

Communication has always been a human need.

We believe it is also a human right.

The International Telecommunication Union (ITU) has always played a vital role in the management of the radio-frequency spectrum and satellite orbits – finite natural resources which are increasingly in demand from an ever-growing number of services. Whether on earth, at sea, in the air or in space, wireless services require spectrum to operate. Through an international treaty, ITU coordinates efforts worldwide to avoid and eliminate harmful interference between radio stations of different countries for everyone to communicate. ITU also establishes global wireless standards to facilitate interoperability and the development of radio infrastructure.
