ITU BBmaps

What is need:

- Status of info-highways and
- identifying connectivity gaps
- investment opportunities in ICT infrastructure
- Harmonized ICT connectivity metrics

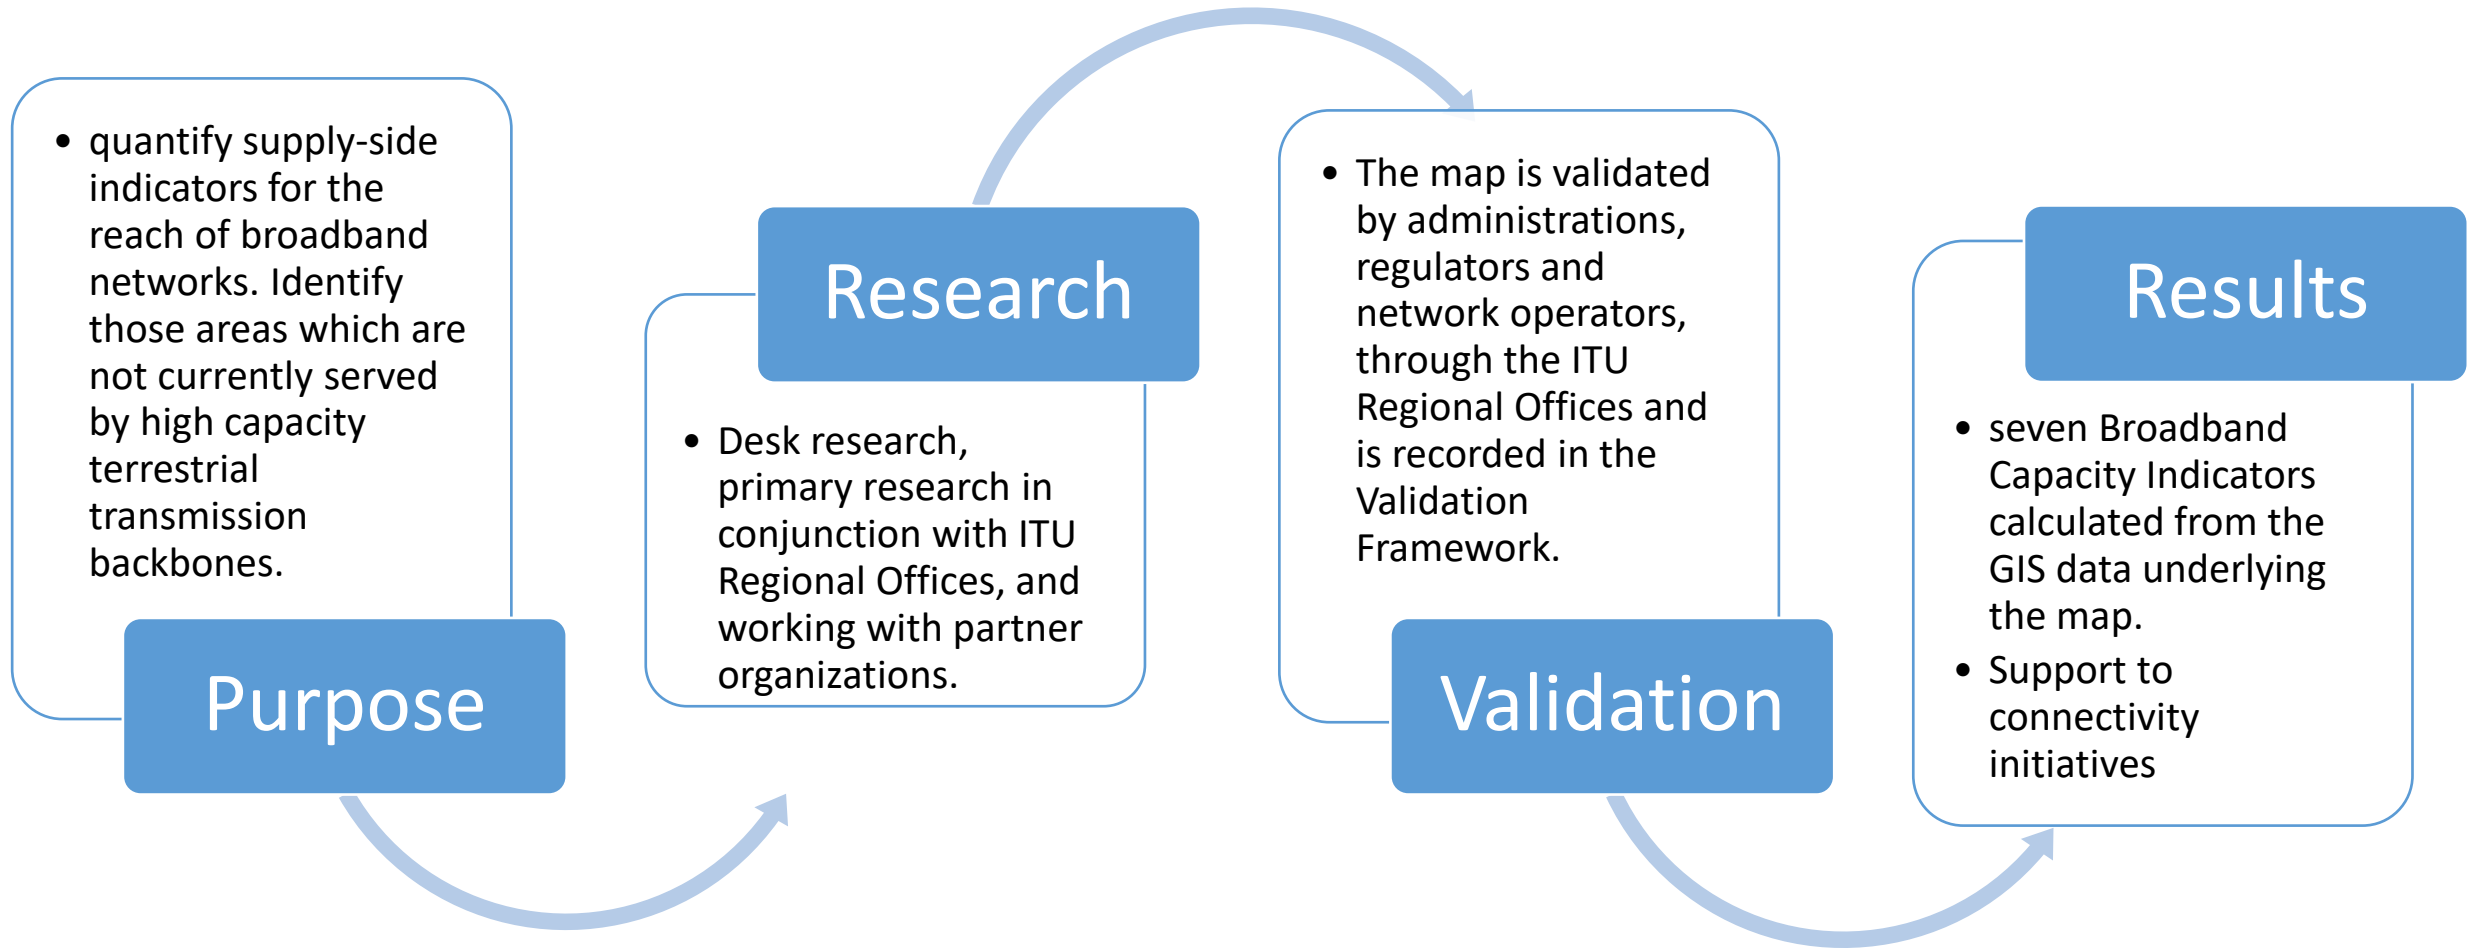

Contribution to **SDG 9**:

The ITU Broadband Maps is taking stock of global backbone connectivity and other key infrastructure metrics to support the

The background features a series of parallel, glowing blue lines that create a sense of depth and perspective, receding towards the horizon. Interspersed among these lines are numerous small, glowing blue arcs and dots, resembling data points or network connections. In the upper right corner, there is a small, semi-transparent icon of a globe with latitude and longitude lines.

**Information on how
countries are connected
to the Global Transmission
networks.**

Data Research

Terrestrial Backbones

- Countries covered: 88
- Total of Km drawn: 3,885,787
- Number of Nodes: 23,807
- Number of Transmission lines: 40,524

<https://itu.int/go/Maps>

Operators:

Region	Terrestrial
Africa	93
Arab States	40
Asia & Pacific	94
CIS	26
Europe	141
The Americas	108
Total	512

Data Validation Framework

Each link in the map is given a validation status.

We use a simple traffic light system:

- Validation - Red Traffic Light
- Validation - Amber Traffic Light
- Validation - Green Traffic Light
- Validation - Public

Red: Information was sourced from a restricted document (for example on TIES), a potentially unreliable publicly available source (such as a third party), may contain information which is confidential or regarded as sensitive by the network operator, and/or is very old and could be out of date (if it is more than 3-5 years old). Information must be validated by network operator or stakeholder to provide clearance that the information is correct, up-to-date, and is not confidential.

Amber: Information was not taken from a publicly available source, may be unreliable because of difficulties reading or interpreting the source material, and/or may be old and out of date. Operator is asked to provide clearance that the information is correct, up-to-date, and is not confidential.

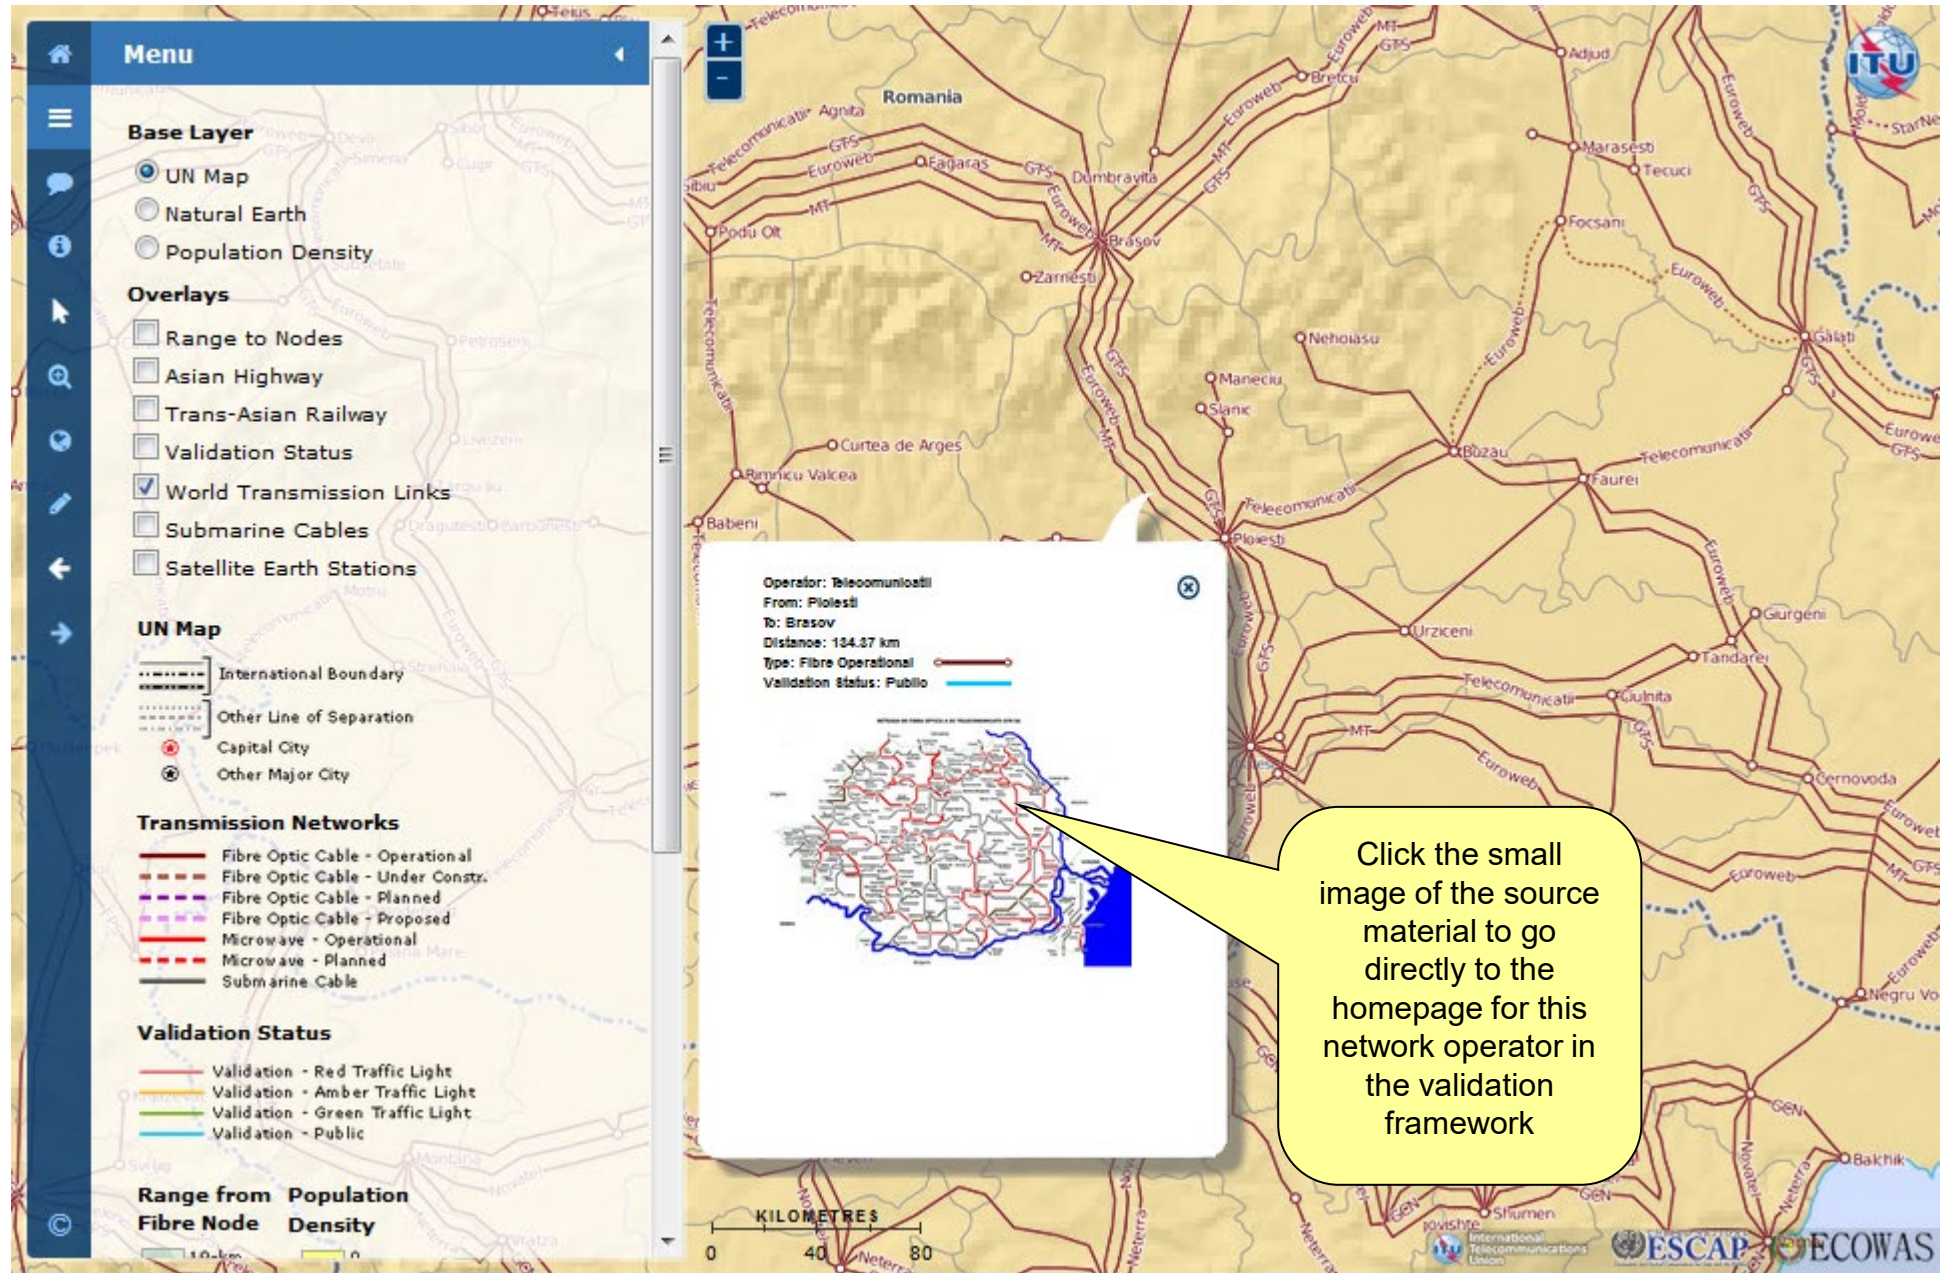

Green: Information was sourced from an authentic, reliable publicly available source (such as a company website, annual report, presentation, or other publication), and has been deliberately put into the public domain by the network operator or administration (it is therefore not confidential). The information is current and correct, and there is no reason why a public version could not be put into the public domain.

Public: Information has been actively checked and validated by stakeholder through the TIES interactive web map platform, specifically granting permission for this information to be put into the public domain.

Data Validation Framework & Data source

Broadband Transmission Capacity Indicators

Indicator 1: **Transmission network length (Route kilometres)**

Indicator 2: **Node locations**

Indicator 3: **Equipment type of terrestrial transmission network**

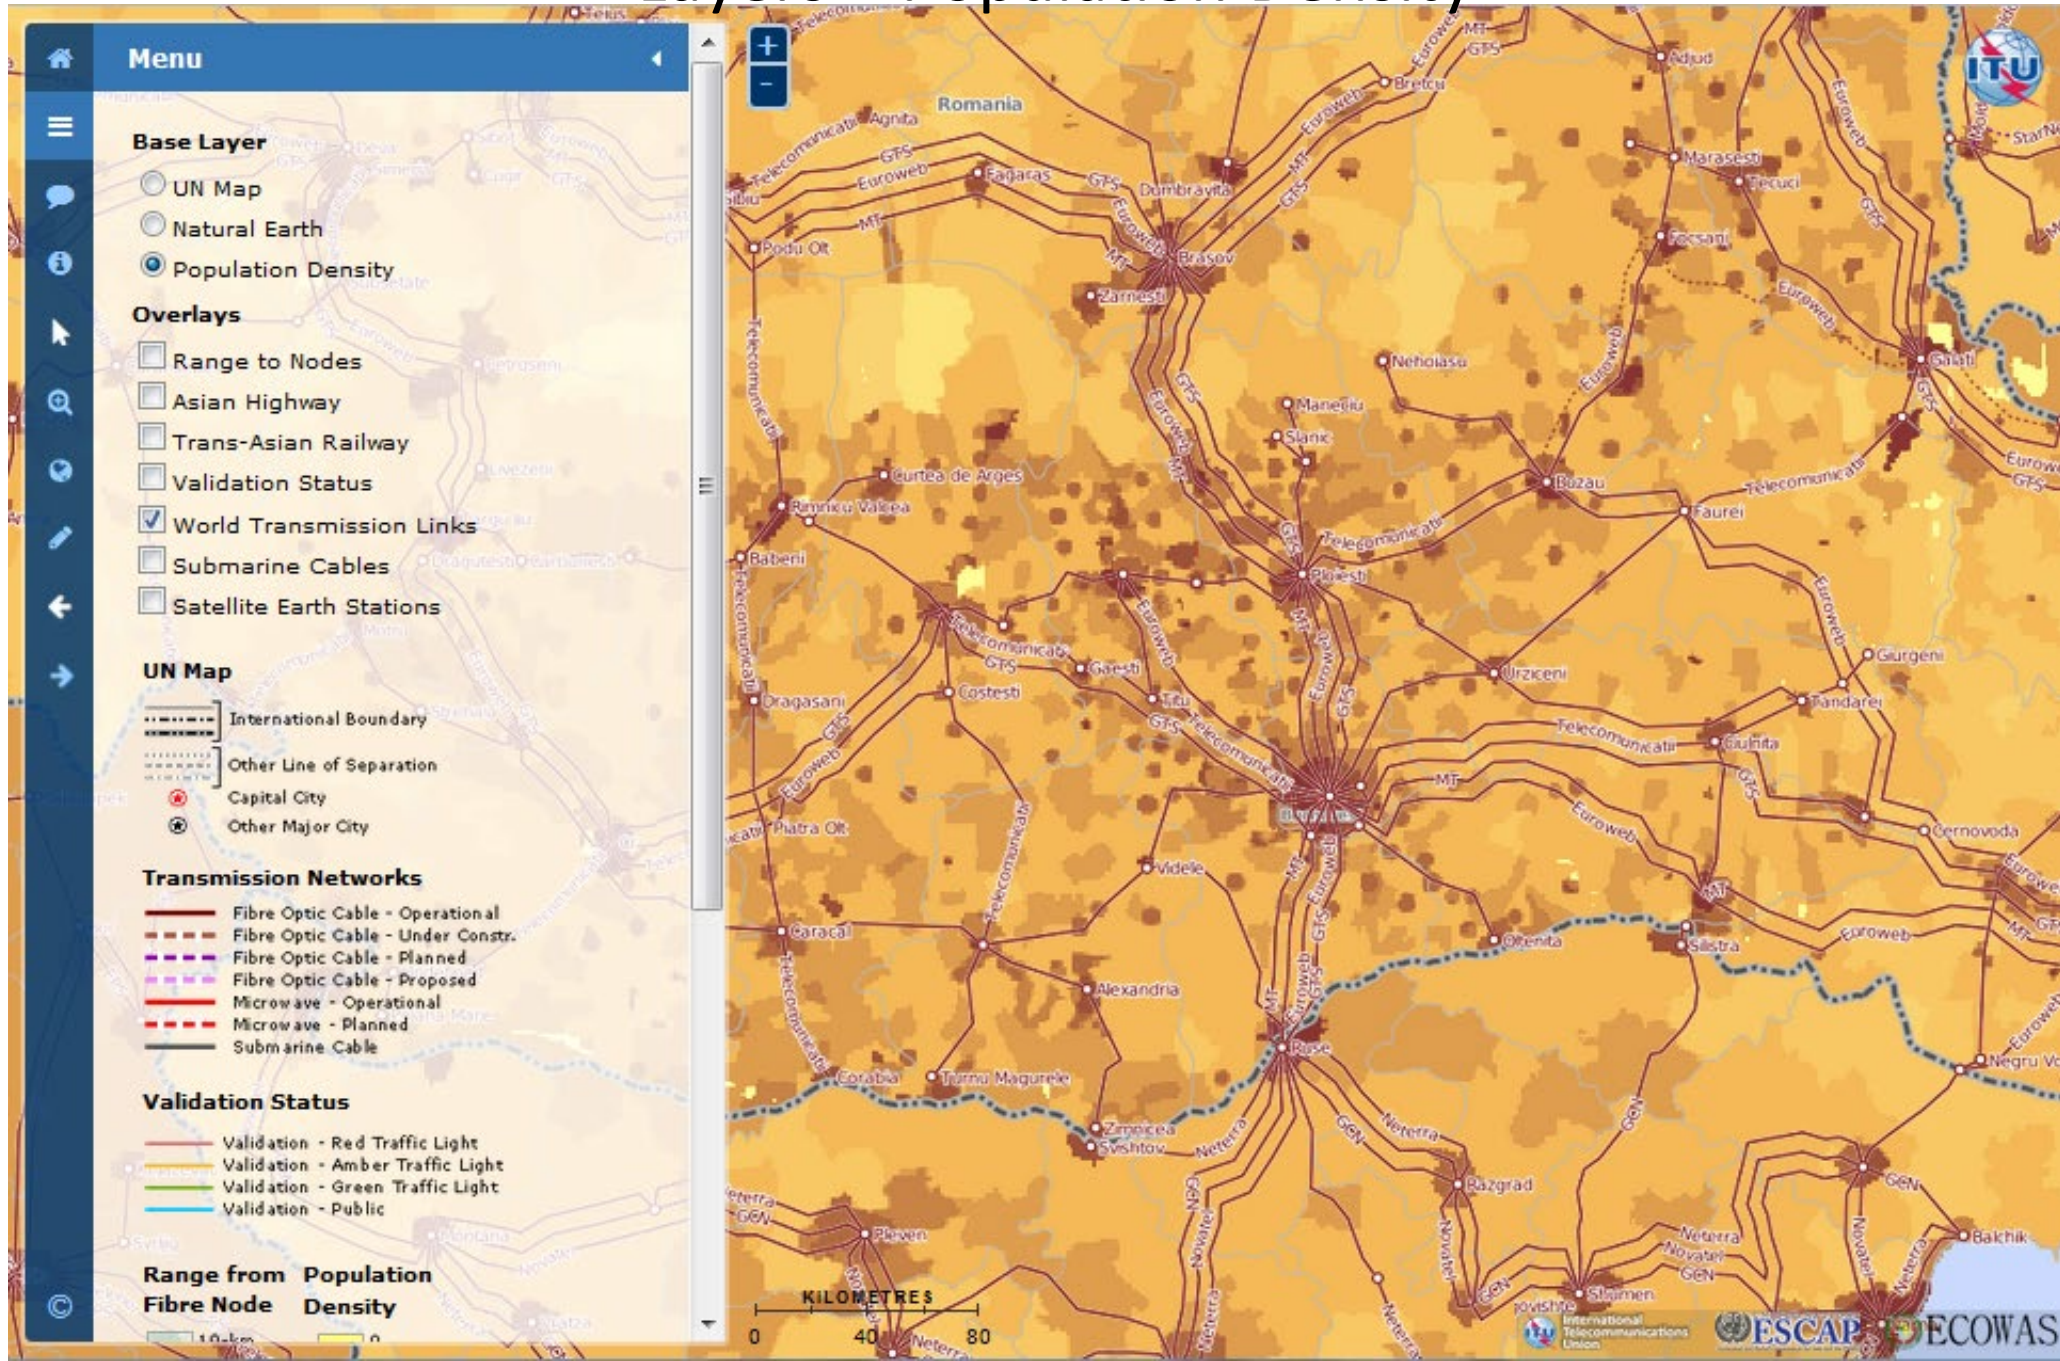

Indicator 4: **Network capacity (bit rate)**

Indicator 5: **Number of optical fibres within the cable**

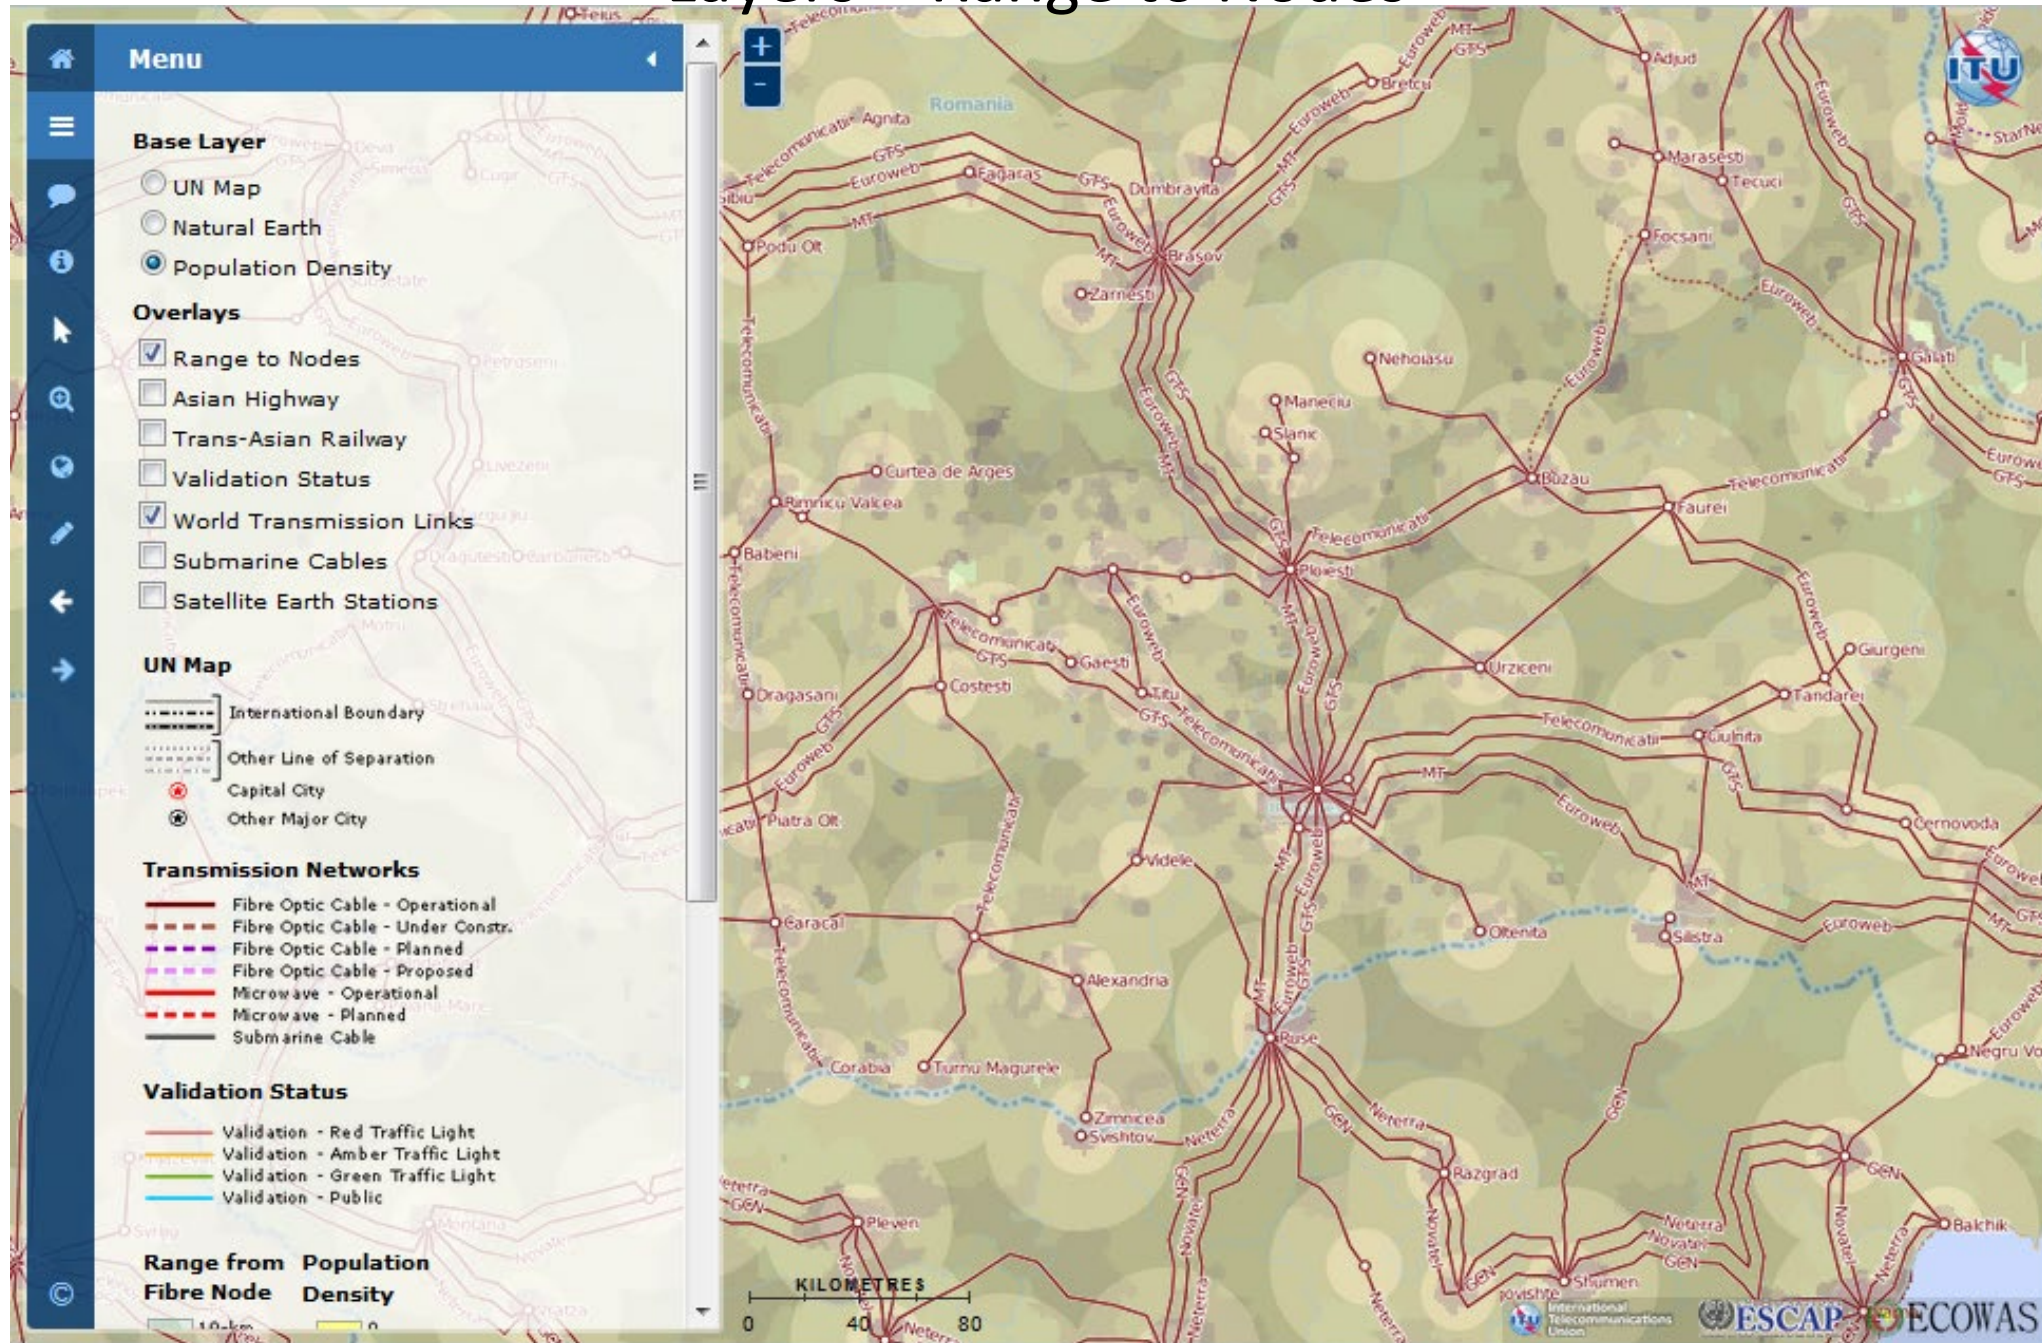

Indicator 6: **Operational status of the transmission network**

Indicator 7: **population within reach of transmission networks**

Layers – Population Density

Layers – Range to Nodes

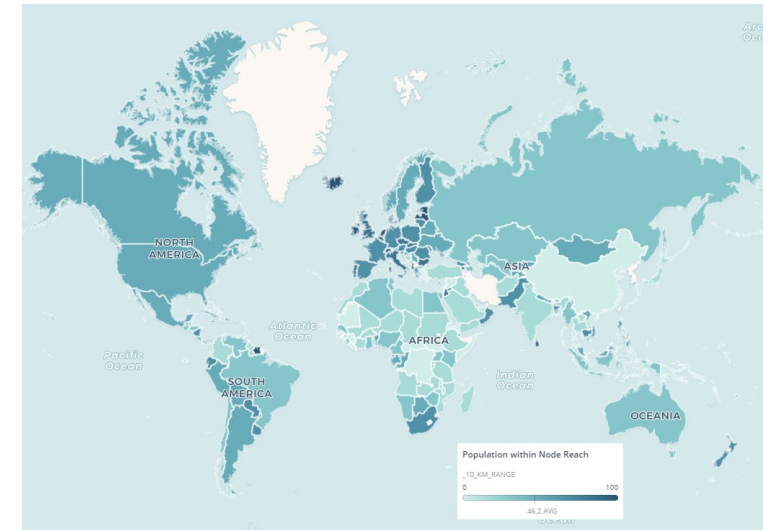

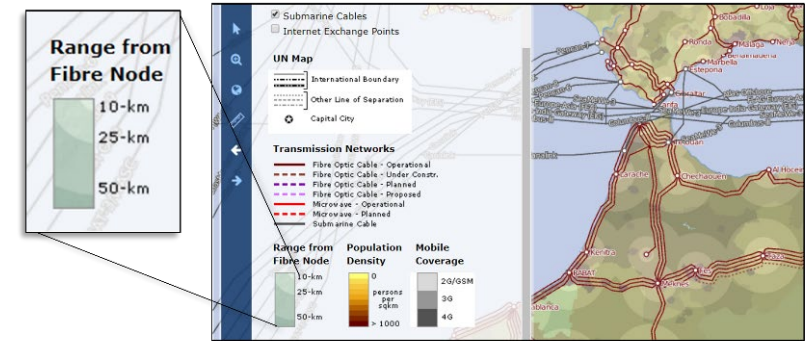

Data Analysis

Distance to Internet high-speed pathways (Access Points)

- **Distance to Internet high-speed pathways (Access Points)**

- Broadband indicators can help with the questions raised, for instance the “Broadband indicator population within 10 Km reach”. This indicator informs about the percentage of people that are within physical reach of an access point (nodes)
- The population living within reach of transmission networks is calculated from network nodes because nodes are access points to the network. This is a useful indicator of the catchment area of a core transmission network or networks, and how many people it potentially serves.

A large orange circle graphic on the left side of the slide, partially cut off by the edge.

Tool to
support
connectivity
initiatives

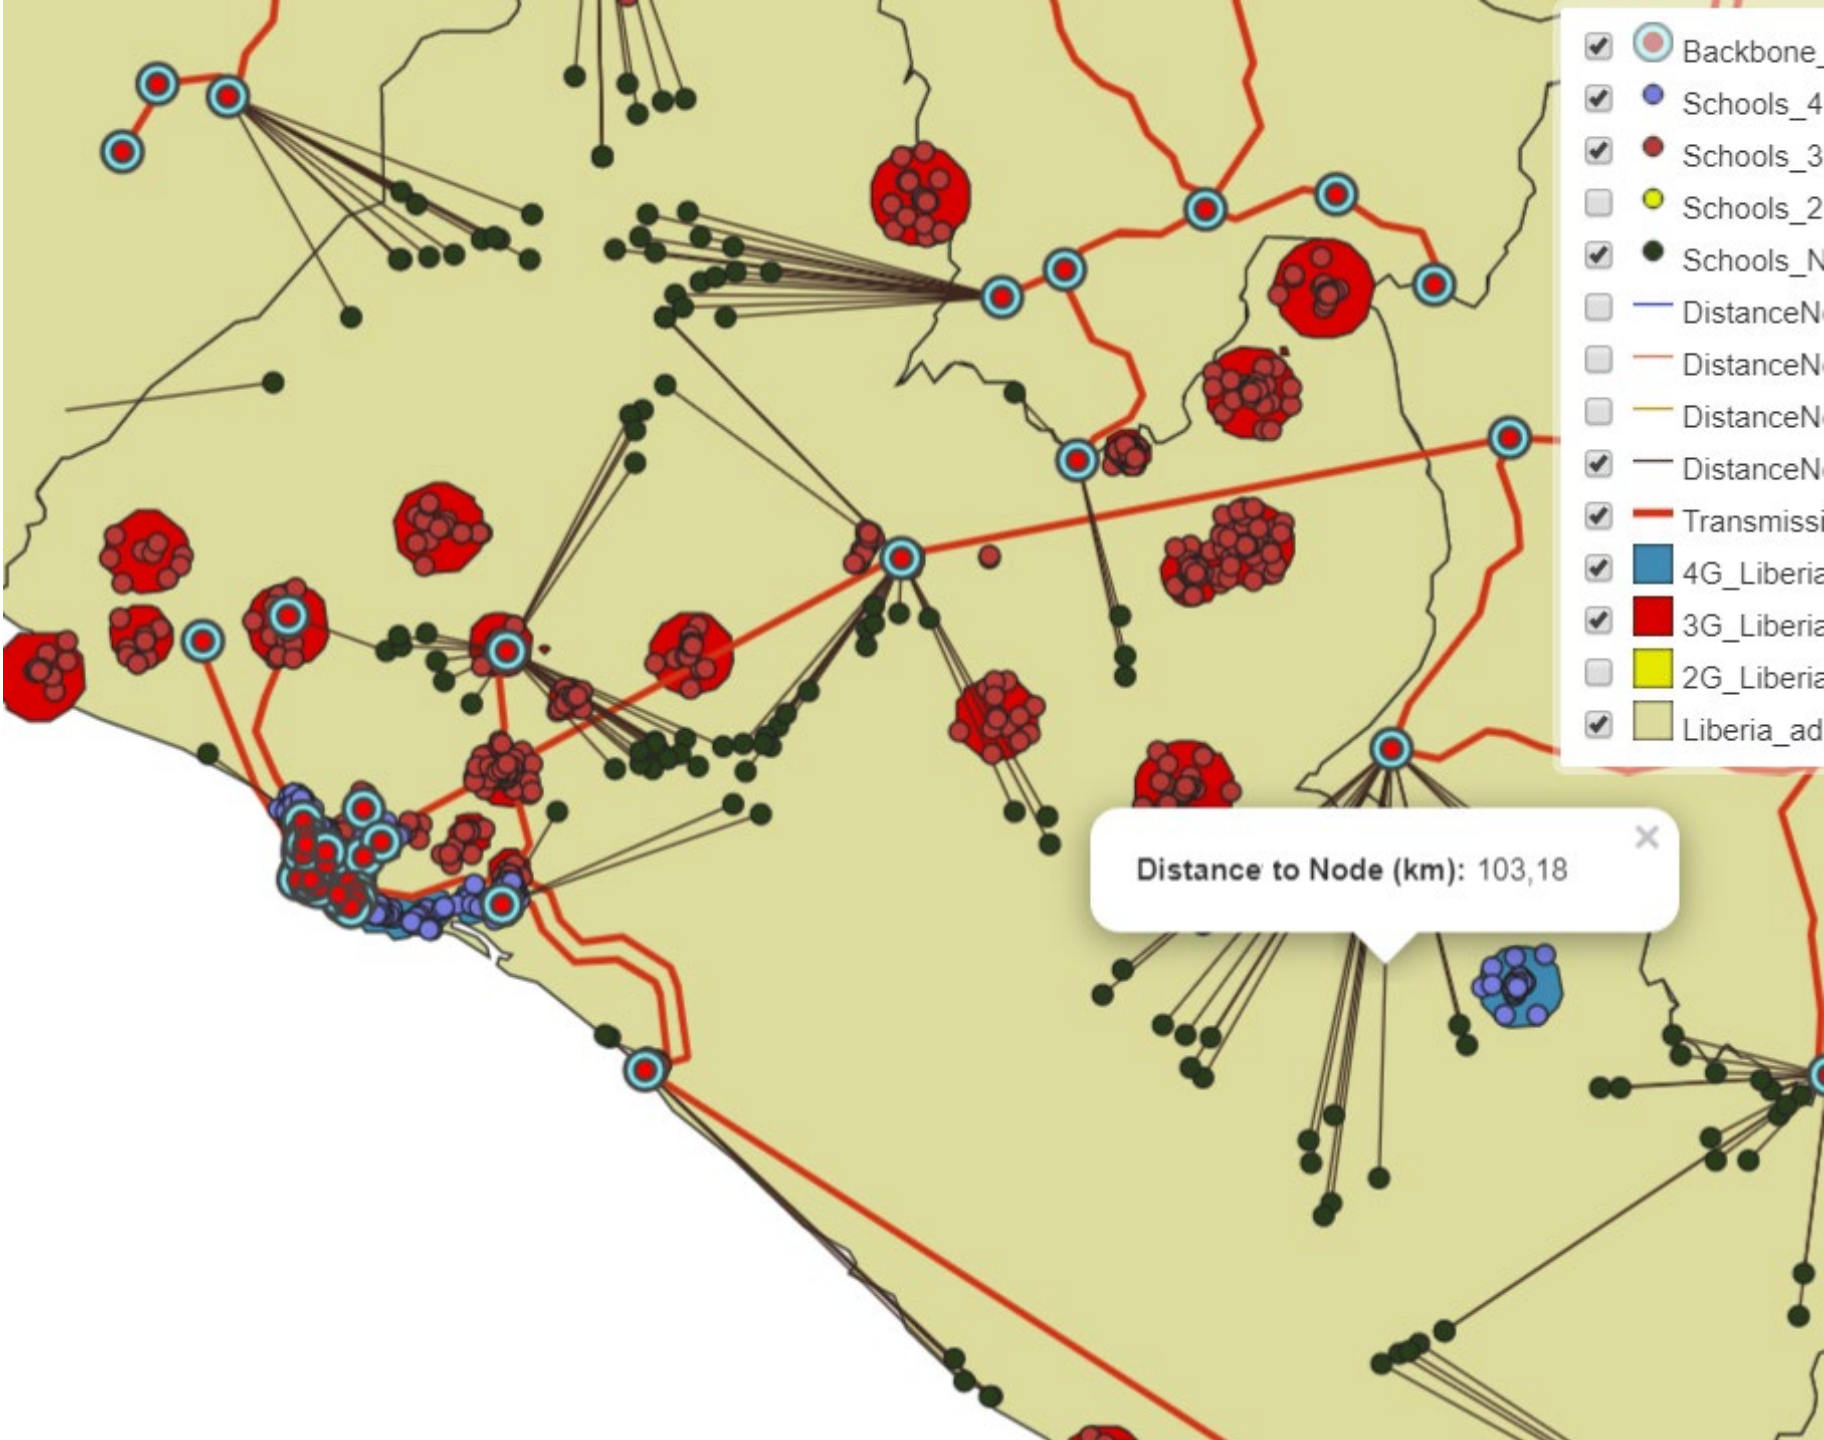

Thematic Priority – Reliable Connectivity to all

- FIGI - Mexico
- GIGA
- PRIDA
- UNESCAP
- DCM

GIGA – Connect every school

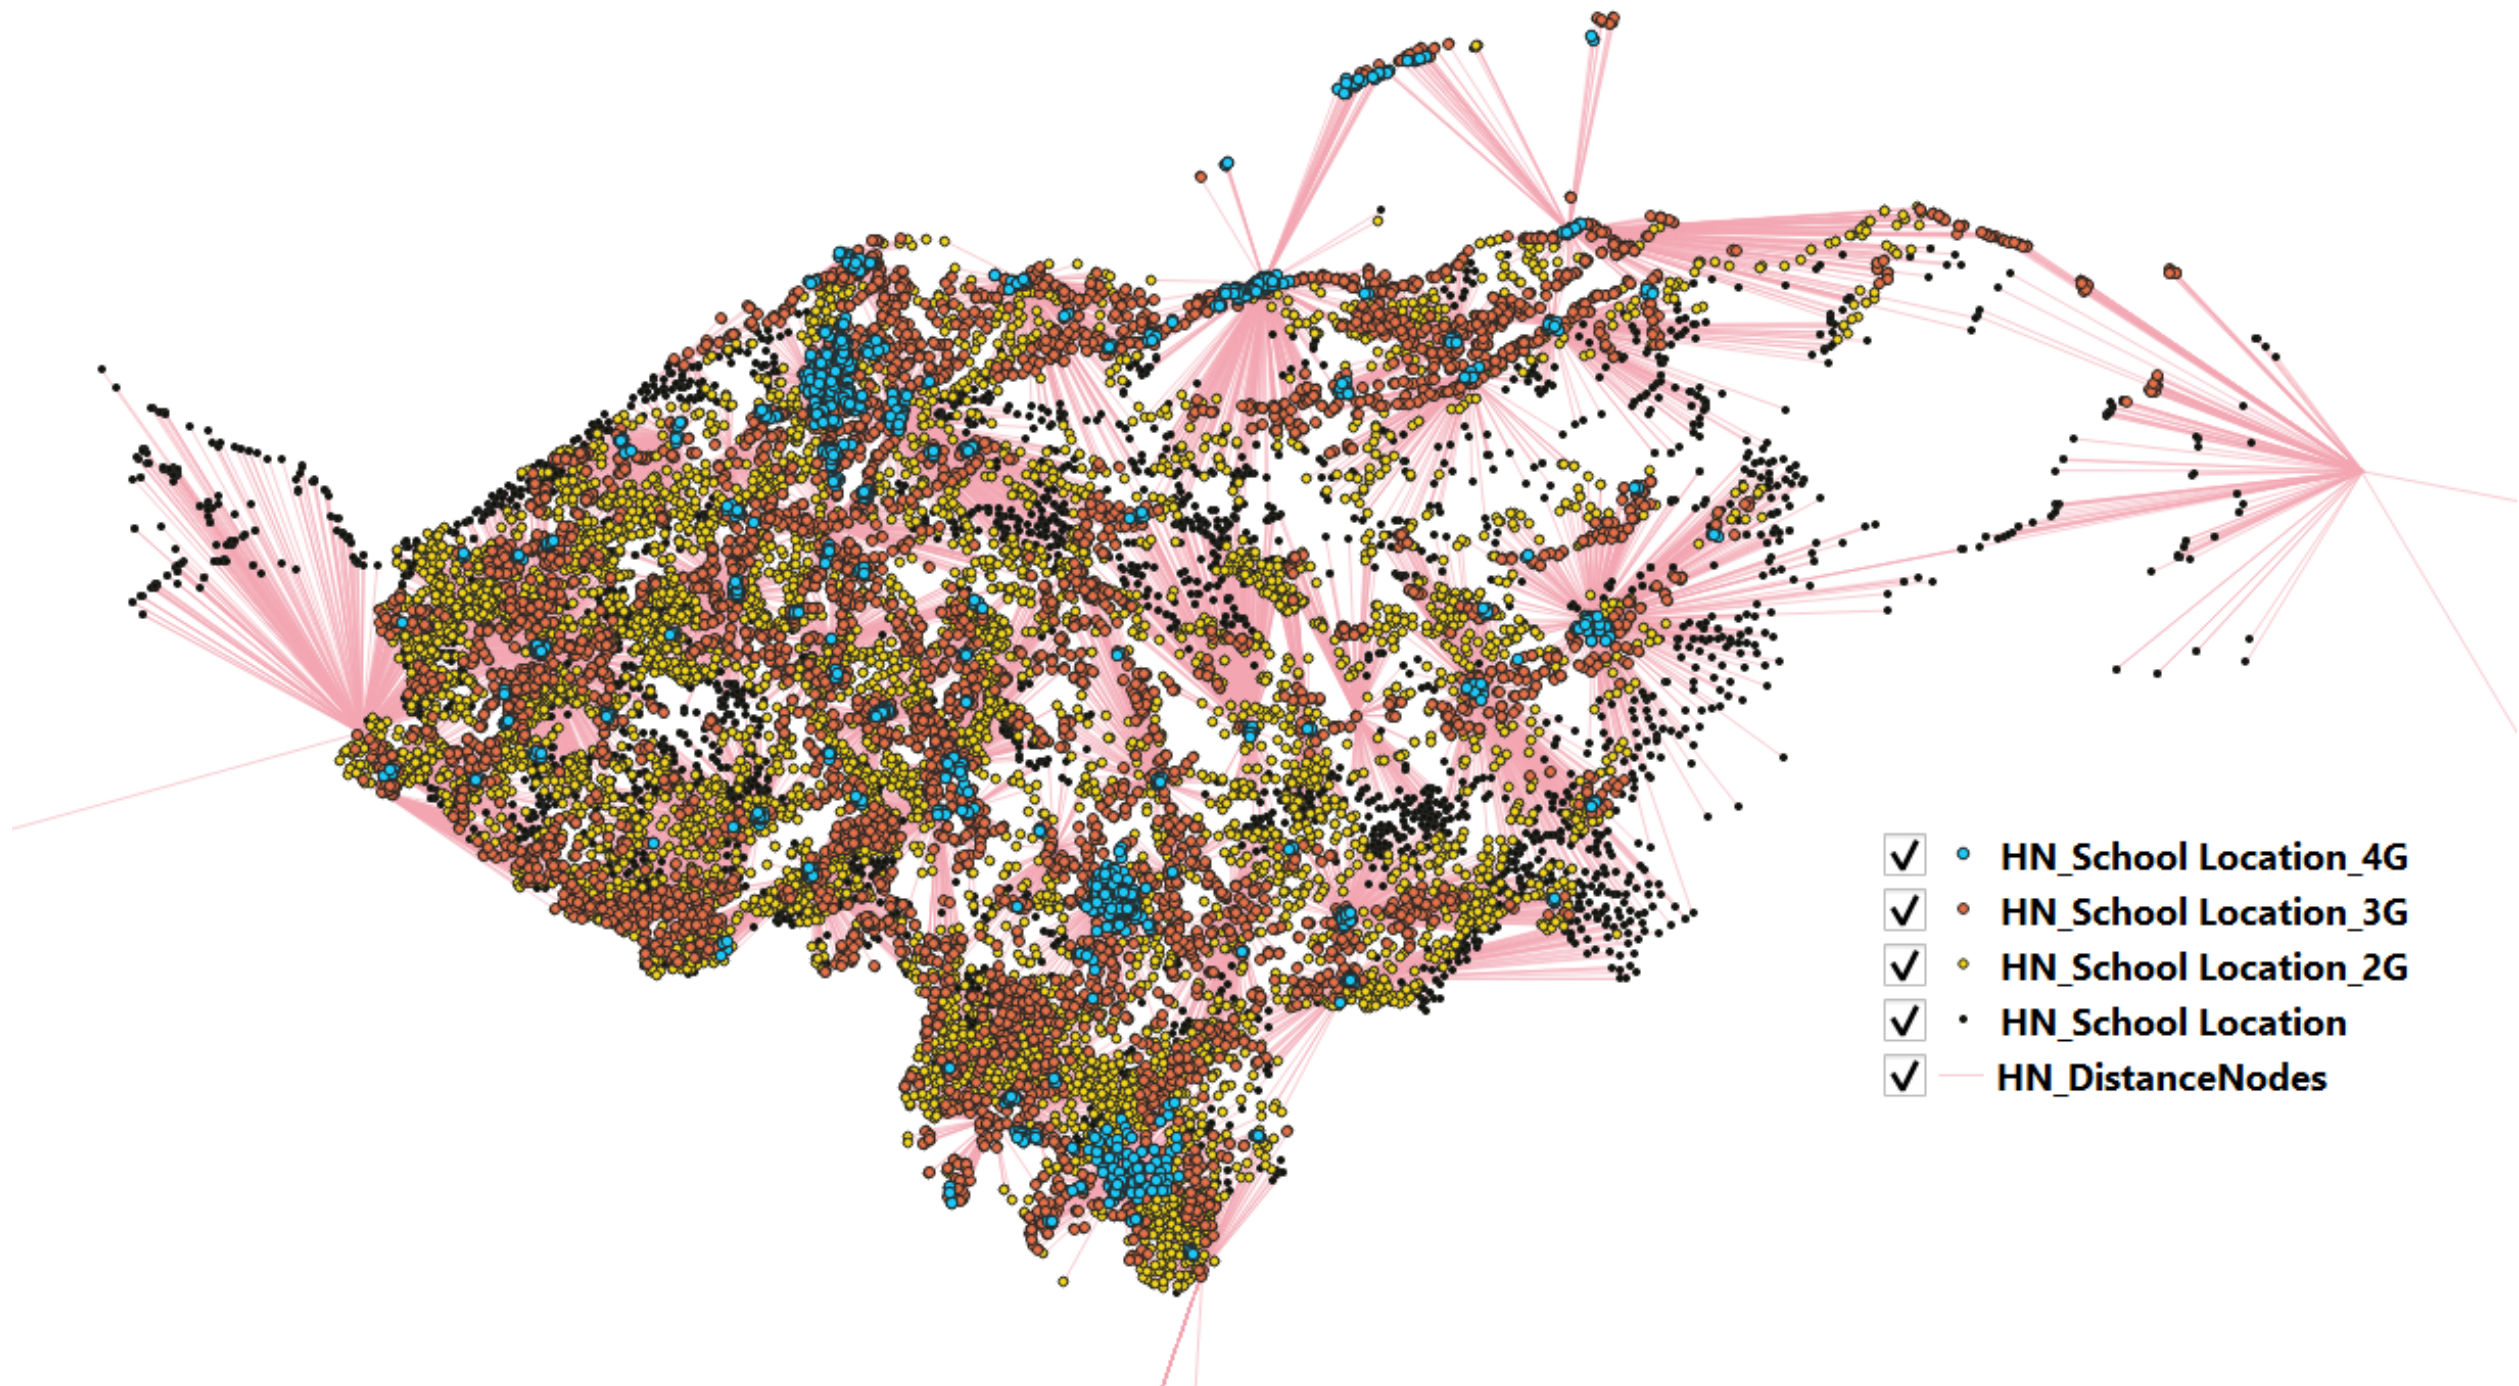

- Map
- Connect
- Finance
- Empower

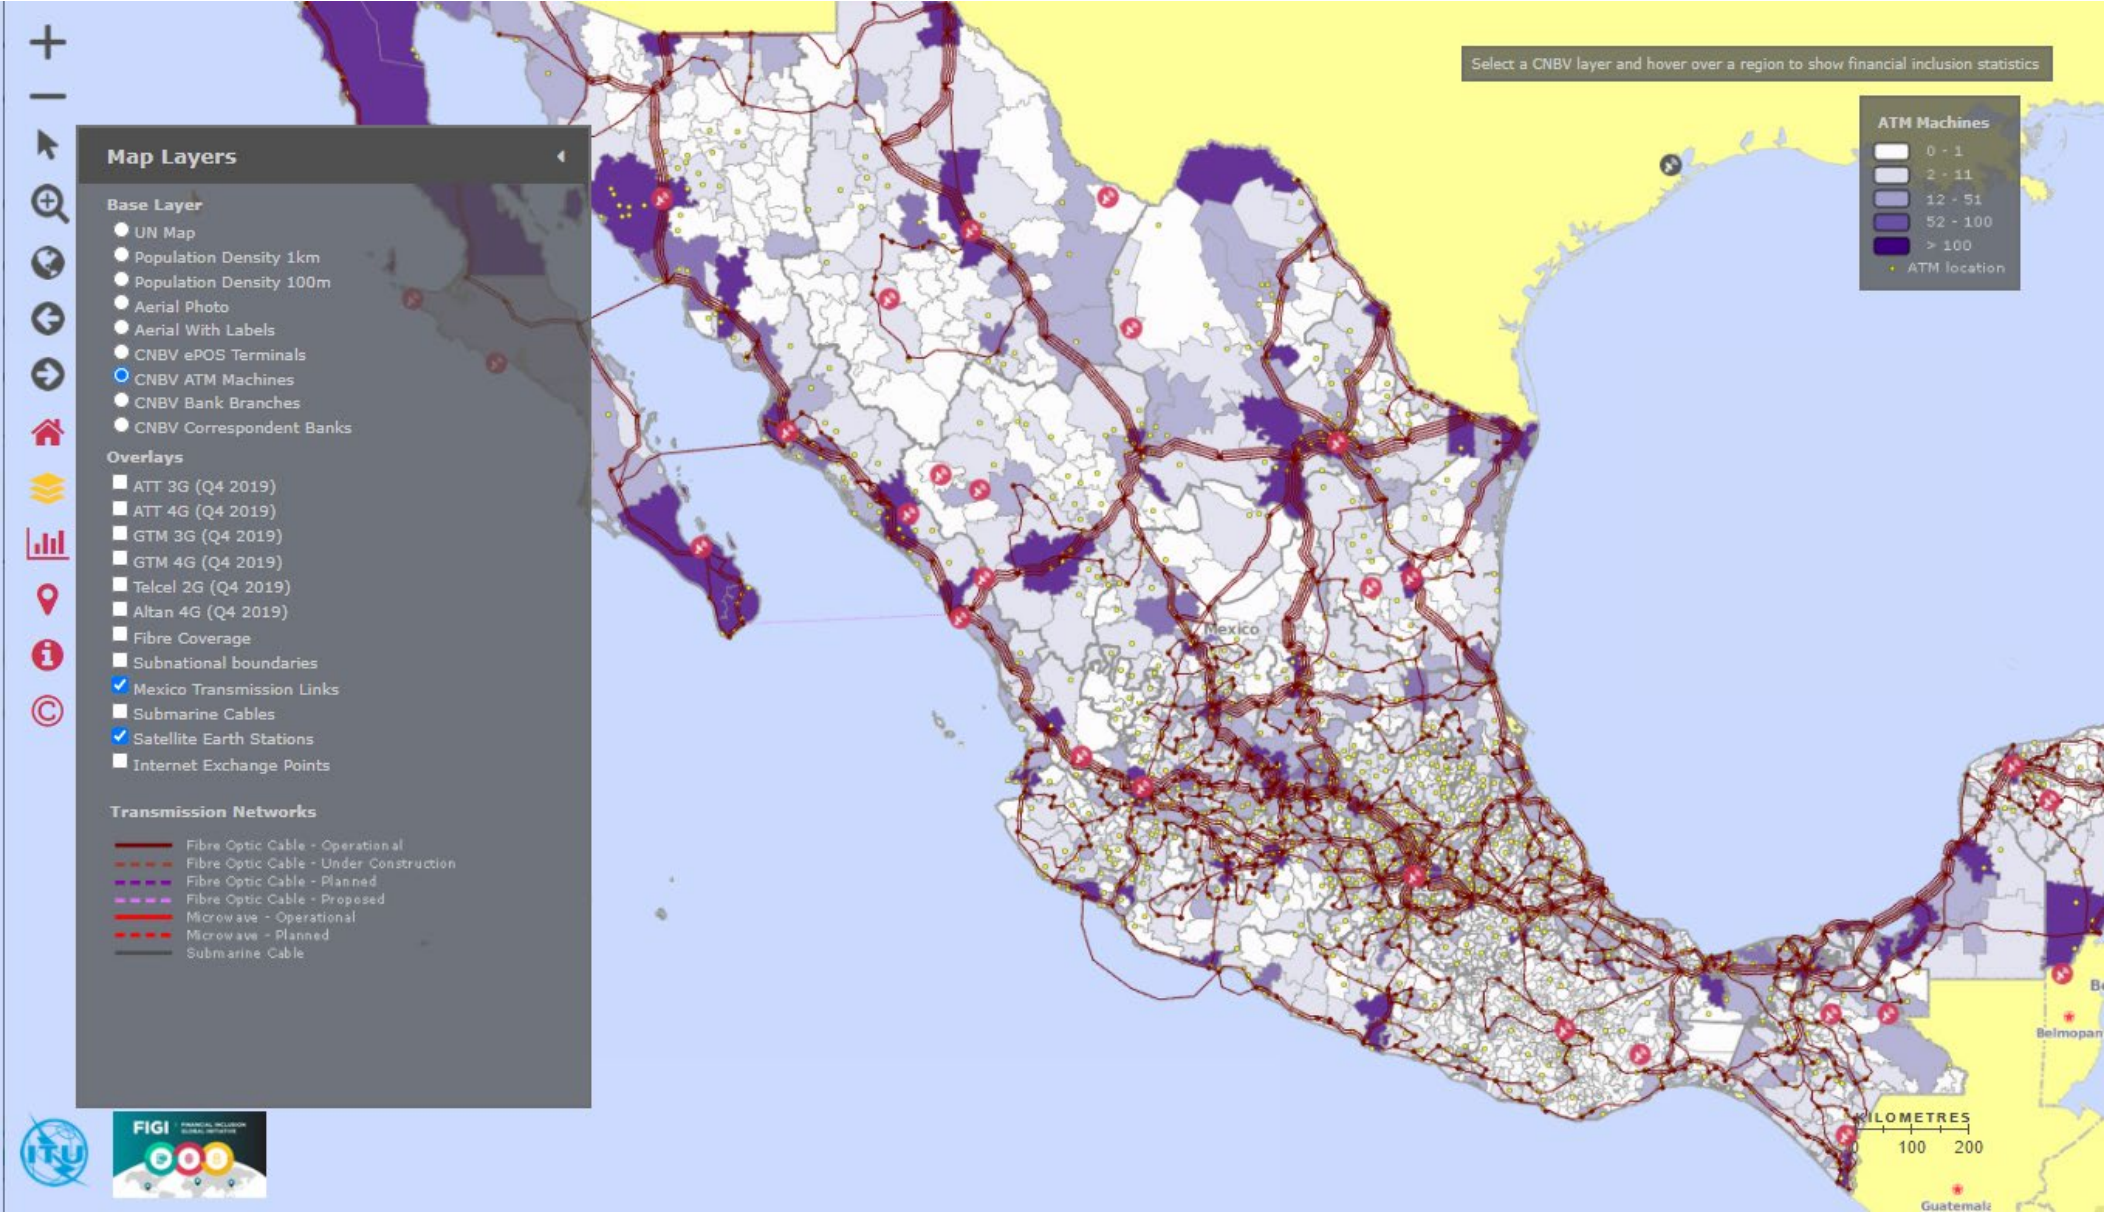

Connecting schools - Increased Data Value (Country case study)

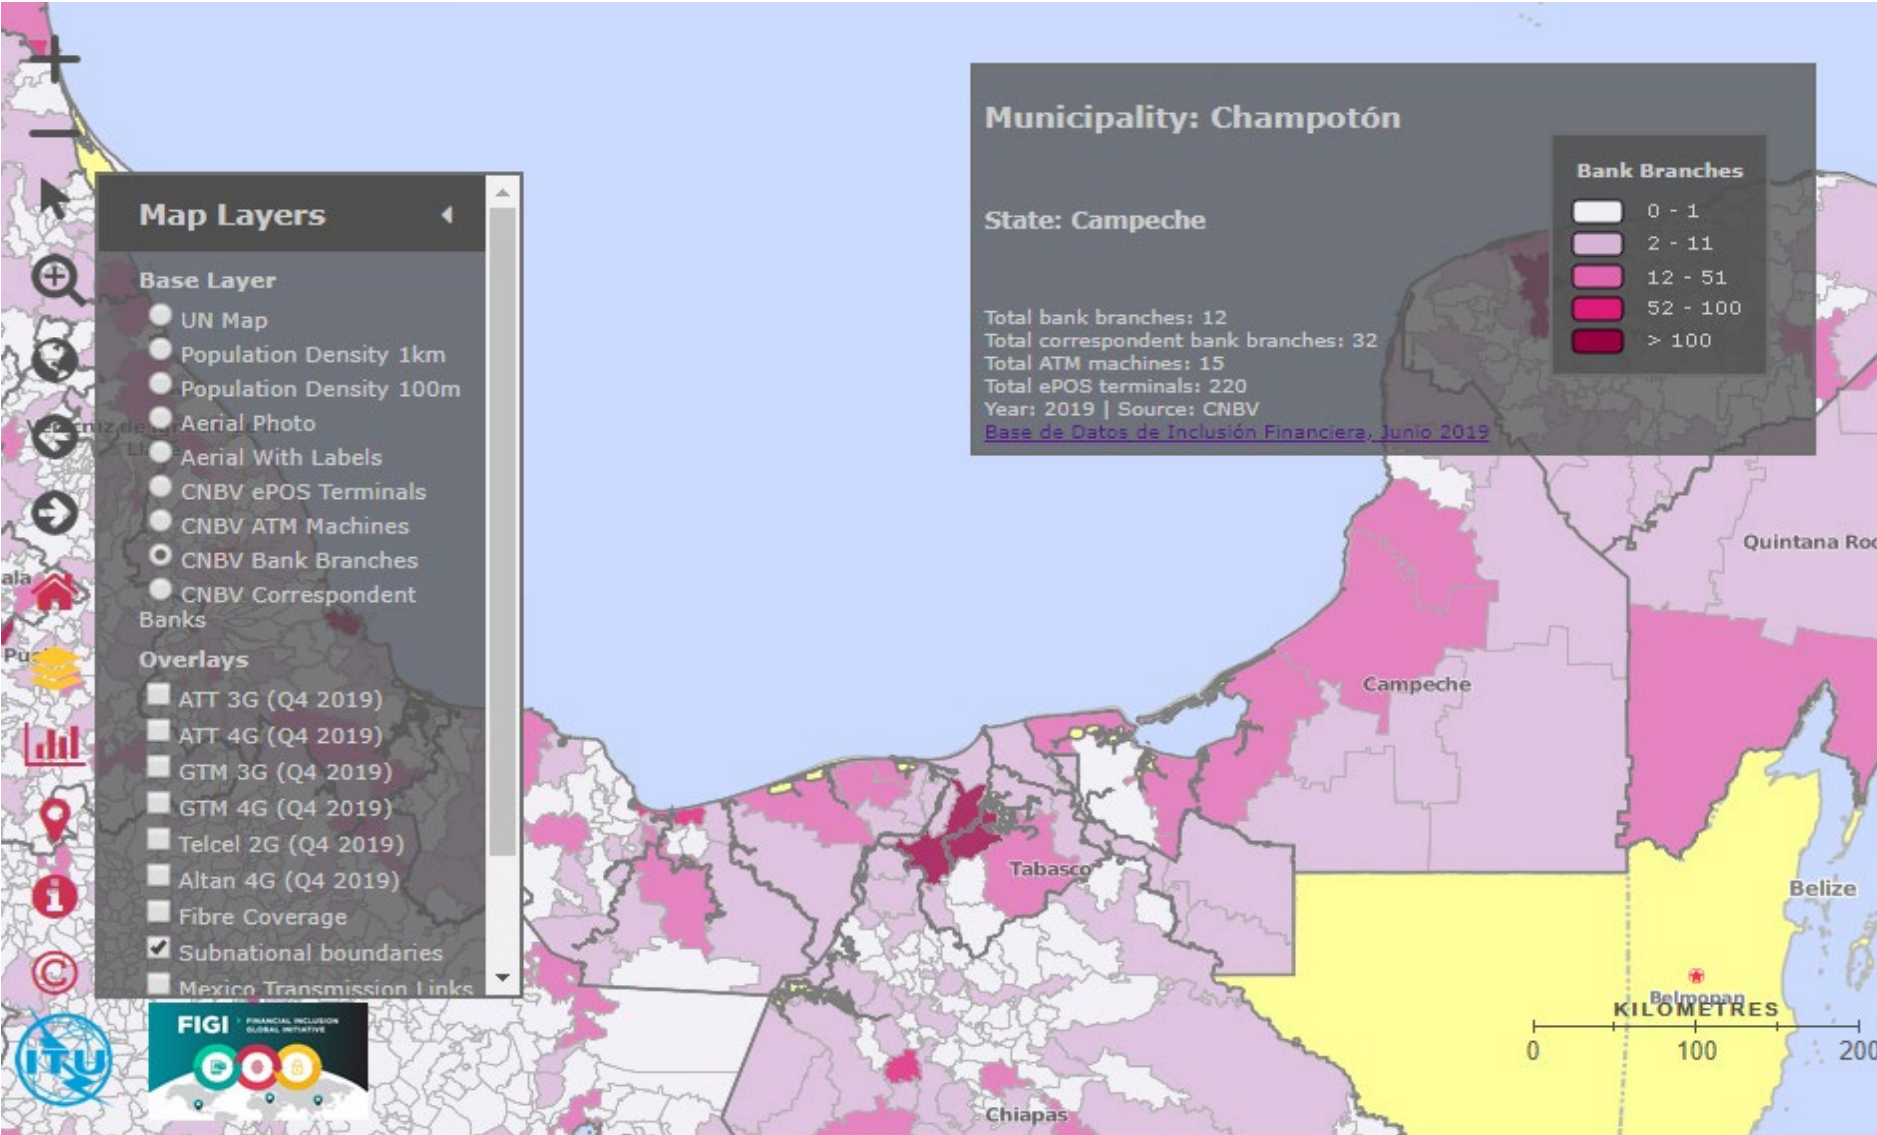

- **Case: school connectivity bid (UNDP)**
 - GIS backbone data as a source of reference to check the level of connectivity of existing and potential candidate sites for free Public Wi-Fi.
 - Ensure that free Wi-Fi sites are in areas that are underserved by service providers.
 - The backbone fiber data was used to determine if there are other significant sources of connectivity options in the sites identified.
- **Lessons**
 - Making existing data available
 - Focused actions -> increased data quality / update
 - Supplement with additional sources to build a robust view of existing infrastructure
 - Consider local terrestrial middle mile providers

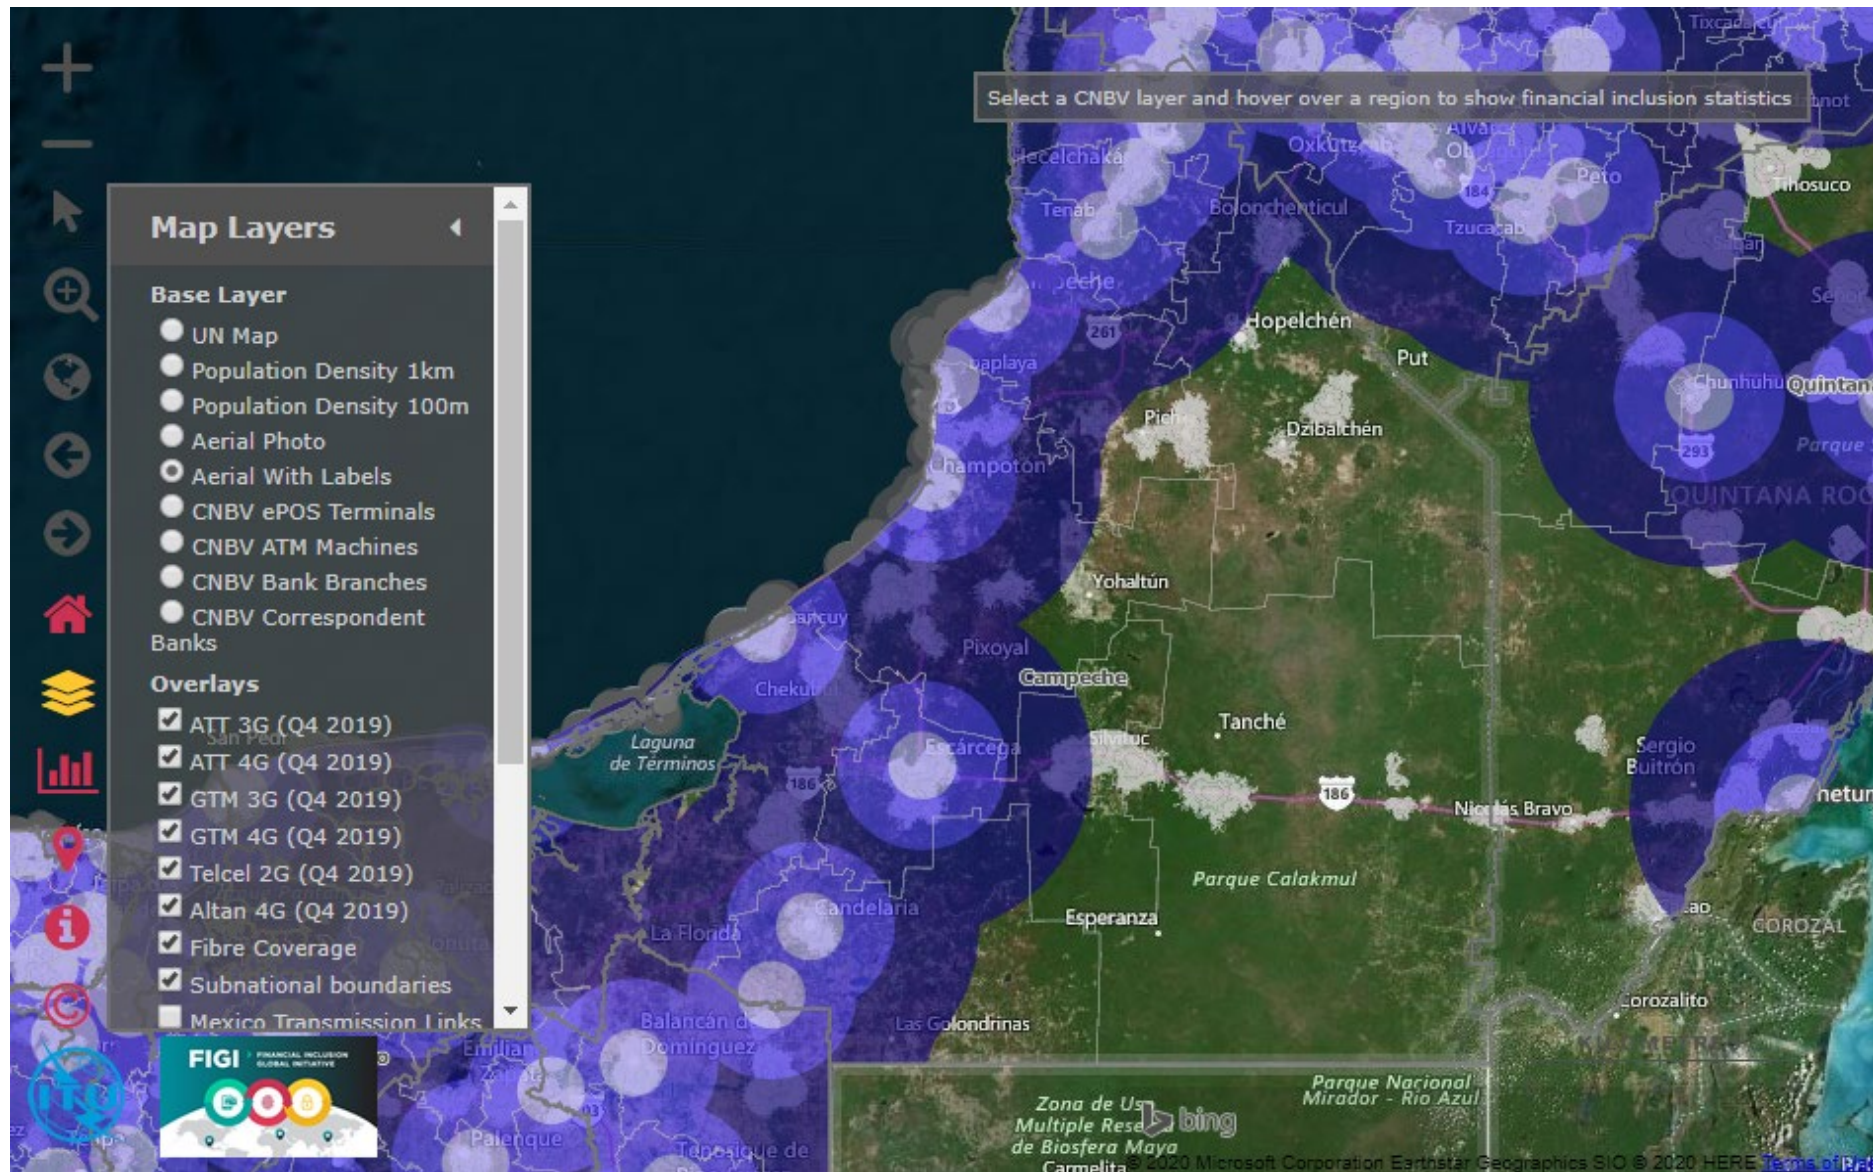

Financial Inclusion - Mexico

Bank Branches by Municipality

Comparison of fibre and mobile coverage

Financial Connectivity Index

- A way to visualise further possible barriers to entry for uptake of FinServ
- Weighted Sum method combines multiple layers:
 - Crime rate per municipality
 - ePOS Terminals
 - ATM Machines
 - Bank Branches
 - Correspondent Banks
- Weighting (adjustable) set to 20%
- To be made available as Web Map Services (WMS) layer, for inclusion into Desktop GIS

ITU-UNESCAP: Asia-Pacific Information Superhighway Maps

Next developments

- Quick Network estimation – ITU Regional Initiative model
- Connectivity estimation – Quality of Service
- New graphical interface
- Support to global, regional and national Infrastructure development initiatives
- Data collection
 - Terrestrial Transmission -Collaboration with National GIS offices
 - New Layers – Satellite Coverage (BR-GIMS)
 - Improving data collection in Central America: Guatemala, Honduras, and El Salvador
- ITU Assistancess
 - Mapping systems
 - Data Structure harmonization
