TITLE: SMALL MODIFICATION OF IDCT MISMATCH SPECIFICATION

P R O P O S A L

Change the refresh interval to
"at least every 132 coded frames".

In the current version of the IDCT mismatch specification it says that the picture must be refreshed with intra mode at least every 128 coded frames. 128 frames was selected more or less randomly as being a reasonable number.

If the proposed change is accepted three macro blocks per coded picture can be refreshed which allows simple strategies.
