32bppBGR, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is B, then G, then R, then a padding channel, and each sample value for each channel is output as a single byte.
 - Otherwise, if PIXEL_FORMAT is equal to 32bppPBGRA, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is B, then G, then R, then Alpha, and each sample value for each channel is output as a single byte.
 - Otherwise, if PIXEL_FORMAT is equal to 16bppBGR565, the output is in the form of packed bit fields within the integer values specified in Table 196, and these integer values are output in raster scan order using 16 bits in little-endian form. (See Note 3.)
 - Otherwise, if PIXEL_FORMAT is equal to 16bppBGR555, the output is in the form of packed bit fields within the integer values specified in Table 197, and these integer values are output in raster scan order using 16 bits in little-endian form. (See Note 3.)
 - Otherwise, if PIXEL_FORMAT is equal to 32bppBGR101010, the output is in the form of packed bit fields within the integer values specified in Table 198, and these integer values are output in raster scan order using 32 bits in little-endian form. (See Note 3.)
- NOTE 3 – When the PIXEL_FORMAT is equal to 16bppBGR565, 16bppBGR555 or 32bppBGR101010, the positions of the bits representing the actual R and B components depend on the value of the RED_BLUE_NOT_SWAPPED_FLAG. In these cases, if RED_BLUE_NOT_SWAPPED_FLAG is equal to 0, the R component bits are in the MSBs of the packed bit fields and the B component bits are in the LSBs; otherwise, in these cases the R component bits are in the LSBs of the packed bit fields and the B component bits are in the MSBs.
- Otherwise, if PIXEL_FORMAT is equal to BlackWhite, the output is in the form of packed bit fields within the integer values specified in Table 199, and these integer values are output as bytes in raster scan order.

- Otherwise, if PIXEL_FORMAT is equal to 32bppCMYK or 32bppCMYKDIRECT, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is C, then M, then Y, then K, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 40bppCMYKAlpha or 40bppCMYKDIRECTAlpha, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is C, then M, then Y, then K, then Alpha, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 64bppCMYK or 64bppCMYKDIRECT, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is C, then M, then Y, then K, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 80bppCMYKAlpha or 80bppCMYKDIRECTAlpha, the decoded channels are interleaved on a sample-by-sample basis in raster scan order, where the ordering of the interleaving is C, then M, then Y, then K, then Alpha, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 12bppYCC420, 16bppYCC422 or 24bppYCC444, the Y samples are output first in raster scan order, then the U samples are output in raster scan order, then the V samples are output in raster scan order, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 20bppYCC422, 32bppYCC422, 30bppYCC444, 48bppYCC444 or 48bppYCC444FixedPoint, the Y samples are output first in raster scan order, then the U samples are output in raster scan order, then the V samples are output in raster scan order, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 20bppYCC420Alpha or 24bppYCC422Alpha, the Y samples are output first in raster scan order, then the U samples are output in raster scan order, then the V samples are output in raster scan order, then the Alpha samples are output in raster scan order, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 32bppYCC444Alpha, the Y samples are output first in raster scan order, then the U samples are output in raster scan order, then the V samples are output in raster scan order, then the Alpha samples are output in raster scan order, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 30bppYCC422Alpha, 48bppYCC422Alpha, 40bppYCC444Alpha, 64bppYCC444Alpha or 64bppYCC444AlphaFixedPoint, the Y samples are output first in raster scan order, then the U samples are output in raster scan order, then the V samples are output in raster scan order, then the Alpha samples are output in raster scan order, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 24bpp3Channels, 32bpp4Channels, 40bpp5Channels, 48bpp6Channels, 56bpp7Channels or 64bpp8Channels, the decoded channels are ordered by increasing channel number, and the samples of each channel are output in raster scan order, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 48bpp3Channels, 64bpp4Channels, 80bpp5Channels, 96bpp6Channels, 112bpp7Channels or 128bpp8Channels, the decoded channels are ordered by increasing channel number, and the samples of each channel are output in raster scan order, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 32bpp3ChannelsAlpha, 40bpp4ChannelsAlpha, 48bpp5ChannelsAlpha, 56bpp6ChannelsAlpha, 64bpp7ChannelsAlpha or 72bpp8ChannelsAlpha, the decoded channels are ordered by increasing channel number with the Alpha channel being considered as having the highest channel number and the samples of each channel are output in raster scan order, and each sample value for each channel is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 64bpp3ChannelsAlpha, 80bpp4ChannelsAlpha, 96bpp5ChannelsAlpha, 112bpp6ChannelsAlpha, 128bpp7ChannelsAlpha or 144bpp8ChannelsAlpha, the decoded channels are ordered by increasing channel number and the last channel is considered the Alpha channel, and the samples of each channel are output in raster scan order, and each sample value for each channel is output using 16 bits in little-endian form.
- Otherwise, if PIXEL_FORMAT is equal to 8bppGray, there is only one decoded channel, and the samples of that channel are output in raster scan order, and each sample value is output as a single byte.
- Otherwise, if PIXEL_FORMAT is equal to 16bppGray, 16bppGrayFixedPoint or 16bppGrayHalf, there is only one decoded channel, and the samples of that channel are output in raster scan order, and each sample value is output using 16 bits in little-endian form.

- Otherwise (PIXEL_FORMAT is equal to 32bppGrayFixedPoint or 32bppGrayFloat), there is only one decoded channel, and the samples of that channel are output in raster scan order, and each sample value is output using 32 bits in little-endian form.

NOTE 4 – Particular care should be taken with regard to the interpretation of this defined output format for PIXEL_FORMAT values with mnemonic names that include "RGB", "BGR" or "CMYK" as part of the mnemonic name due to the specification of little-endian form for packed bit fields. In particular, the first byte of each packed bit field for the PIXEL_FORMAT values 16bppBGR565, 16bppBGR555, and 32bppBGR101010 actually contains the LSBs of the packed bit fields due to the use of little-endian form. Similarly, if the 4 bytes that contain the decoded channel samples for the PIXEL_FORMAT values 32bppRGBE, 32bppBGR, 32bppPBGRA, 32bppCMYK, and 32bppCMYKDIRECT are written or read as 32-bit integers in little-endian form rather than as ordered strings of 4 bytes in which each byte represents a sample value, the ordering of the channels will be swapped relative to the ordering described herein.

This defined format is specified for reference purposes and may be used by some decoders as an interface format for the output of decoded pictures. However, the use of this defined format is not a requirement for conformance to this Specification.

Interpretation of alpha channel information (when present) is considered pre-multiplied or not pre-multiplied as follows.

- If PIXEL_FORMAT is equal to 32bppPBGRA, 64bppPRGBA or 128bppPRGBAFloat, the channels other than the alpha channel are considered to be in pre-multiplied form in relation to the alpha channel.
- Otherwise, the channels other than the alpha channel are considered not to be in pre-multiplied form in relation to the alpha channel. In these cases, the value of PREMULIPLIED_ALPHA_FLAG in the associated IMAGE_HEADER() of the coded image that contains the alpha channel shall be equal to 0.

NOTE 5 – The designation of an alpha channel as pre-multiplied indicates that the decoded sample values do not require multiplication by the alpha channel values when performing compositing (as any such necessary multiplication process was performed as a pre-processing step prior to encoding).

JPEG XR supports three types of numerical encoding: unsigned integer, fixed point, and floating point, each at a variety of bit depths.

PIXEL_FORMAT values having the "Num" column of Table A.6 indicating "UINT" are unsigned integer formats as follows.

- If BPC is equal to BD8, the minimum value is 0 and the maximum value is 255, providing 256 unique values.
- Otherwise (BPC is equal to BD16), the minimum value is 0 and the maximum value is 65 535, providing 65 536 unique values.

In unsigned integer cases, a value of zero ordinarily represents the minimum level or the encoding black for the specific channel and the maximum possible value represents the maximum value for that channel. When all viewable channels for a pixel format are at their maximum numerical value, this corresponds to the brightest representable colour or the encoding white. Exceptions to this general rule include the following unsigned integer cases.

- When OUTPUT_BITDEPTH is BD1BLACK1, a value of zero represents the maximum level or white and a value of one represents the minimum level or black.
- When the OUTPUT_CLR_FMT is YUV444, YUV422 or YUV420, the U and V components are interpreted as colour difference representations that are offset by a constant value, such that the middle value of the range of possible integer values is used for the representation of both the encoding black and the encoding white.
- When the OUTPUT_CLR_FMT is CMYK or CMYKDIRECT, the K component is interpreted as a degree of proximity toward black, such that the maximum value for the K component is used for the encoding black and the minimum value for the K component is used for the encoding white.
- When the OUTPUT_CLR_FMT is NCOMPONENT and the number of encoded components other than the Alpha channel (when present) is greater than 3, in the absence of other information to assist in the colour channel interpretation, the fourth channel should be interpreted as a K channel indicating a degree of proximity toward black as in the cases when the OUTPUT_CLR_FMT is CMYK or CMYKDIRECT (see also Annex C).

PIXEL_FORMAT values having mnemonic names that end in "FixedPoint" specify fixed point representations.

NOTE 6 – A fixed point numerical representation is not commonly supported in prior image file formats. It is supported in JPEG XR to encode an extended range of numerical values more directly while retaining the performance advantages of integer processing.

JPEG XR supports fixed point numerical encoding for 16-bit and 32-bit signed values. In this Specification, the abbreviation SINT is used to refer to signed integer or fixed point values.

Fixed point values having BPC equal to 16 or 32 are interpreted as follows.

- 16-bit Fixed Point, a format referred to as s2.13: The 16 bits that make up an individual value are interpreted as a sign bit, two integer bits and 13 fractional bits. Using this interpretation, a numerical range of -4.0 to $+3.999\dots$ can be represented, with the value of 1.0 represented by the signed integer value 8 192 (0x2000).

- 32-bit Fixed Point, a format referred to as s7.24: The 32 bits that make up an individual value are interpreted as a sign bit, seven integer bits and 24 fractional bits. Using this interpretation, a numerical range of -128.0 to $+127.999\dots$ can be represented, with the value of 1.0 represented by the signed integer value 16 777 216 (0x01000000).

NOTE 7 – JPEG XR does not enable fully lossless compression for 32-bit data in general. The encoding and decoding algorithms use 32-bit computations, and some dynamic range is lost to necessary headroom for signal processing calculations such as overlap and core transform computations. A minimum of 22 bits and typically 24 bits or more precision is retained through the end-to-end encoding and decoding process.

PIXEL_FORMAT values having the "Num" column of Table A.6 indicating "Float" (floating point values) are floating point formats.

JPEG XR supports floating point numerical encoding for 16-bit and 32-bit depths. A packed bit RGB float format is also supported in the form of the RGBE format.

The format of the floating point values is based on the "BPC" column of Table A.6 as follows:

- BPC equal to BD16F indicates the "s5e10" format. The 16 bits are formatted in accordance with the HALF floating point format, with 1 sign bit, 5 exponent bits and 10 normalized mantissa bits.
- BPC equal to BD8 with PIXEL_FORMAT equal to 32bppRGBE indicates a packed bit representation such that three 16-bit floating point values are represented using 4 bytes. The bytes include unsigned 8-bit mantissas for the red, green and blue channels, plus a shared 8-bit exponent.

NOTE 8 – When the exponent for each channel is the same, this representation is a more compact method to encode image data as compared to the representation where BPC is equal to 16 and PIXEL_FORMAT is not equal to 32bppRGBE.

- BPC equal to 32F indicates the "s8e23" format. The numerical value is encoded as a 4-byte ISO/IEC/IEEE 60559 floating point number in little-endian form. This encoding uses 1 sign bit, 8 exponent bits and 23 normalized mantissa bits.

NOTE 9 – JPEG XR does not enable fully lossless compression for 32-bit data in general. The encoding and decoding algorithms use 32-bit computations, so some precision is lost during these calculations. A minimum of 22 bits and typically 24 bits or more precision is retained through the end-to-end encoding and decoding process.

NOTE 10 – For some applications, the bounded range provided by an integer or fixed point representation may not be sufficient. Therefore, JPEG XR also supports a floating point numerical representation. Floating point formatting of image data will typically not compress as efficiently, but floating point capability provides a dramatically larger numerical range while maintaining high precision for small absolute values.

A.7.19 SPATIAL_XFRM_PRIMARY

SPATIAL_XFRM_PRIMARY (when present) indicates a preferred spatial transformation that should be applied to the decoded image. The value of SPATIAL_XFRM_PRIMARY (when present) shall be in the range of 0 to 7, inclusive, in files conforming to this version of this Specification. Decoders conforming to this version of this Specification should interpret values outside the range from 0 to 7 as equivalent to the value 0. When SPATIAL_XFRM_PRIMARY is not present, its value shall be inferred to be equal to 0.

The interpretation of the value of SPATIAL_XFRM_PRIMARY is the same as the interpretation specified in clause 8.3.8 for the syntax element SPATIAL_XFRM_SUBORDINATE.

When the file format specified in this annex is used, the value of SPATIAL_XFRM_SUBORDINATE should be ignored.

A.7.20 IMAGE_TYPE

IMAGE_TYPE indicates an attribute of an individual image in a multi-image file. When present, the value of IMAGE_TYPE shall be in the range of 0 to 3, inclusive. All other values are reserved for future use by ITU-T | ISO/IEC. Decoders shall ignore the most significant 30 bits of IMAGE_TYPE.

If IMAGE_TYPE & 1 is equal to 1, the accompanying image is indicated to be a "preview" image; otherwise the accompanying image is not indicated to be a preview image. A preview image is an alternate representation of another image in the file. The n-th preview image in the file is an alternate representation of the n-th image in the file that is not indicated to be a preview image, where n indicates the ordering in the sequence of IMAGE_FILE_DIRECTORY structures in the file. A preview image should be encoded using a reduced resolution or a reduced quantity of encoded data relative to another image in the file.

NOTE 1 – The only constraint on ordering of images indicated to be a preview image and images not indicated to be a preview image aside is the ordering correspondence constraint. That is, the first preview image is a preview of the first image that is not a preview image; the second preview image is a preview of the second image that is not a preview image; and so on. Provided this constraint is met, preview images and images that are not preview images can otherwise be arranged in any order.

A preview image shall be encoded using the mnemonic value of PIXEL_FORMAT equal to the mnemonic value of PIXEL_FORMAT for the corresponding image that is not indicated to be a preview image or a mnemonic value of PIXEL_FORMAT from the following list: 8bppGray, 24bppBGR, 12bppYCC420, 16bppYCC422, 24bppYCC444,

32bppCMYK, 32bppCMYKDIRECT, 24bpp3Channels, 32bpp4Channels, 40bpp5Channels, 48bpp6Channels, 56bpp7Channels, 64bpp8Channels, 32bppBGRA, 20bppYCC420Alpha, 24bppYCC422Alpha, 32bppYCC444Alpha, 40bppCMYKAlpha, 40bppCMYKDIRECTAlpha, 32bpp3ChannelsAlpha, 40bpp4ChannelsAlpha, 48bpp5ChannelsAlpha, 56bpp6ChannelsAlpha, 64bpp7ChannelsAlpha, 72bpp8ChannelsAlpha.

NOTE 2 – A preview image is intended to be used to enable faster, reduced-complexity access to a basic representation of the image content. If multiple images in a file are indicated to be preview images, the first such image should ordinarily be used by applications.

If $(\text{IMAGE_TYPE} \gg 1) \& 1$ is equal to 1, the accompanying image is indicated to be an individual "page" of a sequence of "page" images in the file; otherwise the accompanying image is indicated not to be an individual page image of a sequence of page images in the file. When $(\text{IMAGE_TYPE} \gg 1) \& 1$ is equal to 1, there should be more than one image in the file for which $(\text{IMAGE_TYPE} \gg 1) \& 1$ is equal to 1. When $(\text{IMAGE_TYPE} \gg 1) \& 1$ is equal to 1, there shall not be any images in the file for which $(\text{IMAGE_TYPE} \gg 1) \& 1$ is equal to 0.

All images in a sequence of pages shall have the same dimensions, as follows.

- For all images with $\text{IMAGE_TYPE} \& 1$ equal to 0 and $(\text{IMAGE_TYPE} \gg 1) \& 1$ equal to 1, the value of IMAGE_HEIGHT and IMAGE_WIDTH shall be equal to the value of IMAGE_HEIGHT and IMAGE_WIDTH for any other image in the file with $\text{IMAGE_TYPE} \& 1$ equal to 0 and $(\text{IMAGE_TYPE} \gg 1) \& 1$ equal to 1.
- For all images with $\text{IMAGE_TYPE} \& 1$ equal to 1 and $(\text{IMAGE_TYPE} \gg 1) \& 1$ equal to 1, the value of IMAGE_HEIGHT and IMAGE_WIDTH shall be equal to the value of IMAGE_HEIGHT and IMAGE_WIDTH for any other image in the file with $\text{IMAGE_TYPE} \& 1$ equal to 1 and $(\text{IMAGE_TYPE} \gg 1) \& 1$ equal to 1.

When a file contains only a single image, IMAGE_TYPE should not be present.

A.7.21 PTM_COLOR_INFO()

The $\text{PTM_COLOR_INFO}()$ syntax structure (when present) is specified in Table A.7.

Table A.7 – $\text{PTM_COLOR_INFO}()$ syntax structure

PTM_COLOR_INFO() {	Descriptor	Reference
COLOR_PRIMARIES	u(8)	A.7.21.1
TRANSFER_CHARACTERISTICS	u(8)	A.7.21.2

A.7.21.2 TRANSFER_CHARACTERISTICS

TRANSFER_CHARACTERISTICS (when present) indicates the opto-electronic transfer characteristic of the image colour components as specified in Table A.9 as a function of a real-valued linear optical intensity input vLc in the range of 0 to 1.

NOTE – Although the transfer characteristics equations found in Table A.9 are provided in the form of a mapping from a real-valued source signal intensity to a real-valued output value as might occur in an analog image capture system, it is intended to be interpreted as guidance to aid in the rendering of the decoded image (by providing a model of a hypothetical capturing system) rather than as a description of the actual image scene signal capturing process.

Table A.9 – Interpretation of TRANSFER_CHARACTERISTICS syntax element

A.7.21.3 MATRIX_COEFFICIENTS

MATRIX_COEFFICIENTS (when present) indicates the matrix coefficients associated with derivation of luma and chroma signals from the green, blue and red primaries, as specified using Table A.10 and the value of FULL_RANGE_FLAG as specified in the following.

Table A.10 – Interpretation of MATRIX_COEFFICIENTS syntax element

Value	Matrix	Informative remark

9-255	Reserved	For future use by ITU-T ISO/IEC

A.7.21.4 RESERVED_K

RESERVED_K (when present) is a 7-bit syntax element that shall be equal to 0 in all codestreams conforming to this version of this Specification. All other values are reserved. Decoders conforming to this version of this Specification shall ignore the value of RESERVED_K.

NOTE – The purpose of the specification for decoders to ignore the value of RESERVED_K is to enable the future definition of a backward-compatible usage of different values of this syntax element.

A.7.21.5 FULL_RANGE_FLAG

FULL_RANGE_FLAG (when present) is used together with TRANSFER_CHARACTERISTICS and MATRIX_COEFFICIENTS to provide an indication of the preferred interpretation of the image colour components.

NOTE 1 – Although the equations found in the following are provided in the form of a mapping from source signals E'_R , E'_G and E'_B to integer output values iR , iG , and iB or Y , Cb , and Cr , they are intended to be interpreted as guidance to aid in the rendering of the decoded image (by providing a model of a hypothetical capturing system) rather than as a description of the actual image scene signal capturing process.

These syntax elements are interpreted as follows:

- If TRANSFER_CHARACTERISTICS is not equal to 11 or 12, E'_R , E'_G and E'_B are considered to be real-valued signals with values between 0 and 1.
- Otherwise {TRANSFER_CHARACTERISTICS is equal to 11 (IEC 61966-2-4) or 12 [Rec. ITU-R BT.1361-0 (historical) extended colour gamut system]}, E'_R , E'_G and E'_B are considered to be real-valued signals with a larger range not specified in this Specification.
- Nominal black is considered to have the property $E'_R = 0$, $E'_G = 0$ and $E'_B = 0$.
- Nominal white is considered to have the property $E'_R = 1$, $E'_G = 1$ and $E'_B = 1$.
- The value of valueBitDepthWhite is calculated as follows.
 - If OUTPUT_BITDEPTH is equal to BD8, the value of valueBitDepthWhite is set equal to 8.
 - Otherwise, if OUTPUT_BITDEPTH is equal to BD10, the value of valueBitDepthWhite is set equal to 10.
 - Otherwise, if OUTPUT_BITDEPTH is equal to BD16S, the value of valueBitDepthWhite is set equal to 13.
 - Otherwise, if OUTPUT_BITDEPTH is equal to BD16, the value of valueBitDepthWhite is set equal to 16.
- The value of valueWhite is set equal to the result of $(1 \ll \text{valueBitDepthWhite})$ taken as real-value.
- The value of chromaOffset is calculated as follows:
 - If OUTPUT_BITDEPTH is equal to BD8, BD10 or BD16, the value of chromaOffset is set equal to $\text{valueWhite} / 2$.
 - Otherwise, if OUTPUT_BITDEPTH is equal to BD16S, the value of chromaOffset is set equal to 0.
- If MATRIX_COEFFICIENTS is equal to 0 or 8, the following applies.
 - If FULL_RANGE_FLAG is equal to FALSE, the following equations apply.
$$R_S = \text{valueWhite} \div 256 * (219 * E'_R + 16)$$
$$G_S = \text{valueWhite} \div 256 * (219 * E'_G + 16)$$
$$B_S = \text{valueWhite} \div 256 * (219 * E'_B + 16)$$
 - Otherwise (FULL_RANGE_FLAG is equal to TRUE), the following equations apply.
$$R_S = (\text{valueWhite} - 1) * E'_R$$
$$G_S = (\text{valueWhite} - 1) * E'_G$$
$$B_S = (\text{valueWhite} - 1) * E'_B$$
 - If MATRIX_COEFFICIENTS is equal to 0, the following equations apply.
$$iR = \text{Round}(R_S)$$
$$iG = \text{Round}(G_S)$$
$$iB = \text{Round}(B_S)$$
 - Otherwise (MATRIX_COEFFICIENTS is equal to 8), the following equations apply.
$$Y = \text{Round}(0.5 * G_S + 0.25 * (R_S + B_S))$$
$$Cb = \text{Round}(0.5 * G_S - 0.25 * (R_S + B_S)) + \text{chromaOffset}$$
$$Cr = \text{Round}(0.5 * (R_S - B_S)) + \text{chromaOffset}$$

NOTE 2 – For purposes of the YCgCo nomenclature used in Table A.10, Cb and Cr of the foregoing equations may be referred to as Cg and Co, respectively. If OUTPUT_BITDEPTH is equal to BD8, BD10 or BD16, the inverse conversion for the above three equations should be computed as

$$\begin{aligned}
t &= Y - (Cb - \text{chromaOffset}) \\
iG &= t + 2 * (Cb - \text{chromaOffset}) \\
iB &= t - (Cr - \text{chromaOffset}) \\
iR &= iB + 2 * (Cr - \text{chromaOffset})
\end{aligned}$$

Otherwise, if OUTPUT_BITDEPTH is equal to BD16S, the inverse conversion for the above three equations should be computed as.

$$\begin{aligned}
t &= Y - (Cb \gg 1) \\
iG &= t + Cb \\
iB &= t - (Cr \gg 1) \\
iR &= iB + Cr
\end{aligned}$$

– Otherwise, if MATRIX_COEFFICIENTS is equal to 1, 4, 5, 6 or 7, the following applies:

- The following equations apply.

$$E'_Y = vKr * E'_R + (1 - vKr - vKb) * E'_G + vKb * E'_B$$

$$E'_{PB} = 0.5 * (E'_B - E'_Y) \div (1 - vKb)$$

$$E'_{PR} = 0.5 * (E'_R - E'_Y) \div (1 - vKr)$$

NOTE 3 – E'_Y is real-valued with the value 0 associated with nominal black and the value 1 associated with nominal white. E'_{PB} and E'_{PR} are real-valued with the value 0 associated with both nominal black and nominal white. When TRANSFER_CHARACTERISTICS is not equal to 11 or 12, E'_Y is real-valued with values in the range of 0 to 1. When TRANSFER_CHARACTERISTICS is not equal to 11 or 12, E'_{PB} and E'_{PR} are real-valued with values in the range of -0.5 to 0.5 . When TRANSFER_CHARACTERISTICS is equal to 11 (IEC 61966-2-4) or 12 [ITU-R BT.1361-0 (historical) extended colour gamut system], E'_Y , E'_{PB} and E'_{PR} are real-valued with a larger range not specified in this Specification.

- If FULL_RANGE_FLAG is equal to FALSE and OUTPUT_BITDEPTH is equal to BD8, BD10 or BD16, Y, Cb and Cr are related to E'_Y , E'_{PB} and E'_{PR} by the following.

$$Y = \text{Clip}(\text{Round}(\text{valueWhite} \div 256 * (219 * E'_Y + 16)), 0, \text{valueWhite} - 1)$$

$$Cb = \text{Clip}(\text{Round}(\text{valueWhite} \div 256 * (224 * E'_{PB}) + \text{chromaOffset}), 0, \text{valueWhite} - 1)$$

$$Cr = \text{Clip}(\text{Round}(\text{valueWhite} \div 256 * (224 * E'_{PR}) + \text{chromaOffset}), 0, \text{valueWhite} - 1)$$

- If FULL_RANGE_FLAG is equal to FALSE and OUTPUT_BITDEPTH is equal to BD16S, Y, Cb and Cr are related to E'_Y , E'_{PB} and E'_{PR} by the following.

$$Y = \text{Round}(\text{valueWhite} \div 256 * (219 * E'_Y + 16))$$

$$Cb = \text{Round}(\text{valueWhite} \div 256 * (224 * E'_{PB}) + \text{chromaOffset})$$

$$Cr = \text{Round}(\text{valueWhite} \div 256 * (224 * E'_{PR}) + \text{chromaOffset})$$

- Otherwise (FULL_RANGE_FLAG is equal to TRUE), Y, Cb and Cr are related to E'_Y , E'_{PB} and E'_{PR} by the following.

$$Y = \text{Round}((\text{valueWhite} - 1) * E'_Y)$$

$$Cb = \text{Round}((\text{valueWhite} - 1) * E'_{PB} + \text{chromaOffset})$$

$$Cr = \text{Round}((\text{valueWhite} - 1) * E'_{PR} + \text{chromaOffset})$$

– Otherwise, no interpretation of FULL_RANGE_FLAG, TRANSFER_CHARACTERISTICS, and MATRIX_COEFFICIENTS is specified in this version of this Specification.

A.7.22 PROFILE_LEVEL_CONTAINER()

PROFILE_LEVEL_CONTAINER() (when present) has the same syntax and semantics as PROFILE_LEVEL_INFO() in 8.6.

A.7.23 IMAGE_WIDTH

IMAGE_WIDTH specifies the width of the image in units of sample columns after decoding and before application of the spatial transformation indicated by the (actual or inferred) value of SPATIAL_XFRM_PRIMARY. The value of IMAGE_WIDTH shall be equal to WIDTH_MINUS1 + 1.

NOTE – When ALPHA_OFFSET is present, the value of IMAGE_WIDTH is equal to the value of WIDTH_MINUS1 + 1 from the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET and is also equal to the value of WIDTH_MINUS1 + 1 from the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET.

A.7.24 IMAGE_HEIGHT

IMAGE_HEIGHT specifies the height of the image in units of sample rows after decoding and before application of the spatial transformation indicated by the (actual or inferred) value of SPATIAL_XFRM_PRIMARY. The value of IMAGE_HEIGHT shall be equal to HEIGHT_MINUS1 + 1.

NOTE – When ALPHA_OFFSET is present, the value of IMAGE_HEIGHT is equal to the value of HEIGHT_MINUS1 + 1 from the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET and is also equal to the value of HEIGHT_MINUS1 + 1 from the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET.

A.7.25 WIDTH_RESOLUTION

WIDTH_RESOLUTION (when present) indicates a nominal width of the associated image after decoding and before application of the spatial transformation indicated by the (actual or inferred) value of SPATIAL_XFRM_PRIMARY. WIDTH_RESOLUTION is in units of columns per inch (columns per 2.54 cm). When WIDTH_RESOLUTION is equal to 0 or is not present, a value of 96 columns per inch should be inferred. The nominal width of the image (before application of the spatial transformation indicated by SPATIAL_XFRM_PRIMARY) is indicated to be $IMAGE_WIDTH \div WIDTH_RESOLUTION$ inches.

NOTE – The nominal width may be interpreted as an indication of a suggested width for printing or display of the image. The combination of IMAGE_WIDTH, IMAGE_HEIGHT, WIDTH_RESOLUTION and HEIGHT_RESOLUTION may be used to determine an indication of a suggested display or printing aspect ratio for the image.

A.7.26 HEIGHT_RESOLUTION

HEIGHT_RESOLUTION (when present) indicates a nominal height of the associated image after decoding and before application of the spatial transformation indicated by the (actual or inferred) value of SPATIAL_XFRM_PRIMARY. HEIGHT_RESOLUTION is in units of rows per inch (rows per 2.54 cm). When HEIGHT_RESOLUTION is equal to 0 or is not present, a value of 96 rows per inch should be inferred. The nominal height of the image (before application of the spatial transformation indicated by SPATIAL_XFRM_PRIMARY) is indicated to be $IMAGE_HEIGHT \div HEIGHT_RESOLUTION$ inches.

NOTE – The nominal height may be interpreted as an indication of a suggested height for printing or display of the image. The combination of IMAGE_WIDTH, IMAGE_HEIGHT, WIDTH_RESOLUTION and HEIGHT_RESOLUTION may be used to determine an indication of a suggested display or printing aspect ratio for the image.

A.7.27 IMAGE_OFFSET

IMAGE_OFFSET specifies the byte position, relative to the beginning of the file, of the start of a CODED_IMAGE() syntax structure in the file (see 8.2) containing the primary image plane in the IMAGE_FILE_DIRECTORY(). When ALPHA_OFFSET is not present, but an alpha plane is present, the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET also contains the alpha image plane.

A.7.28 IMAGE_BYTE_COUNT

IMAGE_BYTE_COUNT specifies the quantity of the image codestream data in the file as follows.

- If IMAGE_BYTE_COUNT is not equal to 0, the quantity of the image codestream data in the file is indicated to be equal to the value of IMAGE_BYTE_COUNT.
- Otherwise (IMAGE_BYTE_COUNT is equal to 0), the quantity of image codestream data in the file is indicated to be equal to $FileSizeInBytes - IMAGE_OFFSET$.

NOTE – When IMAGE_BYTE_COUNT is equal to 0, no additional syntax structures are present in the file after the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET.

A.7.29 ALPHA_OFFSET

ALPHA_OFFSET (when present) specifies the byte position, relative to the beginning of the file, of the start of a CODED_IMAGE() syntax structure for the alpha plane of the image in the IMAGE_FILE_DIRECTORY(). When PIXEL_FORMAT does not indicate the presence of an alpha channel, ALPHA_OFFSET shall not be present.

When PIXEL_FORMAT indicates the presence of an alpha channel, the form of the encoding of the alpha channel is specified as follows.

- If ALPHA_OFFSET is present, the alpha channel is present in a separate CODED_IMAGE() syntax structure of the same IMAGE_FILE_DIRECTORY() syntax structure from the CODED_IMAGE() for the primary image plane. In this case, the syntax element ALPHA_IMAGE_PLANE_FLAG for the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET (A.7.27) shall be equal to zero and the syntax element ALPHA_IMAGE_PLANE_FLAG for the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET shall be equal to 1. In this case, the alpha image plane is a separate alpha image plane.
- Otherwise, the alpha channel is present within the same CODED_IMAGE() syntax structure as the primary image plane and the syntax element ALPHA_IMAGE_PLANE_FLAG shall be equal to one. In this case, the alpha image plane is an interleaved alpha image plane.

When ALPHA_BYTE_COUNT is present, ALPHA_OFFSET shall also be present.

A.7.30 ALPHA_BYTE_COUNT

ALPHA_BYTE_COUNT (when present) specifies the quantity of the alpha plane codestream data in the file. When ALPHA_OFFSET is present, ALPHA_BYTE_COUNT shall also be present.

A.7.31 IMAGE_BAND_PRESENCE

IMAGE_BAND_PRESENCE (when present) indicates which frequency bands are present in the accompanying image data as specified in Table A.11. When IMAGE_BAND_PRESENCE is not present, its value shall be inferred to be equal to 0. The value of IMAGE_BAND_PRESENCE, when present, shall be equal to the value of BANDS_PRESENT of the primary image plane of the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET.

Table A.11 – Interpretation of IMAGE_BAND_PRESENCE and ALPHA_BAND_PRESENCE

IMAGE_BAND_PRESENCE or ALPHA_BAND_PRESENCE	Bands present
0	DC, LP, HP, and Flexbits
1	DC, LP, and HP only
2	DC and LP only
3	DC only

A.7.32 ALPHA_BAND_PRESENCE

ALPHA_BAND_PRESENCE (when present) indicates which frequency bands are represented in the accompanying alpha channel data as specified in Table A.11. When ALPHA_OFFSET is not present, ALPHA_BAND_PRESENCE shall not be present. When ALPHA_OFFSET is present and ALPHA_BAND_PRESENCE is not present, its value shall be inferred to be equal to 0. If the alpha channel is present as an interleaved alpha image plane, the value of ALPHA_BAND_PRESENCE, when present, shall be equal to the value of BANDS_PRESENT of the alpha image plane of the CODED_IMAGE() syntax structure at the position specified by IMAGE_OFFSET. If the alpha channel is present as a separate alpha image plane, the value of ALPHA_BAND_PRESENCE, when present, shall be equal to the value of BANDS_PRESENT of the CODED_IMAGE() syntax structure at the position specified by ALPHA_OFFSET.

A.7.33 PADDING_DATA

PADDING_DATA (when present) consists of a string of byte values of the indicated quantity. PADDING_DATA is formatted as follows.

- The first byte shall be equal to 0x1C.
- The second byte (when present) shall be equal to 0xEA.
- The remaining bytes (when present) shall be equal to 0 in all codestreams conforming to this version of this Specification. Decoders conforming to this version of this Specification shall ignore the value of the remaining bytes.

NOTE – One use for PADDING_DATA is to reserve space within a file for potential later replacement by other data.

Annex B

Profiles and levels

(This annex forms an integral part of this Recommendation | International Standard.)

B.1 General

This annex specifies sets of constraints on the syntax and values of derived parameters that enhance interoperability by establishing bounds on the capabilities that are needed for the decoding of images encoded according to this Recommendation | International Standard. These sets of constraints are classified into profile and level constraints.

NOTE – Typically, a profile constraint restricts the use of algorithmic features, while a level constraint restricts the range of values in a manner intended to constrain resource requirements such as memory storage capacity.

Decoders that claim conformance to a specified profile of this Specification at some specified level shall be capable of decoding any coded image that conforms to all specified constraints for the specified profile at the specified level or any lower specified level and has such conformance expressed syntactically as specified in this annex.

Conformance of a coded image to a particular profile and level is expressed by a PROFILE_LEVEL_INFO() syntax structure. When the PROFILE_LEVEL_INFO() syntax structure is not present, the following inference rules apply:

- PROFILE_IDC shall be inferred to be equal to 111.
- LEVEL_IDC shall be inferred to be equal to 255.

B.2 Profiles

B.2.1 Sub-baseline profile

The sub-baseline profile is defined as the set of coded image syntax that has LONG_WORD_FLAG set equal to FALSE, has OVERLAP_MODE set equal to either 0 or 1, and that is consistent with the use of the following PIXEL_FORMAT mnemonic values (specified in Table A.6): 24bppRGB, 24bppBGR, 32bppBGR, 8bppGray, BlackWhite, 16bppBGR555, 16bppBGR565 or 32bppBGR101010.

NOTE 1 – Although this constraint is specified in terms of concepts defined in Annex A, it also applies when the file format specified in Annex A is not in use. Concepts specified in Annex A are used in this annex only as a reference to establish the set of features supported by the profiles specified in this annex.

NOTE 2 – Encoders may need to set SCALED_FLAG equal to 0 for 32bppBGR101010 encoding to avoid exceeding the dynamic range constraints imposed when LONG_WORD_FLAG is equal to FALSE.

Conformance of a coded image to the sub-baseline profile is indicated by PROFILE_IDC equal to 44. The value 44 for PROFILE_IDC shall not be used in a PROFILE_LEVEL_INFO() syntax structure unless the associated coded image conforms to the constraints specified for the sub-baseline profile.

Values of PROFILE_IDC that are less than 44 may additionally be interpreted by decoders as expressing conformance of the associated coded image to the sub-baseline profile.

B.2.2 Baseline profile

The baseline profile is defined as the set of coded image syntax that is consistent with the use of the following PIXEL_FORMAT mnemonic values (specified in Table A.6): 24bppRGB, 24bppBGR, 32bppBGR, 48bppRGB, 48bppRGBFixedPoint, 64bppRGBFixedPoint, 8bppGray, 16bppGray, 16bppGrayFixedPoint, BlackWhite, 16bppBGR555, 16bppBGR565 or 32bppBGR101010.

NOTE – Although this constraint is specified in terms of concepts defined in Annex A, it also applies when the file format specified in Annex A is not in use. Concepts specified in Annex A are used in this annex only as a reference to establish the set of features supported by the profiles specified in this annex.

Conformance of a coded image to the baseline profile is indicated by PROFILE_IDC equal to 55. The value 55 for PROFILE_IDC shall not be used in a PROFILE_LEVEL_INFO() syntax structure unless the associated coded image conforms to the constraints specified for the baseline profile.

Values of PROFILE_IDC that are less than 55 may additionally be interpreted by decoders as expressing conformance of the associated coded image to the baseline profile.

B.2.3 Main profile

The Main profile is defined as the set of coded image syntax that is consistent with the use of the following PIXEL_FORMAT mnemonic values (specified in Table A.6): 24bppRGB, 24bppBGR, 32bppBGR, 48bppRGB, 48bppRGBFixedPoint, 48bppRGBHalf, 96bppRGBFixedPoint, 64bppRGBFixedPoint, 64bppRGBHalf, 128bppRGBFixedPoint, 128bppRGBFloat, 32bppBGRA, 64bppRGBA, 64bppRGBAFixedPoint, 64bppRGBHalf, 128bppRGBAFixedPoint, 128bppRGBFloat, 32bppPBGRA, 64bppPRGBA, 128bppPRGBAFixedPoint, 32bppCMYK, 40bppCMYKAlpha, 64bppCMYK, 80bppCMYKAlpha, 24bpp3Channels, 32bpp4Channels, 40bpp5Channels, 48bpp6Channels, 56bpp7Channels, 64bpp8Channels, 32bpp3ChannelsAlpha, 40bpp4ChannelsAlpha, 48bpp5ChannelsAlpha, 56bpp6ChannelsAlpha, 64bpp7ChannelsAlpha, 72bpp8ChannelsAlpha, 48bpp3Channels, 64bpp4Channels, 80bpp5Channels, 96bpp6Channels, 112bpp7Channels, 128bpp8Channels, 64bpp3ChannelsAlpha, 80bpp4ChannelsAlpha, 96bpp5ChannelsAlpha, 112bpp6ChannelsAlpha, 128bpp7ChannelsAlpha, 144bpp8ChannelsAlpha, 8bppGray, 16bppGray, 16bppGrayFixedPoint, 16bppGrayHalf, 32bppGrayFixedPoint, 32bppGrayFloat, BlackWhite, 16bppBGR555, 16bppBGR565, 32bppBGR101010 or 32bppRGBE.

NOTE – Although this constraint is specified in terms of concepts defined in Annex A, it also applies when the file format specified in Annex A is not in use. Concepts specified in Annex A are used in this annex only as a reference to establish the set of features supported by the profiles specified in this annex.

Conformance of a coded image to the Main profile is indicated by PROFILE_IDC equal to 66. The value 66 for PROFILE_IDC shall not be used in a PROFILE_LEVEL_INFO() syntax structure unless the associated coded image conforms to the constraints specified for the Main profile.

Values of PROFILE_IDC that are less than 66 may additionally be interpreted by decoders as expressing conformance of the associated coded image to the Main profile.

B.2.4 Advanced profile

The Advanced profile is defined as the set of all coded image syntax that is specified in this Specification.

NOTE – Some image codestreams that conform to the Advanced profile cannot be stored in a file as specified in Annex A due to the lack of specification of any PIXEL_FORMAT value in Annex A that is consistent with the content of the image codestream. For example, a coded image with NumComponents equal to 32 cannot be stored in a file as specified in Annex A.

Conformance of a coded image to the Advanced profile is indicated by PROFILE_IDC equal to 111. The value 111 for PROFILE_IDC shall not be used in a PROFILE_LEVEL_INFO() syntax structure unless the associated coded image conforms to the constraints specified for the Advanced profile.

Values of PROFILE_IDC that are less than 111 may additionally be interpreted by decoders as expressing conformance of the associated coded image to the Advanced profile.

B.2.5 Reserved values of PROFILE_IDC

The value of PROFILE_IDC in a PROFILE_LEVEL_INFO() syntax structure shall not be equal to any value other than 44, 55, 66 or 111. Such other values are reserved for future use by ITU-T | ISO/IEC.

B.3 Levels

Conformance of a coded image to a particular level is indicated by LEVEL_IDC equal to the value shown in the "Level" column of Table B.1.

For a value of LEVEL_IDC specified by the "Level" column of Table B.1, the associated coded image shall obey the following constraints using values obtained from the corresponding row of Table B.1.

- $WIDTH_MINUS1 + LEFT_MARGIN + RIGHT_MARGIN$ shall be less than MaxImageDimension.
- $HEIGHT_MINUS1 + TOP_MARGIN + BOTTOM_MARGIN$ shall be less than MaxImageDimension.
- NUM_HOR_TILES_MINUS1 shall be less than MaxDimensionInTiles.
- NUM_VER_TILES_MINUS1 shall be less than MaxDimensionInTiles.
- $TILE_WIDTH_IN_MB[n] * 16$, when present, shall be less than MaxTileDimension for all values of n greater than or equal to 0 and less than NUM_VER_TILES_MINUS1.
- $(MBWidth - LeftMBIndexOfTile[NUM_VER_TILES_MINUS1]) * 16$ shall be less than MaxTileDimension.
- $TILE_HEIGHT_IN_MB[n] * 16$, when present, shall be less than MaxTileDimension for all values of n greater than or equal to 0 and less than NUM_HOR_TILES_MINUS1.
- $(MBHeight - TopMBIndexOfTile[NUM_HOR_TILES_MINUS1]) * 16$ shall be less than MaxTileDimension.
- When LEVEL_IDC is not equal to 255, the value of ImageBufferBytes(valNC) as specified in Table B.2 shall be less than MaxBufferSizeInBytes, where the value of valNC is determined as follows.

- If LEVEL_IDC is within a PROFILE_LEVEL_CONTAINER() syntax structure, valNC is set equal to the value in the "NC" column of Table A.6 for the corresponding value of PIXEL_FORMAT.
- Otherwise, if ALPHA_IMAGE_PLANE_FLAG is equal to FALSE, valNC is set equal to the value returned by DetermineNumComponents() for the primary image plane.
- Otherwise, valNC is set equal to the value returned by DetermineNumComponents() for the primary image plane plus 1.

When LEVEL_IDC is less than or equal to 128, SHORT_HEADER_FLAG shall be equal to 1.

Table B.1 – Parameters of levels of conformance to this Specification

Level	MaxImageDimension	MaxDimensionInTiles	MaxTileDimension	MaxBufferSizeInBytes
4	2 ¹⁰	2 ⁴	2 ¹⁰	2 ²²
8	2 ¹¹	2 ⁵	2 ¹¹	2 ²⁴
16	2 ¹²	2 ⁶	2 ¹²	2 ²⁶
32	2 ¹³	2 ⁷	2 ¹²	2 ²⁸
64	2 ¹⁴	2 ⁸	2 ¹²	2 ³⁰
128	2 ¹⁶	2 ¹⁰	2 ¹²	2 ³²
255	2 ³²	2 ¹²	2 ³²	Not applicable

NOTE – When LEVEL_IDC is equal to 255 and TILING_FLAG is equal to TRUE, the number of bits used for the syntax elements TILE_WIDTH_IN_MB[n] and TILE_HEIGHT_IN_MB[n] cannot express a value greater than 2¹⁶–1.

Table B.2 – Pseudocode for function ImageBufferBytes(valNC)

ImageBufferBytes(valNC) {	Reference
numBytes = 0	
if (OUTPUT_BITDEPTH == BD8)	
numBytes = valNC * ExtendedWidth[0] * ExtendedHeight[0]	
else if ((OUTPUT_BITDEPTH == BD16) (OUTPUT_BITDEPTH == BD16S) (OUTPUT_BITDEPTH == BD16F))	
numBytes = 2 * valNC * ExtendedWidth[0] * ExtendedHeight[0]	
else if ((OUTPUT_BITDEPTH == BD32S) (OUTPUT_BITDEPTH == BD32F))	
numBytes = 4 * valNC * ExtendedWidth[0] * ExtendedHeight[0]	
else if ((OUTPUT_BITDEPTH == BD1WHITE1) (OUTPUT_BITDEPTH == BD1BLACK1))	
numBytes = ExtendedWidth[0] * ExtendedHeight[0] / 8	
else if ((OUTPUT_BITDEPTH == BD5) (OUTPUT_BITDEPTH == BD565))	
numBytes = 2 * ExtendedWidth[0] * ExtendedHeight[0]	
else /* In the remaining case, OUTPUT_BITDEPTH is equal to BD10 */	
if (OUTPUT_CLR_FMT == RGB)	
numBytes = 4 * ExtendedWidth[0] * ExtendedHeight[0]	
else	
numBytes = 2 * valNC * ExtendedWidth[0] * ExtendedHeight[0]	
return numBytes	
}	

The value of LEVEL_IDC in a PROFILE_LEVEL_INFO() syntax structure shall not be equal to any value other than a value specified in Table B.1. Such other values are reserved for future use by ITU-T | ISO/IEC. Any reserved value of LEVEL_IDC that is lower than some value that is specified in Table B.1 shall be interpreted by decoders as expressing conformance of the associated image to the higher value of LEVEL_IDC that is specified in Table B.1 (in the context of the associated value of PROFILE_IDC).

Annex C

Colour imagery representation and colour management

(This annex does not form an integral part of this Recommendation | International Standard.)

C.1 Background information

While it might be theoretically possible to agree on one method for assigning specific numerical values to real world colours, doing so is not practical. Since any specific device has its own limited range for colour reproduction, the device's range may be a small portion of the agreed-upon universal colour range. As a result, such an approach is an extremely inefficient use of the available numerical values, especially when using only 8 bits (or 256 unique values) per channel.

To represent pixel values as efficiently as possible, devices use a numeric encoding optimized for their own range of possible colours or gamut. In addition, a colour profile is often provided that describes the numeric encoding for the specific device relative to some pre-defined reference standard. For example, a colour profile may include a specification of a non-linear transformation from the range of integer values to the luminance (or radiance) of the colour values as reproduced. This non-linear transformation is called the colour component transfer function (CCTF). In some cases, it may be possible to specify the CCTF using a power function with a single numerical value specifying the exponent or "gamma". The term "gamma" is also sometimes used more informally to refer to any CCTF, although this terminology is not strictly correct. Colour profiles deal with all aspects of the colour interpretation of digital values, and in addition to specifying the CCTF, specify the relations between device values and the profile connection space (PCS) coordinates, which in the case of ICC profiles are based on the CIE 1931 2° standard observer specified in ISO 11664-1. Colour profiles may provide additional information about the encoded image, such as the viewing conditions or image state. ICC profiles also provide a transform to a standard reference medium for interoperability. Colour profiles make it possible to convert image data between different colour encodings, thereby controlling the capture and production of colours using a variety of devices. This science is known as "colour management".

Most common photo and image formats use an 8-bit or 16-bit unsigned integer value to represent some function of the intensity of each colour channel. The minimum value (0) often represents the minimum intensity in a single channel. The encoding of black is achieved in such usage when all channels are zero. The maximum value ($2^n - 1$ for an unsigned bit depth of n bits) often represents 100% intensity or full saturation of an individual channel. When all channels have this maximal value, this typically corresponds to an encoding of white. Various alternative encoding conventions also exist, such as several colour representations specified by the ITU-R for which black may be represented by the value 16 and white may be represented by the value 235 for each colour channel.

The exact meaning of "black", "full saturation" and "white" as well as the specific colours produced by all the intermediate numerical steps in the numerical representation range is dependent on how these values are initially created or captured or how these values are rendered. Different source or destination devices (including cameras, scanners, displays or printers) may use different numerical values to represent the same "real world" colour.

The process of converting colours, and their numerical representation, to the ranges covered by different devices creates some significant complications. First, colours optimized for the gamut of the source device are re-optimized for the gamut of the destination device. This process involves some artistic judgment, as there is no single correct method. Then, the converted colours are encoded using the destination device encoding.

In addition, any intermediate image processing has the potential to produce values that extend beyond the black (low limit) or white (high limit) point of the particular colour encoding, often resulting in these calculated values being clipped to the associated limits. A working space colour encoding with a limited numerical range can cause values to be corrupted during intermediate calculations, even though subsequent image processing may bring these values back within the displayable (black to white) range of the target rendering destination. Because of this issue, many modern image processing software applications use a much larger gamut, including representation of numerical values of greater bit depths, for all intermediate image processing calculations. (It is not uncommon to use 32-bit floating point values for intermediate calculations, minimizing any image corruption caused by rounding errors and clipping at the range limits during the intermediate steps of image processing calculations.) However, most common image formats today require that this image data be converted back to a range-limited, unsigned integer representation, limited to the gamut as defined by a specific colour profile. So once again, the potential for data corruption exists.

C.2 Colour interpretation in the JPEG XR context

To address these challenges, JPEG XR provides a much more flexible approach to the numerical encoding of image data by supporting a wide range of different pixel formats. JPEG XR supports three basic types of numerical encoding, each at a variety of bit depths – specifically, these types are unsigned integer, fixed-point, and floating point representations.

A variety of pixel formats is supported by JPEG XR using unsigned integer representations in bit depths of 8 and 16, as well as smaller bit depths for specialized applications. JPEG XR also supports a number of additional pixel formats that avoid some problematic aspects involved in the unsigned integer representations.

ICC profile data as specified by ICC.1:2001-04 (ICC version 2.4.0.0) or ISO 15076-1:2010 (ICC version 4.3.0.0) can provide at least one unambiguous interpretation of the colours associated with encoded image data. Multiple interpretations may be provided using different rendering intents. The file format specified in Annex A supports the inclusion of ICC profile data for imagery encoded according to this Specification by allowing the use of the field tag value 0x8773, which is specified in ICC.1:2001-04 and ISO 15076-1:2010 for use in tag-based file formats for embedding of ICC profile data.

Unless otherwise selected by the user, device or software receiving the image data, the perceptual rendering intent (0xA2B0 in ICC.1:2001-04 or ISO 15076-1:2010) transform should be used for interpretation of the colour imagery.

Unsigned integer RGB formats, as may be specified using the PIXEL_FORMAT tag defined in A.7.18, are a common form of imagery representation. When present with unsigned integer pixel formats, embedded ICC Profile data provides a non-ambiguous definition of the colour interpretation of an image. The colour interpretation of JPEG XR image data should be defined either explicitly using embedded ICC profile data. When, for an unsigned pixel format, ICC profile data is not present, COLOR_SPACE is not present or not equal to 1, PTM_COLOR_INFO() is not present, and colour interpretation information is not available by other means, unsigned integer RGB data should be assumed to use the sRGB colour encoding specified in IEC 61966-2-1.

Fixed point values are essentially signed, scaled integer values. Rather than interpreting the numbers as the integer step from the minimum limit to the maximum limit for a particular colour encoding, a fixed point number is scaled. In this fixed point colour space, zero could represent either the minimum device value or it could represent absolute black (zero photons). A value of 1.0 could represent the maximum device value or when applied to all channels that make up a pixel, it could represent a perfect diffuse white. The specific scaling for each bit depth specifies exactly what point in the entire signed integer range is interpreted as a value of 1.0. The type of black encoded at zero (e.g. the device black or zero photons), and the type of white encoded at 1.0 (e.g. some encoding maximum or a perfect diffuse white) are determined from the colour profile associated with the encoding.

Unlike unsigned integer values that are often interpreted based on a colour component transfer function (CCTF) that may be different for different colour encodings, it is preferred that the fixed point colour encodings used for the JPEG XR context should be based on a linear CCTF (equivalent to a gamma equal to 1.0).

Floating point numerical formats, as may be specified using the PIXEL_FORMAT tag defined in A.7.18, should also be based on a linear CCTF (gamma = 1.0) colour encoding. ICC profiles embedded in images using a floating point pixel format as specified by PIXEL_FORMAT in A.7.18 should therefore have a linear CCTF in the relative colorimetric rendering intent (0xA2B1 in ISO 15076-1:2010) transform.

Fixed point or floating point RGB data, as may be specified using the PIXEL_FORMAT tag defined in A.7.18, should use the scRGB colour space defined in IEC 61966-2-2, but without the offset and scaling that are applied to produce scRGB unsigned integer values (i.e. the floating point scRGB is only a matrix transform from the CIE 1931 XYZ colour space specified in ISO 11664-1). scRGB is a linear CCTF (gamma = 1.0) colour encoding that uses the same colour primaries and white point chromaticity as sRGB, but has a different CCTF and image state. The scRGB black point is the numerical value 0.0 and corresponds to zero photons in the scene. The scRGB perfect diffuse white point is specified by all three colour channels set to a value of 1.0.

Since the colour rendering of scene colorimetry is often scene-specific, the perceptual intent transforms found in embedded scRGB-float ICC profiles may be image-specific. However, the use of a default perceptual rendering may be appropriate under some circumstances.

Devices and software receiving scRGB image data may also provide users with the opportunity to custom colour render scene-referred colorimetry. If such edits are to be saved, it is recommended that where possible they should be incorporated as changes to the perceptual rendering intent (0xA2B0 in ISO 15076-1:2010) transform in the embedded ICC profile, with the scRGB image data left unchanged.

For Gray pixel formats, as may be specified using the PIXEL_FORMAT tag defined in A.7.18, in the absence of ICC profile data, the represented Gray value should be inferred as the value of all three colour components of the corresponding RGB format.

In the absence of an ICC profile, when no other indication of the colour interpretation is available by other means, any CMYK pixel format (as defined in A.7.18) should be assumed to be encoded according to ANSI CGATS/SWOP¹ TR003-2007 CMYK.

¹ Committee for Graphics Arts Technologies Standards/Specifications for Web Offset Publications.

NOTE 1 – A profile for ANSI CGATS/SWOP TR003-2007 CMYK is available from the ICC Profile Registry. The profile name in the registry is SWOP2006_Coated3v2.icc.

There is no inherent description of the colour context for n-channel data, so when using an n-channel pixel format, it is recommended that an ICC profile should always be included (when applicable). However, if an ICC profile is not present and no other indication of the colour interpretation is available by other means, the following default colour context assumptions are recommended.

- When $n = 3$, the three channels should be assumed to be red, green, and blue (RGB) encoded using the sRGB colour space.
- When $n > 3$, the first four channels should be assumed to be CMYK encoded according to CGATS/SWOP TR003 2007 CMYK. Any additional channels should be discarded.

NOTE 2 – A profile for ANSI CGATS/SWOP TR003-2007 CMYK is available from the ICC Profile Registry. The profile name in the registry is SWOP2006_Coated3v2.icc.

Annex D

Encoder processing

(This annex does not form an integral part of this Recommendation | International Standard.)

D.1 Overview

The encoder carries out the following steps:

- pre-scaling;
- colour conversion;
- transform;
- outer pre-filter;
- outer forward core transform (FCT);
- inner pre-filter;
- inner FCT;
- coefficient prediction;
- quantization;
- coefficient scanning;
- entropy coding.

These steps are explained in D.2 to D.9.

D.2 Pre-scaling

The pre-scaling steps are applied for 16-bit unsigned integer (BD16), 16-bit signed integer (BD16S), 16-bit float (BD16F), 32-bit signed integer (BD32S), 32-bit float (BD32F) and RGBE. They are usually used when the input data range is greater than 27/24 bits. The 27-bit limit is used when data is scaled, and the 24-bit limit applies when the data is unscaled. For the most common cases such as for 16-bit data, the pre-scaling steps are omitted although they may still be used.

For OUTPUT_BITDEPTH equal to BD16, BD16S or BD32S, input values are right-shifted by the value specified by SHIFT_BITS. The function PreScaling1() is specified in Table D.1.

Table D.1 – Pseudocode for function PreScaling1()

PreScaling1(iInput) {	Reference
iOutput = (iInput >> SHIFT_BITS)	
return iOutput	
}	

For OUTPUT_BITDEPTH equal to BD16F, a sign bit extension is applied. The function PreScalingBD16F() is specified in Table D.2.

Table D.2 – Pseudocode for function PreScalingBD16F()

PreScalingBD16F(fV) {	Reference
if (fV < 0)	
iS = 1	
else	
iS = 0	
iX = (fV & 0x7fff) ^ iS - iS	
return iX	
}	

For OUTPUT_BITDEPTH equal to BD32F, the encoder first selects a value of mantissa length LEN_MANTISSA, and an exponent bias EXP_BIAS. LEN_MANTISSA is less than or equal to 23. The function PreScalingBD32F() is specified in Table D.3.

Table D.3 – Pseudocode for function PreScalingBD32F()

PreScalingBD32F(fV) {	Reference
if (fV == 0)	
iX = 0	
else {	
iS = (fV >> 31) & 0x00000001	
iE = (fV >> 23) & 0x000000FF	
iM = (fV & 0x007FFFFFFF) 0x800000	
if (iE == 0) {	
iM ^= 0x800000	
iE++	
}	
iE = iE - 127 + EXP_BIAS	
if (iE <= 1) {	
if (iE < 1)	
iM >>= (1 - iE)	
iE = 1	
if ((iM & 0x800000) == 0)	
iE = 0	
}	
iM = (((iM & 0x007FFFFFFF) + (1 << (23 - LEN_MANTISSA - 1))) >> (23 - LEN_MANTISSA))	
iX = ((iE << LEN_MANTISSA) iM) ^ iS - iS	
}	
return iX	
}	

For OUTPUT_CLR_FMT equal to RGBE, the function PreScalingRGBE() is specified in Table D.4 and Table D.5.

Table D.4 – Pseudocode for function PreScalingRGBE()

PreScalingRGBE(arrayOut[], arrayIn[]) {	Reference
arrayOut[0] = RGBEForwardConversion(arrayIn[0], arrayIn[3])	
arrayOut[1] = RGBEForwardConversion(arrayIn[1], arrayIn[3])	
arrayOut[2] = RGBEForwardConversion(arrayIn[2], arrayIn[3])	
}	

Table D.5 – Pseudocode for function RGBEForwardConversion()

RGBEForwardConversion(iRGB, iE) {	Reference
if (iE == 0)	
return 0	
iAppend = 1	
iE -= 1	
while (((iRGB & 0x80) == 0) && (iE > 0)) {	
iRGB = (iRGB << 1) + iAppend	
iAppend = 0	
iE -= 1	
}	
if (iE == 0)	
iX = iRGB	
else {	
iE++	
iX = (iRGB & 0x7f) + (iE << 7)	
}	
return iX	
}	

D.3 Colour conversion

D.3.1 General

The encoder uses a reversible colour format conversion to convert between the OUTPUT_CLR_FMT and INTERNAL_CLR_FMT.

RGB to YUV444 colour format conversion is performed using FwdColorFmtConvert1() that is specified in D.3.2. In order to convert from RGB to YUV422 or YUV420, downsampling must be performed after colour format conversion using FwdColorFmtConvert1(). RGB to YONLY conversions may be performed using FwdColorFmtConvert1() by discarding the U and V components on the encoder side. CMYK to YUVK colour format conversion is performed using FwdColorFmtConvert2() that is specified in D.3.3. CMYKDIRECT to YUVK colour format conversion is performed using FwdColorFmtConvert3() that is specified in D.3.4.

Prior to colour conversion, a bias is subtracted from all values, to zero centre their range. The amount of the bias is determined by the source bit depth, and is exactly as specified in 9.10.5. When the scaling mode is used, the colour values are shifted left prior to encoder colour conversion.

D.3.2 FwdColorFmtConvert1()

The function FwdColorFmtConvert1() implements the following operations to convert from RGB to YUV444 in Table D.6. When the decoded image is intended to be formatted using OUTPUT_CLR_FMT equal to RGB and OUTPUT_BITDEPTH equal to BD5, BD565 or BD10, the process depends on the selected behaviour for the decoder with respect to the RED_BLUE_NOT_SWAPPED_FLAG syntax element.

NOTE – The specification of semantics for RED_BLUE_NOT_SWAPPED_FLAG was not included in the original edition of this Specification. The specification of RED_BLUE_NOT_SWAPPED_FLAG was added later to address a problem with respect to the observed behaviour of existing implementations. In principle, when OUTPUT_CLR_FMT is equal to RGB and OUTPUT_BITDEPTH is equal to BD5, BD565, or BD10, the value 1 for RED_BLUE_NOT_SWAPPED_FLAG should ordinarily provide better compression capability than the value 0. However, early product implementations of this Specification have operated in a manner corresponding to the value 0. Encoders that are designed primarily for interoperability with early product implementations of this Specification should therefore use the value 0 for RED_BLUE_NOT_SWAPPED_FLAG when OUTPUT_CLR_FMT is equal to RGB and OUTPUT_BITDEPTH is equal to BD5, BD565 or BD10. It is anticipated that, as time passes, decoder implementations will also properly support operation with the value 1 for RED_BLUE_NOT_SWAPPED_FLAG when OUTPUT_CLR_FMT is equal to RGB and OUTPUT_BITDEPTH is equal to BD5, BD565 or BD10.

Table D.6 – Pseudocode for function FwdColorFmtConvert1()

FwdColorFmtConvert1(arrayIn[], arrayOut[]) {	Reference
/* arrayIn[] = {R, G, B} */	
/* arrayOut[] = {Y, U, V} */	
if ((OUTPUT_CLR_FMT == RGB) && (OUTPUT_BITDEPTH == BD5 OUTPUT_BITDEPTH == BD565 OUTPUT_BITDEPTH == BD10) && !RED_BLUE_NOT_SWAPPED_FLAG) {	
/* swappedRBflag = 1 */	
arrayTemp[0] = arrayIn[2]	
arrayTemp[1] = arrayIn[1]	
arrayTemp[2] = arrayIn[0]	
} else {	
/* swappedRBflag = 0 */	
arrayTemp[0] = arrayIn[0]	
arrayTemp[1] = arrayIn[1]	
arrayTemp[2] = arrayIn[2]	
}	
arrayOut[2] = arrayTemp[2] - arrayTemp[0] /* V = B - R, except when swappedRBflag is equal to 1 */	
tempT = arrayTemp[0] - arrayTemp[1] + Ceiling(arrayOut[2] ÷ 2) /* t = R - G + Ceiling(V ÷ 2), except when swappedRBflag is equal to 1 */	
arrayOut[0] = arrayTemp[1] + Floor(tempT ÷ 2) /* Y = G + Floor(t ÷ 2) */	
arrayOut[1] = -tempT /* U = -t */	
}	

D.3.3 FwdColorFmtConvert2()

The function FwdColorConvert2() implements the following operations to convert from CMYK to YUVK in Table D.7.

Table D.7 – Pseudocode for function FwdColorFmtConvert2()

FwdColorFmtConvert2(arrayIn[], arrayOut[]) {	Reference
<i>/* arrayIn[] = {c, m, y, k} */</i>	
<i>/* arrayOut[] = {Y, U, V, K} */</i>	
$arrayOut[2] = arrayIn[0] - arrayIn[2] /* c - y */$	
$arrayOut[1] = arrayIn[0] - arrayIn[1] + Floor(arrayOut[2] \div 2) /* c - m - Floor(V \div 2) */$	
$arrayOut[0] = arrayIn[3] - arrayIn[1] + Floor(arrayOut[1] \div 2) /* k - m - Floor(U \div 2) */$	
$arrayOut[3] = arrayIn[3] - Floor(arrayOut[0] \div 2) /* K = k - Floor(Y \div 2) */$	
}	

D.3.4 FwdColorFmtConvert3()

The function FwdColorConvert3() implements the following operations to convert from CMYKDIRECT to YUVK in Table D.8.

Table D.8 – Pseudocode for function FwdColorFmtConvert3()

FwdColorFmtConvert3(arrayIn[], arrayOut[]) {	Reference
<i>/* arrayIn[] = {c, m, y, k} */</i>	
<i>/* arrayOut[] = {Y, U, V, K} */</i>	
$arrayOut[2] = arrayIn[1] /* V = m */$	
$arrayOut[1] = arrayIn[0] /* U = c */$	
$arrayOut[0] = arrayIn[3] /* Y = k */$	
$arrayOut[3] = arrayIn[2] /* K = y */$	
}	

D.3.5 Macroblock alignment and padding

The width and height of images are not always integer multiples of 16. When an image width or height is not an integer multiple of 16, the image is extended by some means so that the extended image has dimensions that are multiples of 16.

A suggested method of image extension is to perform horizontal replication of the bottom and right edge sample values to the extent necessary to form an input array having a conforming (multiple of 16) extended image width and height.

D.4 Transform

The encoder uses a two level lapped transform, which is structured as follows:

- A pre-filter operation is optionally applied to 4×4 areas evenly straddling blocks in two dimensions. For images with soft tiles, this filter is applied to all such blocks. For images with hard tiles, this filter is applied only to the interior of tiles. Furthermore, a pre-filter is applied to boundary areas which are 2×4 or 4×2 in size, and a pre-filter is applied to the four 2×2 corners on each colour component. For images with hard tiles, these filters are additionally applied at tile boundaries.
- An FCT is applied to all 4×4 blocks. This completes the first transform level.
- DC coefficients of the 4×4 blocks are grouped together. 16 Such coefficients are present for each macroblock colour component, and these are structured as 4×4 blocks in the DC-LP array.
- A second level pre-filter operation is optionally applied to 4×4 areas evenly straddling blocks in two dimensions in the DC-LP array. For images with soft tiles, this filter is applied to all such blocks. For images with hard tiles, this filter is applied only to the interior of tiles. Furthermore, a pre-filter is applied to boundary 2×4 and 4×2 areas, and a pre-filter is applied to the four 2×2 corner areas. For images with hard tiles, these filters are additionally applied at tile boundaries.
- The FCT is applied to each 4×4 block corresponding to DC coefficients in a macroblock colour component.

The pre-filtering operation is applied across macroblock boundaries and optionally across tile boundaries. If HARD_TILING_FLAG is set equal to FALSE, the pre-filtering is applied across tile boundaries. Otherwise, the pre-filtering operation is not applied across tile boundaries and tile boundaries are treated as image edges instead.

These operations are repeated for all colour components. For the special cases of INTERNAL_CLR_FMT equal to YUV422 or YUV420, appropriately modified transforms are applied (for instance a 2×2 transform is used as the block transform of the chroma component DC-LP arrays of YUV420).

"OverlapPreFilter1" in Figure D.1 is used to denote the corner prediction process, and the process is equivalent to "OverlapPostFilter1" detailed in Table 154 and Table 155.

An overview of this process is shown in Figure D.1.

T.832(12)_FD.1

Figure D.1 – Encoder transform

The application of overlap filters is governed by the OVERLAP_MODE syntax element. Lossless coding is possible with all overlap modes, although OVERLAP_MODE equal to 0 is usually best or sufficient for lossless coding. OVERLAP_MODE equal to 1 produces the shortest codestream for a large class of images and quantization levels. OVERLAP_MODE equal to 2 is recommended for high quantization levels, but with slightly higher complexity. OVERLAP_MODE equal to 0 is recommended for lowest complexity encoding/decoding; however, this mode implements a hierarchical block transform and potentially introduces blocking at low bit rates.

The forward core transform (FCT) process can be written as the cascade of three elementary 2×2 transform operations, which are:

- 1) 2×2 Hadamard transform: T2x2h()
- 2) 1D rotate: TOdd()

3) 2D rotate: TOddOdd()

D.4.1 T2x2h()

As specified in 9.9.7.2.

D.4.2 TOdd()

TOdd() is specified by the pseudocode in Table D.9.

Table D.9 – Pseudocode for function TOdd()

TOdd(iCoeff[]) {
iCoeff[1] -= iCoeff[2]
iCoeff[0] += iCoeff[3]
iCoeff[2] += ((iCoeff[1] + 1) >> 1)
iCoeff[3] = ((iCoeff[0] + 1) >> 1) - iCoeff[3]
iCoeff[1] -= ((3* iCoeff[0] + 4) >> 3)
iCoeff[0] += ((3* iCoeff[1] + 4) >> 3)
iCoeff[3] -= ((3* iCoeff[2] + 4) >> 3)
iCoeff[2] += ((3* iCoeff[3] + 4) >> 3)
iCoeff[3] += (iCoeff[1] >> 1)
iCoeff[2] -= ((iCoeff[0] + 1) >> 1)
iCoeff[1] -= iCoeff[3]
iCoeff[0] += iCoeff[2]
}

D.4.3 TOddOdd()

TOddOdd() is specified by the pseudocode in Table D.10.

Table D.10 – Pseudocode for function TOddOdd()

TOddOdd(iCoeff[]) {
iCoeff[1] = -iCoeff[1]
iCoeff[2] = -iCoeff[2]
iCoeff[3] += iCoeff[0]
iCoeff[2] -= iCoeff[1]
iCoeff[0] -= (valT1 = iCoeff[3] >> 1)
iCoeff[1] += (valT2 = iCoeff[2] >> 1)
iCoeff[0] += ((iCoeff[1] * 3 + 4) >> 3)
iCoeff[1] -= ((iCoeff[0] * 3 + 3) >> 2)
iCoeff[0] += ((iCoeff[1] * 3 + 3) >> 3)
iCoeff[1] -= valT2
iCoeff[0] += valT1
iCoeff[2] += iCoeff[1]
iCoeff[3] -= iCoeff[0]
}

D.4.4 FwdPermute()

The forward permutation function FwdPermute() operates on an ordered array of 16 sample values, producing a permuted list. The input to this function is the ordered array arrayInput[i], for i ranging from 0 to 15. The output of this function is the re-ordered array arrayInput[i].

To define the permutation, the array FwdPermArr[i] is specified, for i ranging from 0 to 15, in Table D.11.

Table D.11 – Forward Permutation

i	FwdPermArr[i]
0	0
1	8
2	4
3	6
4	2
5	10
6	14
7	12
8	1
9	11
10	15
11	13
12	9
13	3
14	7
15	5

The function FwdPermute() is specified in Table D.12.

Table D.12 – Pseudocode for function FwdPermute()

FwdPermute(arrayInput[]) {	Reference
for (i = 0; i <= 15; i++)	
arrayTemp[FwdPermArr[i]] = arrayInput[i]	
for (i = 0; i <= 15; i++)	
arrayInput[i] = arrayTemp[i]	
}	

D.4.5 FCT operations

D.4.5.1 FCT4x4()

The input to the FCT4x4 function is an array of length 16, denoted iCoeff[]. The output of this function is a modified array of length 16 denoted iCoeff[].

The FCT4x4() is built using the three operators: T2x2h(), TOdd() and TOddOdd(), followed by the permutation function FwdPermute(). The FCT begins with two transform stages. Each stage consists of four 2x2 transforms which may be done in any arbitrary sequence or concurrently within the stage. However, the first stage transforms must be complete before any of the second stage transforms are initiated. Also, for each function called in the FCT, the inverse of that function is called in the ICT pseudocode (9.9.7.1), with the exact same set of parameters.

When these two transform stages are complete, the coefficients need to be re-ordered by the FwdPermute() function.

The FCT4x4() function is specified by the pseudocode in Table D.13.

Table D.13 – Pseudocode for function FCT4x4()

D.4.5.2 FCT2x2()

The function FCT2x2() is identical to the T2x2h() function specified in Table 161.

D.5 Overlap pre-filtering

D.5.1 Overview

Four operators determine the overlap pre-filters used in the transform. These are:

- 1) Overlap Prefilter4x4
- 2) OverlapPrefilter4
- 3) OverlapPreFilter2x2
- 4) OverlapPreFilter2

The pre-filter makes use of the operators T2x2hEnc(), FwdRotate(), FwdScale() and FwdTOddOdd() that are specified in Table D.14, Table D.15, Table D.16, and Table D.17, respectively.

D.5.1.1 T2x2hEnc()

T2x2hEnc() is specified by the pseudocode in Table D.14.

Table D.14 – Pseudocode for function T2x2hEnc()

T2x2hEnc(iCoeff[]) {
iCoeff[0] += iCoeff[3]
iCoeff[1] -= iCoeff[2]
valT1 = iCoeff[3]
valT2 = iCoeff[2]
iCoeff[2] = ((iCoeff[0] - iCoeff[1]) >> 1) - valT1
iCoeff[3] = valT2 + (iCoeff[1] >> 1)
iCoeff[1] += iCoeff[2]
iCoeff[0] -= (iCoeff[3] * 3 + 4) >> 3
}

D.5.1.2 FwdRotate()

FwdRotate() is specified by the pseudocode in Table D.15.

Table D.15 – Pseudocode for function FwdRotate()

FwdRotate(iCoeff[]) {
iCoeff[1] -= (iCoeff[0] + 1) >> 1
iCoeff[0] += (iCoeff[1] + 1) >> 1
}

D.5.1.3 FwdScale()

FwdScale() is specified by the pseudocode in Table D.16.

Table D.16 – Pseudocode for function FwdScale()

FwdScale(iCoeff[]) {
iCoeff[1] -= (iCoeff[0] * 3 + 0) >> 4
iCoeff[1] -= (iCoeff[0] >> 7)
iCoeff[1] += (iCoeff[0] >> 10)
iCoeff[0] -= (iCoeff[1] * 3 + 0) >> 3
iCoeff[1] = (iCoeff[0] >> 1) - iCoeff[1]
iCoeff[0] -= iCoeff[1]
}

D.5.1.4 FwdTOddOdd()

FwdTOddOdd() is specified by the pseudocode in Table D.17.

Table D.17 – Pseudocode for function FwdTOddOdd()

FwdTOddOdd(iCoeff[]) {
iCoeff[3] += iCoeff[0]
iCoeff[2] -= iCoeff[1]
valT1 = iCoeff[3] >> 1
valT2 = iCoeff[2] >> 1
iCoeff[0] -= valT1
iCoeff[1] += valT2
iCoeff[0] += (iCoeff[1] * 3 + 4) >> 3
iCoeff[1] -= (iCoeff[0] * 3 + 2) >> 2
iCoeff[0] += (iCoeff[1] * 3 + 6) >> 3
iCoeff[1] -= valT2
iCoeff[0] += valT1
iCoeff[2] += iCoeff[1]
iCoeff[3] -= iCoeff[0]
}

D.5.1.5 OverlapPreFilter4x4()

The 4×4 pre-filter is applied to all block junctions (areas straddling 4 blocks evenly) in all colour components when OVERLAP_MODE is 1 or 2. Also, the 4×4 filter is applied to all block junctions in the DC-LP array for all planes when OVERLAP_MODE is 2, and for only the luma plane when OVERLAP_MODE is 2 and INTERNAL_CLR_FMT is equal to YUV420 or YUV422.

The function OverlapPreFilter4x4() is specified in Table D.18.

Table D.18 – Pseudocode for function OverlapPreFilter4x4()

}	

D.5.2 OverlapPreFilter4()

Linear 4-point filters are applied to edge straddling 2×4 and 4×2 areas on the boundary of the image. If the input data is an array of length 4, denoted iCoeff[], the 4-point pre-filter, OverlapPreFilter4(), is specified in Table D.19.

Table D.19 – Pseudocode for function OverlapPreFilter4()

OverlapPreFilter4(iCoeff[])	Reference
iCoeff[0] += iCoeff[3]	
iCoeff[1] += iCoeff[2]	
iCoeff[3] -= ((iCoeff[0] + 1) >> 1)	
iCoeff[2] -= ((iCoeff[1] + 1) >> 1)	
FwdRotate(iCoeff[2], iCoeff[3])	D.5.1.2
iCoeff[3] = -iCoeff[3]	
iCoeff[2] = -iCoeff[2]	
iCoeff[0] -= iCoeff[3]	
iCoeff[1] -= iCoeff[2]	
iCoeff[3] += (iCoeff[0] >> 1)	
iCoeff[2] += (iCoeff[1] >> 1)	
iCoeff[0] -= ((iCoeff[3] * 3 + 4) >> 3)	
iCoeff[1] -= ((iCoeff[2] * 3 + 4) >> 3)	
FwdScale(iCoeff[0], iCoeff[3])	D.5.1.3
FwdScale(iCoeff[1], iCoeff[2])	D.5.1.3
iCoeff[3] += ((iCoeff[0] + 1) >> 1)	
iCoeff[2] += ((iCoeff[1] + 1) >> 1)	
iCoeff[0] -= iCoeff[3]	
iCoeff[1] -= iCoeff[2]	
}	

D.5.3 OverlapPreFilter2x2

The 2×2 pre-filter is applied to areas straddling blocks in the DC-LP array for the chroma components when INTERNAL_CLR_FMT is equal to YUV420 or YUV422 data. The OverlapPreFilter2x2() function is specified in Table D.20.

Table D.20 – Pseudocode for function OverlapPreFilter2x2()

OverlapPreFilter2x2(iCoeff[]) {
iCoeff[0] += iCoeff[3]
iCoeff[1] += iCoeff[2]
iCoeff[3] -= ((iCoeff[0] + 1) >> 1)
iCoeff[2] -= ((iCoeff[1] + 1) >> 1)
iCoeff[1] -= ((iCoeff[0] + 2) >> 2)
iCoeff[0] -= (iCoeff[1] >> 5)
iCoeff[0] -= (iCoeff[1] >> 9)
iCoeff[0] -= (iCoeff[1] >> 13)
iCoeff[0] -= ((iCoeff[1] + 1) >> 1)
iCoeff[1] -= ((iCoeff[0] + 2) >> 2)
iCoeff[3] += ((iCoeff[0] + 1) >> 1)
iCoeff[2] += ((iCoeff[1] + 1) >> 1)
iCoeff[0] -= iCoeff[3]
iCoeff[1] -= iCoeff[2]
}

D.5.4 OverlapPreFilter2

As for the 2-point filters, the 2-point pre-filter is applied to boundary 2×1 and 1×2 samples that straddle blocks. The 2-point pre-filter function OverlapPreFilter2() is specified in Table D.21.

Table D.21 – Pseudocode for function OverlapPreFilter2()

OverlapPreFilter2(iCoeff[]) {
iCoeff[1] -= ((iCoeff[0] + 2) >> 2)
iCoeff[0] -= (iCoeff[1] >> 13)
iCoeff[0] -= (iCoeff[1] >> 9)
iCoeff[0] -= (iCoeff[1] >> 5)
iCoeff[0] -= ((iCoeff[1] + 1) >> 1)
iCoeff[1] -= ((iCoeff[0] + 2) >> 2)
}

D.6 Coefficient prediction

The coefficient prediction process is the same as the corresponding process in the decoder. See 9.6.

D.7 Coefficient scanning

The coefficient scanning process is the same as the corresponding process in the decoder.

D.8 Quantization

Quantization is a process whereby the transform coefficients are divided by the quantization scaling factor and rounded to an integer value, called the *quantized value*.

For lossless coding, the quantization scaling factor is selected to be equal to 1. For lossy coding, the quantization scaling factor is selected to be greater than 1.

The quantization scaling factor used for quantization is determined as a function of the quantization factor in the same manner as for the decoding process. Larger values of the quantization parameter correspond to larger quantization scaling factors and (typically) correspond to lower fidelity representation of the image content.

On the encoder side, the specific rounding method used in the process of quantization is implementation specific, and is not covered in this Specification.

The quantization parameter is allowed to differ across HP, LP and DC bands. The DC QP index within a tile is fixed. The DC QP index across tiles may vary. The HP and LP QP indices within a tile may take on either the same value or one of a multiple value set. The QP index used may change at every macroblock, and is specified in the codestream.

D.9 Adaptive coefficient normalization

Adaptive coefficient normalization partitions the transform coefficients into a VLC-coded part and an FLC part (called FLEXBITS). The VLC-coded part is obtained from a coarse quantization of the coefficient referred to as the normalized coefficient, while the FLEXBITS represents the LSBs and provides a refinement layer over the VLC-coded part. Sign information may also be present as part of FLEXBITS when the normalized coefficient is equal to 0. The partition between the VLC coded and the FLC coded parts is performed as follows.

- 1) The functions `MB_HP()` (8.7.18.2) and `MB_HP_FLEX()` (8.7.18.3) specify how `iLapMean[0]` and `iLapMean[1]` are used to compute the total number of non-zero coefficients that have been coded for the luma and chroma components, respectively.
- 2) The `UpdateModelMB()` function (8.12.2) specifies how this information is used to compute `Model.MBits[0]` and `Model.MBits[1]` which are the number of LSBs that form the FLEXBITS portion of the luma and chroma components, respectively. The more significant bits are VLC coded.

In effect, the number of non-zero coded coefficients is used as a measure of the statistical variance of the block. Thus, a larger number of non-zero coded coefficients in a block produces higher values of `iLapMean[]`, and thus result in FLEXBITS forming a larger fraction of the partition. As a result of this partition, entropy coding is applied only to the normalized coefficients with reduced dynamic range, and thus reduces the computational and memory complexity of entropy coding at both encoder and decoder. An overview of the adaptive coefficient normalization process at the encoder is shown in Figure D.2.

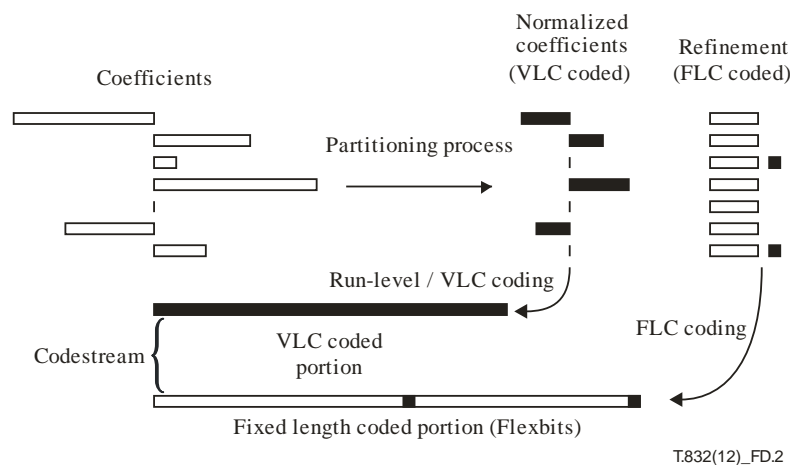

Figure D.2 – Representation of the adaptive normalization process and partitioning of coefficients into VLC coded and FLC coded parts

Annex E

Media type specification

(This annex forms an integral part of this Recommendation | International Standard.)

E.1 General

This annex is a media type specification for images encoded according to the tag-based format specified in Annex A of this Recommendation | International Standard for use in various Internet protocols, according to the scheme defined in IETF RFC 6838. Recent Internet protocols have been carefully designed to be easily extensible in certain areas, and many such protocols are capable of carrying arbitrary labelled content. The mechanism used to label such content is a media type, consisting of a top-level type, a subtype, and in some instances, optional parameters. This annex specifies such a content labelling scheme for JPEG XR coded images, to correspond with a registration in the IANA² central registry.

E.2 Media type specification template information

Media type name: image

Subtype name: jxr

Required parameters: none

Optional parameters: none

Encoding considerations: files are binary and should be transmitted in a suitable encoding without CR/LF conversion, 7-bit stripping etc.; base64 is a suitable encoding.

Security considerations: The conveyed coded image files use a structure that can store image data, metadata corresponding to this image data, and other user-defined data. It should be noted that selected metadata fields may encompass information partly intended to protect the image against unauthorized use or distribution. In this case, the intention may be that alteration or removal of the data in the fields would be treated as an offence. Metadata fields may also contain information about the source of the image content. The data files have an extensible structure, so that it is theoretically possible that metadata fields could be defined in the future that could be used to induce particular actions on the part of the recipient, thus presenting additional security risks, but this type of capability is currently not supported in the current referenced specifications.

Interoperability considerations: JPEG XR coded image files can conform to one of several profiles and levels of capabilities (as specified in Annex B of this Recommendation | International Standard) – not all of which may be supported by a receiving decoder. As a result, implementations may attempt to decode and display an encoded JPEG XR image only to determine that the image cannot be rendered either partially or in full.

Published specification:

(this Recommendation | International Standard) Rec. ITU-T T.832 (2016) | ISO/IEC 29199-2 (20126), *Information technology – JPEG XR image coding system – Image coding specification*

Applications that use this media type: Imaging, fax, messaging and multi-media.

Fragment identifier considerations: N/A

Additional information:

Deprecated alias names for this type: N/A

Magic number(s):

As specified in Annex A of this Recommendation | International Standard, the data begins with a FILE_HEADER() data structure, which begins with a FIXED_FILE_HEADER_II_2BYTES field equal to 0x4949, followed by a FIXED_FILE_HEADER_0XBC_BYTE field equal to 0xBC, followed by a FILE_VERSION_ID which is equal to 1 for the current version of this Recommendation | International Standard (with other values reserved for future use, as modified in additional parts or amendments, by ITU-T | ISO/IEC).

²Internet Assigned Numbers Authority.

Within the payload data, JPEG XR IMAGE_HEADER() data structures begin with a GDI_SIGNATURE, which is a 64-bit syntax element that has the value 0x574D50484F544F00 that corresponds to "WMPHOTO" using the UTF-8 character set encoding specified in Annex D of ISO/IEC 10646, followed by a byte equal to 0.

File extension(s): jxr

Person and email address to contact for further information:

Touradj Ebrahimi, JPEG convenor (convenor@jpeg.org or touradj.ebrahimi@epfl.ch)

Gary J. Sullivan, JPEG XR image coding specification editor (garysull@microsoft.com)

Intended usage: COMMON

Restrictions on usage: N/A

Author: ITU-T and ISO/IEC JTC 1

Change controller: ITU-T and ISO/IEC JTC 1

Provisional registration? (standards tree only): Same (image/jxr)
