CE3-related: TB-level residual coding selection for lossless coding

Zhi-Yi Lin, Tzu-Der Chuang, Ching-Yeh Chen, Chih-Wei Hsu, Yu-Wen Huang,
Shaw-Min Lei (MediaTek)

A. Nalci, H. Wang, M. Coban, M. Karczewicz (Qualcomm)

Overall Summary

- Propose block-level switch between regular residual coding (RRC) and transform skip residual coding (TSRC) for better coding efficiency and flexibility without adding any new low-level syntax
- Method 1: Use transform skip (TS) flag to select between RRC and TSRC
 - A slice-level flag is signalled to specify whether transform is disabled or not
- Method 2: Further allows TS flag to select between RRC and TSRC for BDPCM blocks
 - Another slice-level flag is signalled to specify whether TS flag is inferred as 0 for BDPCM coded blocks

Introduction

- In VTM7.0, lossless coding is achieved by forcing encoder to choose TS mode, so TSRC is always applied
- It was observed that RRC brings more bit savings for lossless coding for some sequences
- Several CE3 proposals proposed to use high level syntax to select between RRC or TSRC for TS mode for the **entire slice**
 - Lack of flexibility
- Propose two methods to support block-level switch between RRC and TSRC without adding any new low-level syntax

Proposed Method 1 – Disable Transform

- A high-level syntax to disable the transform process in decoding process
 - A PPS flag and a slice-level flag are added
- When transform is disabled:
 - The transform process and the quantization process are the same as those when TS mode is applied
 - The TS flag will be used to select the residual method between RRC and TSRC
 - Achieve block-level switching by using the TS flag

Results - Method 1 (Anchor: VTM7.0 Lossless)

Dec Time[%]	108%			102%			106%		

Thank Kwai for cross-checking!!

Proposed Method 2 – Disable TS Inference for BDPCM Blocks

- A high-level syntax to disable the inference of TS flag for BDPCM coded blocks
 - A PPS flag and a slice-level flag are added
- When disabling the inference of always using TS for BDPCM blocks, the TS flag is parsed for BDPCM blocks
 - The TS flag will be used to select the residual method between RRC and TSRC
 - Achieve block-level switching for BDPCM mode

Proposed Method 2 – Disable TS Inference for BDPCM Blocks

transform_unit(x0, y0, tbWidth, tbHeight, treeType, subTuIndex, chType) {	Descriptor
...	
if(tu_cbf_luma[x0][y0] && treeType != DUAL_TREE_CHROMA) {	
if(sps_transform_skip_enabled_flag && (!BdpcmFlag[x0][y0][0] slice_bdpcm_infer_transform_skip_disabled_flag) && tbWidth <= MaxTsSize && tbHeight <= MaxTsSize && (IntraSubPartitionsSplit[x0][y0] == ISP_NO_SPLIT) && !cu_sbt_flag)	
transform_skip_flag[x0][y0][0]	ae(v)
if(!transform_skip_flag[x0][y0][0])	
residual_coding(x0, y0, Log2(tbWidth), Log2(tbHeight), 0)	
else	
residual_ts_coding(x0, y0, Log2(tbWidth), Log2(tbHeight), 0)	
}

Enc Time[%]	136%			117%			114%		
Dec Time[%]	94%			100%			105%		

Conclusion

- Propose block-level switch between RRC and TSRC for better coding efficiency and flexibility without adding any new low-level syntax
- Method 1: Disable transform at high-level
- Method 2: Disable TS inference for BDPCM blocks
